In the ſummer of the year 1798, Dr Jenner, of Berkeley in Glouceſterſhire, publiſhed ſeveral curious and intereſting facts reſpecting this diſeaſe, which had been for a very long time known to the dairy farmers in the weſtern counties of England. The moſt important of theſe is, that *perſons who have once been affected with the cow-pox* are thereby rendered *incapable of variolous infection.*

"It appears (ſays Dr. Jenner) on the nipples of cows in the form of irregular puſtules. At their firſt appearance they are commonly of a paliſh blue, or rather of a colour ſomewhat approaching to livid, and are ſurrounded by an eryſipelatous inflammation. Theſe puſtules, unleſs a timely remedy be applied, frequently degenerate into phagedænic ulcers; the animals become indiſpoſed, and the ſecretion of milk is much leſſened. Inflamed ſpots now begin to appear on different parts of the hands of the domeſtics employed in milking, and ſometimes on the wriſts, which quickly run on to ſuppuration, firſt aſſuming the appearance of ſmall veſications produced by a burn. Moſt commonly they appear about the joints of the fingers, and at their extremities; but whatever parts are affected, if the ſituation will admit, theſe ſuperficial ſuppurations put on a circular form with their edges more elevated than their centre, and of a colour diſtantly approaching to blue. Abſorption takes place, and tumors appear in each axilla. The ſyſtem becomes affected, the pulſe is quickened, and ſhiverings with general laſſitude and pains about the loins and limbs, with vomiting, come on. The head is painful, and the patient is now and then even affected with delirium. Theſe ſymptoms, varying in their degree of violence, generally continue from one day to three or four, leaving ulcerated ſores about the hands, which, from the ſenſibility of the parts, are very troubleſome, and commonly heal ſlowly, frequently becoming phagedænic, like thoſe from whence they ſprung."

There is not perhaps in the annals of medicine, to be found an example of experiment or enquiry, where the life and health of ſuch numbers already born, and of all to be born, were implicated, that has been taken up more generally, received more candidly, or conducted more prudently, than this concerning the cow-pox. Some experiments, however, producing reſults which induced Dr. Jenner to apprehend that a *ſpurious* cow-pox had been communicated, he, in a ſubſequent work, laid down the following rules for the guidance of thoſe who take the matter with which they inoculate *from the cow.* —He ſays, "The moſt perfect criterion by which the judgment may be guided is, perhaps, that adopted by thoſe who attend infected cattle. Theſe white blitters on the nipples, ſay they, *never eat into the fleſhy parts,* like thoſe which are commonly of a blueiſh caſt, and which conſtitute the *true cow-pox,* but that they affect the ſkin only, quickly end in ſcabs, and are not nearly ſo infectious."

Dr. Woodville gives a tabular ſtatement of the progreſſive deſcent of the cow-pox infection from patient to patient, as well as the magnitude of the diſeaſe which was excited by the inoculation. From the table, which extends much beyond our preſcribed limits, we collect the following facts:

1. That out of about 500 caſes of the inoculated cow-pox, one proved fatal; and that in ſome others the diſeaſe, from the number of puſtules, was of formidable ſeverity; while, on the other hand, a very large proportion of the patients were ſcarcely diſordered from the inoculation, and had no puſtules.

2. That the matter of the vaccine diſeaſe has generally produced much fewer puſtules and leſs indiſpoſition than that of the ſmall-pox.

3. That about two-fifths of all the perſons inoculated for the variolæ vaccinæ had no puſtules; and that in not more than a fourth part of them was there experienced any perceptible diſorder of the conſtitution.

Dr. Pearſon alſo engaged very extenſively in this enquiry; and after various inferences drawn from experiments made by himſelf and communicated to others, he ſays:

"It now ſeems to me that the following facts are eſtabliſhed on the foundation of experience:

"1. A conſtitution which has undergone the ſmall-pox is unſuſceptible of again undergoing the diſeaſe.

"2. A conſtitution which has not undergone the ſmall-pox, but which has undergone the cow-pox, is unſuſceptible of undergoing the ſmall-pox.

"3. A conſtitution which has not undergone the cow-pox, but which has undergone the ſmall-pox, is unſuſceptible of undergoing the cow-pox.

"Now, if the variolous poiſon deſtroys the ſuſceptibility of the conſtitution to the future agency of this poiſon, in the reſpect of its producing the ſmall-pox—and if the cow-pox poiſon deſtroys the ſuſceptibility of the conſtitution to the future agency of the variolous poiſon, in the reſpect of its producing the ſmall-pox—and if the variolous poiſon deſtroys the ſuſceptibility of the conſtitution to the future agency of the vaccine poiſon, in the reſpect of its producing the cow-pox—it is demonſtrated, that the ſame ſtate of ſuſceptibility of the conſtitution with reſpect to the future agency of the variolous poiſon, is produced equally by the agency of the variolous poiſon, and by the vaccine poiſon; but if the variolous poiſon produces unſuſceptibility of the conſtitution to the future agency of the vaccine poiſon, it is demonſtrable that the following fourth propoſition is true, viz.

"4. A conſtitution which has undergone the vaccine diſeaſe is unſuſceptible of again undergoing that diſeaſe from the vaccine poiſon, becauſe a ſtate of unſuſceptibility with reſpect to the agency of the variolous poiſon is produced by the vaccine poiſon (2d *propoſition*), and a ſtate of unſuſceptibility with reſpect to the agency of the vaccine poiſon is produced by the variolous poiſon (3d *propoſition*);—but the ſtate of the conſtitution being the ſame in the two caſes whether it be produced by the variolous or vaccine poiſon with reſpect to unſuſceptibility, it ſeems inevitably in courſe, that unſuſceptibility of the conſtitution to the future agency of the vaccine poiſon is produced by the vaccine diſeaſe; and the demonſtration in courſe, could be given of the 1ſt *propoſition,* on the ground of the 2d and 3d *propoſition,* that unſuſceptibility of the conſtitution to the agency of the variolous poiſon is produced by the variolous diſeaſe, if this were not already proved by abundant experience. At a future time, however, I ſhall relate the obſervations and experiments to confirm this *à priori* concluſion; firſt, becauſe theſe proofs will increaſe the validity of the 3d *propoſition;* and ſecondly, becauſe I do not mean to offer this demonſtration as infallible, like mathematical."

It is by no means extraordinary that ſome accidents ſhould occur to throw ſuſpicion on the ſuppoſed efficacy attributed to the practice of inoculating the cow-pox; the preference due to it, however, over *variolous* inoculation, is rendered manifeſt by the following final account of the matter given by Dr. Woodville in a periodical work. He ſays,

"In my report of the new inoculation, publiſhed in May

laſt, including upwards of 500 caſes, I obſerved that the matter of the vaccine diſeaſe generally produced much fewer puſtules, and leſs indiſpoſition, than that of the ſmall-pox. But at the ſame time it was remarked, that in ſome inſtances the cow-pox proved a very ſevere diſeaſe, and that one child died of ſpaſmodic fits, occaſioned by the eruptive fever which it excited. I hinted, however, that if the matter of the cow-pox uſed for the inoculations had been taken only from thoſe patients in whom the diſeaſe appeared very mild and well characteriſed, the reſult would have been more favourable; and I have ſince had the ſatisfaction to find this opinion fully confirmed. For of 1000 perſons inoculated for the vaccine diſeaſe, by me, or under my immediate direction, during the laſt ſix months, not more than 150 had puſtules which proceeded to ſuppuration; nor was there one caſe attended with a dangerous ſymptom.

"Now, out of 1000 perſons inoculated for the ſmall-pox, I find generally that more than 800 have puſtules; and as the ſeverity of the diſeaſe is commonly in proportion to the number of the puſtules, it follows that the cow-pox is milder than the inoculated ſmall-pox in the proportion above mentioned.

"To infants at the breaſt the new inoculation has proved peculiarly ſucceſsful, for I have now had a very conſiderable number of private patients of this deſcription, in none of whom was the inoculation attended with any puſtules, and even very rarely with any perceptible diſorder of the conſtitution.

"That thoſe who have undergone the vaccine diſeaſe, are thereby rendered ſecure againſt the effects of the ſmall-pox, is a truth confirmed by daily experience. Upwards of 1000 of my patients, who had undergone the cow-pox, have been inoculated with variolous matter, yet none of them took the ſmall-pox."

The Society for Bettering the Condition of the Poor, deſirous of extending this practice as much as poſſible, printed and diſtributed an Addreſs to the Poor, which is introduced by theſe preliminary remarks:

"Notwithſtanding the advantage of inoculation for the ſmall-pox," ſay they, "it is a melancholy fact that the poor do ſtill ſuffer very greatly by that diſorder. The following addreſs from the phyſicians, ſurgeons, and apothecaries, of the medical hoſpitals at Mancheſter, on the ſubject of inoculation for the cow-pox, may, it is hoped, have its effect in producing from our medical hoſpitals offers ſimilar to that in the addreſs, and alſo in preparing the minds of the poor to take the full benefit thereof. Two families near Mancheſter have lately inoculated for the cow-pox many hundreds of the neighbouring poor; who have all recovered without any ſickneſs to confine them a ſingle day. Twenty of them were afterwards inoculated for the ſmall-pox; for a few days the uſual ſigns of infection were perceived on the arms; but ſoon diſappeared, without communicating the ſmall-pox to any one of the twenty patients on whom this very ſatisfactory experiment was made."

Their Address to the Poor runs thus:

The experience of ſeveral years has fully proved, that inoculation for the cow-pox is a certain preſervative againſt the ſmall-pox; and is, beſides, ſo mild and ſafe a diſorder, when compared with the inoculated ſmall-pox, that it has been generally introduced among the better informed, and more wealthy inhabitants, both of this kingdom and of various parts of Europe. In order, therefore, to impreſs ſtrongly on the minds of the poor, the uſefulneſs and ſuperior advantages of this new plan of inoculation, the medical gentlemen (whoſe ſignatures are annexed) belonging to theſe charities, have thought it their duty to ſtate, in this public manner, the following obſervations for the ſerious peruſal of all thoſe poor perſons, who feel a proper affection for their offſpring, and who are deſirous of promoting their own intereſt and comfort.

1. *Inoculation* for the *cow-pox* has been practiſed, for ſeveral years, with conſtant ſucceſs, in various parts of this kingdom.

2. It has never failed to prevent the infection of the natural ſmall-pox.

3. It may be communicated with ſafety to perſons of every age and ſex, and at all times and ſeaſons of the year, with equal advantage.

4. The cow-pox is much preferable to the inoculated ſmall-pox, as being a milder and ſafer diſeaſe, and not capable of infecting the perſons living in the ſame family, or even ſleeping in the ſame bed.

5. It does not produce eruptions, which ſcar and diſfigure the face; and is ſeldom, if ever, attended with any other marks of the diſeaſe, than what appear on the arms from inoculation.

6. Neither ſwellings, blindneſs, lameneſs, nor any other complaints, which are known frequently to be the conſequences of the natural ſmall-pox (and ſometimes, though but ſeldom, of the inoculated ſmall-pox), have been obſerved to follow the cow-pox.

7. Alarming fits frequently ſeize children when ſickening of the ſmall-pox; and while cutting their teeth, this diſorder often proves dangerous; but no ſuch objections lie againſt the cow-pox.

8. So far from proving hurtful, delicate and ſickly children are often improved in health by having paſſed through this complaint.

9. Scarcely any remedies or attendance are required for the cow-pox.

10. There is no neceſſity for a courſe of phyſic either before or after inoculation.

11. The *time of the parents will not be taken up in attendance upon the ſick*, to the injury of the ſupport of the reſt of the family: and to poor families, this is *an object of no ſmall importance.*

The prejudices of the poor againſt inoculation for the ſmall-pox, by which thouſands of lives have been annually ſaved, have been often lamented; but if they ſuffer unjuſt prejudices to prevent their laying hold of the advantages now offered to them, by the inoculation of the cow-pox, they will neglect the performance of a duty they owe to themſelves, to their families, and to ſociety at large.—For ſurely it is little leſs than criminal to expoſe their helpleſs children to the attack of ſo terrible and fatal a malady as the ſmall-pox, when it may be readily avoided by the inoculation of ſo mild, ſimple, and ſafe a diſeaſe, as that of the cow-pox.

The great ſuperiority of the inoculation of *vaccine*, in preference to *variolous*, matter, conſiſts in this:

That by the latter, infection is brought from all points of the compaſs; the ſeeds of a fatal diſeaſe are ſcattered over the whole face of the kingdom; and where a ſingle life is preſerved by variolous inoculation, *ſeveral* perhaps are loſt by the *accidental communication* of the natural diſeaſe through the neighbourhood. On the other hand, the cow-pox, beſides being more free from danger to the patient, confers its benefits to individuals without endangering the community, and without the poſſibility of extending itſelf to any perſon in the ſame family.

COX (Richard) (*Encycl.*). This zealous reformer we find had not totally loſt ſight of the popiſh text, *compel them to come in.* A ſtrong proof of his implacability and ſelf-importance appears in his letter to the lord-treaſurer Burleigh, in which he warmly expoſtulates with the council for inter-

posing in behalf of the Puritans, or meddling in affairs of the church, admonishing them to keep their own sphere. Such language from a bishop would make a modern privy-council stare. His works are, 1. Two Latin Orations on the Dispute between Dr. Tresham and Peter Martyr, Lond. 1549, 4to. 2. Liturgy of the Church of England; in compiling, and afterwards correcting which, he was principally concerned. 3. The Lord's Prayer in verse, commonly printed at the end of David's Psalms, by Sternhold and Hopkins. 4. Translation of the Four Gospels, the Acts of the Apostles, and the Epistle to the Romans, in the new translation of the Bible in the reign of Queen Elizabeth. 5. Resolutions of some Questions concerning the Sacrament, in the Collection of Records at the end of Burnet's History of the Reformation. 6. Several Letters to the Queen and others, published in Strype's Annals of the Reformation. He is also said to have been concerned in the declaration concerning the divine institution of bishops, and to have assisted Lilye in his grammar.

CRACKER, or SEA-PHEASANT, in ornithology, the English name of the anas aeuta. See ANAS.

CRAIGMILLAR, a ruinous castle, 2 miles S.E. of Edinburgh, in which Mary queen of Scots resided, after her return from Paris in 1562. Her French retinue were lodged in an adjaeent village, thence called Little France; and here too, repenting her rash match with the profligate Lord Darnley, she often retired, to indulge her melancholy in solitude.

CRAINBURG, a town of Germany, in Carniola, on the river Saave, 20 miles N.W. of Laubach. Long. 14. 5. E. Lat. 46. 36. N.

CRAMBE (*Encycl.*), erroneously spelt CRAMBLE.

CRAMMOND WATER, a river of Edinburghshire, in Scotland, called also the Almond. For several miles it divides this county from Linlithgowshire, and falls into the Frith of Forth, at the small village of Crammond, a place remarkable for the traces of a great Roman station. Its fertile banks are adorned with villages and country seats.

CRANBOURN, a town of Dorsetshire, with a market on Wednesday. It is well watered with streams, and has a fine chase, which extends almost to Salisbury. It is 38 miles N.E. of Dorchester, and 94 W. of London.

CRANBROOK, a large town in Kent, with a market on Saturday, the best in these parts. It is 13 miles S. of Maidstone, and 52 S.E. of London. Long. 0. 39. E. Lat. 51. 4. N.

CRANE (*Encycl.*). In that article, the descriptions of the figures in Plate 88, Vol. II. have been accidentally omitted. The following is a description of Mr. White's crane.

A, a circular-inclined plane, moving on a pivot underneath it, and carrying round with it the axis E. A person walking on this plane and pressing against the lever B, throws off the gripe D by means of an iron rod C, and thus admits the plane and its axis to move freely, and raise the weight G by the coiling of the rope F round the axis E. To shew more clearly the construction and action of the lever and gripe, a plan of a circular-inclined plane with the lever and gripe is added, where B represents the lever, D the spring or gripe. In this plan, when the lever B is in the situation it now appears, the spring or gripe D presses against the periphery of the plane, as shewn by the double line; and the machine cannot move but when the lever B is pressed out to the dotted line H; the gripe is also thrown off to the dotted line I, and the whole machine left at liberty to move. One end of a rope or cord, of a proper length, is fixed near the end of the lever B, and the other end made fast to one of the uprights, serving to prevent the lever moving too far when pressed by the man.

The *improved crane*, represented in the same plate, consists simply in introducing the action of a worm, that communicates the first motion to the crane, upon the axis of the wheel in which the man walks. The axis of this wheel, and that of the worm, are proposed to be in separate parts, and occasionally united by a coupling-box. When goods are to be raised, the two axes should be connected; when lowered, they may be disunited, and the worm turned by a wineh. Thus, the ascent, or descent, of the weight may be accelerated, or stopped at pleasure, by the person walking on the axis of the wheel, or turning the winch; without the remotest possibility of being overpowered by the descending weight.

Explanation of the figure in the plate. A, the wheel in which the man walks. B, the coupling-box. C, the worm. D, the wheel in which it works. E, a wheel upon the same axis, giving motion to F. F, a wheel upon the axis of the windlass. G, the wineh.

This machinery may be applied to a crane already erected upon the common prineiple. The inventor proposes to put a wheel on any convenient axis in the machine, in its present state; and, on this, a worm that may be thrown in or out of *gear* at pleasure; and to let the lever, by which it is effected, lie within the reach of the man's hand in the wheel. The goods being fastened to the crane, and raised from the floor of the warehouse, in order to be let down, the man puts the worm into the gear, leaves the wheel, and causes them to deseend by the wineh.

In the same plate (88. Vol. II.) is given a representation of an excellent contrivance for preventing the shocking aceidents whieh oecasionally happen to the men who work wheel cranes. This is caused by the weight of the goods they are attempting to raise, being too considerable for the power that is opposed to it; eonsequently the wheel runs back with great veloeity, and unless the useful appendage here spoken of, form a part of the construction, the persons within it are dashed to pieces.

In the view of this contrivance, AA is the axle of the crane; BB two circular pieees, on which are affixed, at eonvenient distanees, several pulleys, carrying, by means of a rope, two bows of iron CC, on which rests a wooden holder D; by this last the men ean suspend themselves if the wheel should aceidentally revolve, so as to avoid injury.

These contrivances are alike eminent for their ingenuity; but we can by no means omit noticing a kind of erane invented by Mr. Abraham Andrews, of Higham Ferrers, Northamptonshire. This machine weighs the body suspended, while it is raising; an improvement for whieh the Society for the Encouragement of Arts, &c. in 1791, granted him a premium of 15 guineas.

The proportion of the beam in the plate is as 1 to 20, the large weight being 5 pounds, and the smaller $\frac{1}{4}$ of a pound. The latter, when fixed on the beam-end, will equipoise the former, if hung on the pulley at the end of the gib-beam, which should be placed in a right line with the erane, at the time the weight is adjusted; otherwise it will oecasion a friction that may prevent the moveable beam from playing freely.

The following is a description of Mr. A. Andrews's weighing-crane, represented in Plate 24 of this supplement.

The gib of the crane stands on a horizontal beam, moveable on a centre, at A: and the distanee of the centre A, from the bearing of the upright, being to the distance B in the proportion of 1 to 20, the weight placed at B, de-

termines that of the body ſuſpended in the ſame proportion. C is a ſtub, or piece of wood, which projects from the weight hanging at the end of the gib, and ſerves to prevent the beam from riſing to too great a height.

CRANGANORE, a town and fort of the peninſula of Hindooſtan, on the coaſt of Malabar, lately ſubject to the Dutch, by whom it was taken from the Portugueſe in 1662. In 1789, the Dutch ſold this place to the rajah of Travancore. But Tippoo Sultan, regent of Myſore, diſputing their right to ſell it, a war enſued between that prince and the rajah, who being powerfully ſupported by the Engliſh and their allies, the nizam of the Deccan and the Mahrattas, the war was happily terminated in 1792; Tippoo conſenting to pay above three crores of rupees towards the expences of the war, and to cede one-half of his dominions to the three confederate powers. Cranganore is ſeated at the mouth of a river, 24 miles N. by W. of Cochin. Long. 76. 30. E. Lat. 10. 23. N.

CREA (*Encycl.*), placed erroneouſly after the article CREUSA.

CREETOWN, a ſmall port of Scotland, on the E. ſide of Wigton Bay, in Kirkcudbrightſhire. Here ſeveral ſloops are conſtantly employed in carrying ſea-ſhells coaſtwiſe, or importing coal and lime from Cumberland. The ſhells are dug from banks without the ſea-mark, and are eſteemed a valuable manure.

CREIFF, a town of Scotland, in Perthſhire. Its annual fair for cattle is one of the greateſt in Scotland. It is ſeated on the river Earn, 20 miles W. of Perth.

CREIL, a town of France, in the department of Oiſe, and late province of the Iſle of France. It is ſeated on the Oiſe, five miles from Senlis. Long. 2. 43. E. Lat. 49. 13. N.

CREMIU, a ſmall town of France, in the department of Iſere, and late province of Dauphiny, at the foot of a mountain, a mile from the Rhone. Long. 5. 20. E. Lat. 45. 44. N.

CREMNITZ, the principal mine-town of Upper Hungary, 70 miles N.E. of Preſburg. Long. 19. 6. E. Lat. 48. 32. N.

CREMONA, a city of Italy, and capital of a diſtrict of the Milaneſe, called from it the *Cremoneſe*; is ſituated 45 miles ſouth-eaſt of Milan, in E. Long. 10. 30. and N. Lat. 45. 0.

CREMONESE, a territory of Italy, in the duchy of Milan, bounded on the E. by Mantua, on the N. by Breſciano, on the W. by Cremaſco and Lodez-Lodezan, and on the S. by Parma. It is fertile in wine and fruits, and belongs to the houſe of Auſtria. Cremona is the capital.

CREMPEN, a town of Germany, in the duchy of Holſtein, five miles from Hamburgh.

CRESCENTINO, a town of Piedmont, on the river Po. It was taken by the French in 1704, and by the allies in 1706. It is 20 miles N.E. of Turin. Long. 8. 0. E. Lat. 45. 20. N.

CRESPY, a town of France, in the department of Oiſe, and late province of the Iſle of France, 17 miles S. of Compiegne. Long. 2. 55. E. Lat. 49. 10. N.

CREVECŒUR, a town of France, in the department of the North, and late province of Cambreſis, ſeated on the Scheld, five miles S. of Cambray. Long. 3. 20. E. Lat. 50. 6. N.

CREUSE, a department of France, ſo named from a river that falls into the Vienne, and containing the late province of Marche. Gueret is the capital.

CREUTZNACH, a town of Germany, in the palatinate of the Rhine, with a caſtle on an eminence. It is 20 miles S.W. of Mentz. Long. 7. 55. E. Lat. 49. 44. N.

CREWKERNE, a town of Somerſetſhire, with a market on Saturday. It is ſeated on a branch of the Parret. Three miles beyond this town is a hill that commands one of the moſt beautiful proſpects in the kingdom. Crewkerne is 132 miles W. by S. of London. Long. 3. 0. W. Lat. 50. 50. N.

CREX, in ornithology (*Encycl.*), a ſpecies of RALLUS, erroneouſly ſpelt CREA.

CRICKHOWEL, a town of Brecknockſhire, with a market on Thurſday. It is ſeated on the river Uſk, 10 miles E. by S. of Brecknock. Long. 3. 7. W. Lat. 51. 49. N.

CRIMES *and* PUNISHMENTS (*Encycl.*). Although we have already been ſomewhat particular in what is communicated under this head, we, nevertheleſs, are ſo far aware of the importance of the ſubject to every individual, as to have determined to add, in this place, ſome account of the *general nature of crimes*, in which we ſhall chiefly follow Judge Blackſtone.

I. A crime, or miſdemeanour, is an act committed, or omitted, in violation of a public law, either forbidding or commanding it. This general definition comprehends both crimes and miſdemeanours; which, properly ſpeaking, are mere ſynonymous terms: though, in common uſage, the word "crimes" is made to denote ſuch offences as are of a deeper and more atrocious dye: while ſmaller faults, and omiſſions of leſs conſequence, are compriſed under the gentler name of "miſdemeanours" only.

The diſtinction of public wrongs from private, of crimes and miſdemeanours from civil injuries, ſeems principally to conſiſt in this: that private wrongs, or civil injuries, are an infringement or privation of the civil rights which belong to individuals, conſidered merely as individuals; public wrongs, or crimes and miſdemeanours, are a breach and violation of the public rights and duties, due to the whole community, conſidered as a community, in its ſocial aggregate capacity. As if I detain a field from another man, to which the law has given him a right, this is a civil injury, and not a crime; for here only the right of an individual is concerned, and it is immaterial to the public which of us is in poſſeſſion of the land: but treaſon, murder, and robbery, are properly ranked among crimes; ſince, beſides the injury done to individuals, they ſtrike at the very being of ſociety; which cannot ſubſiſt where actions of this ſort are ſuffered to eſcape with impunity.

In all caſes the crime includes an injury: every public offence is alſo a private wrong, and ſomewhat more; it affects the individual, and it likewiſe affects the community. Thus treaſon in imagining the king's death, involves in it conſpiracy againſt an individual, which is alſo a civil injury: but as this ſpecies of treaſon in its conſequences principally tends to the diſſolution of government, and the deſtruction thereby of the order and peace of ſociety, this denominates it a crime of the higheſt magnitude. Murder is an injury to the life of an individual; but the law of ſociety conſiders principally the loſs which the ſtate ſuſtains by being deprived of a member, and the pernicious example thereby ſet, for others to do the like. Robbery may be conſidered in the ſame view: it is an injury to private property; but, were that all, a civil ſatisfaction in damages might atone for it: the public miſchief is the thing, for the prevention of which our laws have made it a capital offence. In theſe groſs and atrocious injuries the private wrong is ſwallowed up in the public: we ſeldom hear any mention made of ſatisfaction to the individual; the ſatisfaction to the community being ſo very great. And indeed, as the public crime is not otherwiſe avenged than by forfeiture of

life and property, it is impoſſible afterwards to make any reparation for the private wrong; which can only be had from the body or goods of the aggreſſor. But there are crimes of an inferior nature, in which the public puniſhment is not ſo ſevere, but it affords room for a private compenſation alſo: and herein the diſtinction of crimes from civil injuries is very apparent. For inſtance; in the caſe of battery, or beating another, the aggreſſor may be indicted for this at the ſuit of the king, for diſturbing the public peace, and be puniſhed criminally by fine and impriſonment: and the party beaten may alſo have his private remedy by action of treſpaſs for the injury, which he in particular ſuſtains, and recover a civil ſatisfaction in damages. So alſo, in caſe of a public nuiſance, as digging a ditch acroſs a highway, this is puniſhable by indictment, as a common offence to the whole kingdom, and all his majeſty's ſubjects: but if any individual ſuſtains any ſpecial damage thereby, as laming his horſe, breaking his carriage, or the like, the offender may be compelled to make ample ſatisfaction, as well for the private injury, as for the public wrong.

II. The nature of crimes and miſdemeanours in general being thus aſcertained and diſtinguiſhed, we proceed, in the next place, to conſider the general nature of puniſhments: which are evils or inconveniences conſequent upon crimes and miſdemeanours; being deviſed, denounced, and inflicted by human laws, in conſequence of diſobedience or miſbehaviour in thoſe, to regulate whoſe conduct ſuch laws were reſpectively made. And herein we will briefly conſider the *power*, the *end*, and the *meaſure*, of human puniſhment.

1. As to the *power* of human puniſhment, or the right of the temporal legiſlator to inflict diſcretionary penalties for crimes and miſdemeanours. It is clear, that the right of puniſhing crimes againſt the law of nature, as murder and the like, is in a ſtate of mere nature veſted in every individual. For it muſt be veſted in ſomebody; otherwiſe the laws of nature would be vain and fruitleſs, if none were empowered to put them in execution: and if that power is veſted in any one, it muſt alſo be veſted in all mankind; ſince all are by nature equal. Whereof the firſt murderer Cain was ſo ſenſible, that we find him expreſſing his apprehenſions, that whoever ſhould find him would ſlay him. In a ſtate of ſociety this right is transferred from individuals to the ſovereign power; whereby men are prevented from being judges in their own cauſes, which is one of the evils that civil government was intended to remedy. Whatever power therefore individuals had of puniſhing offences againſt the law of nature, that is now veſted in the magiſtrate alone; who bears the ſword of juſtice by the conſent of the whole community. And to this precedent natural power of individuals muſt be referred that right, which ſome have argued to belong to every ſtate (though, in fact, never exerciſed by any), of puniſhing not only their own ſubjects, but alſo foreign ambaſſadors, even with death itſelf; in caſe they have offended, not indeed againſt the municipal laws of the country, but againſt the divine laws of nature, and become liable thereby to forfeit their lives for their guilt.

As to offences merely againſt the laws of ſociety, which are only *mala prohibita*, and not *mala in ſe*; the temporal magiſtrate is alſo empowered to inflict coercive penalties for ſuch tranſgreſſion: and this by the conſent of individuals; who, in forming ſocieties, did, either tacitly or expreſsly, inveſt the ſovereign power with a right of making laws, and of enforcing obedience to them when made, by exerciſing, upon their non-obſervance, ſeverities adequate to the evil. The lawfulnes therefore of puniſhing ſuch criminals is founded upon this principle, that the law by which they ſuffer was made by their own conſent; it is a part of the original contract into which they entered, when firſt they engaged in ſociety; it was calculated for, and has long contributed to, their own ſecurity.

This right therefore, being thus conferred by univerſal conſent, gives to the ſtate exactly the ſame power, and no more, over all its members, as each individual member had naturally over himſelf or others. Which has occaſioned ſome to doubt, how far a human legiſlature ought to inflict capital puniſhments for poſitive offences; offences againſt the municipal law only, and not againſt the law of nature; ſince no individual has, naturally, a power of inflicting death upon himſelf or others for actions in themſelves indifferent. With regard to offences *mala in ſe*, capital puniſhments are in ſome inſtances inflicted by the immediate command of God himſelf to all mankind; as, in the caſe of murder, by the precept delivered to Noah, their common anceſtor and repreſentative, "Whoſo ſheddeth man's blood, by man ſhall his blood be ſhed." In other inſtances they are inflicted after the example of the Creator, in his poſitive code of laws for the regulation of the Jewiſh republic; as in the caſe of the crime againſt nature. But they are ſometimes inflicted without ſuch expreſs warrant or example, at the will and diſcretion of the human legiſlature; as for forgery, for theft, and ſometimes for offences of a lighter kind. This practice is thus juſtified by that great and good man, Sir Matthew Hale: "When offences grow enormous, frequent, and dangerous to a kingdom or ſtate, deſtructive or highly pernicious to civil ſocieties, and to the great inſecurity and danger of the kingdom or its inhabitants, ſevere puniſhment and even death itſelf is neceſſary to be annexed to laws in many caſes by the prudence of lawgivers." It is therefore the enormity, or dangerous tendency, of the crime, that alone can warrant any earthly legiſlature in putting him to death that commits it. It is not its frequency only, or the difficulty of otherwiſe preventing it, that will excuſe our attempting to prevent it by a wanton effuſion of human blood. For, though the end of puniſhment is to deter men from offending, it never can follow from thence, that it is lawful to deter them at any rate and by any means; ſince there may be unlawful methods of enforcing obedience even to the juſteſt laws. Every human legiſlator will be therefore extremely cautious of eſtabliſhing laws that inflict the penalty of death, eſpecially for ſlight offences, or ſuch as are merely poſitive. He will expect a better reaſon for his ſo doing, than that looſe one which generally is given; that it is found by former experience that no lighter penalty will be effectual. For it is found upon further experience, that capital puniſhments are more effectual. Was the vaſt territory of all the Ruſſias worſe regulated under the Empreſs Elizabeth, than under her more ſanguinary predeceſſors? Was it under Catherine II. leſs civilized, leſs ſocial, leſs ſecure? And yet we are aſſured, that neither of theſe illuſtrious princeſſes have, throughout their whole adminiſtration, inflicted the penalty of death: and the latter, upon full perſuaſion of its being uſeleſs, nay even pernicious, gave orders for aboliſhing it entirely throughout her extenſive dominions. But indeed, were capital puniſhments proved by experience to be a ſure and effectual remedy, that would not prove the neceſſity (upon which the juſtice and propriety depend) of inflicting them upon all occaſions when other expedients fail. It is feared this reaſoning would extend a great deal too far. For inſtance, the damage done to our public roads by loaded waggons is univerſally allowed, and many laws have been made to prevent it, none of which have hitherto proved effectual. But it does not therefore follow, that it would be

juſt for the legiſlature to inflict death upon every obſtinate carrier, who defeats or eludes the proviſions of former ſtatutes. Where the evil to be prevented is not adequate to the violence of the preventive, a ſovereign that thinks ſeriouſly can never juſtify ſuch a law to the dictates of conſcience and humanity. To ſhed the blood of our fellow-creature is a matter that requires the greateſt deliberation, and the fulleſt conviction of our own authority: for life is the immediate gift of God to man; which neither he can reſign, nor can it be taken from him, unleſs by the command or permiſſion of him who gave it, either expreſsly revealed, or collected from the laws of nature or ſociety by clear and indiſputable demonſtration.

We would not be underſtood to deny the right of the legiſlature in any country to enforce its own laws by the death of the tranſgreſſor, though perſons of ſome abilities have doubted it; but only to ſuggeſt a few hints for the conſideration of ſuch as are, or may hereafter, become legiſlators. When a queſtion ariſes, whether death may be lawfully inflicted for this or that tranſgreſſion, the wiſdom of the laws muſt decide it: and to this public judgment or deciſion all private judgments muſt ſubmit; elſe there is an end of the firſt principle of all ſociety and government. The guilt of blood, if any, muſt lie at their doors, who miſinterpret the extent of their warrant; and not at the doors of the ſubject, who is bound to receive the interpretations that are given by the ſovereign power.

2. As to the *end*, or final cauſe, of human puniſhments. This is not by way of atonement or expiation for the crime committed; for that muſt be left to the juſt determination of the Supreme Being: but as a precaution againſt future offences of the ſame kind. This is effected three ways: either by the amendment of the offender himſelf; for which purpoſe all corporeal puniſhments, fines, and temporary exile or impriſonment, are inflicted: or, by deterring others by the dread of his example from offending in the like way, "*ut pœna* (as Tully expreſſes it) *ad paucos, metus ad omnes, perveniat;*" which gives riſe to all ignominious puniſhments, and to ſuch executions of juſtice as are open and public: or, laſtly, by depriving the party injuring of the power to do future miſchief; which is effected by either putting him to death, or condemning him to perpetual confinement, ſlavery, or exile. The ſame one end, of preventing future crimes, is endeavoured to be anſwered by each of theſe three ſpecies of puniſhment. The public gains equal ſecurity, whether the offender himſelf be amended by wholeſome correction, or whether he be diſabled from doing any further harm: and if the penalty fails of both theſe effects, as it may do, ſtill the terror of his example remains as a warning to other citizens. The method however of inflicting puniſhment ought always to be proportioned to the particular purpoſe it is meant to ſerve, and by no means to exceed it: therefore the pains of death, and perpetual diſability by exile, ſlavery, or impriſonment, ought never to be inflicted but when the offender appears incorrigible: which may be collected either from a repetition of minuter offences; or from the perpetration of ſome one crime of deep malignity, which of itſelf demonſtrates a diſpoſition without hope or probability of amendment: and in ſuch caſes it would be cruelty to the public to defer the puniſhment of ſuch a criminal till he had an opportunity of repeating perhaps the worſt of villanies.

3. As to the *meaſure* of human puniſhments. From what has been obſerved in the former articles we may collect, that the quantity of puniſhment can never be abſolutely determined by any ſtanding invariable rule; but it muſt be left to the arbitration of the legiſlature to inflict ſuch penalties as are warranted by the laws of nature and ſociety, and ſuch as appear to be the beſt calculated to anſwer the end of precaution againſt future offences.

Hence it will be evident, that what ſome have ſo highly extolled for its equity, the *lex talionis*, or "law of retaliation," can never be in all caſes an adequate or permanent rule of of puniſhment. In ſome caſes indeed it ſeems to be dictated by natural reaſon; as in the caſe of conſpiracies to do an injury, or falſe accuſations of the innocent; to which we may add that law of the Jews and Egyptians, mentioned by Joſephus and Diodorus Siculus, that whoever, without ſufficient cauſe, was found with any mortal poiſon in his cuſtody, ſhould himſelf be obliged to take it. But, in general, the difference of perſons, place, time, provocation, or other circumſtances, may enhance or mitigate the offence; and in ſuch caſes retaliation can never be a proper meaſure of juſtice. If a nobleman ſtrikes a peaſant, all mankind will ſee, that if a court of juſtice awards a return of the blow, it is more than a juſt compenſation. On the other hand, retaliation may ſometimes be too eaſy a ſentence; as, if a man maliciouſly ſhould put out the remaining eye of him who had loſt one before it, it is too ſlight a puniſhment for the mainer to loſe only one of his: and therefore the law of the Locrians, which demanded an eye for an eye, was in this inſtance judiciouſly altered; by decreeing, in imitation of Solon's laws, that he who ſtruck out the eye of a one-eyed man, ſhould loſe both his own in return. Beſides, there are very many crimes, that will in no ſhape admit of theſe penalties, without manifeſt abſurdity and wickedneſs. Theft cannot be puniſhed by theft, defamation by defamation, forgery by forgery, adultery by adultery, and the like. And we may add, that thoſe inſtances, wherein retaliation appears to be uſed, even by the divine authority, do not really proceed upon the rule of exact retribution, by doing to the criminal the ſame hurt he has done to his neighbour, and no more; but this correſpondence between the crime and puniſhment is barely a conſequence from ſome other principle. Death is ordered to be puniſhed with death; not becauſe one is equivalent to the other, for that would be expiation, and not puniſhment. Nor is death always an equivalent for death: the execution of a needy decrepid aſſaſſin is a poor ſatisfaction for the death of a nobleman in the bloom of his youth, and full enjoyment of his friends, his honours, and his fortune. But the reaſon upon which this ſentence is grounded ſeems to be, that this is the higheſt penalty that man can inflict, and tends moſt to the ſecurity of the world; by removing one murderer from the earth, and ſetting a dreadful example to deter others: ſo that even this grand inſtance proceeds upon other principles than thoſe of retaliation. And truly, if any meaſure of puniſhment is to be taken from the damage ſuſtained by the ſufferer, the puniſhment ought rather to exceed than equal the injury: ſince it ſeems contrary to reaſon and equity, that the guilty (if convicted) ſhould ſuffer no more than the innocent has done before him; eſpecially as the ſuffering of the innocent is paſt and irrevocable, that of the guilty is future, contingent, and liable to be eſcaped or evaded. With regard indeed to crimes that are incomplete, which conſiſt merely in the intention, and are not yet carried into act, as conſpiracies and the like; the innocent has a chance to fruſtrate or avoid the villany, as the conſpirator has alſo a chance to eſcape his puniſhment: and this may be one reaſon why the *lex talionis* is more proper to be inflicted, if at all, for crimes that conſiſt in intention, than for ſuch as are carried into act. It ſeems indeed conſonant to natural reaſon, and has therefore been adopted as a maxim by ſeveral theoretical writers, that the puniſhment due to the crime of which one falſely accuſes another, ſhould be inflicted on the perjured informer. Accordingly, when it was once attempted to introduce into

England the law of retaliation, it was intended as a puniſhment for ſuch only as preferred malicious accuſations againſt others; it being enacted by ſtatute 37 Edw. III. c. 18. that ſuch as preferred any ſuggeſtions to the king's great council ſhould put in ſureties of taliation; that is, to incur the ſame pain that the other ſhould have had, in caſe the ſuggeſtion were found untrue. But, after one year's experience, this puniſhment of taliation was rejected, and impriſonment adopted in its ſtead.

But though from what has been ſaid it appears, that there cannot be any regular determinate method of rating the quantity of puniſhments for crimes, by any one uniform rule; but they muſt be referred to the will and diſcretion of the legiſlative power: yet there are ſome general principles, drawn from the nature and circumſtances of the crime, that may be of ſome aſſiſtance in allotting it an adequate puniſhment.

As, firſt, with regard to the object of it: for the greater and more exalted the object of an injury is, the more care ſhould be taken to prevent that injury, and of courſe under this aggravation the puniſhment ſhould be more ſevere. Therefore treaſon in conſpiring the king's death is (in Britain) puniſhed with greater rigour than even actually killing any private ſubject. And yet, generally, a deſign to tranſgreſs is not ſo flagrant an enormity, as the actual completion of that deſign. For evil, the nearer we approach it, is the more diſagreeable and ſhocking: ſo that it requires more obſtinacy in wickedneſs to perpetrate an unlawful action, than barely to entertain the thought of it: and it is an encouragement to repentance and remorſe, even till the laſt ſtage of any crime, that it never is too late to retract; and that if a man ſtops even here, it is better for him than if he proceeds: for which reaſons an attempt to rob, to raviſh, or to kill, is far leſs penal than the actual robbery, rape, or murder. But in the caſe of a treaſonable conſpiracy, the object whereof is the king's majeſty, the bare intention will deſerve the higheſt degree of ſeverity: not becauſe the intention is equivalent to the act itſelf, but becauſe the greateſt rigour is no more than adequate to a treaſonable purpoſe of the heart, and there is no greater left to inflict upon the actual execution itſelf.

Again: The violence of paſſion, or temptation, may ſometimes alleviate a crime; as theft, in caſe of hunger, is far more worthy of compaſſion, than when committed through avarice, or to ſupply one in luxurious exceſſes. To kill a man upon ſudden and violent reſentment is leſs penal than upon cool deliberate malice. The age, education, and character, of the offender; the repetition (or otherwiſe) of the offence; the time, the place, the company wherein it was committed; all theſe, and a thouſand other incidents, may aggravate or extenuate the crime*.

Further: As puniſhments are chiefly intended for the prevention of future crimes, it is but reaſonable that among crimes of different natures thoſe ſhould be moſt ſeverely puniſhed, which are the moſt deſtructive of the public ſafety and happineſs: and, among crimes of an equal malignity, thoſe which a man has the moſt frequent and eaſy opportunities of committing, which cannot be ſo eaſily guarded againſt as others, and which therefore the offender has the ſtrongeſt inducement to commit: according to what Cicero obſerves, "*ea ſunt animadvertenda peccata maxime, quæ difficillime præcaventur.*" Hence it is, that for a ſervant to rob his maſter is in more caſes capital, than for a ſtranger: if a ſervant kills his maſter, it is a ſpecies of treaſon; in another it is only murder: to ſteal a handkerchief, or other trifle of above the value of twelve-pence, privately from one's perſon, is made capital; but to carry off a load of corn from an open field, though of fifty times greater value, is puniſhed with tranſportation only. And, in the iſland of Man, this rule was formerly carried ſo far, that to take away a horſe or an ox was there no felony, but a treſpaſs, becauſe of the difficulty in that little territory to conceal them or carry them off: but to ſteal a pig or a fowl, which is eaſily done, was a capital miſdemeanour, and the offender was puniſhed with death.

Laſtly, as a concluſion to the whole, we may obſerve, that puniſhments of unreaſonable ſeverity, eſpecially when indiſcriminately inflicted, have leſs effect in preventing crimes, and amending the manners of a people, than ſuch as are more merciful in general, yet properly intermixed with due diſtinctions of ſeverity. It is the ſentiment of an ingenious writer, who ſeems to have well ſtudied the ſprings of human action, that crimes are more effectually prevented by the certainty, than by the ſeverity, of puniſhment. For the exceſſive ſeverity of laws (ſays Monteſquieu) hinders their execution: when the puniſhment ſurpaſſes all meaſure, the public will frequently out of humanity prefer impunity to it. Thus alſo the ſtatute 1 Mar. ſt. 1. c. 1. recites in its preamble, "that the ſtate of "every king conſiſts more aſſuredly in the love of the ſubject "towards their prince, than in the dread of laws made with "rigorous pains; and that laws made for the preſervation of "the commonwealth without great penalties are more often "obeyed and kept, than laws made with extreme puniſh-"ments." Happy had it been for the nation, if the ſubſequent practice of that deluded princeſs in matters of religion, had been correſpondent to theſe ſentiments of herſelf and parliament, in matters of ſtate and government! We may further obſerve, that ſanguinary laws are a bad ſymptom of the diſtemper of any ſtate, or at leaſt of its weak conſtitution. The laws of the Roman kings, and the twelve tables of the *decemviri*, were full of cruel puniſhments: the Porcian law, which exempted all citizens from ſentence of death, ſilently abrogated them all. In this period the republic flouriſhed: under the emperors ſevere puniſhments were revived; and then the empire fell.

It is moreover abſurd and impolitic to apply the ſame puniſhment to crimes of different malignity. A multitude of ſanguinary laws (beſides the doubt that may be entertained concerning the right of making them) do likewiſe prove a manifeſt defect either in the wiſdom of the legiſlative, or the ſtrength of the executive, power. It is a kind of quackery in government, and argues a want of ſolid ſkill, to apply the ſame univerſal remedy, the *ultimum ſupplicium*, to every caſe of difficulty. It is, it muſt be owned, much eaſier to extirpate than to amend mankind; yet that magiſtrate muſt be eſteemed both a weak and a cruel ſurgeon, who cuts off every limb, which through ignorance or indolence he will not attempt to cure. It has been therefore ingeniouſly propoſed, that in every ſtate a ſcale of crimes ſhould be formed, with a correſponding ſcale of puniſhments, deſcending from the greateſt to the leaſt: but, if that be too romantic an idea, yet at leaſt a wiſe legiſlator will mark the principal diviſions, and not aſſign penalties of the firſt degree to offences of an inferior rank. Where men ſee no diſtinction made in the nature and gradations of puniſhment, the generality will be led to conclude there is no diſtinction in the guilt. Thus in France the puniſhment of robbery, either with or without murder, was the ſame: hence it was, that though perhaps they were therefore ſubject to fewer robberies, yet they never robbed but they alſo

* Thus Demoſthenes (in his oration againſt Midias) finely works up the aggravations of the inſults he had received. "I "was abuſed (ſays he) by my enemy, in cold blood, out of malice, not by heat of wine, in the morning, publicly, before "ſtrangers as well as citizens; and that in the temple, whither the duty of my office called me."

murdered. In China murderers are cut to pieces, and robbers not: hence in that country they never murder on the highway, though they often rob. And in Britain, beſides the additional terrors of a ſpeedy execution, and a ſubſequent expoſure or diſſection, robbers have a hope of tranſportation, which ſeldom is extended to murderers. This has the ſame effect here as in China, in preventing frequent aſſaſſination and ſlaughter.

Perſons capable, or incapable, of committing CRIMES; or (which is all one) of ſuffering the cenſures of the law upon the commiſſion of forbidden acts.

All the ſeveral pleas and excuſes, which protect the committer of a forbidden act from the puniſhment which is otherwiſe annexed thereto, may be reduced to this ſingle conſideration, the want or defect of *will*. An involuntary act, as it has no claim to merit, ſo neither can it induce any guilt: the concurrence of the will, when it has its choice either to do or to avoid the fact in queſtion, being the only thing that renders human actions either praiſe-worthy or culpable. Indeed, to make a complete crime, cognizable by human laws, there muſt be both a will and an act. For though, *in foro conſcientiæ*, a fixed deſign or will to do an unlawful act is almoſt as heinous as the commiſſion of it; yet, as no temporal tribunal can ſearch the heart, or fathom the intentions of the mind, otherwiſe than as they are demonſtrated by outward actions, it therefore cannot puniſh for what it cannot know. For which reaſon, in all temporal juriſdictions, an *overt* act, or ſome open evidence of an intended crime, is neceſſary, in order to demonſtrate the depravity of the will, before the man is liable to puniſhment. And as a vicious will without a vicious act is no civil crime, ſo, on the other hand, an unwarrantable act without a vicious will is no crime at all. So that to conſtitute a crime againſt human laws, there muſt be, firſt, a vicious will; and, ſecondly, an unlawful act conſequent upon ſuch vicious will.

Now there are three caſes, in which the will does not join with the act: 1. When there is a defect of underſtanding. For where there is no diſcernment, there is no choice; and where there is no choice, there can be no act of the will, which is nothing elſe but a determination of one's choice to do or to abſtain from a particular action: he, therefore, that has no underſtanding, can have no will to guide his conduct. 2. Where there is underſtanding and will ſufficient, reſiding in the party; but not called forth and exerted at the time of the action done; which is the caſe of all offences committed by chance or ignorance. Here the will ſits neuter; and neither concurs with the act, nor diſagrees to it. 3. Where the action is conſtrained by ſome outward force and violence. Here the will counteracts the deed; and is ſo far from concurring with, that it loaths and diſagrees to, what the man is obliged to perform. Infancy, idiocy, lunacy, and intoxication, fall under the firſt claſs; misfortune and ignorance may be referred to the ſecond; and compulſion or neceſſity may properly rank in the third. See INFANCY, IDIOCY, DRUNKENNESS, MISFORTUNE, IGNORANCE, NECESSITY.

CROIA, a town of Albania, in Turkey in Europe, with a biſhop's ſee. It is ſeated near the gulf of Venice, 13 miles N. E. of Durazzo. Long. 19. 27. E. Lat. 42. 6. N.

CROMACK-WATER, a lake of Cumberland, between Buttermere and Lowſewater, with each of which it is connected by the river Cocker. It is four miles long, and, in ſome places, near half a mile over. It is beautified with three ſmall iſles; one of them a rock. At the N. E. corner is a handſome ſtone bridge of four arches over its outlet, the Cocker. The water of this lake, though clear, is not ſo tranſparent as the lake of Derwent; but, as well as Buttermere and Lowes-water, it is of a much greater depth than the Derwent. It abounds with very fine char and red trout.

CROMARTY, a county of Scotland, which comprehends part of a peninſula on the ſouth ſide of the Frith, to which it gives name. On the S. and W. it is bounded by Roſsſhire. It is 12 miles long from E. to W. and about three in its greateſt breadth. It is fertile and well cultivated; but it is now almoſt deſtitute of old trees; though, in the days of James V. it was a foreſt, and afforded ſhelter to many wolves. It ſends one member to parliament, alternately with Nairne.

CROMER, a ſmall town of Norfolk, with a market on Saturday. It is ſeated near the ſea, and was formerly more conſiderable than at preſent; for it had two churches, one of which, with ſeveral houſes, was ſwallowed up by the ſea. The inhabitants are now chiefly fiſhermen. The part of a church, which ſtill remains, was built in the time of the Saxons, of curious flint, and the tower was raiſed to a great height: this, indeed, is all that ſtands, and the other part of this ſtructure being decayed, divine ſervice is performed once a fortnight in the ſteeple. It is 22 miles N. of Norwich, and 127 N. E. of London. Long. 1. 15. W. Lat 53. 0. N.

CROMFORD, a village in Derbyſhire, on the river Derwent, in the road from Derby to Mancheſter. Here Mr. (afterwards Sir Richard) Arkwright erected ſome of the new cotton mills, a capital improvement of mechaniſm due to him; and by means of which the various branches of the cotton manufacture have wonderfully ſpread in this and the adjacent countries. Here alſo Sir Richard Arkwright built, before his death, a noble ſeat, and a church. Cromford is 14 miles N. N. W. of Derby.

CROMWELL (Richard), eldeſt ſon of Oliver Cromwell, was by his father appointed ſucceſſor to the protectorſhip, but very ſoon depoſed by the army. They diſcharged his debts, took all the houſehold ſtuff, plate, &c. gave him a protection for ſix months, and ſo he retired. He was by no means qualified to ſupport the ſtation gained by the aſpiring talents of his father; he was of a moderate temper, and untainted with that fanatical ſpirit which his father had ſo ſucceſsfully cultivated: on the reſtoration he went abroad; but returned in 1680 under the aſſumed name of Clark, and ſettled at Cheſhunt, in Hertfordſhire, where he lived privately, and died in 1712, aged 86.

CRONACH, a town of Germany, in the circle of Franconia, and biſhopric of Bamberg, with a citadel. It is 25 miles N. E. of Bamberg. Long. 11. 35. E. Lat. 50. 27. N.

CRONBORG, a fortreſs of Denmark, on the iſle of Zealand, near Elſinore, which guards the paſſage of the Sound. In this fortreſs is a royal palace, in which the late unfortunate and much-injured queen Matilda was impriſoned till ſhe was permitted to retire to Zell. About half a mile from this, is a garden, called Hamlet's Garden, ſaid, by tradition, to be the ſpot where the murder of his father was perpetrated. Long. 12. 54. E. Lat. 56. 0. N.

CROTALUS (*Encycl.*) In that article, plate 59 ſhould have been referred to inſtead of 89.

CROUCH, a river of Eſſex, which riſes near Horndon, and flowing eaſtward, divides the hundred of Rochford from that of Dengy, and falls into the German Ocean, between Burnham and Foulneſs Iſland. The Walfleet and Burnham oyſters are the product of its creeks and pits.

CROUP, in medicine, an inflammation of the larynx, affecting children under ten years of age, attended with an exſudation of coagulable lymph, which acting as an extraneous body, excites a ſpaſmodic ſtricture of the *rima glottidis*, firſt inducing a difficulty of breathing, with a peculiar ſtridulous noiſe, and in a ſhort time ſuffocation.

This diſeaſe being commonly fatal, requires an early attention to the ſymptoms, and a rigorous mode of treatment, for want of which it is probable many children have been loſt:

though it is evident from diſſection, that it is of an inflammatory nature; yet from reaſoning, as well as from ſome caſes which have lately occurred, there can be little doubt that it is the ſpaſmodic contraction of the lungs, which is the immediate cauſe of death.

As ſoon as poſſible a briſk emetic ſhould be adminiſtered for the purpoſe of freeing the patient from the coagulable lymph which is already ſecreted. Topical bleeding, by means of leeches, ſhould immediately ſucceed, and the diſcharge encouraged. As ſoon as it diminiſhes, a bliſter, ſo large as to cover the whole throat, ſhould be applied, and ſuffered to lie on for thirty hours or longer.

As ſoon as the emetic has operated ſufficiently, opium in large doſes ſhould be adminiſtered, by which means the breathing will in general be ſoon relieved; but ſhould it become more difficult in the courſe of a few hours, the emetic is to be again repeated, and after its operation the opium again employed. This practice is to be alternately uſed till ſuch time as the patient is out of danger, which will in general be in the courſe of three or four days.

Mr. Kendrick, ſurgeon in Warrington, who firſt ſuggeſted the neceſſity of employing opiates in the croup, aſſerts, that this treatment has ſucceeded in four caſes out of five under his care.

CUBAGUA, an iſland of South America, between that of Margaretta and Terra Firma, ſubject to Spain. Long. 54. 30. W. Lat. 10. 15. N.

CUBAN, a large river, formed by the junction of a great number of ſtreams that riſe in the countries comprehended between the Black Sea and the Caſpian. Taking a weſterly direction, it divides the Abkhas and Circaſſians from part of Taurica, and then falls into the Black Sea.

CUBAN, or CUBAN TARTARY, a country of Aſia, bounded on the W. by the ſea of Aſoph; on the N. by the river Don, which ſeparates it from Europe; on the E. by the deſert of Aſtracan; and on the S. by the river Cuban, which divides it from Circaſſia and the country of the Abkhas.

CUCKFIELD, a town of Suſſex, with a market on Friday. It is 13 miles N. W. of Lewes. and 40 S. by W. of London. Long. 0. 12. W. Lat. 51. 4. N.

CUDDAPA, a town of the peninſula of Hindooſtan, ceded by Tippoo Sultan to the nizam of the Deccan. It is ſeated on the river Pennar, 95 miles W. by N. of its entrance, at Gangapatnam, into the bay of Bengal, and 140 N. W. of Madras. Long. 78. 47. E. Lat. 14. 3. N.

CUDWORTH (Ralph), a very learned divine of the church of England in the 17th century. In January 1657 he was one of the perſons nominated by a committee of the parliament to be conſulted about the Engliſh tranſlation of the Bible. In 1678 he publiſhed his *True Intellectual Syſtem of the Univerſe*; a work which met with great oppoſition. He likewiſe publiſhed a treatiſe, entitled *Deus juſtificatus*: or, "The divine goodneſs of God vindicated, againſt the aſſertions of abſolute and unconditionate reprobation." He embraced the mechanical or corpuſcular philoſophy: but with regard to the Deity, ſpirits, genii, and ideas, he followed the Platoniſts. He died at Cambridge in 1688. The late earl of Shafteſbury ſtyles him an excellent and learned divine, of higheſt authority at home, and fame abroad. His daughter Damaris, who married Sir Francis Maſham, of Oates in Eſſex, was a lady of genius and learning: ſhe had a great friendſhip for Mr. Locke, who reſided ſeveral years at her houſe at Oates, where he died in 1704.

CUFF (Henry), the unfortunate ſecretary of the unfortunate Earl of Eſſex, was born at Hinton St. George in Somerſetſhire, about the year 1560, of a genteel family, who were poſſeſſed of conſiderable eſtates in that county. In 1576 he was entered of Trinity College, Oxford, where he ſoon acquired conſiderable reputation as a Grecian, and diſputant. He obtained a fellowſhip in the above-mentioned college; but was afterwards expelled for ſpeaking diſreſpectfully of the founder. He was, however, ſoon after admitted of Merton College; of which, in 1586, he was elected probationer, and, in 1588, fellow. In this year he took the degree of maſter of arts. Some time after, he was elected Greek profeſſor, and, in 1594, proctor of the univerſity.

When he left Oxford is uncertain; nor are we better informed as to the means of his introduction to the Earl of Eſſex. When that nobleman was made lord lieutenant of Ireland, Mr. Cuff was appointed his ſecretary, and continued intimately connected with his lordſhip until his confinement in the Tower; and he is generally ſuppoſed to have adviſed thoſe violent meaſures which ended in their mutual deſtruction. The earl indeed confeſſed as much before his execution, and charged him, to his face, with being the author of all his misfortunes. Mr. Cuff was tried for high-treaſon, convicted, and executed at Tyburn on the 30th of March, 1601. Lord Bacon, Sir Henry Wotton, and Camden, ſpeak of him in very harſh terms. He was certainly a man of learning and abilities.

He wrote two books; the one entitled, The Differences of the Ages of Man's Life; the other, De Rebus Geſtis in Sancto Concilio Nicæno. The firſt was publiſhed after his death; the ſecond is ſtill in manuſcript.

CUJAS (James), in Latin *Cujacius*, the beſt civilian of his time, was born at Toulouſe, of obſcure parents, in 1520. He learned polite literature and hiſtory; and acquired great knowledge in the ancient laws, which he taught with extraordinary reputation at Toulouſe, Cahors, Bourges, and Valence, in Dauphiny. Emanuel Philibert, duke of Savoy, invited him to Turin, and gave him ſingular marks of his eſteem. Cujas afterwards refuſed very advantageous offers from Pope Gregory XIII. who was deſirous of having him teach at Bologna; but he choſe rather to fix at Bourges, where he had a prodigious number of ſcholars; whom he not only took great pleaſure in inſtructing, but aſſiſted with his ſubſtance, which occaſioned his being called the *Father of his Scholars*. He died at Bourges in 1590, aged 70. His works are in high eſteem among civilians.

CULLEN (William), an eminent phyſician and medical teacher, was born in 1712, in the county of Lanerk in Scotland. He ſerved an apprenticeſhip to a ſurgeon and apothecary in Glaſgow, and afterwards went ſeveral voyages to the Weſt Indies, as ſurgeon to a trading ſhip. He at length ſettled at the town of Hamilton, practiſing chiefly in the medical and pharmaceutical branches. It is a very ſingular circumſtance in the hiſtory of medicine, that William Hunter, afterwards ſo eminent as an anatomiſt and accoucheur in London, ſhould at one time have been partner with Cullen in an inconſiderable country town. It appears, however, that, at this early period of their lives, neither of them limited his ambition to ſuch a confined circle; for it was the ſpirit of their partnerſhip to provide means for enabling them alternately to enjoy thoſe further advantages of education which ſcanty circumſtances had hitherto denied them. In conſequence of this agreement, Cullen ſtudied one winter at the univerſity of Edinburgh, while Hunter was practiſing on the common account. Hunter, the next year, viſited London, and followed his fortune in that metropolis, under the auſpices of Dr. Douglas the anatomiſt. Cullen, during his abode at Hamilton, attracted the notice of the Duke of Argyle, who happened to be on a viſit in the neighbourhood, and was intent upon ſome chemical reſearches. It was not difficult for a man of his diſcernment to diſcover in the young apothecary a perſon ſuperior to the ſtation he then occupied. Soon after, a ſudden illneſs of the Duke of Hamilton, whoſe ſeat is adjacent

to the town of his name, occaſioned Cullen to be ſent for; and his treatment of the caſe appeared ſo judicious to Dr. Clark of Edinburgh, who was afterwards conſulted, that he became his liberal encomiaſt. Cullen's improving proſpects induced him to form a matrimonial connection with an amiable woman, the daughter of a neighbouring miniſter. He afterwards took the degree of doctor of phyſic, and ſettling at Glaſgow, was appointed, in 1746, chemical lecturer in the univerſity of that city. Here he began to diſplay thoſe talents for teaching, which ever afterwards ſo advantageouſly diſtinguiſhed him. His enunciation was diſtinct, his manner lively and familiar, and he peculiarly excelled in the art of clear and methodical arrangement. He ſoon became a great favourite with the ſtudents, and rendered chemiſtry an object of ardent purſuit among them, the effects of which were afterwards happily exemplified in the diſcoveries of his pupil, the celebrated Dr. Black. His private practice kept pace with his growing reputation; and, in 1751, he was more directly engaged in the ſervice of the healing art, by his appointment of profeſſor of medicine in the univerſity. The fame of Edinburgh as a medical ſchool has by nothing been ſo much promoted as by the vigilance of its curators to ſeize upon every man of diſtinguiſhed merit within their reach, and incorporate him among their profeſſors. Thus, on the death of Dr. Plummer, the chemical profeſſor, in 1756, Dr. Cullen received an unanimous invitation to the vacant chair; and he did not heſitate to quit all his advantages at Glaſgow for a ſtation in the univerſity of the Scottiſh metropolis. Here he ſoon arrived at that extraordinary degree of academical popularity which for ſo many years diſtinguiſhed him beyond all his brethren, and for which he was indebted, not only to his merit as a teacher, but to the laudable pains he took to ingratiate himſelf with his pupils. He was cordially attentive to all their intereſts, admitted them freely to his houſe, converſed with them on the moſt familiar terms, ſolved their doubts and difficulties, gave them the uſe of his library, and in every reſpect treated them with the affection of a friend, and the regard of a parent. It is impoſſible for thoſe who perſonally knew him in this relation ever to forget the ardour of attachment which he inſpired. His influence upon young minds was augmented by the novelty of his opinions, and the freedom of his animadverſions upon the medical ſyſtems then chiefly in vogue, but which undoubtedly preſented ſeveral points of attack. The older profeſſors had all been educated in the Boerhaavian ſchool, and though men of merit, were naturally prejudiced in favour of the doctrines they had imbibed. Dr. Cullen called in queſtion ſome of the fundamental principles of the theory of the Leyden profeſſor, eſpecially thoſe which depended upon the humoral pathology. He introduced new ſpeculations, which, if not always ſatisfactory, never failed to be ingenious, and afforded animated topics for the debates and diſcuſſions of the ſtudents. Whilſt he was chemical profeſſor, he had no public opportunity of delivering his medical opinions, except in the clynical lectures which fell to his ſhare in courſe. Indeed, at the death of Dr. Alſton, in 1760, he was deſired to finiſh the courſe of materia medica which that profeſſor had begun; and this gave occaſion to ſome further diſplay of his ſyſtems. It was not till the deceaſe of Dr. Whytt, in 1766, that a proper medical chair became vacant. The body of ſtudents then made a great effort to procure Dr. Cullen's appointment to the practical profeſſorſhip; but this was occupied by Dr. Gregory, who ſucceeded to Dr. Rutherford. A compromiſe, however, took place between them, by which they agreed to give lectures on the theory and practice of phyſic in alternate years: and ſome have accounted this period to have been the moſt flouriſhing for medical ſcience which Edinburgh ever witneſſed. This arrangement was broken by Dr. Gregory's lamented death; after which Dr. Cullen continued to hold the practical chair till within a few months of his own deceaſe. His private employ kept pace with his academical reputation, and he roſe to be the firſt phyſician in point of practice in Scotland. He was likewiſe frequently conſulted from England, and other countries, which were filled with practitioners who had been his pupils, and retained a high veneration for his talents. Dr. J. Brown, from being the votary, became the rival and opponent of Dr. Cullen, who at length began to feel ſome of that jealouſy towards an innovator which he himſelf had once inſpired. The hiſtory of academical ſquabbles would improperly be introduced into this ſketch; we therefore cloſe the life of this eminent perſon with mentioning, that he died on February 5, 1790, in his ſeventy-ſeventh year. Notwithſtanding the ſources of emolument he enjoyed, a large and expenſive family, and inattention to economy, ſo far exhauſted his income, that he left a ſlender proviſion for the ſurvivors, which was augmented by a penſion from the crown, granted upon the ground of his having been king's phyſician for Scotland.

Dr. Cullen's ſcientific merits are now more particularly to be diſcuſſed. As a chemiſt, no conſiderable diſcovery can be aſcribed to him; but he was an extremely uſeful teacher of the ſcience, from the liberal and comprehenſive views he took of it, and the great clearneſs of method with which he treated it. He likewiſe, from an accurate collection of facts, formed very complete hiſtories of ſeveral of its departments, particularly thoſe connected with medicine and the materia medica; and it is certain that no man in theſe kingdoms has done ſo much to render chemiſtry a popular ſtudy, eſpecially among the medical faculty.

His character, as a preceptor and improver in the theory and practice of phyſic, is to be eſtimated from the works he publiſhed, as a ſort of text-book of his lectures, and of which various ſucceſſive editions appeared, enlarged and altered according to the progreſs of his profeſſional labours. Of theſe the principal is that which, in a bald tranſlation of the Latin term, *Primæ Lineæ*, uſed by Haller and others, he entitled "Firſt Lines of the Practice of Phyſic." The complete edition of this work appeared in 1784, in four volumes octavo. Regarding the affections of the motions and moving powers of the animal economy as the leading enquiry in conſidering the diſeaſes of the human body, he aſſumes the general principles of Hoffman, but corrected and extended in their application. He diſclaims, however, all thoſe hypothetical opinions which are uſually called theories; and aſſerts, that the doctrines he lays down are only inductions from that generaliſation of *facts* relative to the ſound and diſeaſed body, which it has been his great buſineſs to collect. Nor has any ſyſtematiſt more fairly deſerved the praiſe of being a faithful collector of facts, and allowing them all due weight in his reaſonings. He has not, however, been contented with a merely empirical baſis for medical practice, but has always endeavoured to inveſtigate the proximate cauſe of diſeaſes, and to build upon it a conſiſtent method of cure. The moſt remarkable of his attempts of this kind is his doctrine of the proximate cauſe of fevers, in which he endeavours to prove the co-exiſtence of ſpaſm and atony in the body. Whatever be thought of the ſubtle reaſonings upon which his opinions in this and other inſtances are founded, no candid judge will deny the great merit derived to his work from the excellent deſcriptions and ſagacious diſcriminations it contains, and the full and commonly juſt views of practice which it diſplays. Dr. Cullen affords the rare and inſtructive example of a man naturally addicted to all the refinements of ſpeculation, who yet pays ſuch a reſpect to experience, as to ſubmit to its deciſion in all points of practice, even at the hazard of appearing inconſiſtent with his own doctrine. This diſpoſition, which has given his opponents ſome advantage

over him in argument, greatly adds to his value as a guide in an art ſo uncertain in its principles as that of medicine. Another of his claſs-books is his "Synopſis Noſologiæ Methodicæ," of which the third edition, in two volumes octavo, appeared in 1782. This contains the ſeveral noſologies of Sauvages, Linnæus, Vogel, and Sagar, with one of his own, meant as an improvement upon all theſe. As methodical arrangement was one of his peculiar talents, it might be expected that he ſhould ſucceed in this taſk as far as the nature of the ſubject would admit; and, without diſparagement to his predeceſſors, it may be pronounced that he has improved upon them all in the elegance of his characteriſtic definitions, and the judiciouſneſs of his diſtribution. The "Lectures on Materia Medica," which we have mentioned as drawn up by Dr. Cullen on an emergency, were thought ſo ingenious, that copies of them were multiplied among the ſtudents; and at length, in 1772, one of them ſurreptitiouſly reached the preſs. The doctor obtained an injunction to ſtop the ſale of this imperfect publication; but, with ſome corrections, it was afterwards ſuffered to proceed. He promiſed, however, at ſome period to give an improved edition of his own; and this appeared in 1789, in two volumes quarto. This is a work very different from the common ſyſtems on the ſubject, and indeed, as a critic has obſerved, rather deſerves the title of the philoſophy of the materia medica than the ſimple hiſtory of it. The arrangement is taken from the medical indications, and to each claſs are prefixed introductory obſervations, which form a ſyſtem of therapeutics. Many of the general doctrines of medicine are likewiſe detailed. As it contains a number of the mature opinions of the author on the moſt important topics, it is well entitled to attention, although it is in many points defective as a treatiſe on the ſubject aſſigned. Its general ſpirit is that of medical ſcepticiſm; of a man who has read much, thought much, and determined little: and it has been remarked of Dr. Cullen's writings in general, that he has been more ſucceſsful in demoliſhing the ſyſtems of others, than in eſtabliſhing his own. A pamphlet Concerning the Recovery of Perſons drowned and ſeemingly dead, 1775, is to be added to the liſt of his publications.—We are indebted to the popular biographical work of Dr. AIKIN for the foregoing particulars.

CULM, a town of Weſtern Pruſſia, with a biſhop's ſee, ſeated near the Viſtula, 60 miles S. of Dantzic. Long. 18. 30. E. Lat. 53. 24. N.

CULMORE, a town of Ireland, in the county of Londonderry, ſeated on the coaſt of Loughfoyle, five miles N. of Londonderry. Long. 7. 3. W. Lat. 55. 8. N.

CULMSEE, a town of Poland, five miles from Culm, whoſe biſhop generally reſides here.

CUMANA, a town of S. America, in Terra Firma, capital of a province of the ſame name. Long. 63. 35. W. Lat. 9. 46. N.

CUMBERLAND (Richard), a very learned Engliſh divine in the latter end of the 17th century, was ſon of a citizen of London, and educated at Cambridge. In 1672 he publiſhed his excellent Treatiſe of the Laws of Nature; and in 1686, An Eſſay toward the Jewiſh Weights and Meaſures. After the revolution he was nominated by King William to the biſhopric of Peterborough, without the leaſt ſolicitation on his part. He purſued his ſtudies to the laſt; and the world is obliged to him for clearing up ſeveral difficulties in hiſtory, chronology, and philoſophy. After the age of 83, he applied himſelf to the ſtudy of the Coptic language, of which he made himſelf maſter. He was as remarkable for humility of mind, benevolence of temper, and innocence of life, as for his extenſive learning. He died in 1718.

CUMBRAY; GREATER and LESSER, two little iſlands in the Frith of Clyde, to the E. of the iſle of Bute. The former is remarkable for its excellent free-ſtone quarries, and the ruins of an ancient cathedral dedicated to St. Columba. Upon the latter is a lighthouſe.

CUPAR, a royal borough of Scotland, in Fifeſhire, and the county-town, 8 miles N. by E. of Falkland, in a rich valley, on the N. ſide of the river Eden.

CURIA-MARIA, an iſland of Aſia, on the coaſt of Arabia Felix, oppoſite the mouth of the river Prim. Long. 55. 25. E. Lat. 17. 0. N.

CURING, a term uſed to denote that proceſs which is applied to any animal or vegetable article of food, with a view to preſerve it for future uſe. Salting, drying, pickling, or ſmoking, are the common means uſed for this purpoſe. The following is the ſpecification of the patent granted to Mr. Batley, of Streatham, Surrey, for a new method of curing herrings, ſprats, &c —"After ſevering the head, and taking out the entrails of the herrings or ſprats, ſalt the body of the fiſh with bay or rock, or the common ſalt, in the caſks (if not ſufficiently ſalted as ſea ſticks), but the bay or rock ſalt is preferable, as the common is more apt to abſorb the pickle, and occaſion the fiſh to ruſt. In the next place pack the fiſh in a caſk, in the uſual way, and between every layer ſprinkle a ſmall portion of ſalt, and alſo pickle, ſufficient to cover the fiſh. Such pickle is to be made with one pound of bay ſalt, four ounces of ſaltpetre, and from two to four pounds of melaſſes (to ſuit different palates), to a gallon of ſpring water, if to be procured, and boil the ſame till the whole of the ingredients are diſſolved. (River water may anſwer the purpoſe, but ſpring water is preferable.) When the fiſh are ſo packed, leaving a vacuum between two and three inches of the head of the caſk, for a full portion of pickle, then let the caſk be headed up, and properly coopered, with a cork-hole, either in the head or centre, through which may be poured a further ſupply of the pickle, for the preſervation of the fiſh; and when the herrings or ſprats, but particularly the latter, are intended for travelling, it may be adviſable to put a falſe top, bored with holes, between the fiſh and caſk-head, in order to prevent their being too much ſhaken: the ſame proportion of any ſugar might be uſed as a ſubſtitute for melaſſes, but the extra price would probably be conſidered as an impediment; and from one to three months ſhould be allowed for curing, in order to give the fiſh a full flavour before they are uſed, ſmoked or dried. The above pickle would anſwer for flavouring the fiſh in their original ſtate, if needful; but, on account of the oil and filth contained in the heads and roes, the preferable mode of curing and preſerving the body of the fiſh is by ſevering the head from, and taking out the entrails, as the only effectual means of eradicating the noxious qualities which would otherwiſe adhere to them. And, in curing ſprats, it is expedient to ſprinkle a larger quantity of ſalt in proportion between each layer than is requiſite for the herrings when packed in the caſk. And as the ſprat caſks will ſeldom exceed ten gallons, a vacuum of about one inch from the head for caſks of that dimenſion will be ſufficient."

CURL, a diſeaſe affecting the plant of the potatoe, very well known to agriculturiſts. The remedy for this is a matter of ſuch national importance as to induce the Society for the Encouragement of Arts, Manufactures, and Commerce, to offer their gold medal, or thirty pounds, to the perſon who ſhould diſcover the nature and cauſe of it, and point out an effectual cure. They received the three following papers; and being deſirous of encouraging every attempt to enſure ſucceſs in the culture of that valuable vegetable, divided the pecuniary premium equally among the three candidates.

From Mr. Hollin's paper we ſelect the following abſtract:

"The curl in potatoes," ſays he, "is a diſeaſe which admits of three different ſtages or degrees.

" 1ſt. The *half-curled* plants, have leaves ſomewhat long, and curled only in a moderate degree: they produce a tolerable crop, if the ſummer be not very dry; but if otherwiſe, the potatoes will be ſmall and watery.

" 2d. The *completely-curled* plants, ſeldom more than ſix or ſeven inches high: they ſoon ripen and die. The potatoes are generally ſmaller than a nutmeg, of a ruſty red colour, and unwholeſome as food.

" 3d. The *corrupted potatoes*, or thoſe in which the vegetative power is nearly deſtroyed, never appear above ground. The ſeed may be found at Michaelmas, as freſh, to appearance, as when it was ſet, with a few ſmall potatoes cloſe to it.

" The *firſt cauſe* of the curl in potatoes muſt be traced to the manner in which the ſeed was raiſed the preceding year.

" If the potatoes be ſet late in the ſeaſon, that is, from the middle of May to the middle of June, in a rich ſoil, well manured, having a ſouthern aſpect, and if the ſummer ſhould be hot and dry till (we will ſuppoſe) the beginning of Auguſt, when the blow of the plants has fallen off, then the ſeed will be exhauſted in feeding the plant only; and very few potatoes will appear. Should the weather now become moiſt and genial, the plants, eſpecially if they ſhould be earthed, will blow afreſh, and a plentiful crop of very large potatoes may yet be produced.

" Theſe potatoes are perfectly fit for uſe as food; but as they were produced from the ſtalk of the plant, after the ſeed itſelf was exhauſted, they will be defective in moiſture and vegetative power: and the plants which proceed from them the following year will be found to be curled."

Second cauſe. " The curl," ſays Mr. Hollins, " may be produced without manure or earthing, provided the potatoes be ſown (at the end of May) thick together, in a rich ſoil, and covered with green fern, or other litter, before the plants appear. The rain rots the fern or litter, and enables it to penetrate as a manure to the roots; and the plants are forced, as in the preceding experiment, to a ſecond growth, and blow. The ſeed thus raiſed produced plants that were curled."

" The forcing potatoes by cultivation, as above deſcribed, I find to be the cauſe of the curl, both from my own experiments, repeated for ſeveral years ſucceſſively, and alſo from the obſervations I have made upon the practice and ill ſucceſs of my neighbours.

" It is well known that the flowers of many plants, ſuch as the poppy, the roſe, and many others, are much altered by cultivation; they become *double*, the ſtamina are converted into petals, the generic character is loſt, they become what botaniſts call monſters; the parts of generation being changed, no ſeed is produced. If I may be allowed to conſider any part of a plant in which the vegetative power reſides as a ſeed, it will be found that rich cultivation produces, if not abſolutely the ſame, at leaſt a ſimilar imperfection in the potatoe; for the flower and the bulbous root are both enlarged by cultivation. In the flower little or no ſeed is produced: in the potatoe, the vegetative power is impaired or deſtroyed, according to the degree of the diſeaſe.

" It is obſervable that, wherever the vegetative power is impaired, there is always a deficiency of moiſture; which confirms my opinion, mentioned before, and is itſelf proved by the following experiment.

" Both healthy and curled plants may be raiſed from the ſame potatoe, in the following manner:

" Dig up, in the beginning of October, ſome potatoes raiſed as is deſcribed in the preceding pages. Amongſt the largeſt will be found ſome that have, in different parts, different degrees of moiſture, the leaſt at the butt, and the moſt at the crown end, the quantity of moiſture gradually increaſing from the butt to the crown. Take one ſet from the crown and another from the butt: the former will produce an healthy, the latter a curled plant. The curl-producing potatoes are alſo obſerved to be drier both before and after boiling, and are boiled in a ſhorter time."

The mode of preventing the curl in potatoes recommended by Mr. Hollins is this: he ſays, 1ſt. " The beſt time of ſetting is from the beginning of April to the middle of May. Make ridges a yard aſunder: put your manure firſt into the trench, and with moderation: ſet the potatoes in a triangular form, five or ſix inches aſunder, cover them with the ſoil to the thickneſs of five or ſix inches. There is but little danger of laying on too much of the ſoil: the deeper are the ſets, the better will they be protected from the ſcorching heat of the ſun, if the ſeaſon ſhould be dry. This diſtance of five or ſix inches is ſo ſmall as to prevent the plants growing too rank, and yet ſufficient for each of them to be expoſed to the ſun and the air.

" 2dly. When they have grown to the height of ſix or ſeven inches above the ground, you muſt not earth them, as is the uſual practice. You muſt take away the weeds, and may draw a little mould to them; but you muſt be careful to do it before the bloſſom-buds appear, which time is generally about the end of June.

" They will now require no further care, excepting that of weeding.

" I am of opinion that early ſetting is advantageous, on account of the greater chance of early rain, which will be very beneficial to the plants if the ſummer ſhould be dry. By this proceſs, the plants will be healthy; the young potatoes will be formed in due ſeaſon; they will grow gradually; the plant will ripen and die in due time, and will not be forced into a ſecond growth by the rain which may fall in September. The ſap being thus left in the potatoe, it becomes a *ſeed* endued with an unimpaired perfect vegetative power, and the plants which are raiſed from them will be found to be entirely free from the curl.

" N. B. The potatoes may be dug as ſoon as they can be handled without cruſhing the peel, that is, about the end of September.

" Sound potatoes are procured with the greateſt certainty from earth that has been peeled and burnt: the ſoil thus prepared is well ſuited to the growth of potatoes. In this they grow gradually, and are not forced beyond their natural ſize: in doubtful ſeed, it is ſafeſt to plant the ſmalleſt potatoes *whole*.

" The ſoil the moſt likely to produce the curl, is that which is rich in itſelf, much manured, and has a ſouthern aſpect. In other ſituations, where the ſoil is not rich, and the garden is cold, either from its being upon the ſide of a hill, or expoſed to the north, the curl has not yet appeared; which is known to be the caſe in the mountainous parts of Radnorſhire and Montgomeryſhire. This is perfectly conſonant with my theory; for where the ſoil is poor, and the ſituation cold, the plants cannot be forced into a ſecond growth by earthing and manure.

" I do not mean to diſſuade thoſe who are anxious to raiſe large crops for immediate uſe, from earthing and manuring to the utmoſt extent; I only caution them againſt uſing potatoes ſo raiſed for *ſeed*. By earthing and manuring, you will doubtleſs raiſe large crops of large potatoes perfectly good, as food, but imperfect as ſeed; for the vegetative power will be impaired by this forcing cultivation. Hence it will be the intereſt of every prudent cultivator, to allot a portion of his potatoe-garden to the raiſing of ſeed-potatoes. If the directions which I have given be followed, I have not the leaſt doubt of ſucceſs; at leaſt I am certain that the curl will not make its appearance."

Mr. Pitt's *paper*.—"Having been a grower of potatoes," ſays he, "upon a conſiderable ſcale, for theſe ten years, I write wholly from experience: my annual growth has generally been from five hundred to one thouſand buſhels. I have frequently had a few curled, but not for ſeveral years, unleſs I planted curled ſorts in ſmall quantities, on purpoſe for obſervation. The curl in potatoes is doubtleſs owing to a degeneracy in the ſeed; to the particular ſpecies or variety being worn out; by too great a ſameneſs, and too long planting on the ſame ſort of land: and this degeneracy is by no means peculiar to the potatoe; every known plant, and perhaps even animal, is ſubject to a ſimilar degeneracy. Wheat, ſown too long on the ſame ſpot, without changing the ſeed, will generally become ſmut and hen-corn. I have known barley, by being ſown nine or ten years on the ſame kind of ſoil, degenerate to the lightneſs of oats; and oats, from the ſame cauſe, become little more than huſk and chaff. Peas, too long ſown without change, ripen later, and become ſo unkindly, that the pods, on the upper part of the haulm, never fill. To conſider the ſame idea, and apply it in an inſtance or two, to the animal creation, I have known a good breed of hogs, by repetition of breeding male and female from the ſame farrow, become ſo rickety, that they could not be reared; and have very credible accounts of the ſame effects taking place in the human ſpecies, by confining intermarriages to two or three families for generations.

"I hope this digreſſion will be excuſed, as tending to illuſtrate the main ſubject, by making the cauſe of the diſorder, in queſtion, apparent.

"The *cure*, I have no doubt, conſiſts in planting ſorts that have hitherto retained their health and their perfection; (and many ſuch ſorts there are; freſh varieties are annually raiſed, and may be multiplied almoſt to infinity, by ſowing the bell or natural ſeed of the potatoe): and indeed it is the duty, as well as intereſt, of every cultivator, whether of potatoes, or any other vegetable, to procure his ſeed from as perfect a plant as poſſible, and by no means to uſe the ſeed of a worn-out, degenerate plant.

"I have never underſtood, that the curl in potatoes has been, in this country, by any means formidable to the attentive cultivator. No one in their ſenſes would plant a degenerate ſort but upon a narrow ſcale, nor indeed is there the leaſt occaſion: for the bounty of nature has always at hand plenty of ſubſtitutes, equal or ſuperior in quality to former ſorts, even when they were in perfection. The varieties that I have known fail by curling, in this country, are only three: their provincial names are, firſt, an early ſort, called here Pretty Bettys; in lieu of which are introduced Champions and Golden Balls, both excellent early ſorts: ſecondly and thirdly, the old Winter Reds, and Pink Eyes, have both failed, and we have inſtead of them, Ayleſbury Whites, the Cluſter Potatoe, the Ox Noble, red and white Surinam for cattle; a dark purple kind, called by ſome the Pomegranate Potatoe; and many other valuable ſorts, which never have yet curled. The rational remedy, therefore, undoubtedly, is the raiſing and introducing of freſh varieties; a practice which has never yet been interrupted by any difficulty."

Mr. Holt's *paper*.—"On the cauſe and prevention of the curl in potatoes," ſays Mr. Holt, "I beg leave to offer the following thoughts, being a ſubject of no ſmall importance to the farmer, and to which I have paid not a little attention.

"The cauſe of this diſeaſe, as far as I can judge, does not ariſe from peculiarity of ſoil, variety of manure, difference of ſeaſon (dry or moiſt): the cauſe, therefore, whatever it may be, it ſhould ſeem, originates from the ſet, which, when once infected, I imagine is incurable; and the diſeaſe or curl appears to be nothing more than a total degeneracy of the plant, by being worn out, through want of change of ſeed, upon the ſame ſoil, with probably ſome other cauſes co-operating.

"It is a well-known fact, to every experienced farmer, that almoſt every ſpecies of grain and vegetables require repeated renewal, or change from different ſoils: or they wear out, (as the phraſe is), yield but imperfect crops, if continued too long; and defeat the cultivator in his expectations of reaping benefit. Why may not this too cauſe the ſame effect in potatoes, by their being too repeatedly planted, and occaſion the blaſted, early-matured appearance of the ſtems, which is always followed by a failure of crop.

"In confirmation of the above theory, this diſtrict for ſome years ſuffered great injury from curled potatoes. As the diſeaſe had but then lately made its appearance, the cultivators were at a loſs for a remedy.—This was obtained by totally diſcarding their former ſeed-plants; and of late years large quantities have been annually imported from Scotland.

"This practice has been attended with ſucceſs: few crops, I believe I may venture to ſay none, have been infected with the diſeaſe, if renewed; but if the ſame ſeed was imprudently, for a few years, continued upon the ſame ſoil, ſome plants would appear infected; and if ſtill continued longer, the diſeaſe, inſtead of being *partial*, would ſoon become *total*, with few exceptions. The cuſtom now is, to import every year from Scotland.

"There may be other reaſons which cauſe a degeneracy of wearing out of the plant.—Every ſeed has its peculiar ſeaſon, when it is moſt proper to be committed to the earth. In ſome, the budding of certain plants, or the blowing of flowers, indicate this preciſe moment to the attentive cultivator: the month, or even the day of the month, is his only guide in others. To a few of theſe the moſt favourable time is very limited, ſo very limited, that the winter turnip will not (in this diſtrict) yield a crop, if its ſeed be not ſown within a very few days before or after the 20th of July; but better, if five days before this period, than the ſame number of days afterwards. From the 20th of March to the end of April is a proper ſeaſon for planting moſt of the kinds of the winter potatoe: but this root, the friend and great ſupport of the labouring man, is not ſo very ſhy of her favours; productive crops have been obtained when planted even in July.—Time, however, for acquiring ſufficient maturity, is not allowed from ſuch late planting; for the crop, though productive, is not perfect, being neither ſo ſolid nor palatable; and this may be one cauſe of accelerating a decay, or bringing on the curl.

"The potatoe is alſo liable to other diſorders: in very dry ſeaſons, excreſcences will ariſe, vulgarly called the ſcab; in moiſt ſeaſons, little holes or cavities appear, called the canker; and both theſe diſorders increaſe according to the length of time they remain in the earth after having acquired maturity. It is more than probable, that theſe diſorders may haſten the decay, and cauſe the curl.

"One method of preventing the diſeaſe, namely, by changing the ſeed, has been already mentioned: another ſource of prevention offers, from raiſing new kinds from the ſeed or apple of the plant, or the ſame kinds renewed again from the ſeed. Raiſing new kinds from ſeed, however, requires no ſmall portion of diſcernment; for the ſeed from the ſame plant will produce ſo many varieties, that it requires nice judgment of the cultivator properly to ſelect. Great numbers, from inſpection only, will be weeded out and rejected; and of thoſe retained, more will be again rejected the ſucceeding and following years: of the remaining few, there may different characters ſtill exiſt; ſuch as ill or well-flavoured, cloſe or coarſe-grained, productive, non-produc-

tive, &c. &c. Each may have their reſpective value: but I think it may be generally aſſerted, that the finer kinds ſooner degenerate; the coarſe kinds, which are almoſt, if not always, more productive, retain their vigour the longeſt. The following example confirms this opinion.

"Spring, 1785.—I procured a new kind of potatoe, called a Dabb, lately raiſed from ſeed; where, I know not: the character of which was large, coarſe-grained, ſtrong-flavoured, and of courſe rejected from the table; but being very productive, was uſeful for cattle. The laſt year it was ſo much improved, as to be no longer rejected: it ſtill retains the quality of being productive, even ſo much as yielding, this preſent year, ſix buſhels from every ſtatute perch. It ſhould be obſerved, that the preſent very luxuriant crop may be in great meaſure owing to having been planted on a virgin ſoil, which was never before improved, or broken up; very little dung was uſed. Here is an evident change for the better; the plants are vigorous, and there is at preſent no appearance of decay: this new ſoil may be the means of preſerving the plant a few years longer; but a total change of ſeed will, in time, become abſolutely neceſſary.

"Hence, it ſhould appear, that although the diſeaſe, after the preſent ſtock has been, to a certain degree, infected, can never be cured, yet means may be taken for prevention: and that this is the caſe in this diſtrict is evident; few crops, of late years, having failed, by being much infected with this diſorder; for, wherever the curl has appeared, in ever ſo ſmall a degree, that ſtock has been rejected by the attentive cultivator, and new ſeed obtained.

"It was ſo late as the year 1565, when the potatoe was firſt imported from its native ſoil, America, into Ireland; and afterwards (owing as is reported, to a ſhipwreck) they were planted upon the ſea-coaſt, in Lancaſhire, from whence their cultivation has been progreſſive, from the weſt, through every part of the kingdom; in ſome of which but very lately. It is alſo imagined, that this diſeaſe firſt appeared in this very diſtrict of the kingdom wherein they were firſt cultivated; and this happened about the year 1764: a remarkable circumſtance at which time I yet well remember:—a perſon, full of enterpriſe, obſerving the curl in a few ſtems of a certain crop, and that they at the ſame time decayed, or arrived at maturity ſooner than the reſt, had them carefully ſelected out, imagining he had luckily obtained, ſomehow, a new and early kind; and had all of them planted the next ſeaſon: that he was diſappointed of his ſucceeding crop was evident; but from what cauſe he was puzzled.

"I am the more encouraged to offer theſe hints, for that, after having drawn them up, in the manner here ſent, I read them over to a very intelligent farmer in this neighbourhood, who ſaid that theſe thoughts totally correſponded with his own. I have ſhewn them alſo to a reſpectable clergyman, who, to his other many excellent qualities, is always ready to communicate information, and has favoured me with the following extract from a private letter.

"'A labouring man in my neighbourhood has got a very good potatoe: the only fault is, that out of four plants, three of them are abominably curled; on which account I deſired he would give me four potatoes. From each potatoe I took a *ſhoot*, not a *ſet*, in order to ſee if the ſhoots would be curled: they were not: ſo, poſſibly their not being curled may be accidental, or poſſibly the curl may ariſe from the *ſet* planted. Another year, I will plant a dozen or more, of theſe potatoe-ſhoots: then, if there ſhould be no curl, I ſhall be clearly of opinion, that the curl ariſes from ſome diſeaſe in the *ſet*. What I mean by ſhoot, is—I put three or four ſets into a flower-pot; when they have ſhot to be about two inches high, and have fibres, I take the ſets up, and with a knife cut the ſhoots off, leaving not the leaſt piece of a ſet on the ſhoot. I then plant the ſhoots.'

"It ſhould appear, from the above ingenious experiment, of which future trials will confute or confirm the fact, that it corroborates the above theory, by proving the diſeaſe in the ſet; and which, when the cauſe or ſeat of the diſorder is lopped away, the cure is effected by the force of nature to heal itſelf, and the power of vegetation on the ſmall fibres, which retain newly-acquiredlife, though from an infected parent ſtock.

"The nature of vegetation is ſo myſterious, that we muſt acknowledge our ignorance in her wonderful proceſs. We know that many varieties of fruits may, by a ſingle bud of each, be inoculated upon one and the ſame ſingle ſtock; and that, from this one root or fountain-head, may be obtained the different fruits therein depoſited; but by what law of attraction or repulſion this common ſtock or parent can divide, aſſimilate, correct, and adjuſt, the different particles of matter of which each fruit is diſtinguiſhed, by ſhape and flavour, is beyond our reach to know. It is true that but a very ſmall part of the food of plants or fruits is filtered through the roots of the plants: the leaves, the bark, the wood, imbibe from the atmoſphere, and perform their taſk: but being of different ſhape, texture, and grain, each has its ſeparate and particular mode of operation, and thereby cauſes different effects. Nor yet are we able to ſay, what it may be that gives the different flavours to fruit; whether from the component particles of matter differently arranged, or whether from the ſeparate and component parts being of different ſhapes, &c. &c. Theſe are ſecrets hitherto withheld, and probably ever will be hid from the ſearch of man."

CURSOLIERS, a ſmall iſland of Livadia, in the gulf of Patras, formerly called Echanades.

CUSSET, a town of France, in the department of Allier, and late province of Bourbonnois, 17 miles N. of Roanne. Long. 4. 5. E. Lat. 46. 17. N.

CUSTOM *and* HABIT (*Encycl.*). In our original article we omitted the neceſſary conſideration of the *effects of cuſtom and habit in the animal economy*. Theſe may be reduced to five heads. 1. On the ſimple ſolids. 2. On the organs of ſenſe. 3. On the moving power. 4. On the whole nervous power. 5. On the ſyſtem of blood-veſſels.

1. *Effects on the ſimple ſolids.* Cuſtom determines the degree of flexibility of which they are capable. By frequently repeated flexion, the ſeveral articles of which theſe ſolids conſiſt are rendered more ſupple and moveable on each other. A piece of catgut, *e. g.* when on the ſtretch, and having a weight appended to its middle, will be bended thereby perhaps half an inch; afterwards, by frequent repetitions of the ſame weight, or by increaſing the weight, the flexibility will be rendered double. The degree of flexibility has a great effect in determining the degree of oſcillation, provided that elaſticity is not affected; if it go beyond this, it produces flaccidity. Again, cuſtom determines the degree of tenſion; for the ſame elaſtic chord that now oſcillates in a certain degree of tenſion, will, by frequent repetition of theſe oſcillations, be ſo far relaxed, that the extenſion muſt be renewed in order to produce the ſame tenſion, and conſequently the ſame vibrations, as at firſt. This appears in many inſtances in the animal economy, as when different muſcles concur to give a fixed point, or tenſion, to each other: and thus a weakly child totters as it walks; but by giving it a weight to carry, and by thus increaſing the tenſion of the ſyſtem, it walks more ſteadily. In like manner the fulneſs of the ſyſ-

tem gives ſtrength, by diſtending the veſſels every-where, and ſo giving tenſion: hence a man, by good nouriſhment, from being weak, acquires a great increaſe of ſtrength in a few days; and, on the other hand, evacuations weaken by taking off the tenſion.

2. *Effects on the organs of ſenſe.* Repetition gives a greater degree of ſenſibility, in ſo far only as it renders perception more accurate. Repetition alone gives laſting impreſſions, and thus lays the foundation of memory; for ſingle impreſſions are but retained for a ſhort time, and are ſoon forgot. Thus a perſon, who at preſent has little knowledge of cloths, will, by frequently handling them, acquire a ſkill of diſcerning them, which to others ſeems almoſt impoſſible. Many are apt to miſtake this for a nicer ſenſibility, but they are much miſtaken; for it is an univerſal law, that the repetition of impreſſion renders us leſs acute. This is well illuſtrated by the operation of medicines; for all medicines which act on the organs of ſenſe muſt, after ſome time, be increaſed in their doſe, to produce the ſame effect as at firſt. This affords a rule in practice with regard to theſe medicines; it becoming neceſſary, after a certain time, to change one medicine even for a weaker of the ſame nature. Thus medicines, which even have no great apparent force, are found, by long uſe, to deſtroy the ſenſibility of the ſyſtem to other impreſſions. But to this general rule, that, by repetition, the force of impreſſions is more and more diminiſhed, there are ſome exceptions. Thus perſons, by a ſtrong emetic, have had their ſtomachs rendered ſo irritable, that 1-20th of the firſt doſe was ſufficient to produce the ſame effect. This, however, oftener takes place when the vomit is repeated every day; for if the ſame vomit be given at pretty conſiderable intervals, the general rule is obſerved to hold good. Thus two contrary effects of habit are to be noted; and it is proper to obſerve, that the greater irritability is more readily produced when the firſt impreſſion is great, as in the caſe firſt given of the ſtrong emetic. This may be further illuſtrated by the effect of fear, which is commonly obſerved to be diminiſhed on repetition; which can only be attributed to cuſtom: while, on the other haud, there are inſtances of perſons, who, having once got a great fright, have for ever after continued ſlaves to fears excited by impreſſions of the like kind, however ſlight; which muſt be imputed entirely to exceſs of the firſt impreſſion, as has been already obſerved. To this head alſo belongs the aſſociation of ideas, which is the foundation of memory and all our intellectual faculties, and is entirely the effect of cuſtom; with regard to the body alſo, theſe aſſociations often take place. And ſometimes, in producing effects on the body, aſſociations ſeemingly oppoſite are formed, which, through cuſtom, become abſolutely neceſſary; *e. g.* a perſon long accuſtomed to ſleep in the neighbourhood of a great noiſe, is ſo far from being incommoded on that account, that afterwards ſuch noiſe becomes neceſſary to produce ſleep. It will be of uſe to attend to this in medical practice; for we ought to allow for, however oppoſite it may ſeem at the time, whatever uſually attended the purpoſe we deſigned to effect. Thus, in the inſtance of ſleep, we muſt not exclude noiſe when we want to procure reſt, or any cauſes which may ſeem oppoſite to ſuch an effect, provided cuſtom has rendered them neceſſary.

3. *Effects on the moving fibres.* A certain degree of tenſion is neceſſary to motion, which is to be determined by cuſtom; *e. g.* a fencer, accuſtomed to one foil, cannot have the ſame ſteadineſs or activity with one heavier or lighter. It is neceſſary alſo that every motion ſhould be performed in the ſame ſituation, or poſture of the body, as the perſon has been accuſtomed to employ in that motion. Thus, in any chirurgical operation, a certain poſture is recommended; but if the operator has been accuſtomed to another, ſuch a one, however awkward, becomes neceſſary afterwards to his right performance of that operation.

Cuſtom alſo determines the degree of *oſcillation*, of which the moving fibres are capable. A perſon accuſtomed to ſtrong muſcular exertions is quite incapable of the more delicate. Thus writing is performed by ſmall muſcular contractions; but if a perſon has been accuſtomed to ſtronger motions with theſe muſcles, he will write with much leſs ſteadineſs.

This ſubject of tenſion, formerly attributed to the *ſimple fibres*, is probably more ſtrictly applicable to the moving: for, beſides a tenſion from flexion, there is alſo a tenſion from irritation and ſympathy; *e. g.* the tenſion of the ſtomach from food, gives tenſion to the whole body. Wine and ſpirituous liquors give tenſion; *e. g.* a perſon that is ſo affected with tremor as ſcarcely to hold a glaſs of any of theſe liquors to his head, has no ſooner ſwallowed it, than his whole body becomes ſteady; and after the ſyſtem has been accuſtomed to ſuch ſtimuli, if they are not applied at the uſual time, the whole body becomes flaccid, and, of conſequence, unſteady in its motions.

Again, cuſtom gives facility of motion. This ſeems to proceed from the diſtenſion which the nervous power gives to the moving fibres themſelves. But in whatever manner it is occaſioned, the effect is obvious, for any new or unuſual motion is performed with great difficulty.

It is ſuppoſed that ſenſation depends on a communication with the ſenſorium commune, by means of organs ſufficiently diſtended with nervous influence. We have found, that ſenſibility is diminiſhed by repetition. And we have now to obſerve, that in ſome caſes it may be increaſed by repetition, owing to the nervous power itſelf flowing more eaſily into the part on account of cuſtom. Attention to a particular object may alſo determine a greater influx into any particular part, and thus the ſenſibility and irritability of that particular part may be increaſed.

But with regard to facility of motion, the nervous power, no doubt, flows moſt eaſily into thoſe parts to which it has been accuſtomed: yet facility of motion does not entirely depend on this, but in part alſo on the concurrence of the action of a great many muſcles; *e. g.* Winſlow has obſerved, that, in performing any motion, a number of muſcles concur to give a fixed point to thoſe intended chiefly to act, as well as to others that are to vary and modify their action. This, however, is aſſiſted by repetition, and the freer influx; as by experience we know the proper attitude for giving a fixed point in order to perform any action with facility and ſteadineſs.

Cuſtom gives a ſpontaneous motion alſo, which ſeems to recur at ſtated periods, even when the exciting cauſes are removed. Thus, if the ſtomach has been accuſtomed to vomit from a particular medicine, it will require a much ſmaller doſe than at firſt, nay, even the very ſight or remembrance of it will be ſufficient to produce the effect; and there are not wanting inſtances of habitual vomiting, from the injudicious adminiſtration of emetics. It is on this account that all ſpaſmodic affections ſo eaſily become habitual, and are ſo difficult of cure; as we muſt not only avoid all the exciting cauſes, even in the ſmalleſt degree, but alſo their aſſociations.

Cuſtom alſo gives ſtrength of motion: ſtrength depends on ſtrong oſcillations, a free and copious influx of the nervous power, and on denſe ſolids. But in what manner all theſe circumſtances have been brought about by repetition, has been already explained. The effect of cuſtom, in producing ſtrength, may be thus illuſtrated; a man that begins with lifting a calf, by continuing the ſame practice every day, will be able to lift it when grown to the full ſize of a bull.

All this is of conſiderable importance in the practice of phy-

fic, though but too little regarded; for the recovery of weak people, in great meaſure, depends on the uſe of exerciſe, ſuited to their ſtrength, or rather within it, frequently repeated and gradually increaſed. Further, it is neceſſary to obſerve, that cuſtom regulates the particular celerity with which each motion is to be performed: for a perſon accuſtomed. for a conſiderable time, to one degree of celerity, becomes incapable of a greater; *e. g.* a man accuſtomed to ſlow walking will be out of breath before he can run twenty paces. The train, or order, in which our motions are to be performed, is alſo eſtabliſhed by cuſtom; for if a man hath repeated motions, for a certain time, in any particular order, he cannot afterwards perform them in any other. Cuſtom alſo very frequently aſſociates motions and ſenſations: thus, if a perſon has been in uſe of aſſociating certain ideas with the ordinary ſtimulus which in health excites urine, without theſe ideas the uſual inclination will ſcarce excite that excretion; and, when theſe occur, will require it even in the abſence of the primary exciting cauſe: *e. g.* it is very ordinary for a perſon to make urine when going to bed; and if he has been, for any length of time, accuſtomed to do ſo, he will ever afterwards make urine at that time, though otherwiſe he would often have no ſuch inclination: by this means ſome ſecretions become. in a manner, ſubject to the will. The ſame may be ſaid of going to ſtool: and this affords us a good rule in the caſe of coſtiveneſs; for by endeavouring to fix a ſtated time for this evacuation, it will afterwards, at ſuch time, more readily return. It is further remarkable, that motions are inſeparably aſſociated with other motions: this, perhaps, very often proceeds from the neceſſary degree of tenſion; but it alſo often depends merely on cuſtom, an inſtance of which we have in the uniform motions of our eyes.

4. *Effects on the whole Nervous Power.* We have found, that, by cuſtom, the nervous influence may be determined more eaſily into one part than another, and therefore, as all the parts of the ſyſtem are ſtrongly connected, the ſenſibility, irritability, and ſtrength of any particular part, may be thus increaſed. Cuſtom alſo has the power of altering the natural temperament, and of inducing a new one. It is alſo in the power of cuſtom to render motions periodical, and periodically ſpontaneous. An inſtance of this we have in ſleep, which is commonly ſaid to be owing to the nervous power being exhauſted, the neceſſary conſequence of which is ſleep, *e. g.* a reſt of the voluntary motions to favour the recruit of that power: but if this were the caſe, the return of ſleep ſhould be at different times, according as the cauſes which diminiſh the nervous influence operate more or leſs powerfully; whereas the caſe is quite otherwiſe, theſe returns of ſleep being quite regular. This is no leſs remarkable in the appetites, that return at particular periods, independent of every cauſe but cuſtom. Hunger, *e. g.* is an extremely uneaſy ſenſation; but goes off of itſelf, if the perſon did not take food at the uſual time. The excretions are further proofs of this, *e. g.* going to ſtool, which, if it depended on any particular irritation, ſhould be at longer or ſhorter intervals according to the nature of the aliment. There are many other inſtances of this diſpoſition of the nervous influence to periodical motions, as the ſtory of the ideot of Stafford, recorded by Dr. Plot (Spectator, No. 447.), who, being accuſtomed to tell the hours of the church-clock, as if ſtruck, told them as exactly when it did not ſtrike by its being out of order. Montaigne tells us of ſome oxen that were employed in a machine for drawing water, who, after making 300 turns, which was the uſual number, could be ſtimulated by no whip or goad to proceed further. Infants, alſo, cry for and expect the breaſt at thoſe times in which the nurſe has been accuſtomed to give it.

Hence it would appear, that the human economy is ſubject to periodical revolutions, and that theſe happen not oftener may be imputed to variety; and this ſeems to be the reaſon why they happen oftener in the body than mind, becauſe that is ſubject to greater variety. We ſee frequent inſtances of this in diſeaſes, and in their criſes; intermitting fevers, epilepſies, aſthmas, &c. are examples of periodical affections: and that critical days are not ſo ſtrongly marked in this country as in Greece, and ſome others, may be imputed to the variety and inſtability of our climate; but perhaps ſtill more to the leſs ſenſibility and irritability of our ſyſtem; for the exhibition of medicine has little effect in diſturbing the criſes, though it be commonly aſſigned as a cauſe.

We are likewiſe ſubject to many habits independent of ourſelves, as from the revolutions of the celeſtial bodies, particularly the ſun, which determines the body, perhaps, to other daily revolutions beſides ſleeping and waking. There are alſo certain habits depending on the ſeaſons. Our connections, likewiſe, with reſpect to mankind, are means of inducing habits. Thus regularity from aſſociating in buſineſs, induces regular habits both of mind and body.

There are many diſeaſes, which, though they aroſe at firſt from particular cauſes, at laſt continue merely through cuſtom or habit. Theſe are chiefly of the nervous ſyſtem. We ſhould, therefore, ſtudy to counteract ſuch habits; and accordingly Hippocrates, among other things for the cure of epilepſy, orders an entire change of the manner of life. We likewiſe imitate this in the chincough; which often reſiſts all remedies till the air, diet, and ordinary train of life, are changed.

5. *Effects on the Blood-veſſels.* From what has been ſaid on the nervous power, the diſtribution of the fluids muſt neceſſarily be variouſly affected by cuſtom, and with that the diſtribution of the different excretions; for though we make an eſtimate of the proportion of the excretions to one another, according to the climate and ſeaſons, they muſt certainly be very much varied by cuſtom.

On this head we may obſerve, that blood-letting has a manifeſt tendency to increaſe the quantity of the blood; and if this evacuation be repeated at ſtated times, ſuch ſymptoms of repletion, and ſuch motions are excited at theſe times, as render the operation neceſſary. The ſame has been obſerved in ſome ſpontaneous hæmorrhages. Theſe, indeed, at firſt, may have ſome exciting cauſes, but afterwards they ſeem to depend chiefly on cuſtom. The beſt proof of this is with regard to the menſtrual evacuation. There is certainly ſomething originally in females, that determines that evacuation to the monthly periods. Conſtant repetition of this, comes to fix it, independent of ſtrong cauſes, either favouring or preventing repletion; *e. g.* blood-letting will not impede it, nor filling the body induce it: and, indeed, ſo much is this evacuation connected with periodical motions, that it is little in our power to produce any effect by medicines but at thoſe particular times. Thus, if we would relax the uterine ſyſtem, and bring back this evacuation when ſuppreſſed, our attempts would be vain and fruitleſs, unleſs given at that time when the menſes ſhould have naturally returned.

CUSTRIN, a handſome town of Germany, in the New Marche of Brandenburg, with a caſtle. It is ſeated in a moraſs, ſurrounded by two branches of the Oder, 46 miles E. by N. of Berlin. Long. 14. 40. E. Lat. 52. 40. N.

CUTAIS, the capital of Imeritia, a country between the Black Sea and the Caſpian, and the reſidence of its ſovereign prince David. The remains of its cathedral ſeem to prove that it was once a conſiderable place, but it now ſcarcely deſerves the name of a village.

CUTCH, a territory of conſiderable extent in Hindooſtan Proper. It is governed by a rajah of its own, and is ſituated

on the S. E. of Sindy; the E. branch of the Indus ſeparating the two countries. It extends along the N. coaſt of the gulf of Cutch, and is ſeparated from Guzerat by the river Puddar, or one of its branches. It abounds with hills, woods, and ſandy wilds. The interior part of it is unknown. Its capital is Boodge-boodge.

CUXHAVEN, a ſea-port of Bremen, ſituated on the German Ocean, between the mouths of the Elbe and the Weſer.

CYCLOID (*Encycl.*). On the ſubject of *cycloidal curves*, a French writer has the following remark: "Il ſemble qu'une deſtinée particulière attachée à la cycloide, lui donne préferablement aux autres courbes un plus grand nombre de propriétés rémarquables."

Definition I.

When a circle is made to rotate on a rectilinear baſis, the figure deſcribed on the plane of the baſis by any point in the plane of the circle is called a trochoid. A circle concentric with the generating circle, and paſſing through the deſcribing point, may be called the deſcribing circle.

Definition II.

If the deſcribing point is in the circumference of the rotating circle, the two circles coincide, and the curve is called a cycloid.

Definition III.

If a circular baſis be ſubſtituted for a rectilinear one, the trochoid will become an epitrochoid, and the cycloid an epicycloid.

Scholium 1. The terms have hitherto been too promiſcuouſly employed; the terms cycloid and trochoid have been uſed indifferently; and the term epicycloid has comprehended the epitrochoid, the terms prolate and contracted being ſometimes added to imply that the deſcribing point is within or without the generating circle. The interior epicycloid and epitrochoid may very properly be diſtinguiſhed by the names hypocycloid and hypotrochoid, whenever they are the ſeparate objects of conſideration. The different ſpecies of epicycloids may be denominated according to the number of their cuſps, combined with that of the entire revolutions which they comprehend; for inſtance, the epicycloid deſcribed by a circle on an equal baſis is a ſimple unicuſpidate epicycloid; and if the diameter of the generating circle be to that of the baſis as 5 to 2, the figure will be a quintuple bicuſpidate epicycloid. If the deſcribing circle of a trochoid or cycloid be ſo placed as to touch the middle of the baſis, and each of the ordinates parallel to the baſis be diminiſhed by the correſponding ordinate of the circle, the curve thus generated has been denominated the companion of the trocloid, the figure of the ſines, and the harmonic curve.

Scholium 2. The invention of the cycloid has been attributed by Wallis, Ph. Tr. for 1697, n. 229, to Cardinal Cuſanus, who wrote about the year 1450: but it ſeems to be at leaſt as probable that the curve which appears in Cuſanus's figure was meant for the ſemicircle employed in finding a mean proportional. Bovillus, in 1501, has a juſter claim to the merit of the invention of the cycloid and trochoid, if it can be any merit to have merely imagined ſuch curves to exiſt. In 1599, Galileo gave a name to the common cycloid, and attempted its quadrature, but having been accidentally miſled by repeated experiments on the weight of a flat ſubſtance cut into a cycloidal form, he fancied that the area bore an incommenſurable ratio to that of the circle, and deſiſted from the inveſtigation. Merſennus deſcribed the cycloid, in 1615, under the name of la trochoide, or la roulette, but he went no further. Roberval ſeems to have firſt diſcovered the comparative quadrature and rectification of the cycloid, and the content of a cycloidal ſolid, about the year 1635, but his treatiſe was not printed until 1695. Torricelli, in 1644, firſt publiſhed the quadrature and the method of drawing a tangent. Wallis gave, in 1670, a perfect quadrature of a portion of the cycloid. The epicycloid is ſaid to have been invented by Rœmer; its rectification and evolute were inveſtigated by Newton in the Principia, publiſhed in 1687. In 1695 Mr. Caſwell ſhewed the perfect quadrability of a portion of the epicycloid, and Dr. Halley immediately publiſhed an extenſion of Caſwell's diſcovery, together with a compariſon of all epitrochoidal with circular areas. M. Varignon is alſo ſaid to have reduced the rectification of the epitrochoid to that of the ellipſis, in the ſame year. Nicole, Delahire, Paſcal, Reaumur, Maclaurin, the Bernoullis, the commentators on Newton, and many others, have contributed to the examination of cycloidal curves, both in planes and in curved ſurfaces; and Waring, the moſt profound of modern algebraiſts, has conſiderably extended his reſearches upon the nature of thoſe lines which are generated by a rotatory progreſſion of other curves. In the preſent eſſay the moſt remarkable properties of cycloidal curves are deduced in a ſimpler and more general manner than appears to have been hitherto done, the equations of ſeveral ſpecies are inveſtigated, a ſingular property of the quadricuſpidate hypocycloid is demonſtrated, and the peculiarities of the ſpiral of Archimedes are derived from its generation as an epitrochoid.

PROPOSITION I. THEOREM. PL. 23. FIG. 1.

In any curve generated by the rotation of another on any baſis, the right line joining the deſcribing point, and the point of contact of the generating curve and the baſis, is always perpendicular to the curve deſcribed.

It may by ſome be deemed ſufficient to conſider the generating curve as a rectilinear polygon of an infinite number of ſides; ſince, in this point of view, the propoſition requires no further demonſtration; and, indeed, Newton and others have not ſcrupled to take it for granted: but it is preſumed that a more rigid proof will not be conſidered as ſuperfluous. Let M be the deſcribing point, and P the point of contact; and let LO, MP, and NQ, be ſucceſſive poſitions of the ſame chord of the generating curve at infinitely ſmall diſtances; then it is obvious, and eaſily demonſtrable, that the arcs OP and PQ, deſcribed by the point P of the generating curve in its paſſage from O to P, and from P to Q, will be perpendicular to the baſis at P, and will therefore touch each other. Let the arcs L,IMK, and N, be deſcribed with the radius PM, on the centres O, P, and Q. Then the curve deſcribed by M will touch IMK; for ſince O and Q lie ultimately in the ſame direction from P, if L be above IMK, N will alſo be above it, ſince theſe points muſt be in the circles L and N, and infinitely near to M; and if L is below IMK, N, for the ſame reaſon, muſt be below it; and M is common to the circle and the curve, therefore the curve touches the circle IMK at M, and is perpendicular to the radius PM.

PROPOSITION II. PROBLEM.

To draw a tangent to a cycloidal curve at any given point.

On the given point as a centre deſcribe a circle equal to the deſcribing circle of the curve, and from the interſection of this circle, with the line deſcribed by the centre of the generating circle, let fall a perpendicular on the baſis; the point thus found will be the point of contact, and the tangent will be perpendicular to the right line joining this point of contact and the given point, by the firſt propoſition. It will be obvious, from inſpection, which of the two interſections of the circle to be deſcribed, with the tract of the centre, is to be taken as the place of that centre correſponding to the given point.

PROPOSITION III. PROBLEM. FIG. 2.

To find the length of an epitrochoid.

Let C be the centre of the baſis VP, K that of the rotating circle PR, and of the deſcribing circle GL, P the point of con-

tact, and M the describing point. Then joining MXC, and supposing VX to be an element representing the motion of the point P in either the basis or the generating circle, draw the arc MN on the centre C, and join CVN, then NM will represent the motion of the point M as far as it is produced by the revolution round the centre C: take MO to VX as GK to PK, then MO will be the motion of M arising from the revolution round K, and NO will be the element of the curve produced by the joint motion. Let CH be parallel to PM, then CX or CP : CM : : VX : MN, and PK : MK : : CP : HM : : VX : MO, therefore CM : HM : : MN : MO, and these lines being perpendicular to CM, HM, the triangle NMO is similar to CMH, and MN : NO : : CM : CH, hence CP : CH : : VX : NO. Take PY to CP as PK to CK, then CH : CP : : PM : PY : : NO : VX. On L describe the circle PFB, and draw IMLF: let FD be perpendicular to PRB, take DE to DF as PL, and E will be always in the ellipsis BEP: let AE and AF be tangents to the ellipsis and circle at E and F; then the increment of the arc BF will be to MO as PL to GL, and to VX as PL to PR. Join GM, and parallel to it draw PI; then PIL is a right angle, and ILP=AED, and IM : IL : : PG : PL : : DE : DF, by construction; therefore the figure IPML is similar to DAEF, as PL to PM so is AF to AE, and so is the increment of the arc BF to that of BE; but the increment of BF is to VX as PL to PR, therefore the increment of BE is to VX as PM to PR. Now, it was proved that NO : VX : : PM : PY; therefore the increment of BE is to NO as PY to PR, or as CP to 2 CK: and the whole elliptic arc BE is to the whole SM as the radius of the basis to twice the distance of the centres.

Corollary 1. The fluxion of every cycloidal arc is proportional to the distance of the describing point from the point of contact.

Corollary 2. In the epicycloid the ellipsis coincides with its axis BP, and the arc BE with BD, which is double the versed sine of half the arc GM, in the describing or generating circle: therefore the length of the curve is to this versed sine as four times the distance of the centres to the radius of the basis.

PROPOSITION IV. PROBLEM. FIG. 2, 3.

To find the centre of curvature of an epitrochoid.

Let PY be, as in the last proposition, to CP as PK to CK, and on the diameter PY describe the circle PZY, cutting PO in Z: take OW a third proportional to OZ and OP, and W will be the centre of curvature. For, let QP=VX be the space described by P, while NO is described by O; it is obvious from prop 1, that the intersection of NQ and OP must be the centre of curvature. Let Qr be perpendicular to rΔ parallel to QN; then, by prop. 3, NO : VX or QP : : PO : PY, but by similar triangles QP : Cr : : PY : PZ; therefore NO : Qr : : PO : PZ, and by division, NO : ΔO : : OP : OZ, and by similar triangles : : OW : Or or OP.

Corollary. When Z coincides with O or M, OW is infinite; therefore whenever PZY intersects the describing circle, the epitrochoid will have a point of contrary flexure at the same distance from C as this intersection: and the circle PZY is given when the basis and generating circle are given, whatever the magnitude of the describing circle may be.

PROPOSITION V. PROBLEM. FIG. 4.

To find the evolute of an epicycloid.

In the epicyloid SM, the point M being in the circumference of PMR, PZ will be to PM in the constant ratio of PY to PR, and MZ to PM as RY to PR; and PM to MW in the same ratio; hence PM : PW : : RY : PY : : CR : CP, therefore the point W is always in a circle PWΞ of which the radius is to PK in that proportion and which touches SP in P. On the centre C describe a circle ΔΞΘ touching PWΞ in Ξ; then, since CR : CP : : PR : PΞ, we have by division CR : CP : : CP : PΞ, and the circle PWΞ being to ΔΞΘ as PMR to SP, the arc PM being equal to SP, the similar arc PW will be equal to AΞ, and, taking AΞΘ = PWΞ, ΞΘ will be always equal to ΞW, and W in a curve ΘWS similar to SM, of which it is the evolute.

PROPOSITION VI. PROBLEM. FIG. 5.

To find the area of an epitrochoid.

On the centre C describe a circle touching the epitrochoid in S, take GΠ to GC as PR to PC, and let the circle GΦΠ describe on the basis SG the epicycloid SΦ. Then taking GM always to GΦ as GL to GΠ, M will be in the epitrochoid SM; for the angular motion of the chord GΦ, is the same as that of GM in the primary epitrochoid. Let SΩ be the evolute of SΦ, and GWΞ its generating circle. On diameters equal to ΞG, ΞL, and ΞΠ, describe three circles, AD, AE, and AF, touching the right line AB in A; let the angle BAD be always equal to GΠΦ, and it is evident that AD, AE, and AF, will be equal respectively to WG, WM, and WΦ. But the angular motion of WG on W being equal to the sum of the angular motions of GM on G and CG on C, is to that of AF, or of GM, or half that of KM, in the ratio of CΠ to CG, or CR to CP; therefore the fluxions of the areas SWG, SWM, and SWΦ are to those of the segments AD, AE, and AF, in the same ratio; and that ratio being constant, the whole areas, and their differences, are also respectively to each other as CR to CP.

Scholium. The quadrable spaces of Halley are those which are comprehended between the arc of the epitrochoid, that of the describing circle, and that of a circle concentric with the basis and cutting the describing circle at the extremities of its diameter.

PROPOSITION VII. PROBLEM. FIG. 6.

To find a central equation for the epicycloid.

Let CT be perpendicular to RT, the tangent at the point M, then PMR will be a right angle, and PM parallel to CT. On the centre C describe through M the circle MNO, and let MQ be perpendicular to RO. Then the rectangle OQN = PQR, OQ : PQ : : QR : QN, by addition OQ : PQ : : OR : PN; hence by division OP : PQ : : IR : PN, and $PQ = \frac{OPN \text{ or } INP}{IR}$. But $PMq = PR \times PQ = \frac{PR}{IR} \times INP$; and by similar triangles CT : CR : : PM : PR, whence $CTq = \frac{CRq}{PRq} \times PMq = CRq \times \frac{INP}{IRP}$. Let MZ and RY be tangents to SP, then INP = MZq, and IRP = RYq, $CT = CR \times \frac{MZ}{RY}$, and CT will be to MZ in the constant ratio of CR to RY. Putting CP = a, CR = b, CM = s, CT = u, then $uu = bb\frac{ss - aa}{bb - aa}$.

PROPOSITION VIII. PROBLEM. FIG. 7.

To find a geometrical equation for the conchoidal epitrochoid.

Let CP = PK. On the centre C describe a circle equal to GM, cutting SC in Z. Join MZF, then the arc DZ = GM, and MZ is parallel to CK, therefore EF is also equal to DZ or GM, CF is parallel to KM, and MF = CK: therefore this epitrochoid is the curve named by Delahire the conchoid of a circular basis, as was first observed by Reaumur in 1708, and afterwards by Maclaurin, in 1720. Call CK, a, DE, b, ZH, x, HM, y, ZM, s; and let ZI be perpendicular to CK; then FZ = $a - s$, $CI = \frac{a - s}{2}$, and, CIZ and ZHM being similar, CZ : CI : : ZM : ZH.

or $\frac{b}{2} : \frac{a-s}{2} :: s : x$; hence $bx = as - ss$, $bx + ss = as$, $b^2x^2 + 2bxs^2 + s^4 = a^2s^2$, and by ſubſtituting for s^2, $x^4 + 2bx^3 - a^2x^2 + b^2x^2 + 2x^2y^2 + 2bxy^2 + y^4 - a^2y^2 = 0$.

Corollary 1. Join FN, and complete the parallelogram MPNL, then ſince EF = DZ = EN, FN is perpendicular to EK, and ML to NI, and, NL being always equal to FM or CK, L is always in a circle deſcribed on the centre N, LM a tangent to that circle, and ZM a perpendicular to that tangent drawn from the point Z.

Corollary 2. Fig. 8. The unicuſpidate epicycloid admits of a peculiar central equation, with reſpect to the point S. Call SM, s, and let ST = u be perpendicular to the tangent MT, then $u = \overline{\frac{s^5}{2a}}^{\frac{1}{2}}$. For the triangles SIP and MTS being ſimilar, and IP being half of SM, or s, SP = $\sqrt{\frac{as}{2}}$, SPq : SMq :: IPq : STq, or $\frac{as}{2} : s^2 :: \frac{ss}{4} : u^2$, and $2au^2 = s^3$.

Corollary 3. Fig. 8. The unicuſpidate epicycloid is one of the cauſtics of a circle. For making the angle CRY = MRC = $\frac{1}{2}$ SCP, the triangle CRY is iſoſceles, and CY is conſtant; ſo that all rays in the direction of the tangent MR will be reflected by the circle QR towards Y, and conſequently SM will be the cauſtic of a radiant point at Y.

PROPOSITION IX. PROBLEM. FIG. 9.

To find a geometrical equation for the tricuſpidate hypocycloid.

Let PA and MF be perpendicular to CS. Join PMB, KM, RMG, and PD. Then the angle APB is equal to the difference of APC and MPR, or to that of their complements PRM, PCA: but PRM = $\frac{1}{2}$ PKM = $\frac{1}{2}$ PCA, therefore APB = $\frac{1}{2}$ PCA = ADP = APS, and the triangles APS and APB are ſimilar and equal. Let SC = a, SF = x, FM = y, and SB = r. Then SA : SP :: SP : SD, and SP = $\sqrt{ar}$. Draw PE perpendicular to BP; then BE = SD = $2a$, BC = $a - r$, EC = $3a - r$, and by ſimilar triangles, CP : CR :: EC : CG = $\frac{1}{2}$ EC = $a - \frac{1}{3}r$; therefore GB = $\frac{2}{3}r$; but BE : BG :: BP : BM, or $2a : \frac{2}{3}r :: \sqrt{ar} : \frac{r}{3a}\sqrt{ar}$ = BM; again, BP : BM :: BA : BF, or $\sqrt{ar} : \frac{r}{3a}\sqrt{ar} :: \frac{r}{2} : \frac{rr}{6a}$, and SF = x, = $r - \frac{rr}{6a}$, $6ax = 6ar - rr$, and $r = 3a \pm \sqrt{9aa - 6ax}$. But MF$q$ = BMq − BFq, or $y^2 = \frac{r^3}{9a} - \frac{r^4}{36aa}$, and $36a^2y^2 = 4ar^3 - r^4$. By adding to this the ſquare of the former equation, and proceeding in the ſame manner to exterminate r, we obtain an equation of the value of x and y, which, when the ſurds are brought to the ſame ſide, and the ſquare of the whole is taken, is at laſt reduced to $x^4 - \frac{4}{3}ax^3 + 2x^2y^2 - 12axy^2 + y^4 + 12a^2y^2 = 0$, a regular equation of the fourth order.

Scholium. The equation of the correſponding hypotrochoids may be inveſtigated nearly in the ſame manner, by dividing PR and PM in a given ratio, but the proceſs will be ſomewhat more tedious.

PROPOSITION X. PROBLEM. FIG. 10.

To find a geometrical equation for the bicuſpidate epicycloid.

Let CP = PR. Join RMS, PM, PD; draw CT perpendicular to RT, TE to CR, and EG, MB, RA, to SC. Then the angle DRP = $\frac{1}{2}$ MKP = SCP, and by equal triangles, RA = CT, and RD = CD, and by ſimilar triangles RM : RP :: RE : RT, and RP : RD :: RT : RC; therefore RM : RD :: RE : RC, and ME is parallel to SC, and EG = BM. Put CP = a, BC = x, BM = y, CM = s, CT = u; then by prop. 7. $u^2 = \frac{4}{3}\overline{s^2 - a^2}$; or $\frac{3}{4}u^2 = s^2 - a^2$; but RC : CT :: CT : CE :: CE : EG, or y, hence $y = \frac{u^3}{4aa}$ $u^6 = 16a^4y^2$, $\frac{27}{64}u^6 = \frac{27}{4}a^4y^2 = \overline{ss - aa}^3 = \overline{xx + yy - aa}^3$; whence by involution the equation of the ſixth order may be had at length.

Corollary. Since CRM = SCR, a ray in the direction of the tangent MR will be reflected by a circle FR always parallel to SC: therefore SM is the cauſtic of the circle FR when the incident rays are parallel to CS.

PROPOSITION XI. PROBLEM. FIG. 11.

To find a geometrical equation for the quadricuſpidate hypocycloid.

Let CR = PR, then the angle PRM = $\frac{1}{2}$ PKM = 2PCS, RAC = ACR, RA = RC = RB = RP, AB = SC, and drawing the perpendiculars CT, TD, TE, and MF, RM = RT, AM = BT, AF = EC, FC = AE, and FM = BD. Let SC = a, FC = x, FM = y, CM = s, CT = u; then AB : AC :: AC : AT :: AT : AE, whence AT = $\overline{axx}^{\frac{1}{3}}$, and in the ſame manner BT = $\overline{ayy}^{\frac{1}{3}}$; and CT being a mean proportional between AT and TB, $u^2 = \overline{a^2x^2y^2}^{\frac{1}{3}}$, and $u^6 = a^2x^2y^2$. But by prop. 7. $3u^2 = a^2 - s^2$, therefore $27a^2x^2y^2 = \overline{a^2 = s^2 = a^2 = x^2 = y^2}^3$; whence the equation may be had at length by involution. The ſame reſult may be obtained by Dr. Waring's method of reduction, from $\overline{axx}^{\frac{1}{3}} + \overline{ayy}^{\frac{1}{3}} = a$.

Corollary. Since the portion of the tangent AB intercepted between the perpendiculars AC, BC, is a conſtant quantity, this hypocycloid may in that ſenſe be called an equitangential curve; and the rectangular corner of a paſſage muſt be rounded off into the form of this curve in order to admit a beam of a given length to be carried round it.

PROPOSITION XII. PROBLEM.

To inveſtigate thoſe caſes in which the general propoſitions either fail or require peculiar modifications.

Caſe 1. Fig. 12. If the generating circle be conſidered as infinitely ſmall, or the baſis as infinitely large, ſo as to become a ſtraight line, the epicycloid will become a common cycloid, and the ratio of CP to CK in prop. 3. cor. 2. becoming that of equality, the length of the arc SM will be four times the verſed ſine of half PM, and VM twice the chord RM or VX, therefore the ſquare of the arc VM is always as the abſciſs VZ. The evolute is an equal cycloid, and the circles in prop. 6. being as 1 to 4, the area of the cycloid is to that of its generating circle as 3 to 1. The properties of the cycloid as an iſochronous and as a brachiſtochronous curve belong to mechanics, and it is demonſtrated by writers on optics that its cauſtic is compoſed of two cycloids.

Caſe 2. Fig. 13. If the generating circle be ſuppoſed to become infinite while the baſe remains finite, the epicycloid will become the involute of a circle; and the fluxion of the curve being always, by prop. 3. cor. 1. to that of PM as PM to CP, its length SM will be a third proportional to IP and PM. Call CP, a, and PM, x, then the fluxion of SM is $\frac{xx}{a}$; but the rectangle contained by half PM and the fluxion of SM is the fluxion of the area PSM, or PSM = $\int\frac{xx\dot{x}}{2a} - \frac{x^3}{6a}$. The epitrochoid deſcribed by the point C of the gene-

rating plane will be the ſpiral of Archimedes, ſince CN is always equal to PM = PS = QV; and ſince the angular motion of CN and PM are alſo equal, the area CON = PSM $= \frac{x^3}{6a}$. Inſtead of the ellipſis of prop. 3. let PX be a parabola of which IP is the parameter, and continuing NM to X, the arc PX will be equal to CON. For making LQ = CP, it is well known that the fluxion of PX varies as XQ or as PN, which repreſents the fluxion of CON. For the curvature, PY in prop. 4. becomes = CP, and the radius is a third proportional to NZ and NP.

Caſe 3. Suppoſing now the generating circle to become again finite, but to have its concavity turned towards the baſis, the ſame curve will be deſcribed as would be deſcribed by the rotation of a third circle on the ſame baſis in a contrary direction, equal in diameter to the difference of thoſe of the two firſt circles.

Caſe 4. If the circles be of the ſame ſize, with their concavities turned the ſame way, no curve can be deſcribed; but if the generating circle be ſtill further leſſened, a hypocycloid will be produced, if the ſame figure as that which would be deſcribed by a third circle equal in diameter to the difference of the two firſt. All the general propoſitions are equally applicable to hypocycloids with other epicycloids, as might eaſily have been underſtood from an inſpection of the figures, if there had been room for a double ſeries.

Caſe 5. Fig. 14. If the diameter of the generating circle be half that of the baſis, the hypocycloid will become a right line, and the hypotrochoid an ellipſis. For ſince the angle PKM = 2 PCS, PCM, being half PKM, coincides with PCS, and M is always in CS. Let GNL be the deſcribing circle of the hypotrochoid, and join GNO, then NL is parallel, and ON perpendicular to SC and ON = HL, which is always to GO as CL to CG; therefore AN is an ellipſis: and the centre C will evidently deſcribe a circle.

CYRIL (St.) biſhop of Jeruſalem, ſucceeded Maximus in 350. He was afterward depoſed for the crime of expoſing to ſale the treaſures of the church, and applying the money to the ſupport of the poor during a great famine. Under Julian he was reſtored to his ſee, and was firmly eſtabliſhed in all his old honours and dignities under Theodoſius; in which he continued unmoleſted to his death in 386. The remains of this father conſiſt only of 23 catecheſes, and one letter to the Emperor Conſtantius.

CYRILL (St.), patriarch of Alexandria, ſucceeded Theophilus, his uncle, in 412. Scarce was he inſtalled, when he began to exert his authority with great vigour; he drove the Novatians and Jews from Alexandria, permitting their wealth and ſynagogues to be taken from them. This proceeding highly diſpleaſed Oreſtes, the governor of the city, who ſaw that if the biſhop's authority was not ſoon ſuppreſſed it might grow too ſtrong for that of the magiſtrate. Upon which a kind of civil war broke out between Oreſtes and the biſhop; many tumults were raiſed, and ſome battles fought in the very ſtreets of Alexandria. St. Cyrill alſo diſtinguiſhed himſelf by his zeal againſt Neſtorius biſhop of Conſtantinople, who, in ſome of his homilies, had aſſerted that the Virgin Mary ought not to be called the mother of God. The diſpute at firſt proved unfavourable to Cyrill, whoſe opinion was not only condemned, but himſelf deprived of his biſhopric and thrown into priſon. But he was ſoon after releaſed, and gained a complete victory over Neſtorius, who in 431 was depoſed from his ſee of Conſtantinople. Cyrill returned to his ſee at Conſtantinople, where he died in 444. St. Cyrill alſo wrote againſt Theodorus of Mopſueſta, Diodorus of Tarſus, and Julian the apoſtate. He compoſed commentaries on St. John's goſpel, and wrote ſeveral other books. His works were publiſhed in Greek and Latin in 1638, in ſix volumes folio.

CYRIL LUCAR, patriarch of Conſtantinople. This eminent man, who has been ſtrangely neglected by the writers of biographical collections, was born in the iſle of Candia at the time when it was under the protection of the Venetians. He received his education at Venice under Maximus Margunius, afterwards biſhop of Cerigo (an iſland in the entrance of the Archipelago), who wrote in Greek a learned diſcourſe concerning the proceſſion of the Holy Ghoſt. After he had finiſhed his ſtudies there, and had acquired a perfect knowledge of the Latin and Italian languages, he travelled into various parts of Europe, the better to fit himſelf for the ſervice of his country. On his return into the Eaſt he was made a prieſt, and afterwards archimandrite, or prior of a convent. In 1600 he was made the bearer of a letter from Meletius patriarch of Alexandria, to Sigiſmund III. king of Poland and Sweden; the occaſion of which was this: ſeveral biſhops of Lithuania and Black Ruſſia who had hitherto continued in the communion of the Greek church, wrought upon by ſeveral temporal advantages, which they propoſed to gain in the diet of Poland, ſent two of their number to Rome to make their ſubmiſſion to the pope in 1595. This gave great offence to the other members of the Greek church, but the deſign of an union being favoured by the king, a ſynod was called at Breſta, to eſtabliſh this affair. At this ſynod the Duke of Oſtoravia and thoſe of the Greek party appeared, and firmly refuſed to ſubmit to the propoſed union. The name of *non-unitia*, or *diſſenters*, was given to thoſe perſons who reſolved to adhere to the Greek church, and in obedience to the Patriarch of Conſtantinople. Cyril was one of theſe, being ſent thither for the expreſs purpoſe of breaking off the union of the Ruſſians with the church of Rome. Afterwards this party had ſeveral conferences with the Proteſtant noblemen and divines, particularly thoſe of the Lutheran communion; and ſome ſteps were taken to effect an union between the Proteſtant and Greek churches. But this excellent deſign proved abortive. About this time Sigiſmund, out of his zeal for the Roman church, publiſhed an edict againſt the ſpreading of the Greek religion in his dominions; and ſoon after wrote a treatiſe to Meletius, adviſing him to make his ſubmiſſion to the pope. This letter he anſwered with all due reſpect, deſiring him to beſtow his favour upon Cyril, the bearer, as being worthy of it, both for his learning and integrity. His active way of life, and knowledge of the world, gained by his travels and employments, rendered him every-where conſpicuous and deſerving in the eſteem of all of the higheſt dignity of his church. The patriarchal ſee of Alexandria becoming vacant, he was choſen to ſucceed Meletius, and in that ſeat he continued nineteen years. The great deference which the other patriarchs of the Greek communion pay to the ſee of Conſtantinople induces them to make frequent journeys thither. Here Cyril came about the beginning of 1612; and in the lent following a prieſt of that church, who had received part of his education among the Jeſuits, ſaid many things in favour of the Romiſh religion, which occaſioned Cyril to oppoſe him with the greateſt earneſtneſs. While he was at Conſtantinople the patriarch of that ſee died; a circumſtance which uſually produces conſiderable confuſion, as the reſt of the biſhops make uſe of all kinds of means to get the election. The Turks take advantage of theſe diſſenſions; and as the patriarch muſt be confirmed by the grand-ſeignior, the viſier and baſhas expect conſiderable bribes from all the candidates. Cyril had a great party among the biſhops, who wiſhed him to be advanced to the patriarchate for the good of the Greek church. To prevent his being elected, the oppoſite party made uſe of the accuſtomed mode;

and by advancing a large ſum, got Timothy biſhop of Marmara appointed; but he died ſoon after, and Cyril was choſen without oppoſition to the vacant chair in 1621. This appointment was very mortifying to the Jeſuits, and other zealous members of the Roman communion, becauſe they knew how great an enemy he was to their corruptions, how well inclined to a reformation, and particularly favourable to the Proteſtant churches. Every artifice, therefore, was adopted to effect his ruin; and, by the help of the French ambaſſador, they were in hopes to get him depoſed, in order that Gregory biſhop of Amaſa, a creature of their own, might occupy his place. Cyril inſtantly called a ſynod, in which the ambitious pretender was excommunicated. The enemies of the patriarch, however, ſucceeded in prejudicing the mind of the viſier againſt him, and he was baniſhed to Rhodes; after which Gregory was advanced to the patriarchal dignity, on a promiſe of paying twenty thouſand dollars, but not being able to raiſe this ſum, Anthimus archbiſhop of Adrianople purchaſed the place. This gave great ſatisfaction to the court of Rome, and Pope Urban VIII. complimented the French ambaſſador on his ſkill and dexterity in this infamous buſineſs. But this triumph did not laſt long, for the Engliſh ambaſſador, Sir Thomas Rowe, interpoſed ſo effectually, that Cyril was recalled to Conſtantinople, and Anthimus made his ſubmiſſions to him and received abſolution. New deſigns were then formed, and the pope ſent over an anti-patriarch, under the title of Apoſtolical Suffragan, enjoining full power to do what was neceſſary to promote the intereſts of the Roman church. Accordingly ſeveral titular biſhops were created of Smyrna, Naxia, and other places. The Greeks, alarmed at this attempt upon their church, made heavy complaints to the viſier, and with ſuch ſucceſs, that the ſuffragan was glad to eſcape for his life, and the titular biſhops were thrown into priſon. Matters ſeemed now to wear a favourable aſpect; but the calm was of ſhort duration, for Cyril's enemies were only watching an opportunity to complete their grand object. In 1627 a Greek prieſt, called Mataxa, who had reſided in England ſeveral years, and had learnt there the art of printing, arrived at Conſtantinople, and brought with him a printing preſs and types for the uſe and information of the poor Greeks. The deſign was excellent; but it was difficult to get the luggage aſhore without giving jealouſy to the Turks. The prieſt was brought to Sir Thomas Rowe by the Archbiſhop of Corinth, from the patriarch, to beg of him to own the goods, which accordingly he did. The ambaſſador, however, would not permit the preſs to be worked in his houſe, but adviſed them to take one in the neighbourhood for the purpoſe. When the Jeſuits heard that this preſs was ſet up, they were greatly alarmed, and were determined to put an end to the work, which they knew to be unfavourable to their cauſe. They inſinuated that the patriarch intended to ſubvert the faith of his own church, on which he cauſed a ſmall book to be printed concerning the doctrine of that church, dedicated to Charles I. king of England. This gave them additional offence; but as they could gather nothing from this book on which to ground an accuſation, they had recourſe to another which he had written and got printed in England, in defence of the divinity of Chriſt againſt the Jews. Having gathered ſome paſſages from this treatiſe which oppoſed the Koran, they laid them before the viſier, at the ſame time charging Cyril with the deſign of ſtirring up the Coſſacks to invade the empire. The viſier, without any further enquiry, ſent his ſoldiers to the printing-houſe, and took poſſeſſion of its contents; but Mataxa eſcaped. The Engliſh ambaſſador, on this, waited upon the viſier, and expoſtulated with him ſo effectually, that he was convinced of having been impoſed upon, and promiſed to reſtore all the goods within three days. And as the jeſuits had taken great liberties with the name of Sir Thomas, by repreſenting him as the head of the heretics, and a friend of ſeditious perſons, ſatisfaction was made to him, by ſending the accuſers to priſon, where they would have ſuffered by the bow-ſtring, if he had not interceded for their lives. The patriarch now enjoyed repoſe for a conſiderable time; though his enemies ſtill ſoſtered their virulent animoſity againſt him, and promoted diſſenſions among his biſhops, in order to effect, at laſt, his deprivation. In 1630, a Confeſſion of Faith, drawn up by Cyril, was printed in Latin at Geneva, and occaſioned conſiderable obſervation, and ſome controverſy. The Romaniſts, nettled at a work which flatly oppoſed the dogmata of their church, and the pretenſions of their pontiff, cauſed an anſwer to be made to it in Greek, and diſperſed over the Eaſt. Soon after this the French ambaſſador at Conſtantinople gave a dinner to the patriarch and his friends; after which he ſhewed him the Confeſſion which had been ſent to him by order of the pope; with expreſs orders to demand of him if he was the real author of it, and maintained the doctrines therein contained. Cyril honeſtly replied, that it undoubtedly was his Confeſſion; but that as he owed no obedience to the pope, he was not obliged to render him any account of his faith; adding beſides, that he ſtood at the head of a church to which he would be always ready to give ſatisfaction in a general ſynod, referring all to the Word of God, and the fathers of the primitive church. To this the ambaſſador replied, that at Rome, and in France, they looked upon him as a Calviniſt, which ſect was much hated by the king, his maſter, who, therefore, wiſhed that the patriarch would become a Roman-catholic. The anſwer of this good man was in theſe words: "In the articles of my belief, and my eternal ſalvation, I ſhall neither follow the king of France nor the pope of Rome; neither will I act contrary to the dictates of my own conſcience." In 1634 his enemies got him baniſhed to the iſle of Tenedos, and Anaſtaſius to be elected in his room; but, in a few months, he was reſtored to his ſeat, though not without a heavy contribution being paid to the grand-ſeignior. The year following another competitor was ſet up; the patriarch was ſent to the iſle of Rhodes; and ſo eager were his adverſaries to deſtroy him utterly, that a deſign was formed to take him off the iſland, and carry him to Italy, where, doubtleſs, he would have been made a ſacrifice of by the inquiſition. This deſign being diſcovered, the governor of the iſland removed him from thence, and thus prevented the ſcheme from being carried into effect. In July, 1636, he was reſtored again, and the viſier being his friend, he reſted ſafely for ſome time; but, in 1638, Bairam Baſha becoming the favourite of the ſultan, repreſented Cyril as a dangerous man, by whoſe inſtigation the Coſſacks had lately committed ſome depredations on the frontiers; and that, by his influence over the people of his perſuaſion, he might probably ſtir them up to mutiny. The emperor on this ſent an order for his being ſtrangled immediately. The governor of Conſtantinople, on receiving this mandate, ſent his officers to ſeize on the patriarch, and ſent him priſoner to a caſtle on the Boſphorus. From thence he was conveyed into a boat, where the fatal bow-ſtring being applied to his neck, he was ſoon diſpatched; they then ſtripped the body and threw it into the ſea, from whence it was afterwards taken by ſome fiſhermen, and by ſome of his friends buried on the ſhore. When this was made known to the government, an order came for taking the body up, and throwing it again into the ſea, which was done; but the body was afterwards recovered, and buried obſcurely in one of the ſmall iſlands that lie over againſt the bay of Nicomedia.

He was, in all reſpects, a great man, and may juſtly be termed a martyr for truth and religion, having been perſecuted

by his enemies all through his public life, for firmly reſiſting the encroachments of a foreign power, and ſtrenuouſly ſupporting the independence and faith of his own church.

He had a great regard for the Engliſh church and nation, which, about the ſame time, was ſuffering violently from the attacks of reſtleſs and ambitious men. He ſent over to King Charles I. that famous Alexandrian MS. of the New Teſtament which is now in the king's library, and has been edited in a capital manner by the late learned Dr. Woide.

CZERCASSI, a town of Ruſſia, in the Ukraine, with a caſtle, ſeated near the Dnieper, 85 miles SE. of Kiow. Long. 32. 5. E. Lat. 49. 0. N.

CZERSKO, a town of Poland, on the Viſtula, twenty miles N.W. of Warſaw. Long. 21. 31. E. Lat. 52. 26. N.

D

DAM

DACHSBACH, a town of Franconia, 22 miles S. of Bamberg.

DACHSTEIN, a town of France in the department of Lower Rhine, with a palace that belonged to the ſee of Straſburg. Long. 7, 45. E. Lat. 48. 35. N.

DACHSTUHL, a town of Germany, in the circle of Upper Rhine, and principal place of a lordſhip, which gives the poſſeſſor a ſeat and voice at the diets of the circles, though not at that of the empire. It is 22 miles S.E. of Treves.

DADO, in architecture and joinery, a word which has three different meanings, 1ſt. It denotes the *cubic* part of the pedeſtal of a column or ſtatue, included between the baſe and the entablement. 2d. That part of the pedeſtal of a pilaſter, which correſponds with the *dado* in ſolid work. 3dly. It means that part of the wainſcotting, or ſtucco work, which is a lateral prolongation of the dado of a pilaſter; *i. e.* the place included between the foot-board and the cornice of the wainſcotting.

DAFAR, or DOFAR, a town of Arabia Felix, ſeated on a bay of the ſame name, on the S.E. coaſt. Long. 53. 25. E. Lat. 16. 30. N.

DAGISTAN, or DAGHESTAN, a town of Perſia, capital of the province of Dagheſtan; ſituate on a river, which runs into the Caſpian Sea, 240 miles N.W. of Meſchid.

DAHL, the fineſt river of Sweden, which flows through Dalecarlia and on the S. confines of Geſtricia, and falls into the gulf of Bothnia, to the E. of Geſle. Near Eſcarleby, it forms a celebrated cataract, ſcarce inferior to the fall of the Rhine at Lauffen.

DAILLIE (John), a Proteſtant miniſter near Paris, was one of the moſt learned divines of the 17th century, and was the moſt eſteemed by the Catholics, of all the controverſial writers among the Proteſtants. He was tutor to two of the grandſons of the illuſtrious Mr. Du Pleſſis Mornai. Mr. Daillie having lived fourteen years with ſo excellent a maſter, travelled into Italy with his two pupils: one of them died abroad; with the other he ſaw Italy, Switzerland, Germany, Flanders, Holland, and England, and returned in 1621. He was received miniſter in 1623, and firſt exerciſed his office in the family of Mr. Du Pleſſis Mornai; but this did not laſt long, for that great lord died ſoon after. The memoirs of this great man employed Mr. Daillie the following year. In 1625 he was appointed miniſter of the church of Saumur, and in 1626 removed to Paris. He paſſed all the reſt of his life in the ſervice of this laſt church, and compoſed ſeveral works: his firſt piece was his maſter-piece, and an excellent work, Of the Uſe of the Fathers, printed in 1631. It is a ſtrong chain of reaſoning, which forms a moral demonſtration againſt thoſe who would have religious diſputes decided by the authority of the fathers. He died in 1670, aged 77.

DAM, a town of the United Provinces, in Groningen, ſeated on the Damſter, three miles from the ſea, and fifteen S.W. of Embden. Long. 6. 48. E. Lat. 53. 22. N.

DAM, a town of Pruſſian Pomerania, ſeated on the Oder, ten miles S.E. of Stetin. Long. 14. 50. E. Lat. 53. 31. N.

DAMANHOUR, a town of Egypt, near the canal of Alexandria; 32 miles E.S.E. of Alexandria.

DAMAR, a town of Arabia Felix, in Yemen, 100 miles S. of Sanaa. Long. 46. 33. E. Lat. 16. 0. N.

DAN

DAMASCENUS (John), an illuſtrious father of the church in the 8th century, born at Damaſcus, where his father, though a Chriſtian, enjoyed the office of counſellor of ſtate to the Saracen caliph; to which the ſon ſucceeded. He retired afterwards to the monaſtery of St. Sabas, and ſpent the remainder of his life in writing books of divinity. His works have been often printed; but the Paris edition in 1712, two volumes folio, is eſteemed the beſt.

DAMASCIUS, a celebrated heathen philoſopher, born at Damaſcus in the year 540, when the Goths reigned in Italy. He wrote the Life of his maſter Iſidorus; and dedicated it to Theodora, a very learned and philoſophical lady, who had alſo been a pupil to Iſidorus. In this Life, which was copiouſly written, he frequently made oblique attacks on the Chriſtian religion. We have nothing remaining of it but ſome extracts preſerved by Photius. Damaſcius ſucceeded Theon in the rhetorical ſchool, and Iſidorus in that of philoſophy, at Athens.

DAMGARTIN, a town of Swediſh Pomerania, with a caſtle, ſeated on the Recknils, eighteen miles W. of Stralſund. Long. 12. 57. E. Lat. 54. 16. N.

DAMM, a town of Upper Saxony, in the duchy of Pomerania. The inhabitants carry on a conſiderable trade in ſteel manufactures. It is ſeated on the Plone, five miles E. of Stetin. Long. 14. 39. E. Lat. 53. 21. N.

DAMME, a ſtrong town of Flanders, ſeated on the canal between Sluys and Bruges. It was taken by the duke of Marlborough in 1706, and ceded to the Dutch at the peace of Utrecht.

DAMME, a town of the United Provinces, in Groningen Though unfortified, it enjoys the privileges of a city, and before the late revolution had a voice among the ſtates of Groningen. It ſuffered much by inundations ſome years ſince. It is ſeated on the Damſter, fourteen miles N.E. of Groningen.

DANBURY, a village in Eſſex, ſituate on a hill, five miles E. of Clelmsford, and ſixteen W. of the ſea. The ſpire of the church was burnt by lightning in 1750, but was ſoon after rebuilt, and forms a ſea-mark.

DANCALI, or DANKALI, a kingdom of Abyſſinia, on the coaſt of the Red Sea. The ſoil is unproductive; and its chief riches conſiſt in ſalt and honey. It is governed by a prince nominally tributary to the negus, or emperor of Abyſſinia.

DANDOLO (Henry), doge of Venice, a brave admiral

and politician. With a Venetian fleet he took Conſtantinople in 1203, and had the moderation to refuſe to be emperor. He died in 1250.

DANET (Peter), abbot of St. Nicholas de Verdun, was one of the perſons choſen by the duke of Montauſier to write on the claſſics for the uſe of the dauphin. He had a ſhare in Phædrus, which he publiſhed with notes and explications in Latin. He alſo wrote a dictionary in Latin and French, and another in French and Latin. He died at Paris in 1709.

DANGER, Isles of, three iſlands in the S. Pacific Ocean, ſeen by Commodore Byron in 1765, but were ſo ſurrounded by rocks and breakers, that it was unſafe to attempt to land. The commodore ſuppoſed them to be the iſlands ſeen by Quiros, in the beginning of the 17th century, and named Solomon's Iſlands. Long. 169. 28. W. Lat. 10. 15. S.

DANNEBERG, a town of Lower Saxony, capital of a diſtrict of the ſame name. It belongs to the elector of Hanover, and is ſeated on the Tetze, near the Elbe, forty miles S.E. of Lunenburgh. Long. 11. 29. E. Lat. 53. 14. N.

DANTE (Ignatius) a deſcendant of the poet, was born at Perugia, and took the habit of a Dominican monk. He became ſkilful in philoſophy and divinity, but more ſo in the mathematics. He was invited to Florence by the great duke Coſmo I. and explained to him the ſphere, and the books of Ptolemy. He read public lectures on the ſame ſubject, and had many auditors in the univerſity of Bologna, where he explained geography and coſmography. Being returned to Perugia, he made a fine map of that city, and of its whole territory. The reputation of his learning cauſed him to be invited to Rome by Gregory XIII. who employed him in making geographical maps and plans. He acquitted himſelf ſo well in this, that the pope thought himſelf obliged to prefer him; and accordingly gave him the biſhopric of Alatir, near Rome. He went and reſided in his dioceſe; but Sixtus V. who ſucceeded Gregory XIII. would have him near his perſon, and ordered him to return to Rome. Dante was preparing for the journey, but was prevented by death, which ſeized him in 1586. He publiſhed at Florence, in 1569, a treatiſe Of the Conſtruction and Uſe of the Aſtrolabe. He alſo wrote notes on the Sphere of Sacroboſco, on the Aſtrolabe, and on the Univerſal Planiſphere. He made a ſphere of the world in five tables; and was the author of ſome other ſmall things.

DANVERS (Henry), a brave warrior in the end of the ſixteenth, and beginning of the ſeventeenth century; and created earl of Danby by King Charles I. was the ſecond ſon of Sir John Danvers, knight, by Elizabeth his wife, daughter and coheir to John Nevil, the laſt Lord Latimer. He was born at Danteſey in Wiltſhire, on the 28th day of June, 1573. After an education ſuitable to his birth, he went and ſerved in the Low-country wars, under Maurice count of Naſſau, afterwards Prince of Orange; and was engaged in many military actions of thoſe times, both by ſea and land. He was made a captain in the wars of France, occaſioned in that kingdom by the league: and there knighted for his good ſervice under Henry IV. king of France. Next, he was employed in Ireland, as lieutenant-general of the horſe, and ſerjeant-major of the whole army, under Robert earl of Eſſex, and Charles baron of Mountjoy, in the reign of Queen Elizabeth. Upon the acceſſion of King James I. he was, on account of his family's deſerts and ſufferings, advanced, on the 21ſt of July, 1603, to the dignity of a peer of this realm, by the title of Baron of Dantcſey; and in 1605, by a ſpecial act of parliament, reſtored in blood, as heir to his father, notwithſtanding the attainder of his elder brother, Sir Charles Danvers, knight. Moreover, he was appointed lord preſident of Munſter in Ireland, and in 1620, made governor of the iſle of Guernſey, for life. By King Charles I. he was created earl of Danby, on February 5, 1625-6; and made one of his privy-council, and knight of the order of the Garter. Being himſelf a man of learning, as well as a great encourager of it, and obſerving that opportunities were wanting in the univerſity of Oxford for the uſeful ſtudy of botany, he purchaſed a piece of ground by the river Charwell, oppoſite to Magdalen College; which he encompaſſed with a curious wall of ſquare poliſhed ſtone, and repleniſhed with a great variety of plants and herbs proper for the ſtudy of phyſic and botany. He founded alſo an almſhouſe and a free-ſchool, at Malmeſbury in Wiltſhire. In his latter days he choſe a retired life; and, upon what account is not well known, fell under the diſpleaſure of the court. At length he died, at his houſe in Cornbury-Park in Oxfordſhire, January the 20th, 1643-4, in the ſeventy-firſt year of his age: and was buried in the chancel of the pariſh-church of Danteſey, under a noble monument of white marble, with an epitaph, which contains the beſt character that can be given of him. He was never married.

Danvers (John), was younger brother and heir of Henry. He was alſo a knight and one of the gentlemen of the privy-chamber to King Charles I. and was ſo ungrateful and inhuman as to ſit in judgment upon his gracious maſter, that unfortunate prince, and to be one of thoſe who ſigned the warrant for his execution. He died before the reſtoration of King Charles II. but, however, all his eſtates both real and perſonal were confiſcated in 1661. From Lord Clarendon we underſtand, he was neglected by his brother, and, by a vain expence in his way of living, contracted a vaſt debt, which he knew not how to pay, and being a proud formal weak man, between being ſeduced and a ſeducer, became ſo far involved in their counſels, that he ſuffered himſelf to be applied to their worſt offices, taking it to be a high honour to ſit upon the ſame bench with Cromwell, who employed and contemned him at once; nor did that party of miſcreants look upon any two men in the kingdom with that ſcorn and deteſtation as they did upon Danvers and Mildmay.

DARABGERD, or Darab-guierd, a town of Perſia, in Farſiſtan, ſaid to have been founded by Darius. It is large, but not populous, and near it ſalt is found of various colours, white, black, red, and green. A conſiderable manufacture of glaſs is carried on here. It ſtands 116 miles E.S.E. of Schiras.

DARAH, or Dras, a country of Africa; bounded on the N. by Morocco, Gezula, and Tafilet, and on the E. and S. by Zahara, and on the W. by Sus. A river of the ſame name flows through it. The principal produce is indigo and dates. The inhabitants are Arabs and Mahometans; and ſome of the diſtricts of the country are dependent on Morocco.

DARAPOORY, a town of the peninſula of Hindooſtan, in Myſore, 88 miles E. of Seringapatam. Long. 78. 26. E. Lat. 12. 11. N.

DARAPORUM, a town of the peninſula of Hindooſtan, in Myſore, 36 miles E.S.E. of Coimbetore, and 73. W. of Trichinopoly. Long. 77. 30. E. Lat. 10. 42. N.

DAR-EL-HAMARA, a town of the kingdom of Fez, built by the Romans. Its trade conſiſts in oil and corn; and it is ſeated on a mountain. Long. 6. 35. W. Lat. 34. 20. N.

DARGONNE (Dom Bonaventure), a religioniſt of the Carthuſian order, was born at Paris in 1640, and died in 1704. We have of his a very judicious work, entitled, Un Traité de la Lecture des Pères de l'Egliſe; the beſt edition of which is that of 1697. He publiſhed alſo, Des Melanges d'Hiſtoire & de Littérature, under the name of Vigneul de Marville, in 3 vols. 12mo; the laſt of which is ſaid to be done by the abbé Banier. This is a very curious and intereſting collection of critical reflections and literary anecdotes. He has been called to account by the critics for what he has ſaid of Bruyere. He was the author of ſome other things.

DARIEN, a river and gulf of Terra Firma, which divide the provinces of Darien and Carthagena. In 1695 the Scotch obtained a charter from William III., empowering them to form a ſettlement on the N.W. point of the gulf, where the country had never been occupied by the Spaniards, but continued to be poſſeſſed by the native Indians. This ſettlement excited ſuch an alarm among the maritime powers of Europe, and particularly the jealouſy of the Spaniſh court and of the Engliſh Eaſt-India Company, that the adventurers, meeting with every obſtruction from the very adminiſtration that had granted their charter, were obliged to abandon the ſettlement.

DARLASTON, a village near Stone, in Staffordſhire, where are the remains of a caſtle on a hill.

DAROCA, a town of Spain, in Arragon, on the Xiloca, 38 miles S.S.W. of Saragoſſa. Long. 1. 5. W. Lat. 41. 15. N.

DARORE, a town of the Decean of Hindooſtan, 80 miles E. by S. of Amednagur. Long. 76. 10. E. Lat. 18. 50. N.

DART, a river in Devonſhire, which riſes at the foot of Dartmoor Hills, croſſes Dartmoor to Aſhburton, and after paſſing Totneſs, where it is navigable for ſmall veſſels, is joined by the Hareborn, and falls into the Engliſh Channel, at Dartmouth.

DARTMOOR, an extenſive mooriſh tract, in Devonſhire, bounded on the N. by bleak hills, and extending ſouthward quite through the centre of the county to the ſea. It contains about 80,000 acres, and is watered by the river Dart. Many ſheep are bred here, but of a ſmall kind, and ſubject to the rot. The chief riches of the inhabitants are their black cattle, which thrive well on the coarſe ſour herbage.

DARWAR, a ſtrong town of Hindooſtan, in the kingdom of Myſore, and one of the ſultan's frontier towns, 88 miles S. by W. of Viſiapour, and ninety E.N.E. of Goa. Long. 75. 29. E. Lat. 16. 5. N.

DASSEN-EYLAND, or Iſle of Deer, one of the three ſmall iſlands to the N. of the Cape of Good Hope; ſo called on account of the great number of deer which were firſt carried thither in 1601. Here are alſo ſheep whoſe tails weigh 19 pounds. Long. 18. 7. E. Lat. 33. 25. S.

DASSOUCI, a celebrated French muſician and poet of the 17th century, who publiſhed his own adventures, which are very odd, in the ſtyle of a buffoon. He relates, that he was born at Paris; that his father, an advocate in the parliament, was of Sens in Burgundy; that his mother was of Lorrain, a very little woman, and very prone to anger; that her huſband and ſhe, not being able to agree, parted by conſent, after having divided their children and their ſubſtance; that he lived with his father at Paris, where he was ill-treated by a ſervant, who was his father's miſtreſs; that at nine years of age he went to Calais, where he made people believe that he underſtood aſtrology, and was ſon to a famous calculator of nativities; that, having by a little artifice cured a perſon who conceited himſelf ſick, he paſſed for a magician; that he was obliged to leave Calais privately, the mob threatening to throw him into the ſea. Bayle knows nothing more of him, till the time that the Duke de St. Simon got Lewis XIII. to hear him at Germains; when he hit that prince's humour by a drinking ſong of his own making, which it afterwards became the faſhion to ſing at court. The king liſtened to his ſongs ever after, and admitted him freely into his cloſet; and they called Daſſouci, Phœbus Garderobin, becauſe he had his lutes always in the king's wardrobe. He continued this game under Lewis XIV. but having an inclination to go to Turin, he left Paris about 1655. Arriving at Lyons, he found many temptations to detain him. He entertained with his muſic all the convents of ſinging nuns; and there was not one of thoſe devout virgins, who had not already a copy of his Ovid in a Merry Humour. This was the title of a work, wherein he tranſlated part of Ovid's Metamorphoſes into burleſque verſe. He ſtayed three months at Lyons, in the midſt of diverſions, plays, and entertainments, being highly careſſed by Moliere, and the Bejars; after which he went to Avignon with Moliere, and then to Pezenas, where the aſſembly of the ſtates of Languedoc was held. He was maintained by thoſe players a whole winter; and followed Moliere as far as Narbonne. Afterwards he went to Montpellier, where he was impriſoned, and very near being burnt, for a ſuſpected commerce with a male. He continued three months at Montpellier after his releaſe, and drew up an account of that Tragi-comical Adventure, ſo he calls it; which however he did not print, though the chief magiſtrate, who had ſeen it, gave him leave. He afterwards ſaw ſeveral towns of Provence; and went to wait on the Prince of Morgues at Monaco, who made him a handſome preſent.

Being arrived at Turin, he had ſome trouble to confute by his preſence the report of his execution, which had been read in the Burleſque Gazette. He laboured to procure a ſettlement in that court, and ſuppoſes he ſhould have ſucceeded, if the muſicians of the country had not grown jealous of him. He pretends, that the beauty of his poetry laid him open to the indignation of a poet of Auvergne, who criticiſed and proſecuted him: and adds, that he ſuffered much for having neglected the favourites, becauſe he impoliticly fancied it ſufficient to make his court to their royal highneſſes. Perceiving they grew cold towards him, he requeſted either to be diſmiſſed, or to have a fixed penſion; and, to his great mortification, obtained the former. About 1674 he publiſhed two ſmall volumes, which he had compoſed in the priſon of the Chatelet at Paris. He was confined there at that time: but we know nothing of the particulars relating either to his confinement or his enlargement. Daſſouci had ſeveral enemies: among the reſt, Cyrano de Bergerac and Boileau. He was a very indifferent ſort of man, as we learn from his own accounts and confeſſions: there is no occaſion to depend upon the teſtimony and authority of his ſatiriſts for this.

DAVENANT (John), biſhop of Saliſbury, and a very learned man, was the ſon of an eminent merchant, and born in Watling-ſtreet, London, about 1570. He was admitted of Queen's College, Cambridge, in 1587, where he took his degrees in arts regularly. A fellowſhip was offered him about 1594, but his father would not ſuffer him to accept it, on account of his plentiful fortune; however, after his father's deceaſe, he accepted of one, and was admitted into it in 1597. He took his doctor's degree in 1609, having long diſtinguiſhed himſelf by his parts and learning; and the ſame year was elected Lady Margaret's profeſſor of divinity. In 1614 he was choſen maſter of his college; and became ſo conſiderable, that he was one of thoſe eminent divines, ſent by James I. to the ſynod of Dort in 1618. He returned to England in May 1619, after having viſited the moſt eminent cities in the Low-countries. In 1621 he was advanced to the ſee of Saliſbury, and continued in favour during the remainder of James's reign; but in 1630-1 he incurred the diſpleaſure of the court, by meddling, in a ſermon preached before the king at Whitehall, with the predeſtinarian controverſy; "all curious ſearch into which" his majeſty had ſtrictly enjoined, in his declaration prefixed to the 39 articles in 1628, "to be laid aſide." For this pretended contempt of the king's declaration he was not only reproved the ſame day, but alſo ſummoned to anſwer two days after before the privy-council; and, though he was diſmiſſed without further trouble, and even admitted to kiſs the king's hand, yet he was never afterwards in favour at court. He died of a conſumption, April 20, 1641, to which, it is ſaid, a ſenſe of the ſorrowful times he ſaw coming on did not a little

contribute; and was buried in Saliſbury cathedral. He was a man of exemplary manners, and a great divine; but ſtrictly attached to Calviniſm with all its abſurdities.

He wrote, 1. A Latin Expoſition of St. Paul's Epiſtle to the Coloſſians, the third edition of which was printed at Cambridge in 1639. It is the ſubſtance of lectures, read by him as Margaret profeſſor. 2. Prælectiones de Duobus in Theologia Controverſis Capitibus: de Judice Controverſiarum, primo: de Juſticia Habituali & Actuáli, altero, Cant. 1631. 3. In 1634, he publiſhed the queſtions he had diſputed upon in the ſchools, 49 in number, under this title; Determinationes Quæſtionum quarundam Theologicarum. 4. Animadverſions upon a Treatiſe lately publiſhed, and entitled, God's Love to Mankind, manifeſted by diſproving his abſolute Decree for their Damnation, Camb. 1641.

DAVENANT (William), younger brother to the former, and fourth ſon of Sir William Davenant, was educated at Magdalen-hall in Oxford, where he took the degree of B.A. in 1677. He tranſlated into Engliſh from the French, a book, entitled, Animadverſions upon the famous Greek and Latin Hiſtorians, written by La Mothe le Voyer, who was tutor to Lewis XIII. He took the degree of M. A. in 1680; and about the ſame time, entering into orders, was preſented to a living in the county of Surrey, by his patron Robert Wymondſole, of Putney, eſq. He travelled with this gentleman into France; and in the ſummer of 1681, was unfortunately drowned in a river near Paris, as he was ſwimming for his own diverſion.

DAVENANT (Doctor Charles), an eminent civilian and writer, eldeſt ſon of the preceding, and educated in Cambridge: he wrote ſeveral political tracts; and likewiſe plays. He was (1685) impowered, with the maſter of the revels, to inſpect the plays deſigned for the ſtage, that no immoralities might be preſented. His Eſſays on Trade are in high eſteem; and were lately reprinted in five vols. 8vo. Doctor Davenant was inſpector-general of exports and imports; and died in 1712.

DAVENPORT (Chriſtopher), a learned Engliſhman, was born at Coventry, in Warwickſhire, about 1598, and educated in grammar-learning at a ſchool in that city. He was ſent to Merton College in Oxford at fifteen years of age; where ſpending two years, he, upon an invitation from ſome Romiſh prieſt, afterwards went to Douay. He remained there for ſome time; and then going to Ypres, he entered into the order of Franciſcans among the Dutch there, in 1617. After ſeveral removals from place to place, he became a miſſionary into England, where he went by the name of Franciſcus à Sancta Clara; and at length was made one of the chaplains to Henrietta Maria, the royal conſort of Charles I. Here he did all he could to promote the cauſe of Popery, by gaining diſciples, raiſing money among the Engliſh Catholics to carry on public matters abroad, and by writing books for the advancement of his religion and order. He was very eminent for his uncommon learning, being excellently verſed in ſchool divinity, in fathers and councils, in philoſophers, and in eccleſiaſtical and profane hiſtory. He was, Wood tells us, a perſon of very free diſcourſe, while his fellow-labourer in the ſame vineyard, Hugh Creſſy, was reſerved; of a lively and quick aſpect, while Creſſy was clouded and melancholy: all which accompliſhments made him agreeable to Proteſtants as well as Papiſts. Archbiſhop Laud, it ſeems, had ſome knowledge of this perſon; for, in the ſeventh article of his impeachment, it is ſaid, that "the ſaid archbiſhop, for the advancement of Popery and ſuperſtition within this realm, hath wittingly and willingly received, harboured, and relieved, divers Popiſh prieſts and Jeſuits, namely, one called Sancta Clara, alias Davenport, a dangerous perſon and Franciſcan friar, who hath written a Popiſh and ſeditious book, entitled, Deus Natura, Gratia, &c. wherein the thirty-nine Articles of the Church of England, eſtabliſhed by act of parliament, are much traduced and ſcandalized: that the ſaid archbiſhop had divers conferences with him, while he was writing the ſaid book, &c." To which article, the archbiſhop made this anſwer: "I never ſaw that Franciſcan friar, Sancta Clara, in my life, to the utmoſt of my memory, above four times, or five at moſt. He was firſt brought to me by Dr. Lindſell: but I did fear, that he would never expound the articles ſo, that the church of England might have cauſe to thank him for it. He never came to me after, till he was almoſt ready to print another book, to prove, that epiſcopacy was authoriſed in the church by divine right; and this was after theſe unhappy ſtirs began. His deſire was, to have his book printed here; but at his ſeveral addreſſes to me for this, I ſtill gave him this anſwer: That I did not like the way which the church of Rome went concerning epiſcopacy; that I would never conſent, that any ſuch book from the pen of a Romaniſt ſhould be printed here; that the biſhops of England are very well able to defend their own cauſe and calling, without any help from Rome, and would do ſo when they ſaw cauſe: and this is all the conference I ever had with him." Davenport at this time abſconded, and ſpent moſt of thoſe years of trouble in obſcurity, ſometimes beyond the ſeas, ſometimes at London, ſometimes in the country, and ſometimes at Oxford. After the reſtoration of Charles II. when the marriage was celebrated between him and Catherine of Portugal, Sancta Clara became one of her chaplains; and was for the third time choſen provincial of his order for England, where he died May 31, 1680.

He was the author of ſeveral works: 1. Paraphraſtica Expoſitio Articulorum Confeſſionis Anglicæ. This book was, we know not why, much railed at by the Jeſuits, who would fain have had it burnt; but being ſoon after licenſed at Rome, all further rumour about it ſtopped. 2. Deus, Natura, Gratia: ſive, Tractatus de Prædeſtinatione de Meritis, &c. This book was dedicated to Charles I. and Prynne contends, that the whole ſcope of it, as well as "the paraphraſtical Expoſition of the Articles," reprinted at the end of it in 1635, was to reconcile the king, the church, and the articles of our religion to the church of Rome. He publiſhed alſo a great number of other works, which are not now of conſequence enough to be mentioned.

DAVENPORT (John), elder brother of Chriſtopher juſt mentioned, was born at Coventry, in 1597; and ſent from thence with his brother to Merton College in 1613. He afterwards took a different rout from him; for whereas Chriſtopher went to Douay, and became a Catholic, John went to London, and became a Puritan. He was miniſter of St. Stephen's in Coleman-ſtreet, and ſeemed by his fanatical brethren a perſon of excellent gifts in preaching, and in other qualities belonging to a divine. About 1630, he was appointed by certain factious and diſcontented perſons, one of the feoffees for the buying in impropriations; but, that project miſcarrying, he left his paſtoral charge about 1633, under pretence of oppoſition from the biſhops, and went to Amſterdam. Here, endeavouring to be a miniſter in the Engliſh congregation, and to join with them in all duties, he was oppoſed by John Paget, an elder, on account of ſome difference between them about baptiſm; upon which he wrote, in his own defence, A Letter to the Dutch Claſſis, containing a juſt Complaint againſt an unjuſt Doer; wherein is declared the miſerable Slavery and Bondage that the Engliſh Church at Amſterdam is now in, by Reaſon of the tyrannical Government and corrupt Doctrine of Mr. John Paget, their Miniſter, Amſt. 1631. Two or three more pieces relating to this controverſy were publiſhed by him afterwards; and ſuch were his

parts and learning, that he drew away from them many of their congregation, to whom he preached and prayed in private houſes.

In the beginning of the rebellion, he returned into England, as other Nonconformiſts did, and had a cure beſtowed on him; but finding matters not go on agreeably to his humour, he went into New England, and became a paſtor of New Haven there. He afterwards removed from thence to Boſton in 1668, where he died the year following. He was the author of A Catechiſm containing the chief Heads of the Chriſtian Religion, which was printed in London in 1659: ſeveral Sermons: The Power of congregational Churches aſſerted and vindicated: and of An Expoſition of the Canticles, which has never been publiſhed.

DAVID (George), a moſt extraordinary heretic, was the ſon of a waterman of Ghent, and educated a glazier, or, as ſome ſay, a glaſs-painter. He began about 1525 to preach ſuch whimſies as theſe, namely, that he was the true Meſſiah, the third David, nephew of God, not after the fleſh, but after the ſpirit. "The heavens," he ſaid, "being empty, he was ſent to adopt children worthy of that kingdom; and to reſtore Iſrael, not by death, as Chriſt, but by grace." With the Sadducees, he denied eternal life, the reſurrection, and the laſt judgment: with the Adamites he was againſt marriage, and for a community of women: and with the followers of Manes, he thought that the body only, and not the ſoul, could be defiled by ſin. According to him, the ſouls of unbelievers ought to be ſaved, and thoſe of the apoſtles damned. Laſtly, he affirmed it folly to believe that there was any ſin in denying Jeſus Chriſt; and ridiculed the martyrs for preferring death to apoſtacy. A perſecution being commenced againſt him and his followers, he fled firſt to Frieſland, and from thence to Baſil, where he lurked under the name of John Bruck. He died in that city in 1556, promiſing to his diſciples, that he ſhould riſe again in three days; which, as it happened, was not altogether falſe; for the magiſtrates of Baſil, underſtanding at length who he was, did, about that time, dig up his corpſe, which, together with his writings, they cauſed to be burned by the common executioner. As great a madman as this George David was, he had his followers, which continued ſome time after his death.

DAVIES (Dr. John), was born in Denbighſhire, and educated by William Morgan, afterwards biſhop of St. Aſaph. He was admitted a ſtudent of Jeſus College, Oxford, in 1589, and afterwards became a member of Lincoln College in the ſame univerſity. He was rector of Malloyd, or Manylloyd in Merionethſhire, and afterwards a canon of St. Aſaph. He commenced doctor in 1616, and was highly eſteemed by the univerſity, ſays Wood, as well as verſed in the hiſtory and antiquities of his own nation, and in the Greek and Hebrew languages; a moſt exact critic, an indefatigable ſearcher into ancient writings, and well acquainted with curious and rare authors. His works are, 1. Antiquæ Linguæ Britannicæ nunc communiter dictæ Cambro-Britannicæ, a ſuis Cymræcæ vel Cambricæ, ab aliis Wallicæ Rudimenta, &c. 1621, 8vo. 2. Dictionarium Latino-Britannicum, 1632, folio. With this is printed Dictionarium Latino-Britannicum, which was begun and greatly advanced by Thomas Williams, phyſician, before 1600. It was afterwards completed and publiſhed by Dr. Davies. 3. Adagia Britannica, Authorum Britannicorum nomina, & quando floruerunt, 1632, printed at the end of the Dictionary before mentioned. 4. Adagiorum Britannicorum Specimen, MS. Bibl. Bodl. He alſo aſſiſted W. Morgan, biſhop of Landaff, and Richard Parry, biſhop of St. Aſaph, in tranſlating the Bible into Welſh, in that correct edition which came out in 1620. He alſo tranſlated into the ſame language (which he had ſtudied at vacant hours for thirty years) the book of Revolution, written by Robert Parſons, a Jeſuit.

DAVIES (John), an eminent and learned critic, was the ſon of a merchant in London, and born there April 22, 1679. After being educated in claſſical learning at the Charterhouſe ſchool, he was, in 1695, ſent to Queen's College, Cambridge; where he took the degree of B.A. in 1698. In 1701 he was choſen fellow of his college; and the year following took the degree of M. A. In 1711, having diſtinguiſhed himſelf by ſeveral learned publications, hereafter to be mentioned, he was collated by Moore biſhop of Ely to the rectory of Fen-Ditton near Cambridge, and to a prebend in the church of Ely; taking the ſame year the degree of LL.D. Upon the death of Dr. James, he was choſen maſter of Queen's College, March 23, 1716-17; and created D.D. in 1717, when George I. was at Cambridge. He died March 7, 1731-32, aged 53, and was buried in the chapel of his college; where a flat marble ſtone was laid over his grave, with a plain inſcription. His mother, who was a daughter of Sir John Turton, Knt. is ſaid to have been living in 1743.

This learned man was not, as far as we can find, the author of any original works, but only employed himſelf in giving fair and correct editions of ſome Greek and Latin authors of antiquity. Thus, in 1703 he publiſhed in 8vo. 1. Maximi Tyrii Diſſertationes, Gr. and Lat. ex Interpretatione Heinſii, &c. 2. C. Julii Cæſaris, & A Hirtii quæ extant omnia, Cant. 1706, 4to. It was republiſhed in 1727. 3. M. Minucii Fælicis Octavius, Cant. 1707, 8vo. It was printed again in 1712, 8vo. with the notes greatly enlarged and corrected, and the addition of Commodianus, a writer of the Cyprianic age. 4. Then he formed a ſcheme of publiſhing new and beautiful editions of Cicero's philoſophical pieces, by way of ſupplement to what Grævius had publiſhed of that author; and accordingly put out, in 1709, his Tuſculanarum Diſputationum, Libri quinque, 8vo. This edition, and that of 1738, which is the fourth, have at the end the emendations of his intimate friend Dr. Bentley. The other pieces were publiſhed by our author in the following order: De Naturâ Deorum, 1718. De Divinatione & de Fato, 1721. Academica, 1725. De Legibus, 1727. De Finibus Bonorum & Malorum, 1728. Theſe ſeveral pieces of Tully were printed in 8vo. in a fair and handſome manner; have been received with a general applauſe; and have paſſed, moſt of them, through ſeveral editions. He had alſo gone as far as the middle of the third book of Cicero's Offices; but being prevented by death from finiſhing it, he recommended it in his will to the care of Dr. Mead, who put it into the hands of Dr. Thomas Bentley, that he might fit and prepare it for the preſs. But the houſe where Dr. Bentley lodged, which was in the Strand, London, being ſet on fire through careleſſneſs, as it is ſaid, by reading after he was in bed, Davies's notes and emendations periſhed in the flames. 5. Another thing publiſhed by our learned author, which we have not mentioned, was, Lactantii Firmiani Epitome Divinarum Inſtitutionum, Cant. 1718, 8vo.

DAVILA (Henrico Catherino), a celebrated hiſtorian, was born of an illuſtrious family in the iſle of Cyprus; but was obliged to leave his country, on its being taken by the Turks, in 1571. He firſt retired to Avila in Spain, whence his family ſuppoſed they had derived their name and origin; from thence he went to France, and made himſelf known at court under the reigns of Henry III. and Henry the Great. He there diſtinguiſhed himſelf on ſeveral occaſions by his valour; and at length went to Venice, where he had a very handſome penſion ſettled upon him by that republic, in whoſe ſervice his brother Lewis Davila had been a commander. Davila, while he was at Venice, wrote his admirable Hiſtory of the Civil Wars of France, which contains every thing worth

notice that paſſed from the death of Henry II. in 1559, to the peace of Vervins in 1598. He was killed about the year 1635, by a gentleman of Verona; who, in a diſpute about furniſhing him with carriages in purſuance of his having a commiſſion from the republic, diſcharged a piſtol at Davila, and wounded him in ſuch a manner, that he died ſoon after. Davila's ſon, a youth of about 18, being preſent, had the ſpirit to revenge the death of his father; for, inſtantly ruſhing upon the murderer, he cut him in pieces.

DAVIS (Henry Edwards), ſon of Mr. John Davis, of Windſor, was born July 11, 1756, and educated at Ealing, Middleſex, whence he removed to Baliol-College, Oxon, May 17, 1774, and took his degree about Jan. 1778, as B.A. In the ſpring of that year he diſtinguiſhed himſelf amongſt the earlieſt examiners of ſome remarkable aſſertions, and inſinuations yet more extraordinary, introduced in the Hiſtory of the Decline and Fall of the Roman Empire. So much accurate knowledge, and a judgment ſo well matured as that Examination diſcovered, has been rarely found at the age of twenty-one. The hiſtorian, in his Vindication, exerted very conſiderable efforts, though ſtrongly aſſailed by veterans in literature, to defend himſelf againſt his juvenile opponent. Mr. Davis, in his Reply, manifeſted no ordinary degree of candour and firmneſs. Such proofs of learning, ſagacity, and zeal for the Chriſtian cauſe, drew the particular attention of men, eminent by their public ſtation, their talents, and acquired advantages, and ſtill more diſtinguiſhed by their virtue and piety. In 1780, having entered into full orders, he was eſtabliſhed, in a manner peculiarly to his honour, in a fellowſhip of his college; and, for ſome time before his death, was tutor; an office which he diſcharged with ſolicitude and conſtancy, too great for the ſenſibility of his mind and the delicacy of his conſtitution. A lingering illneſs removed him from the ſociety of his many eſtimable friends, and deprived the public of his expected ſervices. Feb. 10, 1784, without any apparent change between a placid ſlumber and death, he expired. He was buried at Windſor, which was the place of his birth. He had cultivated a taſte for elegant literature, particularly in poetry, and occaſionally wrote for the Gentleman's Magazine; the particulars cannot now be aſcertained, except that in the Magazine for April 1782, p. 181, a letter ſigned C. and D. pointed out a very erroneous repreſentation, for ſuch it is preſumed it will appear to impartial readers, in a paſſage of Mr. Gibbon concerning Gennadius. Of this the diſcovery belongs to Mr. Davis; though in the drawing of it, as the ſignature imports, a learned friend was concerned.

It may be added, that, before his publication of the Examination, he had given ſeveral proofs of an early genius; and as in this he reſembled ſome eminent men, ſo he did alſo in another reſpect, being from his infancy of a very tender and delicate conſtitution. His apprehenſion was quick, his judgment correct; and in his application he was indefatigable.

DAVOS, a town of Switzerland, and capital of a juriſdiction of the ſame name, in the country of the Griſons. In the diſtrict are two lakes well furniſhed with fiſh, mines of copper, lead, and ſilver; and the inhabitants breed a great number of cattle: ſixty miles S.E. of Zurich. Long. 27. 21. E. Ferro. Lat. 46. 40. N.

DAUN, a town of Germany, in the electorate of Treves, ſeated on the Lezer, at the foot of a mountain, on which is a caſtle, twelve miles N. of Mont Royal.

DAUPHIN, Fort, a fort built by the French, on the E. coaſt of Madagaſcar. Long. 45. 10. E. Lat. 24. 55. S.

DAWES (Sir William), an eminent Engliſh prelate, was the youngeſt ſon of Sir John Dawes, bart. and born at Lyons, near Braintree, in Eſſex, Sept. 12, 1671. He was educated at Merchant-Taylors' ſchool in London, where he made a great proficiency in claſſical learning; and was alſo tolerably verſed in the Hebrew tongue, even before he was fifteen years of age: which was chiefly owing to the additional care that Kidder, afterwards biſhop of Bath and Wells, but then rector of Rayne near Braintree, was pleaſed to take of his education. In 1687 he was ſent to St. John's College in Oxford; but his father's title and eſtate deſcending to him, upon the death of his two elder brothers, about two years after, he left Oxford, and entered himſelf a nobleman in Catharine-hall, Cambridge. He took poſſeſſion of his eldeſt brother's chambers, who died there juſt before of a fever, at the ſame time that his other brother, who was lieutenant of a ſhip, was unhappily drowned. After he had taken the degree of M. A. he viſited his eſtate in Eſſex, and intended to make a ſhort tour into ſome other parts of the kingdom, which he had not ſeen; but his progreſs was ſtopped by his happening to meet with Frances, the eldeſt daughter of Sir Thomas Darcy, of Braxſtead-lodge in Eſſex, a fine and accompliſhed woman, whom he ſoon after married.

As ſoon as he arrived at the proper age, he was ordained deacon and prieſt by Compton biſhop of London. He intended, from the very firſt, to enter into holy orders; and is ſaid to have prepared himſelf for this, by making ſome of the moſt eminent Engliſh divines his ſtudy, while he was very young. Shortly after, he was created D.D by a royal mandate, in order to be qualified for the maſterſhip of Catharine-hall, to which he was unanimouſly elected in 1696, upon the death of Dr. John Eachard. He did ſeveral beneficial acts to his college: particularly, he contributed liberally towards the finiſhing a chapel which his predeceſſor had begun; and, by his intereſt at court, procured the firſt vacant prebend of Norwich to be annexed, by act of parliament, to the maſterſhip of Catharine-hall for ever. In 1696 he was made a chaplain in ordinary to King William; and ſhortly after, was preſented by his majeſty to a prebend in the church of Worceſter. Sir William, it ſeems, had pleaſed the king ſo well in a ſermon, preached at Whitehall, Nov. 5, 1696, that his Majeſty ſent for him, and without any ſolicitation gave him this prebend; telling him at the ſame time, that "the thing indeed was but ſmall, and not worth his acceptance, but as an earneſt of his future favour, and a pledge of what he intended for him." Nov. 10, 1698, he was collated by Archbiſhop Teniſon to the rectory, and, the month following, to the deanery of Bocking in Eſſex; where he behaved in a very charitable and exemplary manner.

After Queen Anne's acceſſion, Sir William was made one of her chaplains, and was in a fair way for ſome of the higheſt dignities in the church. Accordingly, though he miſſed the biſhopric of Lincoln, which was vacant in 1705, yet her Majeſty, of her own accord, named him to the ſee of Cheſter in 1707. The reaſon of his miſſing Lincoln was his having, in a ſermon upon Jan. 30, uttered ſome bold truths, which were not agreeable to certain perſons in power; who took occaſion from thence to perſuade the queen, contrary to her inclinaion, to give it to Dr. Wake, afterwards archbiſhop of Canterbury. This, however, made no impreſſion upon Sir William; and, therefore, when he was told by a certain nobleman, that he had loſt a biſhopric by his preaching, his reply was, that "as to that he had no manner of concern upon him, becauſe his intention was never to gain one by it." In 1713-14, he was tranſlated to the archiepiſcopal ſee of York; at which time he was alſo made a privy-counſellor of ſtate. He continued above ten years in this high ſtation, much honoured and reſpected; and then a diarrhœa, to which he had been ſubject afore-time, coming to be attended with a fever, and ending in an inflammation of his bowels, put a period to his life, April 30, 1724. He was buried in the chapel of Catharine-hall, Cambridge,

near his lady, who died Dec. 22, 1705, in her 29th year. He had ſeven children, three of which only, namely, Elizabeth, Jane, and Darcy, ſurvived him.

He was the author of ſeveral things, ſome of which were publiſhed by himſelf, and others after his deceaſe, under the title of his Whole Works, with a Preface, giving ſome Account of the Life, Writings, and Character of the Author, 1733, in 3 vols. 8vo. Thoſe publiſhed by himſelf were, 1. An Anatomy of Atheiſm, 1693. This is a poem, conſiſting of five ſheets, and was written by the author before he was eighteen years of age. It is more remarkable for its argument and eaſineſs of diction, than for any briſkneſs and force of imagination. 2. The Duties of the Cloſet, &c. written before he was 21 years of age. 3. The Duty of Communicating explained and enforced, &c. compoſed for the uſe of his pariſhioners at Bocking. 4. Sermons preached upon ſeveral Occaſions before King William and Queen Anne, 1707, 8vo. dedicated to that queen. 5. A Preface to the Works of Biſhop Blackall, publiſhed in 1723.

DAWES (Richard), an Engliſh ſcholar, celebrated for the publication of a work, entitled, Miſcellanea Critica, was born in 1708; and, after a ſchool-education under Mr. Anthony Blackwall, admitted of Emanuel College, Cambridge, in 1725. In 1736 he publiſhed a ſpecimen of a Greek tranſlation of Paradiſe Loſt; of which, in his preface to the Miſcellanea Critica, he had candour enough to point out the imperfections himſelf. Mr. Dawes died in 1766, and left ſome MSS. to which Mr. Burges who afterwards publiſhed an improved edition of the Miſcellanea Critica, had acceſs. There are ſome others in Dr. Aſkew's collection, who bought Mr. Dawes's library.

DAX, or ACQS, an ancient town of France, in the department of Landes, with a biſhop's ſee. Here are ſome famous hot baths, the ſpring of which diſcharges 543 cubic feet of water in 15 minutes. It is ſeated on the Adour, 24 miles N.E. of Bayonne. Long. 1. 0. W. Lat. 43. 42. N.

DAY (Thomas), an eminent miſcellaneous writer, the only ſon of Thomas Day, eſq. one of the collectors outwards of the cuſtoms in the ports of London, was born in the year 1748. He received his education at Charter-houſe, and removed thence to Oxford. He afterwards made a tour on the Continent, and, on his return to England, entered himſelf of the ſociety of the Middle Temple, and was called to the bar. But, although poſſeſſed of great eloquence, with a mind not only able to comprehend, but to improve the modes of judicial proceedings, he was diſguſted with the technical nicety of legal proceſs; and being poſſeſſed of an ample fortune, much augmented by the accumulation of a long minority, he declined the emoluments of the law, and devoted his time to literary purſuits. In 1777 he married Miſs Eſther Milnes, of Wakefield, in Yorkſhire; and with this lady he lived retired many years at Anningſley, in the county of Surrey; where he amuſed himſelf with the occupation of a large farm, more for the ſake of maintaining a number of poor families whom he employed around it, than with any view to his own advantage. He occaſionally interfered in the politics of the times, with the honeſt zeal of a diſintereſted patriot, and the manly firmneſs of an independent country gentleman. But, on the 28th of September, 1789, a period was put to his valuable life by a fall from his horſe, as he was riding out with ſome gentlemen in Berkſhire.

Mr. Day's firſt publication, in 1773, was The Dying Negro, a poetical epiſtle. In 1776 he publiſhed another poem, entitled The Devoted Legions, addreſſed to Lord George Germaine, and the commanders of the forces againſt America.

In 1783 he produced the Hiſtory of Sandford and Merton; a work of great importance to youth, and which he afterwards extended to three volumes 12mo. It conſiſts of a variety of tales interwoven with a ſtory, in which two children and their tutor are the principal characters. This work was followed by another, with the ſame benevolent views, entitled The Hiſtory of Little Jack, and printed in 1788, in the Children's Miſcellany. Mr. Day likewiſe publiſhed occaſionally many political productions; 1. Reflections on the preſent State of England, and the Independence of America. 2. Fragment of an original Letter on the Slavery of the Negroes 3. A Dialogue between a Juſtice of the Peace and a Farmer. 4. The Letters of Marius; or, Reflections upon the Peace, the Eaſt-India Bill, and the preſent Criſis. 5. A Letter to Arthur Young, eſq. on the Bill now pending in Parliament to prevent the Exportation of Wool.

DEADMAN'S HEAD, a cape in Cornwall, between St. Maw's and Fowey.

DEAFNESS (*Encycl.*). Under that article we have noticed an invariable conſequence attending thoſe who have the misfortune to be born *totally deaf*, namely, that they are alſo, by a natural conſequence, *dumb* alſo. We have alſo mentioned the names of ingenious men who have found means to ſupply theſe lamentable defects in a great degree, and give to ſociety many uſeful members. To their aſſiſtance, however, the poor could by no means attain, and this became an inducement with a few benevolent gentlemen, poſſeſſing an abundance of the temporal bleſſings of Providence, to appropriate a part of their ſuperfluity to the purpoſe of raiſing theſe poor *automata* to a ſtate of intellectual exiſtence and uſefulneſs, by opening a ſchool for their inſtruction at Bermondſey.

On making enquiry into the nature and extent of this inſtitution, it appears that, although it is in a proſperous condition, when the date (1792) of its eſtabliſhment is conſidered; yet it is far from being ſufficiently opulent to extend aſſiſtance to all who ſtand in need of it. It was the wiſh of its founders to have confined their bounty to inſtruction only; but receiving applications for relief from the moſt diſtant parts of the kingdom, it was found impracticable to fix on a ſituation where the children might have been daily collected: they were therefore obliged to add to it board and lodging, which neceſſarily contracted the ſphere of their benevolence.

The number of *deaf* and *dumb* perſons in this country is ſuppoſed to amount to ſeveral hundreds; more than 80 of whom, of a proper age, that is, between nine and fourteen, have applied for admittance; but the funds of the inſtitution have not enabled the governors to receive above half that number: ſome have received inſtruction and been diſcharged, capable of expreſſing their ideas, and acknowledging their gratitude; and 35 are now in the aſylum.

Their education conſiſts in learning to ſpeak and read articulately; to write, cypher, and underſtand language; and a manufactory is about to be erected adjoining the ſchool, where ſome of the boys are to be inſtructed in the art of a taylor; others in that of a ſhoemaker, and the girls are to be taught to make ſtays; by which they will be rendered capable of earning their own maintenance, and becoming uſeful members of ſociety.

From this account it appears, that there are at this moment upwards of 40 children, proper objects of this inſtitution, to whom, for want of more liberal ſupport, the governors cannot extend relief; and who, being unable to earn their own ſubſiſtence, are heavy burthens to their indigent parents; many of whom have large families, and are ſcarcely able to procure the common neceſſaries of life.

DEAN, a town in Glouceſterſhire, with a market on Monday. It had its name from the foreſt of Dean, in which it is

ſeated, 11 miles W. of Glouceſter, and 112 W.S.W. of London. Long. 2. 31. W. Lat. 51. 50. N.

DEAN, a foreſt in Glouceſterſhire, including that part of the county which lies between the Severn and the ſhires of Monmouth and Hereford. It contains four market towns and 23 pariſhes. It is fertile in paſture and tillage, bears very fine oaks, and has rich mines of iron and coal. It was once reckoned the chief ſupport of the Engliſh navy; and the Spaniſh armada, it is ſaid, was expreſsly commiſſioned to deſtroy it. It is now thinned by frequency of felling, and narrowed by increaſe of cultivation, though a few deer ſtill continue to run wild in its receſſes. The foreſt of Dean, and the vale of the ſame name, abound in orchards, which produce great plenty of excellent cyder.

DEBALPOUR, a town of Hindooſtan Proper, capital of a diſtrict in the country of Moultan. It is ſituated on the great road from Delhi to Moultan, 146 miles S. of Lahore, and 190 E. by S. of Moultan. Long. 73. 50. W. Lat. 29. 10. N.

DEBEN, a river in Suffolk, which riſes near Debenham, and flows to Woodbridge, where it expands into a long narrow arm of the German Ocean, a little to the N. of Harwich.

DEBENHAM, a town in Suffolk, with a market on Friday, ſeated near the head of the Deben, on the ſide of a hill, 24 miles E. of Bury St. Edmunds, and 84 N.E. of London. Long. 1. 17. E. Lat. 52. 22. N.

DEBTOR (*Encycl*). By the act for relieving inſolvent debtors, 41 Geo. III. c. 70. gaolers are to make out alphabetical liſts of priſoners, who, on March 1, 1801, or ſince, and at the time of making them out, were in cuſtody for debt, ſtating at whoſe ſuit each priſoner is detained, which liſts are to be delivered upon oath to the quarter ſeſſions; to be kept by the clerk of the peace, and may be examined *gratis*.

Three copies of liſts to be fixed up in each priſon ten days before the ſeſſion.

Priſoners, on March 1, 1801, for debts not exceeding 1,500l. conforming to this act, to be diſcharged.

Perſons diſcharged from priſon after March 1, 1801, and before the paſſing of this act, without their conſent, entitled to the benefit of this act, on ſurrendering themſelves at ſeſſions.

Likewiſe perſons impriſoned before the paſſing of this act for any debt which they ſhall have been impriſoned, at the ſuit of the ſame plaintiff, before March 1, 1801, entitled to the benefit of this act.

Juſtices, on petitions of the priſoners, delivering ſchedules of their eſtates, may iſſue warrants for bringing them to the quarter ſeſſion.

Two juſtices may, upon petition from debtors, aſſemble their courts as ſoon as may be after paſſing this act, for the purpoſes thereof, and appoint days for the diſcharge of priſoners.

Schedules to remain with the clerk of the peace for inſpection.

Debtors intending to apply for their diſcharge, to give previous notice thrice in the London or Dublin gazette; and if they be in cuſtody in any gaol out of London, or in any gaol out of Dublin, then alſo in ſome newſpaper which ſhall be publiſhed near them; and for each notice the priſoner ſhall pay the ſum of 4d. and no more.

Debtors to deliver ſchedules to the gaoler previous to the firſt notice, and for neglect to be remanded to priſon.

Gaoler to atteſt ſignatures to ſchedules, and to give copies to debtors, and alſo to creditors demanding them, on penalty of 20l.

Notice ſhall be ſigned by the debtor and gaoler.

Debtors applying at the ſeſſion, proving notices were duly inſerted, ſhall, in open court, upon oath, deliver in ſigned ſchedules, containing certain particulars.

Schedule and oath to be ſubſcribed by the debtor, and to remain with the clerk of the peace for peruſal of creditors.

Court, at the requeſt of a creditor, may examine gaolers on oath; and the debtor's oath not being diſproved, the court to order his diſcharge.

Eſtate and effects of diſcharged debtors veſted in the clerk of the peace, who is to aſſign the ſame to ſuch creditors as the court ſhall direct, in truſt for the whole. And aſſignees are to get in effects, and ſell them. Aſſignees are alſo to make dividend within three months, firſt verifying their accounts on oath. Thirty days' notice of making dividends to be given. No creditor to ſhare till he has proved his debt. Reality of debts may be enquired into at the ſeſſion. Surplus of effects to be paid the debtor.

Creditors for annuities, or money payable at any future time, to receive dividends as under a commiſſion of bankrupt.

Powers of clerk of the peace for the county of Lancaſter to extend to his deputies.

Eſtates of debtors, not inſerted in ſchedules, to be veſted in the clerk of the peace.

Holders of ſecurities, without conſideration given, not entitled to any benefit.

Eſtates to be veſted in the clerk of the peace for the time being.

No ſuit in equity to be commenced without conſent of the majority in value of creditors.

Schedules to be produced by clerks of the peace to creditors, and ſigned copies to be evidence.

Clerk of the peace refuſing to produce ſchedules, &c. to forfeit 10l. with treble coſts.

Aſſignees to compound with lords of manors for copyhold or cuſtomary eſtates.

The debtors right only to be affected by this act.

Act not to prevent mortgages, &c. taking place of claims of an inferior nature.

Power of leaſing lands or over real or perſonal eſtate, veſted in aſſignees.

The acting gaoler at the time of delivering the liſts to take the oath.

At the ſeſſion, on requeſt of creditors, gaolers to be ſworn.

At requeſt of creditors, gaolers may be examined on oath at the ſeſſions touching commitments.

Debtors forſwearing, to be deemed guilty of perjury.

Perſons diſcharged not liable for debts prior to March 1, 1801.

Priſoners are not to be diſcharged of debts ſubſequent to March 1, 1801.

Priſoners who, on application as inſolvent debtors, have been remanded back, and ſince diſcharged without their conſent, entitled to the benefit of this act.

Act may be pleaded to any action of eſcape.

Act may be pleaded generally by priſoners.

This act not to extend to attorneys, or ſervants, embezzling money: nor to perſons obtaining money on falſe pretences. Priſoners remanded to priſon under any inſolvent act for fraudulently obtaining money, ſhall not receive any benefit under this act; nor perſons charged in execution for damages recovered in any action for criminal converſation; nor perſons removing effects of the value of 50l. liable to be diſtrained for rent; nor perſons ſelling or aſſigning effects to defraud creditors.

Gaolers to permit priſoners to be ſpoken with, on penalty of 40l.

Gaolers making falſe entries, to forfeit 500l.

Debtors refuſing to diſcover the trade and abode of the perſon at whoſe ſuit detained, or to come to the lodge, ſhall be excluded the benefit of this act.

Juſtices may hold a ſeſſion at or near the county gaol.

Priſoners in cuſtody for fees, &c. claimed by gaolers, or other officers of the priſon, ſhall be diſcharged.

Act not to extend to debtors to the crown, or offenders againſt revenue laws, unleſs the treaſury certify their conſent.

Determination of juſtices to be final, unleſs the priſoner get rid of the objections to his diſcharge.

Eſtates of which priſoners are ſeized in tail to be delivered up to creditors.

Aſſignees may apply for the further examination of debtors to two juſtices.

Juſtices to call before them debtors, and if they refuſe to appear, may commit them.

Reward of 20l. per cent. for diſcovering any part of debtor's eſtate not compriſed in ſchedule.

Diſcharge of priſoner fraudently obtained, void.

Aſſignees, with conſent of majority in value of creditors, may compound for debts, and ſubmit diſputes to arbitration.

Any perſon concealing eſtates of debtors, ſhall forfeit 100l. for every offence, and alſo double the value of the eſtate ſo concealed.

If aſſignees die, others may be choſen.

Courts, on complaint, may remove aſſignees.

Where mutual credit has been given, the balance to be ſtated.

Priſoners, for not paying monies awarded, coſts, &c. entitled to the benefit of this act; and alſo priſoners on proceſſes out of courts of conſcience.

No perſons who have taken the benefit of any inſolvent act within five years, to be entitled to relief under this.

Affirmation of quakers to be taken.

This act not to extend to Scotland.

DECAPITATION, the act of beheading, or ſevering the head from the body; a mode of public puniſhment exerciſed in this and ſome other countries.

Among other ſingular queſtions lately agitated in France and Germany, the following is not the leaſt curious: "*Whether the ſeparated head of a perſon ſuffering on the ſcaffold be ſtill, for a certain time, conſcious of its ſufferings?*" This queſtion was propoſed at the time the guillotine was firſt adopted as the inſtrument of public execution in France; and the writings which appeared on this apparently whimſical ſubject, were numerous. Profeſſor Soemmering maintained in a particular treatiſe, firſt printed in the *Moniteur*, that the conſciouſneſs of the ſufferer ſtill continued for ſome time; and the profeſſor is ſo far perſuaded of the truth of this aſſertion, that in his opinion, the ſevered head would ſtill emit ſounds, if it were not ſeparated from the organs of ſpeech, as well as thoſe of reſpiration.

Profeſſor Wedekind controverted this opinion, and defended the French method of beheading as the quickeſt and leaſt painful ſpecies of death, by which all conſciouſneſs is at once intercepted and annihilated: he ſays, that the blood-veſſels of the ſeparated head are, *ipſo facto*, inſtantly and completely emptied of the blood, and that the organ of the mind is thus rendered totally inactive; conſequently, the head cannot be conſcious, either of its former or preſent ſtate.

Mr. Cloſſius, of Tubingen, though not fully convinced that the head, in a diſſevered ſtate, retains conſciouſneſs, yet conſiders this fact as highly probable, and on the whole, agrees in opinion with Soemmering. He dwells at conſiderable length, in his treatiſe *On Decapitation*, upon the objections ſtarted by Wedekind, and endeavours to prove that the blood-veſſels of the head are by no means ſo quickly and completely emptied, as the profeſſor is diſpoſed to think; and that even without an actual circulation of the blood, there may ſtill remain ſome activity and energy in the brain. He produces in ſupport of his hypotheſis, a variety of arguments, derived partly from analogy and a compariſon of the ſymptoms of a perſon beheaded with thoſe obſerved in ſimilar ſituations; and partly from appearances which have been noticed in individuals executed by the ſword or guillotine. On account of this probability, ought not the dictates of humanity to be liſtened to, and inſtead of beheading, ſhould not another mode of execution be deviſed, by which the deadly blow, and the complete annihilation of the natural ſtructure of the brain, might take place at the ſame inſtant? Such, for inſtance, would be a ſudden and violent convulſion of the brain, a mortal thruſt on the ſtomach, and the like.

Another German writer on this ſubject, C. A. Eſchenmayer, combats the opinion of Soemmering, but deals ſo much in confuſed philoſophic ſpeculations and vague hypotheſes, that we ſhall forbear taking notice of what he advances; and proceed to give ſome account of a French treatiſe, entitled *Opinion du Citoyen Sue, ſur le Supplice de la Guillotine*; à Paris, 16 pp. 8vo.—Citizen Sue, not contented with aſſerting that the head ſtill continues to live, and to feel the moſt excruciating pain, as long as the blood remains warm in the ſmalleſt veſſels, maintains that the lower part of the body alſo muſt ſuffer, after the head has been ſtruck off. His arguments are not a little curious. He compares the act of beheading with that of amputation of a limb; as it has been obſerved that perſons have felt, or at leaſt imagined that they felt, pain in a limb, after being ſeparated from the body by a chirurgical operation, as alſo after a diſlocation of the vertebræ; that the upper parts of the body remain ſenſible and alive, while the lower extremities are lifeleſs and inſenſible to pain. The incongruity of this mode of reaſoning from analogy is ſo palpable that it requires no refutation.

The author quotes various inſtances of preternatural births, or monſters born without a brain, and ſpinal marrow, on which he grounds his conjecture, that the lower extremities of the body are ſtill ſenſible to pain, after a ſeparation of the head has taken place. But, beſides the obvious inconſiſtency in this compariſon, it requires to be previouſly proved, that ſuch monſters have ever had conſciouſneſs, and ſuffered pain, on account of the unnatural ſtructure of their bodies. The remarkable facts witneſſed by the author, during a number of executions at Paris, and related in this treatiſe; for inſtance, the ſingular phenomenon of ſmiling, or rather of bluſhing, in the trunkleſs head of Madame Cordet, the aſſaſſin of Marat, are no doubt curious, but not concluſive.

The ſubject of diſpute is indeed ſuch as admits of no poſitive deciſion; for the feelings of a perſon, after the mortal blow has been given by the ſword or guillotine, cannot be aſcertained, and we may pronounce it impoſſible for human reaſon to form an adequate conception of their greater or leſs duration. If there exiſt a ſomething within the body, which after its diſſolution haſtens towards another deſtination, in which we ſhall not be inſenſible to agreeable or diſagreeable ſenſations, this ſomething will no doubt alſo poſſeſs the conſciouſneſs of its ſituation, whether the body has been deſtroyed by a putrid fever, by poiſon, by a concuſſion of the brain, or by any other mode of depriving or taking away life. It does not, indeed, here, depend upon the ſtate of the circulation of the blood, or other relations, as connected with the body; for it muſt be admitted, that this ſomething, if it continue

after and without the body, has no connection with corporeal cauſes, organs of the mind, or the like.

DECCAN, an extenſive tract of country in Aſia, which, according to the ſignification of its name, the South, has been ſuppoſed to include the whole regions of Hindooſtan Proper. But, in its more accurate ſenſe, it contains only the countries ſituate between Hindooſtan Proper, the Carnatic, the Weſtern Sea, and Oriſſa; namely, the provinces of Candeiſh, Dowlatabad, Viſiapour, Golconda, and the W. part of Berar. It is bounded on the N. by the river Nerbudda, by Bengal, and by Bahar; and the river Kiſtna forms its ſeparation on the S. from the peninſula of Hindooſtan. All this vaſt country was once a province of the Mogul empire. Candeiſh, Viſiapour, and a part of Dowlatabad, are ſubject to the Mahrattas; the remainder to the nizam of the Deccan.

DECCAN, the dominions of the nizam of the Deccan, compriſing Golconda, the principal part of Dowlatabad, and the weſtern part of Berar; the latter ſubject to a tribute of a fourth part of its net revenne to the Berar Mahrattas. His territories are bounded on the N.W. by the Poonah Mahrattas, on the N. by the Berar Mahrattas, on the E. by the Northern Circars, and on the S. by the Carnatic and Myſore. By family ſucceſſion, in 1780, the nizam became poſſeſſed of the diſtricts of Adoni and Tachore, and of the Guntoor Circar; and by the peace of 1792 he had a ſhare of the country ceſſions made by Tippoo Sultan, including Kopaul, Cuddapa, and Gangecolla. His dominions (without including the ceſſions) are ſuppoſed to be 430 miles from N.W. to S.E. by 300 wide. His capital is Hydrabad.

DECISE, an ancient town of France, in the department of Nievre, ſeated in an iſland formed by the Loire, 16 miles S.E. of Nevers. Long. 4. 31. E. Lat. 46. 50. N.

DECKENDORF, a town of Lower Bavaria, ſeated near the Danube, 37 miles S.E. of Ratiſbon. It was taken by the Swedes in 1641. Long. 12. 55. E. Lat. 48. 42. N.

DECKER (Thomas), a writer in the reign of James I. and being a contemporary with Ben Jonſon, became more eminent by having a quarrel with that great poet, than he would perhaps otherwiſe have done from the merit of his own works. What the original occaſion of their conteſt was, is unknown; but Jonſon, who certainly could never "bear a rival near the throne," has, in his Poetaſter, the Dunciad of that author, among many other poets whom he has ſatirized, been peculiarly ſevere on Decker, whom he has characteriſed under the name of Criſpinus. This compliment Decker has amply repaid in his Satyromaſtix, or the Untruſting a humorous Poet, in which, under the title of young Horace, he has made Ben the hero of his piece. Although, as we before obſerved, Decker was but a middling poet, yet he did not want his admirers, even among the poets of his time; ſome of whom thought themſelves not diſgraced by writing in conjunction with him;—Webſter having a hand in three of his plays, and Rowley and Ford joining with him in another. His Honeſt Whore, and the comedy of Old Fortunatus, are allowed to be ſolely his, which are ſaid to contain beauties, in reſpect to character, plot, and language, equal to the abilities of any of thoſe authors that he was ever aſſiſted by; and indeed in the former, equal to any dramatic writer (Shakſpeare excepted) that this iſland has produced.

The preciſe time of this author's birth and death are not recorded; yet he could not have died young, as the firſt play we find of his writing was publiſhed in 1600, and the lateſt date we meet with to any other is in 1638, except the Sun's Darling, which, Langbaine obſerves, was not publiſhed till after the death of its author.

DECREET, in the law of Scotland, a final decree or judgment of the lords of ſeſſion, from which an appeal only lies to parliament.

DECREET-*Arbitral*, in Scots law, the ſentence or judgment of one to whom parties voluntarily ſubmit the determination of any queſtion betwixt them.

DEDDINGTON, a town in Oxfordſhire, with a market on Tueſday. It was anciently a corporation, and ſent members to parliament in the reign of Edward III. It is 16 miles N. of Oxford, and 70 W.N.W. of London. Long. 12. 1. W. Lat. 52. 2. N.

DEE, a river of Scotland, which riſes in Aberdeenſhire, amid the mountains of Mar Foreſt, and flows through a wild country till it reaches the fertile vale of Brae-mar, whence it proceeds in an eaſterly direction to Aberdeen, below which it falls into the Britiſh Ocean.

DEE, a river of Scotland, which riſes in the N.W. part of Kirkcudbrightſhire, and joining the Ken, below New Galloway, falls into the Iriſh ſea at Kirkcudbright.

DEED (*Encycl.*). Any indenture (except pariſh indentures), leaſe, or deed-poll; and any charty-party releaſe, contract, or other obligatory inſtrument; or any procuration or letter of attorney; for every 15 common law ſheets of 72 words each, 5 W. & M. c. 21, 6d. 9 and 10 W. III. c. 25, 6d. 12 Anne, ſ. 2, c. 9, 6d. 30 Geo. II. c. 19, 1s. 16 Geo. III. c. 34, 1s. 17 Geo. III. c. 50, 1s. 6d. 23 Geo. III. c. 58, 1s. 35 Geo. III. c. 30, 1s. 37 Geo. III. c. 90, 3s. 41 Geo. III. c. 10, 3s. 41 Geo. III. c. 86, 2s. Total fifteen ſhillings.

And moreover, by 37 Geo. III. c. 111, there ſhall be paid upon every deed which ſhall be made after Aug. 1, 1797, an additional ſtamp duty of 10s. over and above all duties now payable on the vellum or paper whereon ſuch deed ſhall be engroſſed (but this is upon the firſt ſkin only), the proviſions of this act being as follow:

This is not to extend to any bond or letter of attorney; nor any deed whatever, bearing date Aug. 1797.

Alſo it ſhall not extend to any indenture of apprenticeſhip, where a ſum not exceeding 10l. ſhall be given; nor to any leaſe for not exceeding twenty-one years, the full improved annual value whereof, and rent reſerved thereby, ſhall not be more than 10l.* nor to any leaſe for lives, or years determinable on lives, where the fine ſhall not exceed 20l. nor the rent reſerved 40s.

Nor ſhall any deed be ſubject to the payment of any greater duty than the ſum before mentioned, or to be ſtamped on more than one ſkin, with the additional ſtamp; or to be ſtamped with more than one ſuch ſtamp.

Nor ſhall the duty by this act impoſed be liable to the regulations reſpecting the ſtamping of parchment and paper, according to the number of common law ſheets engroſſed thereon.

Upon payment, within 60 days, after the date of the deed, of the duty hereby impoſed, the ſtamp-officers may ſtamp any

* But by 39 and 40 Geo. III. c. 42, the above duties ſhall extend to every deed which by law may form, or is intended to form, a part of any conveyance of lands or tenements, whereby a greater intereſt in the ſame ſhall be conveyed than a term of twenty-one years, whatever may be the value thereof; and any ſuch deed as aforeſaid, already executed, that is not ſo ſtamped, may be taken to the office, at any time within twelve months after July 9, 1800, to be ſtamped upon payment of duty.

vellum, parchment, or paper, on which any deed ſhall have been engroſſed, or on which any deed ſhall be intended to be engroſſed, with the additional ſtamp.

And if the duty ſhall not be paid within ſixty days, then it ſhall be lawful to ſend the deed to the head office, and on payment of the duty, and the further ſum of 10l. by way of penalty, the ſame may be ſtamped.

But grants, conveyances, and aſſurances under the ſeal of the duchy of Lancaſter, according to 19 Geo. 3. c. 45, where the conſideration does not exceed 10l. are exempted by that act, and 39 and 40 Geo. 3. c. 72, from all duty.

Note, the number of ſtamps required to be uſed on deeds are one for every fifteen common law ſheets (of 72 words each) contained in the deed, or in any ſchedule or inſtrument annexed thereto, or any indorſement thereon.

DEERHURST, a village in Glouceſterſhire, three miles S. of Tewkeſbury, ſubject, by its low ſituation, to frequent inundations from the Severn. Here was a palace built, and afterwards converted to a monaſtery in 715, which the Danes deſtroyed; but it was rebuilt and made an alien priory, under the patronage of the abbot of Tewkeſbury. Its being rebuilt in the reign of Edward the Confeſſor, and its conſecration by the then biſhop of Worceſter, is denoted by a Latin inſcription on a ſtone, which, in 1675, was dug up in an orchard.

DEFECATE (*Encycl.*). The various ways in which defecation, or CLARIFICATION as it is otherwiſe called, may be performed, are very fully ſet forth in the following obſervations of Citizen Parmentier.

"The term *defecation* or *clarification* is generally applied in pharmacy to an operation, by means of which liquids are freed from the foreign ſubſtances that impair their tranſparency.

"This operation, ſimple as it may appear to be, nevertheleſs merits particular attention; eſpecially when we conſider the advantages which are obtained from it in the chemical and pharmaceutical arts. I therefore thought it might be uſeful to communicate ſome general obſervations on clarification.

"It is not my intention, in this place, to diſcuſs the different methods employed for the proceſs of clarification, nor to enumerate in detail the reſpective effects which they produce upon the different ſubſtances to which they are applied; but I ſhall content myſelf with pointing out the principal phænomena that are obſerved in operations of this kind.

"The end propoſed, when we wiſh to clarify a fluid, is to free it from ſubſtances which, without being diſſolved, remain ſuſpended in it, and impair its tranſparency and limpidity; but theſe ſubſtances are ſeparated ſometimes by ſubſiding or filtration; ſometimes by the action of the air, of heat, of light, of motion, and of fermentation; ſometimes finally, by the aid of agents, which, in uniting the particles diſperſed in the liquid which we wiſh to clarify, often change their nature, and no longer permit them to remain in the ſtate in which they were before. We ſhall commence an enquiry with conſidering ſpontaneous clarification. This never takes place, unleſs when the particles, that are to be ſeparated, have a ſpecific gravity decidedly inferior or ſuperior to that of the fluid in which they are ſuſpended; they can then unite either at the lower part of the fluid or at its ſurface, and there form a maſs which may very eaſily be removed, if the ſeparation has been complete; the fluid then poſſeſſes all the tranſparency that can be deſired, and which the moſt accurate filtration cannot augment.

"This mode of clarification is ſometimes ſubject to ſeveral inconveniences, the chief of which are, that it requires a conſiderable length of time to effectuate it, and that, during this interval, it contributes to favour the formation of new products, which, changing the compoſition of the fluid that was to be clarified, do not leave it the ſame as it was previous to its clarification, independent of the ſubſtances that impaired its tranſparency. We find a very ſtriking example of what happens in this caſe, when we conſider the circumſtances with which the ſpontaneous clarification of the juices of plants or fruits is attended. Theſe juices, when freſh expreſſed, are always turbid; they nevertheleſs become clear by imperceptible degrees; but then their nature is no longer altogether the ſame as it was before; for they contain products which would not have been found in them if they had been clarified immediately after having been expreſſed. Hence it alſo proceeds, that the juices of the lemon, the gooſeberry, the Seville orange, &c. when examined before or after their ſpontaneous clarification, are ſo widely different with reſpect to their taſte, ſmell, colour, and economical properties.

"In general, we may eſtabliſh it as a conſtant rule, that all the liquids ſuſceptible of fermentation are thoſe in which ſpontaneous fermentation produces the effects of which we have juſt been treating; whilſt theſe effects do not take place in thoſe which are little or not at all ſuſceptible of fermentation, and the tranſparency of which is impaired merely by particles which are incapable of exerting any operation upon the conſtituent parts of theſe liquids.

"Thus, for example, water, alcohol, ether, oil, &c. when deprived of their perfect tranſparency, may eaſily acquire it again by ſpontaneous clarification, without the ſmalleſt change taking place in the compoſition of theſe fluids; for, if we examine them after they have been clarified, we ſhall find them ſimilar to others that have not been ſubjected to the proceſs of clarification.

"The ſecond proceſs for clarifying fluids conſiſts in filtering them; but this operation can never be performed without the aid of intermediate ſubſtances, the very minute pores of which ſuffer only the fluid to paſs through them, but intercept the paſſage of all the particles that were merely ſuſpended in it.

"An infinite variety of ſubſtances are uſed as inſtruments of filtration: paper, woollen, linen and cotton cloth, carded cotton, ſponge, ſand, earths, pounded glaſs, charcoal, porous ſtones, &c. all theſe ſubſtances may be uſefully employed in this operation; but their nature and purity ought to be examined, eſpecially when we have to filter ſaline ſubſtances.

"It is the buſineſs of the chemical and pharmaceutical operator to chooſe, amongſt the different kinds of filters, that which, whilſt it is the beſt adapted for effecting the clarification of the fluids, is at the ſame time incapable of producing any change in its conſtituent principles. Now this choice is to be determined by the knowledge which we have of the nature of the fluid, and of the ſpecies of filter which it may be proper to employ.

"If it be an aqueous, vinous, ſpiritnous, or oily liquid, paper may be employed without any inconvenience, provided it be of a good quality. This laſt condition is to be ſtrictly attended to, otherwiſe the product of the filtration will often be defective.

"Paper is known to be a kind of web, formed of vegetable fibres, that have undergone various preparations. The particles of theſe fibres are intermingled in ſuch a manner, as to leave between them pores, the tenuity of which is always proportionate to the ſtate in which the paſte was at the moment when it was converted into paper. If this tenuity be conſiderable, the pores are ſoon obſtructed by the ſediment which is depoſited by the liquid we wiſh to filter; the filtration then ceaſes to take place. When, on the contrary, the pores are very wide, the filtration is effected rapidly, but always in an imperfect manner; for, whilſt the liquid paſſes through the

filter, it carries with it the more minute particles that were ſuſpended in it, and only the groſſer ones remain upon the ſurface of the filter.

" The great art, therefore, is to chooſe paper, the pores of which have preciſely the ſize requiſite for admitting only the fluid that is to be filtered, but none of the particles that impair its tranſparency.

" We meet with two ſorts of paper in commerce, which nearly produce this effect, and, though they are not always ſo perfect as might be deſired, they are thoſe which have hitherto been preferred. The one, which is ſemi-white, bears the peculiar appellation of *papier Joſeph*; the other is a kind of grey paper, but not ſo coarſe as that which is uſed for wrapping different cheap articles of merchandize: both of them are manufactured without ſize.

" The whiteneſs of the *papier Joſeph* ſhews that it has been manufactured with a purer paſte than that which has ſerved for the manufacture of the grey paper; the liquids that have been filtered through it are always tranſparent; but it has the inconvenience of tearing very readily, and its pores are ſoon obſtructed, ſo that the filtration goes on but ſlowly.

" The grey paper can ſerve for a greater length of time to furniſh alſo clear liquids; but, as the paſte with which it has been manufactured has not been ſo well purified as that of the *papier Joſeph*, it always communicates to the liquids a diſagreeable taſte, which proceeds from the ſolution of the foreign ſubſtances contained in this paper. This is alſo the reaſon why certain fluids, ſuch as whey, wine, ſpirituous compounds, and other potable liquids, that have been filtered through grey paper, have always a ſmell and taſte, which are eaſily recogniſed by experienced organs. Hence it proceeds, that, amongſt theſe liquids, ſome are more ſuſceptible of ſpoiling than when they have been filtered through the *papier Joſeph*.

" The nature of the paper demands our attention moſt of all when we have to filter ſaline ſolutions. If we have employed grey paper, it often happens, that a part of its ſubſtance is diſſolved by their action, ſo that the filtered liquid is not ſo pure as we ſhould wiſh to have it. This inconvenience, which is not equally perceptible when we uſe the *papier Joſeph* in preference, may be ſtill more diminiſhed by the precaution of not employing filters till after they have previouſly been waſhed ſeveral times with boiling water. A careful preparer of medicines ought always to keep a ſtore of filters waſhed in this manner, in order that he may be able to uſe them as occaſion requires. *Joſſe*, a man of diſtinguiſhed merit in pharmacy, to whom we are indebted for many important obſervations, has found their advantages in a variety of circumſtances. He has remarked, amongſt others, that whey, clarified and filtered through *papier raiſin*, could be kept in good preſervation for more than a fortnight, when filtered every day; which was not the caſe with the ordinary grey paper, though previouſly waſhed.

" By a diametrically oppoſite effect, different vegetable juices have been kept tranſparent and in good preſervation, without paſſing into the acid ſtate, by filtering them every day through grey paper: it has only been obſerved, that their colour became more intenſe during the firſt days, and that they afterwards gradually became colourleſs.

" But if the nature of filters demands our conſideration, their form and poſition are no leſs deſerving of our attention. In order that a filter of paper may produce its full effect, it is neceſſary that it ſhould not adhere at all points to the ſubſtance which ſupports it; otherwiſe the filtration would ſoon be interrupted. This inconvenience is avoided by folding it different ways; but as theſe folds ſoon become deranged, ſome prefer placing ſtraw, or glaſs tubes, between the filter and the ſupport. I confeſs that this latter expedient has not always ſucceeded with me, and that I have moſtly remarked, that the folds made in the filters produced as much effect as the ſtraw and tubes. In Germany, they uſe, for this purpoſe, funnels grooved on their inner ſurface.

" A period arrives, at which, whatever precautions may have been taken, the filtration grows languid, and at length is entirely ſuſpended; this circumſtance takes place, when the pores of the paper are obſtructed in ſuch a manner as no longer to afford a paſſage to the fluid. Sometimes we may prolong the filtration, by giving a ſlight circular motion to the funnel; but this effect is of ſhort duration, and nothing more is left for us to do than to change the filter. It appears that no means have hitherto been diſcovered for remedying this inconvenience, to which all kinds of filters are liable.

" It has been already obſerved, that filters of woollen cloth, linen, and carded cotton, are alſo in uſe; thoſe of woollen cloth were formerly very much in uſe; they are even the firſt that were employed; they were made in the form of a cone, the baſe of which was kept open by means of a ring, which was afterwards faſtened to a frame with ſtrings. This ſpecies of filter was termed the bag of Hippocrates; it is ſtill uſed for filtering ſpirituous compounds. As it may be made very capacious, it is able to receive a large quantity of liquid at once, but it paſſes through very ſlowly; often even it is neceſſary to wait for a long time before the liquid paſſes through clear, on which account one ought never to have recourſe to it, unleſs when others cannot be procured.

" However, when ſyrups are to be filtered, woollen cloth is uſed; but then, inſtead of giving it the form of a bag, the cloth is merely fixed upon a ſquare frame, to which it is attached at its four corners by means of pegs. The boiling ſyrup is poured upon the middle of it, which almoſt always bags a little, and often at the end of a few minutes the liquor paſſes through very clear.

" This filter thus diſpoſed may ſtill be employed for filtering many other liquids, eſpecially ſuch as are of a watery nature, and do not contain pot-aſh or ſoda in ſolution; for, were they never ſo ſlightly akaline, the filter would ſoon be deſtroyed, and the filtered liquid would not poſſeſs the requiſite qualities.

" Linen and paper are generally employed for filtering the alkaline liquids, and they anſwer the purpoſe very well, eſpecially when theſe liquids are not too much concentrated.

" As to carded cootton, it is reſerved for filtering ſuch fluids as are conſidered precious, whether on account of the difficulty of procuring them, or of the ſmall quantity with which one is provided.

" In order to form this filter, carded cotton is introduced into the tube of a glaſs funnel, and ſtuffed in with a rod of glaſs, ſo that it forms a kind of cork ſlightly compreſſed: the fluid which we wiſh to filter is then poured into the funnel. The filtration takes place drop by drop, and after the firſt have been ſeparated, thoſe which follow are always clear. The eſſential oils may very conveniently be filtered by this means, without danger of waſte, which would inevitably take place if any of the other filters, of which I have already ſpoken, were uſed.

" The acids, eſpecially thoſe that are in a concentrated ſtate, can only be filtered through pounded glaſs; but we muſt uſe the precaution not to employ this ſubſtance till after we have waſhed it ſeveral times, at firſt with a large quantity of water, and afterwards with an acid, in order to deprive it of the earthy or other foreign particles that might be diſſolved by the acids which we wiſh to filter.

" The filters of glaſs may very well be formed in a funnel.

The great art that is required in order that they may produce this effect, is firſt to fix ſome fragments of glaſs in the tube, afterwards to add other ſmaller ones, and thus to continue, always diminiſhing the ſize of the fragments, till we have formed a thickneſs of three or four fingers' breadths, the upper layer of which ought to be glaſs reduced to fine powder.

"This kind of filter lets the liquid paſs through with ſufficient facility, that in leſs than an hour it is poſſible to filtrate ſeveral killogrammes of acid, in a funnel of glaſs of a moderate ſize.

"Sand is alſo very commonly uſed for clarifying the water employed for domeſtic purpoſes. The ciſterns lined with ſand are in fact real filters, the effect of which is the more certain, the more the layers of ſand are diſpoſed in ſuch a manner, that the water which covers them is obliged ſucceſſively to paſs through them, and that they retain the ſubſtances which injure its tranſparency.

"The art of conſtructing ciſterns lined with ſand has not yet arrived at the degree of perfection to which it might be brought, and though its object may ſeem to be of but ſmall importance, it nevertheleſs well deſerves the attention of philoſophers.

"For the reſt, experience proves that ciſterns lined with ſand can be uſed with advantage only during a certain time; frequently it is neceſſary to renew the ſand which they contain, or at leaſt to waſh it, in order to deprive it of the earthy and heterogeneous ſubſtances which the water depoſits in it, and which, when they have accumulated to a certain degree, not only prevent the filtration, or render it incomplete, but alſo communicate to the liquid a taſte, which is the more diſagreeable the longer they have remained in it.

"Nothing is more eaſy, as is well known, than to deprive the water of rivers of the earth which it often carries along with it, and which impairs its tranſparency. All that is required, is to let it ſtand for ſome hours in an earthen veſſel, but uncovered, for the action of the air is neceſſary in order to effect this precipitation in a ſpeedy and complete manner.

"However, though the practice of filtering water deſtined to be uſed as drink is to be traced to the moſt remote antiquity, it muſt be confeſſed, that the ciſterns eſtabliſhed for this purpoſe do not only free them of the mud which rendered them turbid, but likewiſe deprive them of a ſuperabundance of air with which they are ſometimes impregnated, a ſuperabundance which conſtitutes their lightneſs, their ſharpneſs, &c. in a word, that ſuperiority which the water of the Seine, for example, has over that of all known rivers. The proof that this is the caſe, is that by dint of repeated filtrations one may render water inſipid, heavy, and unwholeſome.

"Thus when one wiſhes to determine the ſpecific gravity of the water of the Seine, one ought to take it from the river on a day when it is limpid, or, at leaſt let it clear itſelf by ſtanding, and not chooſe the filtered water in preference; for if this operation renders water more clear, it at the ſame time produces conſiderable changes in it, by depriving it, as has been remarked, of the air which it contains in ſuperabundance.

"I have known a perſon whoſe organs of taſte were rendered ſo acute by exerciſe, that he could diſtinguiſh water that had been filtered through ſand from ſuch as had not, by the different impreſſions which that made upon them. The latter appeared to him to be more ſapid and light. This undoubtedly proceeds from the abſence of the air we have mentioned, and which may be ſtill more diſtinctly perceived under the recipient of the pharmaceutical apparatus. Some perſons, intereſted in ſupporting the opinion contrary to that which has been advanced above, have aſſerted that if the water were continually obliged to paſs through ten feet of ſand and gravel from below upwards, it would be in a condition to produce, with the weight of the heterogeneous ſubſtances, an effect capable of contributing to purify it completely, that is to ſay, to deprive it of its ſalts: the prepoſſeſſion was ſo great that the following reaſoning was adduced in favour of this notion.

"'If theſe filters are ſufficient for depriving the water of its air, why ſhould not this operation of filtration be equally proper for depriving it of the ſalts which it contains?' but attention has not been paid to the circumſtances that theſe ſalts, held in ſolution in the water, being of greater ſpecific weight, filter themſelves together with it through the ſmalleſt tubes, whilſt the air, being ſpecifically lighter than the water, and exiſting in it in a ſtate different from that of the ſalts, ſeparates itſelf eaſily; finally, it has alſo been attempted to apply filtration to the water of the ſea, with a view to render it palatable; the proceſs for this purpoſe has been announced to government as a new and ingenious invention; it conſiſted in a filtration which was effected from below upwards by the application of force.

"But the union of the ſaline ſubſtances with the water is not a mere mechanical ſtate of diviſion; they are not merely interpoſed between its particles, as ſome philoſophers have maintained, but they are perfectly diſſolved in the water, and poſſeſs a degree of fluidity equal to its own. Theſe ſalts conſequently become capable of paſſing through filters with the moſt minute pores. It is therefore only by reducing the water to the ſtate of vapours that we can ſeparate the ſaline ſubſtances which it holds in ſolution, and no other expedient than diſtillation will ever produce a ſatisfactory effect. But let us reſume the ſubject of the general effects of filtration.

"Beſides the filters of which we have already treated, the ſtones known by the appellation of filtering-ſtones are alſo employed for clarifying water. Of theſe there are ſeveral kinds; they are very porous, as they conſiſt for the greater part of free-ſtone. They are hollowed out and filled with water. This fluid gradually inſinuates itſelf amongſt their pores, and appears on the outſide in the form of clear drops, which fall into a receptacle upon which the ſtones are placed.

"Theſe ſtones ought previouſly to be waſhed ſeveral times with water; it is even remarked, that the water which is filtered through them during the firſt days has a diſagreeable taſte, which depends upon the foreign ſubſtances this fluid has diſſolved in paſſing through the ſtone; ſo that it is not till the water which paſſes through has no longer any peculiar taſte that it is fit to be uſed for drink.

"Upon the whole, the filtering-ſtone, as it has been extolled, is a bad means for procuring good water. Beſides, the filtration proceeds very ſlowly, and frequently even ceaſes to take place, unleſs we uſe the precaution of rubbing both the inſide and outſide of the ſtone, from time to time, with a hard bruſh, in order to detach the mud which the water depoſits upon it. It is undoubtedly to theſe inconveniences that we ought to attribute the diſrepute into which this kind of filtration ſtands at preſent.

"It now only remains for us to ſpeak of the proceſſes employed, in order to give different fluids that perfect limpidity, which they can never acquire by ſpontaneous clarification and by means of filters, of whatever kind they may be.

"If it be true, that the opacity obſervable in certain fluids is entirely owing to the interpoſition of molecules which are not diſſolved, but merely ſuſpended in them by the aid of a ſtate of extreme diviſion, it is certain alſo, that under other circumſtances the deficiency of tranſparency depends entirely upon the imperfect ſolubility of one or more ſubſtances which theſe fluids contain; ſo that in order to give them the deſired limpidity, it is abſolutely neceſſary to have recourſe to means which augment the ſolubility of the ſubſtances in queſtion, or at leaſt effect their total ſeparation.

"Albuminous and gelatinous matter, the acids, certain ſalts, lime, cream, blood, alcohol, may in many caſes contribute to effect the clarification of certain fluids, for which the ordinary filters would be inadequate. However, theſe agents are not to be uſed indiſcriminately, and the preference which is given to the one above the other always requires to be determined according to the knowledge which we have of the compoſition of the liquid we wiſh to clarify. Accident has diſcovered, for example, that two handfuls of marl, reduced to a coarſe powder, and thrown into the preſſing tub, clarify cider.

"The effect of the albuminous and gelatinous matters is principally remarkable in the vinous liquids. It is on this account that they are employed when it is required to fine wines, that is to ſay, when we wiſh to give them that high degree of limpidity which they can rarely acquire and preſerve by mere repoſe. In this caſe, nothing more is required, than to diſſolve either of theſe two ſubſtances in a ſmall quantity of water, and to mix this ſolution cold with the wine; a ſhort time after, a kind of net-work is obſerved throughout the whole mixture, which ſoon contracting together collects all the foreign ſubſtances from the wine, and carries them with it to the bottom of the vat.

"In other inſtances, one is obliged to heat the liquids with which we mix the albuminous matter; and it is only at the moment of ebullition that the clarification takes place. The moſt of the ſyrups are clarified by this proceſs, and no other has yet been diſcovered that produces a better effect.

"It is alſo obſerved, that albuminous matter alone is not always ſufficient to clarify liquids, even though we raiſe them to a degree of temperature ſufficient to make them boil, but that it is neceſſary to aſſiſt its operation by means of an acid, or a ſalt with a redundance of acid. In proof of this, we may adduce what takes place in the clarification of whey.

"In fact, it is demonſtrated that it is only when we add to this fluid, at the moment when it begins to boil, ſome acidulous tartarite of potaſh (*cream of tartar*), or vinegar, that the albuminous matter with which it had previouſly been mixed, coagulates and carries with it the caſeous matter, which impaired the tranſparency of the ſerum.

"For the reſt, it is eaſily conceived that the quantity of acid which it will be proper to add in this caſe, muſt always bear a relation to the ſtate of the fluid, and that it would be ridiculous to pretend that the proportion can be fixed in an invariable manner.

"New cream is employed with advantage for clarifying ſpirituous liquors: one or two ſpoonfuls to the pint are ſufficient to produce this effect in the ſpace of a few hours in the cold. But as in this clarification, ſome caſeous particles always remain ſuſpended in the fluid, by reaſon of their great tenuity, it is neceſſary to ſeparate them at laſt by filtration through a bag or through paper.

"Finally, there are ſome fluids, which, in order to become clear, require to be ſubjected to a degree of heat nearly approaching that of boiling water. Theſe are principally ſuch as are rendered opaque merely by ſubſtances, the ſolubility of which cannot become complete, unleſs it be facilitated by raiſing the temperature of their ſolvent above its natural ſtate. Many ſaline ſolutions ſtand in this predicament, and whoever occupies himſelf ever ſo little with chemiſtry, will frequently meet with ſuch.

"Moſt of the freſh-expreſſed juices of vegetables may alſo be partially clarified by the operation of heat. Thus it is cuſtomary amongſt apothecaries to have recourſe to this means with thoſe juices which, on account of their thickneſs and viſcoſity, are not ſuſceptible of being filtered.

"Frequently a ſlight degree of heat, applied to the expreſſed and filtered juices of certain vegetables, is ſufficient ſuddenly to deſtroy their tranſparency; in this caſe a flaky whitiſh ſubſtance floats in the liquid, and collects at the bottom of the veſſel. This is the ſubſtance which Rouelle, the younger, conſidered as the vegeto-animal matter of corn, and which I demonſtrated, as far back as the year 1772, to be nothing more than a ſubſtance analogous to the white of egg; which proves that at that period we were upon the way to inſcribe albumen amongſt the products of the vegetable kingdom.

"An important obſervation, upon which I ought to inſiſt, is, that in general it appears abſolutely neceſſary to ſeparate the *magma*, which forms in liquors that are clarified with albuminous matter, eſpecially when, in order to concentrate thoſe liquids, it is neceſſary to evaporate them by the aid of ebullition. Without this precaution, this *magma* would diſſolve, and the liquors would become more turbid than they were previous to the clarification. It proceeds from a ſimilar cauſe, that broth, from which the ſcum has not been taken off, always retains a diſagreeable appearance, and will not keep.

"Though the employment of albuminous matter for clarifying the juices of certain vegetables be of utility, it is, however, not without its inconveniences. Amongſt others, one that has been remarked is, that it changes the nature of theſe fluids in ſuch a manner, as partly to deſtroy their medicinal properties. It is known what happens to certain pharmaceutical preparations, ſuch as decoctions of medicines, when, in order to clarify them, recourſe has been had to white of egg and heat; for then they are almoſt without effect, unleſs we take care to double the proportions of the ingredients that ought to enter into their compoſition, *Lewis* has remarked that this operation deprived the ſyrup of diacodium of all its powers.

"Theſe are the obſervations which I thought would be uſeful to collect on the ſubject of clarification. My intention in communicating them was to ſhew, that ſuch an operation, though ſimple in appearance, muſt not be performed in an indifferent manner, and that, amongſt the various proceſſes that are in common uſe, ſome do not preſent reſults equally ſatisfactory with thoſe of others. The choice ought therefore always to be determined according to the nature of the ſubſtances upon which we have to operate. I confine myſelf to the relation of the facts; to others I leave it to give the explanations of them that may be deſired."

DEFESCH (William), a German, and ſome time chapel-maſter at Antwerp, was in his time a reſpectable profeſſor on the violin, and leader of the band for ſeveral ſeaſons at Marybone-Gardens. His head was engraved as a frontiſpiece to ſome muſical compoſitions publiſhed by him, and his name is to be found on many ſongs and ballads to which he ſet the tunes for Vauxhall and Marybone-Gardens. He died about 1751, aged 70.

DEFORCEMENT, in Scots law, the oppoſing or reſiſting of the officers of the law in the execution of their office.

DEINSE, or DEYNSE, a town of Auſtrian Flanders, ſeated on the Lis, eight miles S.W. of Ghent. Long. 3. 39. E. Lat. 50 59. N.

DEIZABAD, a town of Perſia, in Irac-Agemi, ninety miles N. of Iſpahan.

DELACOUR (James), an elegant, though neglected poet, was an inhabitant of Cork, in Ireland, and much careſſed for his ſprightly wit and moral conduct, beauties which are very rarely united. His firſt publiſhed poem was entitled The Proſpect of Poetry, inſcribed to Boyle earl of Orrery, and introduced by complimentary verſes from ſeveral reſpectable writers of the day. Though rather too impetuous and fiery (a ſad prediction of his future deſtiny), it contains ſome paſ-

ſages, ſurpriſingly beautiful and ſublime; the meaſure is harmonious, the deſign uniform, though not new, and, altogether, it is a performance of infinite merit. His deſcription of the birth of Love is replete with tender and elegant conception. Mr. Bell, in his compilation of Fugitive Poeſy, has very judiciouſly retained, indeed, we may ſay, revived this piece.

His Progreſs of Beauty, which is, we ſuppoſe, very ſcarce in this kingdom, is far ſuperior to Lord Lanſdowne's on the ſame ſubject, and with the ſame title. His Epithalamium, alſo, has all the delicacy and ſweetneſs of Catullus. But, alas! all human endowments are variable, and the ſage of this day has often been the ideot of the next.

Poor *Delacour*, at an earlier age than his unrivalled countryman *Swift*, was a member of ſociety no more. All his once vivid faculties were fled, and all his myrtles blaſted. We aſſign him the myrtle, becauſe like *Lee*, who loſt his reaſon alſo, his chief talent lay in chaſte amorous deſcription. He was frequently ſeen in the open ſtreet, with a mob of boys around him, pouring forth extempore rhymes, chiefly ſatirical; not unfrequently exhibiting ſome bright, but evaneſcent, flaſhes of fancy amidſt his wildeſt delirium!

Even during the long period of Delacour's inſanity, the light of the poet was not totally extinguiſhed: there exiſts a manuſcript copy of his Verſes on the Earthquake at Liſbon, compoſed in ſome ſerener moment, full of loftiy, but extravagant conception. And he produced about the ſame time ſome little pieces, which appeared in the Gentleman's Magazine, then the repoſitory of wit and genius; and, in particular, ſome lines to the author of the Seaſons (which inſpired even the leaden pen of old Dennis the critic); and an humourous epitaph on a tallow-chandler, who bequeathed ten pounds to reward the beſt tribute to his memory.

DELEBIO, a town of Swiſſerland, in the Valteline, on a ſmall river which runs into the Adda, five miles N.W. of Morbegno.

DELFINO, a town of Turkey in Europe and capital of Lower Albania, where the pacha reſides. It is fifty miles E.N.E. of Lariſſa.

DELFTSHAVEN, a fortified town of Holland, on the N. ſide of the Meaſe, with a canal to Delft, &c. It is between Rotterdam and Schiedam, not three miles from either.

DELFZUYL, a fortreſs of the United Provinces, in Groningen. It was taken by the Spaniards in 1581, and retaken by the Dutch in 1590. It is ſeated on the Damſter, thirteen miles N.E. of Groningen.

DELICHI, a river of Albania, the Acheron of the ancient poets, who feigned it to be in hell.

DELICT, in Scots law, ſignifies ſuch ſmall offences or breaches of the peace as are puniſhable only by fine or ſhort impriſonment.

DELLAMCOTTA, a fortreſs of the country of Bootan, which commands the principal paſs over the mountains. It was taken by ſtorm in 1773, by a detachment under the command of Captain John Jones, and is 175 miles N. of Moorſhedabad.

DELOS (*Encycl.*). Anciently this iſland was governed by its own kings. Virgil mentions one Anius reigning here in the time of the Trojan war. He was, according to that poet, both king and high-prieſt of Apollo, and entertained Æneas with great kindneſs. The Perſians allowed the Delians to enjoy their ancient liberties, after they had reduced the reſt of the Grecian iſlands. In after ages, the Athenians made themſelves maſters of it; and held it till they were driven out by Mithridates the Great, who plundered the rich temple of Apollo, and obliged the Delians to flee with him. Mithridates was in his turn driven out by the Romans, who granted the inhabitants many privileges, and exempted them from all ſorts of taxes. At preſent it is quite abandoned; the lands being covered with ruins and rubbiſh, in ſuch a manner as to be quite incapable of cultivation. The inhabitants of Mycone hold it now, and pay but ten crowns land-tax to the grand-ſignior for an iſland which was once one of the richeſt in the world.—Strabo and Callimachus tell us that the iſland of Delos was watered by the river Inapus: but Pliny calls it only a ſpring; and adds, that its waters ſwelled and abated at the ſame time with thoſe of the Nile. At preſent there is no river in the iſland, but one of the nobleſt ſprings in the world; being twelve paces in diameter, and incloſed partly by rocks, and partly by a wall. Mount Cynthus, whence Apollo had the ſurname of *Cynthius*, is by Strabo placed near the city, and ſaid to be ſo high, that the whole iſland was covered by its ſhadow; but our modern travellers ſpeak of it as an hill of a very moderate height. It is but one block of granate of the ordinary ſort, cut, on that ſide which faced the city, into regular ſteps, and incloſed on both ſides by a wall. On the top of the mountain are ſtill to be ſeen the remains of a ſtately building, with a moſaic pavement, many broken pillars, and other valuable monuments of antiquity. From an inſcription diſcovered there ſome time ago, and which mentions a vow made to Serapis, Iſis, and Anubis, ſome have conjectured, that on this hill ſtood a temple dedicated to theſe Egyptian deities, though no-where mentioned in hiſtory.—The city of Delos, as is manifeſt from the magnificent ruins ſtill extant, took up that ſpacious plain reaching from one coaſt to the other. It was well peopled, and the richeſt city in the Archipelago, eſpecially after the deſtruction of Corinth; merchants flocking thither from all parts, both in regard of the immunity they enjoyed there, and of the convenient ſituation of the place between Europe and Aſia. Strabo calls it one of the moſt frequented empories in the world; and Pliny tells us, that all the commodities of Europe and Aſia were ſold, purchaſed, or exchanged there. It contained many noble and ſtately buildings; as, the temples of Apollo, Diana, and Latona; the porticoes of Philip of Macedon, and Dionyſius Eutyches; a gymnaſium; an oval baſon made at an immenſe expence, for the repreſentation of ſea-fights; and a moſt magnificent theatre. The temple of Apollo was, according to Plutarch, begun by *Eryſichton* the ſon of Cecrops; but afterwards enlarged and embelliſhed at the common charges of all the ſtates of Greece. Plutarch tells us, that it was one of the moſt ſtately buildings in the univerſe; and ſpeaks of an altar in it, which, in his opinion, deſerved a place among the wonders of the world. It was built with the horns of various animals, ſo artificially adapted to one another, that they hanged together without any cement. This altar is ſaid to have been a perfect cube; and the doubling it was a famous mathematical problem among the ancients. This went under the name of *Problema Deliacum*; and is ſaid to have been propoſed by the oracle, for the purpoſe of freeing the country from a plague. The diſtemper was to ceaſe when the problem was ſolved.—The trunk of the famous ſtatue of Apollo, mentioned by Strabo and Pliny, is ſtill an object of great admiration to travellers. It is without head, feet, arms, or legs; but from the parts that are yet remaining, it plainly appears, that the ancients did not exaggerate when they commended it as a wonder of art. It was of a gigantic ſize, though cut out of a ſingle block of marble; the ſhoulders being ſix feet broad, and the thighs nine feet round. At a ſmall diſtance from this ſtatue lies, amongſt confuſed heaps of broken columns, architraves, baſes, chapiters, &c. a ſquare piece of marble 15½ feet long, ten feet nine inches broad, and two feet three inches thick; which undoubtedly ſerved as a pedeſtal for this coloſſus. It bears, in very fair characters, this inſcription in Greek, "The Naxians to Apollo." Plutarch tells us, in the life of Nicias, that he

cauſed to be ſet up, near the temple of Delos, an huge palm-tree of braſs, which he conſecrated to Apollo; and adds, that a violent ſtorm of wind threw down this tree on a coloſſian ſtatue raiſed by the inhabitants of Naxos. Round the temple were magnificent porticoes built at the charge of various princes, as appears from inſcriptions which are ſtill very plain. The names of Philip king of Macedon, Dionyſius Eutyches, Mithridates Evergetes, Mithridates Eupator, kings of Pontus, and Nicomedes king of Bithynia, are found on ſeveral pedeſtals.—To this temple the inhabitants of the neighbouring iſlands ſent yearly a company of virgins to celebrate, with dancing, the feſtival of Apollo and his ſiſter Diana, and to make offerings in the name of their reſpective cities.

DELRIO (Martin Anthony), a moſt learned man, was born at Antwerp of Spaniſh parents, in 1551. The progreſs he made in letters, while a very boy, is recorded with wonder. He was taught grammar in the Low-countries; and then ſent to Paris to learn rhetoric and philoſophy under the Jeſuits. Afterwards he went to ſtudy civil law in the new univerſity of Douay; but removing from thence to Louvain, he laid aſide that purſuit, and applied himſelf to polite literature. This he cultivated with ſo much ardour and ſucceſs, that he ſurpriſed the public, when he was only nineteen years of age, with ſome good notes upon the tragedies of Seneca. He cited in this work almoſt 1100 authors, with all the aſſurance of a man who had read them thoroughly, and weighed their ſentiments with great judgment and exactneſs. The reputation he acquired by this firſt eſſay of his erudition was afterwards increaſed. He is ſaid to have underſtood at leaſt ten languages, and to have read every thing, ancient or modern, that he thought worth reading. He was admitted LL. D. at Salamanca in 1574; and was afterwards a counſellor of the parliament of Brabant, and an intendant of the army. In 1780 he became a Jeſuit at Valladolid; from whence, going into the Low-countries, he taught divinity and the belles-lettres, and contracted a firm friendſhip with Lipſius. He taught alſo at Liege, at Mayence, at Gratz, and at Salamanca. He died at Louvain, in 1608, about two years after his friend Lipſius.

Beſides notes upon Seneca, Claudian, and Solinus, he wrote a great number of works, the principal of which are, 1. Diſquiſitiones Magicæ. 2. Commentaries upon ſome Books of the Old Teſtament. 3. Explications of ſome of the hardeſt and moſt important Texts of Scripture. We muſt not confound him with John Delrio, of Bruges, dean and grand vicar of Antwerp, who died in 1624; and who was the author of Commentaries upon the 119th Pſalm.

DELSPERG, a town of Swiſſerland, in the biſhopric of Baſle, ten miles N.W. of Soleure. Long. 7. 23. E. Lat. 47. 17. N.

DEMBEA, a conſiderable lake of Abyſſinia, in a province of the ſame name, in the W. part of the empire. It is ſuppoſed to be 450 miles in circumference, and contains many iſlands, one of which is a place of confinement for ſtate priſoners.

DEMER, a river which riſes in the biſhopric of Liege, waters Haſſelt, Dieſt, Sichem, Arſchot, and Mechlin, below which it joins the Senne, and takes the name of Rupel.

DEMERARY, a Dutch ſettlement in Guiana, on a river of the ſame name, three leagues W. of Paramaribo. It was taken by the Engliſh in 1781; but the French diſpoſſeſſed them of it ſoon after, and by the treaty of peace in 1783, it was reſtored to the Dutch. It was again taken by the Engliſh in April 1796.

DEMMIN, an ancient town of Swediſh Pomerania, in the duchy of Stetin, on the river Peen. Long. 13. 22. E. Lat. 53. 52. N.

DE MISSY (Cæſar), a man greatly diſtinguiſhed in the learned world, though no great author in form, was born at Berlin, Jan. 2, 1703, being the ſon of a merchant there. He ſtudied firſt at the French college at Berlin, and thence removed to the univerſity of Francfort on the Oder. He was examined for the miniſtry in 1725, and after ſome difficulties obtained it; but the eccleſiaſtics there being hampered with ſubſcriptions, to which he could not aſſent, he quitted the country ſoon after. He preached about five years in different towns of the United Provinces, from whence he was invited to London in 1731, and ordained to ſerve the French chapel in the Savoy. In 1762 he was named by the Biſhop of London to be one of the French chaplains to the king in his chapel at St. James's. He died Auguſt 10, 1775. He ſeldom publiſhed any thing except occaſionally, in conſequence of unforeſeen engagements, or at the importunity of friends. Several little poetical pieces, eſſays both in ſacred and profane literature, epitomes of books, memoirs, diſſertations, &c. by De Miſſy, with his initials C. D. M. or ſome aſſumed name, and frequently anonymous, appeared in different collections and periodical journals in Holland, France, and England, from 1721. He was greatly aſſiſting to many of the learned in their ſeveral undertakings: among others who are indebted to him, were the late Profeſſor Wetſtein, in his ſplendid edition of the Greek Teſtament, and the late Dr. Jortin, in his Life of Eraſmus. He was twice married, but left no child.

DEMONA, a fort of Piedmont, on the river Sture, ten miles S.W. of Coni. Lon. 7. 28. E. Lat. 44. 18. N.

DEMOTICA, or Dimotuc, a town of Turkey in Europe, in Romania, where a Greek archbiſhop reſides. It was the reſidence of Charles XII. for ſome years; and is ſituate near the Maritſch, twelve miles S. of Adrianople.

DEMPSTER (Thomas), a very learned man, but of a ſingular character. He was born in Scotland, but we do not find in what year. He went over to France, for the ſake of embracing the catholic religion; and taught claſſical learning at Paris about the beginning of the ſeventeenth century. Though his buſineſs was to teach ſchool, yet he was as ready to draw his ſword, and as quarrelſome, as if he had been a duelliſt by profeſſion: and it is ſaid, that there ſcarce paſſed a day but he had ſomething or other of this kind upon his hands. This ſpirit and turn of temper drew him into many ſcrapes; and one in particular, which obliged him to quit the country. Grangier, principal of the College of Beauvais at Paris, being obliged to take a journey, appointed Dempſter his ſubſtitute. Dempſter cauſed a ſcholar to be whipped in full ſchool, for challenging one of his fellows to fight a duel. The ſcholar, to revenge this affront, brought three gentlemen of his relations, who were of the king's life-guards, into the college. Dempſter made the whole college take arms; hamſtrung the three life-guard mens' horſes before the college gate; and put himſelf into ſuch a poſture of defence, that the three ſparks were forced to aſk for quarter. He gave them their lives; but impriſoned them, and did not releaſe them for ſome days. They ſought another way to revenge themſelves: they cauſed an information to be made of the life and moral behaviour of Dempſter, and got ſome witneſſes to be heard againſt him. Upon this he went over to England, where he found refuge; but did not make any long ſtay. He went abroad again, and read lectures upon polite learning in ſeveral univerſities; in that of Niſmes particularly, where he diſputed for a profeſſor's chair, and obtained it. He went to Bologna, and was profeſſor there for the remainder of his life; and was then alſo admitted a member of the Academy della Rotte. He died there in September 1625, leaving behind him ſeveral learned works: as Commentaries on Roſinus de Antiquitatibus Romanorum, and upon Claudian, &c.; four

books of Epiſtles; ſeveral dramatic pieces, and other poems; ſome books of law; an Apparatus to the Hiſtory of Scotland; a Martyrology of Scotland; and a Liſt of the Scottiſh Writers.

DENAIN, a village of France, in the department of the North, remarkable for a victory gained over Prince Eugene, by Marſhal Villars, in 1712. It is ſeated on the Scheld, eight miles W. of Valenciennes.

DENDER, a river of Auſtrian Hainault, which waters Leuze, Ath, Leſſines, Grammont, Ninove, and Aloſt, and joins the Scheld at Dendermonde.

DENDERA, a town of Egypt, on the W. ſide of the Nile. Near it are very magnificent ruins, ſuppoſed to be thoſe of an ancient temple of Serapis. It is 48 miles S.S.E. of Girge, and 242 S. of Cairo. Long. 31. 40. E. Lat. 26. 10. N.

DENDRANATOMY, a term uſed by ſome for a deſcription of the various parts of trees; as root, trunk, branch, bark, wood, pith, flower, fruit, &c. See PLANTS, VEGETATION, &c.

DENIA, an ancient ſea-port of Spain, in Valencia, on the Mediterranean Sea, and at the foot of a mountain, 52 miles E. of Alicant. Long. 0. 36. E. Lat. 38. 44. N.

DENMARK (*Encycl.*). The laws of Denmark are ſo conciſe, that the whole body is contained in one quarto volume, written in the language of the country. Every man may plead his own cauſe, without employing either council or attorney: but there are a few advocates for the benefit of thoſe who cannot or will not ſpeak in their own defence. The proceedings are ſo ſummary, that a ſuit may be carried through all the courts, and finally decided, in thirteen months. There are three courts in Denmark, and an appeal lies from the inferior to the ſuperior tribunal. The loweſt of theſe is, in cities and towns, denominated the *Byfoglids Court*; and in the country, the *Herredsfougds*. Cauſes may be appealed from this to the *Landſtag*, or general head-court for the province: but the final appeal lies to the court of *High-right* in Copenhagen, where the king preſides in perſon, aſſiſted by the prime nobility. The judges of the two other courts are appointed by his majeſty's letters patent, to ſit and determine cauſes *durante bene placito*. Theſe are puniſhable for any miſdemeanours of which they may be guilty; and when convicted of having paſſed an unjuſt ſentence, they are condemned to make reparation to the injured party. Their ſalaries are very inconſiderable, and paid out of the king's treaſury, from the fines of delinquents, beſides a ſmall gratuity from the plaintiff and defendant when ſentence is paſſed. Such is the peculiar privilege enjoyed by the city of Copenhagen, that cauſes appealed from the Byfoglids court, inſtead of paſſing through the provincial court, are tried by the burgomaſter and common-council; from whence they proceed immediately to the higheſt court, as the laſt reſource. Affairs relating to the revenue are determined in the rent-chamber of Denmark, which is analogous to our court of exchequer. To another tribunal, compoſed of ſome members from this rent-chamber, from the admiralty, and college of commerce, merchants appeal for redreſs, when their commodities are ſeized for non-payment of duties. All diſputes relating to the ſea are determined by the court of admiralty, conſtituted of commiſſioners appointed for theſe purpoſes. The chancellary may be more properly termed a ſecretary's office. It conſiſts of clerks, who write and iſſue all the king's decrees and citations, tranſcribe papers, and, according to the directions they receive, make draughts of treaties and alliances with other nations. The government of Denmark is very commendable for the excellent policy it maintains. Juſtice is executed upon criminals with great ſeverity; and ſuch regulations are eſtabliſhed as effectually prevent thoſe outrages that are daily committed in other countries. No man preſumes to wag his tongue againſt the government, far leſs to hatch ſchemes of treaſon. All the ſubjects are, or ſeem to be, attached to their ſovereign by the ties of affection. Robbery on the highway, burglary, coining or clipping, are crimes ſeldom or never heard of in Denmark. The capital crimes uſually committed are theft and manſlaughter. Such offenders are beheaded very dexterouſly with one ſtroke of a ſword. The executioner, though infamous, is commonly rich; becauſe, over and above the functions of his office, he is employed in other ſcandalous occupations, which no other perſon will undertake. He, by means of his underſtrapper, called the pracher, empties all the jakes, and removes from houſes, ſtables, or ſtreets, dead dogs, horſes, &c. which no other Dane will vouchſafe to touch on any conſideration whatſoever.

In Copenhagen there is a maſter of the police, who ſuperintends the economy of that city. No torches are allowed to be carried through the ſtreets of this city, becauſe great part of the houſes are of timber, and the wind is generally high. In lieu of flambeaux, the court and quality uſe large round lanthorns, fixed to the end of long poles. In a word, the maſter of the police regulates every thing that relates to the decency, good order, quiet, and ſecurity, of the capital. The apotheearies in this kingdom are under excellent regulations: their number at Copenhagen is reſtricted to two; and one is allowed to every other town of importance. They are examined and appointed by the college of phyſicians, and confirmed by the king himſelf; otherwiſe they cannot exerciſe the profeſſion. Their ſhops are viſited three times a-year by the magiſtrates, accompanied with phyſicians, who inſpect their medicines and regulate the prices. They are obliged to keep an exact account of every thing they ſell, to ſpecify the name of the perſon who bought it, and that of the doctor by whom it was preſcribed; ſo that accidents are prevented, and murders by poiſon eaſily diſcovered.

DENNIS, or ST. DENNIS, a famous town of the Iſle of France, with a Benedictine abbey, wherein are the tombs of the kings of France, with a conſiderable treaſure. E. Long. 2. 26. N. Lat. 48. 56.

DENYS (the Little), a Scythian, became abbot of a monaſtery at Rome: he was the firſt who computed time from the birth of Dionyſius to Chriſt, and fixed that great event, according to the vulgar æra. He was alſo a learned canon-law writer, and died about the year 540.

DEPURATION. See DEFECATION in this SUPPLEMENT.

DERENBURG, a town of Lower Saxony, in the principality of Halberſtadt, ſix miles W.S.W. of Halberſtadt, and 17 E. of Goſlar.

DEREOTE, or DEIROUTE, a town of Egypt, in the iſle formed by the canal from Cairo to Roſetta. Here is a magnificent temple. Long. 31. 45. E. Lat. 30. 40. N.

DERHAM (William). (*Encycl.*). To our account of this excellent philoſopher and divine, it may not be amiſs to add a liſt of his works, moſt of them publiſhed in the Philoſophical Tranſactions. 1. Part of a Letter dated Dec. 6, 1697, giving an Account of ſome Experiments about the Height of the Mercury in the Barometer at the Top and Bottom of the Monument in London; and alſo a Deſcription of a portable Barometer. 2. A Letter dated Jan. 13, 1697-8, about a Contrivance to meaſure the Height of the Mercury in the Barometer, by a Circle, on one of the Weather Plates: with a Regiſter or Diary of the Weather, obſerved every Day at Upminſter, during the Year 1697. 3. A Letter to Dr. Sloane; with a Regiſter of the Weather, Winds, Barometer's Height, and Quantity of Rain fallen at Upminſter in Eſſex, during the Year 1698. 4. A Regiſter, &c. as above, for the Year

1699. In these registers, he exhibits to view, in separate columns, every day, at the hours of eight, twelve, and nine, the weather, winds, clouds, height of the barometer, rain, &c. 5. Observations on the Death-Watch, or that Insect which makes a noise like the Beats of a Watch. 6. Observations on the Weather, Rain, Winds, &c. for 1699, 1700, 1701, 1702, compared with other Observations made at Townley in Lancashire, by Mr. Townley, and communicated to our Author. 7. An Account of some Spots observed in the Sun in June 1703. 8. Observations on the great Storm, Nov. 26, 1703. 9. The History of the Death-Watch: from which the Superstitious may learn, to the great Ease and Comfort of their Souls, that the tickling Noise of this minute Creature, which fills them with such Terrors and Forebodings, is nothing more than a wooing Act, and commonly heard in July, or about the Beginning of August. 10. An Account of an Instrument for finding the Meridian, with a Description of the same. 11. Experiments on the Motion of Pendulums in vacuo. 12. A Prospect of the Weather, Winds, and Height of the Mercury in the Barometer, on the first Day of the Month; and of the whole Rain in every Month in 1703, and the Beginning of 1704: observed at Townley in Lancashire, by R. Townley, Esq. and at Upminster in Essex, by our Author. 13. An Account of a Glade of Light seen in the Heavens, March 20, 1705-6. 14. Tables of the Weather, &c. for 1705. 15. An Account of a pyramidal Appearance in the Heavens, seen in Essex, April 3, 1707. 16. Experiments and Observations on the Motion of Sound; in Latin. 17. On the Migration of Birds. 18. An Account of an Eclipse of the Sun, Sept. 3, 1708, as observed at Upminster: and of an Eclipse of the Moon, Sept. 18, 1708. 19. An Account of a strange Meteor, or Aurora Borealis, in Sept. or Oct. 1706. 20. An Account of a Child's crying in the Womb. It was the child of one Clark, of Horn-Church in Essex, who was heard to cry in his mother's womb, at times, for five weeks. 21. The History of the great Frost in 1708. 22. Account of Spots observed in the Sun by our Author, from 1703 to 1708; and from 1707 to 1711. 23. Of subterraneous Trees found at Dagenham-Breach in Essex. 24. Account of an Eclipse of the Moon, seen at Upminster, Jan. 12, 1711-12. 25. Of a Woman big with Child, and having the Small-pox, delivered of a Child having the same Distemper, Sept. 8, 1713. 26. An Account of the Rain at Upminster, for eighteen Years. 27. Tables of the barometrical Altitudes for 1708, at Zurich in Switzerland; and of the Rain of Pisa in Italy, and Zurich, and Upminster, for 1707, 1708: with Remarks on the Winds, Heat and Cold, &c. 28. Mischiefs occasioned by swallowing the Stones of Bullace and Sloes. 29. Extract from Mr. Gascoigne's and Mr. Crabtree's Letters, proving Mr. Gascoigne to have been the Inventor of the telescopic Sights of Mathematical Instruments, and not the French. 30. Observations about Wasps, and the Difference of their Sexes. 31. Observations on the Lumen Boreale, or Streaming, Oct. 8, 1726. 32. Tables of the Eclipses of Jupiter's Satellites, from 1700 to 1727; with Remarks on those Tables. 33. The Difference in Time of the Meridians of divers Places, computed from Observations on the Eclipses of Jupiter's Satellites. 34. A Letter to Sir Hans Sloane, Bart. containing a Description of some uncommon Appearances, observed in an Aurora Borealis, Oct. 13, 1728. 35. Of the Meteor called the Ignis Fatuus, from Observations made in England by our Author, and others in Italy, communicated by Sir Thomas Dereham, Bart.

He published in his younger years, The Artificial Clock-Maker; or, a Treatise of Watch and Clock Work, shewing to the meanest Capacities the Art of calculating Numbers to all Sorts of Movements; the Way to alter Clock-Work; to make Chimes, and set them to musical Notes; and to calculate and correct the Motion of Pendulums. Also, Numbers for divers Movements: with the ancient and modern History of Clock-Work; and many Instruments, Tables, and other Matters, never before published in any other Book. The fourth edition of this book, with large emendations, was published in 1734, 12mo. In 1711 and 1712 he preached sixteen sermons at Boyle's Lectures; which, having put into a new form, he published in 1713, under this title, Physico-Theology; or, a Demonstration of the Being and Attributes of God from his Works of Creation: with large Notes, and many curious Observations, 8vo. And, in pursuance of the same design, he published, in 1714, Astro-Theology; or, a Demonstration of the Being and Attributes of God from a Survey of the Heavens. Illustrated with copper-plates, 8vo. In 1716 he was made a canon of Windsor, being at that time chaplain to the Prince of Wales; and, in 1730, received the degree of D.D. from the university of Oxford, on account of his learning, and the services he had done to religion by his culture of natural knowledge. When Eleazar Albin published his Natural History of Birds, and English Insects, in 4 vols. 4to. with many beautiful cuts, it was accompanied with very curious notes and observations by our learned author. He also revised the Miscellanea Curiosa, published in 3 vols. 8vo. 1726. The last thing he published of his own composition was, Christo-Theology; or, a Demonstration of the Divine Authority of the Christian Religion, being the Substance of a Sermon preached at Bath, Nov. 2, 1729, and published at the earnest Request of the Auditory, 1730, 8vo. But, besides his own, he published some pieces of Mr. Ray, and gave new editions of others, with great additions from the author's own MSS. To him the world is likewise indebted for the publication of the Philosophical Experiments and Observations of the late eminent Dr. Robert Hooke, and other eminent Virtuosos in his Time, 1726, 8vo. with copper cuts. He communicated also to the Royal Society several pieces, which he received from his learned correspondents.

DERNE, a town of Barbary, capital of a district in Tripoli, near the coast, and the residence of a sangiac. Long. 22. 45. E. Lat. 32. 55. N.

DERRICK (Samuel), a native of Ireland, was born in 1724. Being intended for trade, he was some time placed with a linen-draper in Dublin, but disliking his business, he quitted it and his country about 1751, and commenced author in London. Soon after he arrived at the metropolis, he indulged an inclination which he had imbibed for the stage, and appeared in the character of Gloucester, in Jane Shore; but with so little success, that he never repeated the experiment. After this attempt he subsisted chiefly by his writings, but being of an expensive disposition, running into the follies and excesses of gallantry and gaming, he lived almost all his time the slave of dependence, or the sport of chance. His acquaintance with people of fashion, on Beau Nash's death, procured him at length a more permanent subsistence. He was chosen to succeed that gentleman in his offices of master of the ceremonies at Bath and Tunbridge. By the profits of these he might have been enabled to place himself with economy in a less precarious state; but his want of conduct continued after he was in the possession of a considerable income, by which means he was at the time of his death, March 7, 1760, as necessitous as he had been at any period of his life. He translated one piece from the French of the King of Prussia, called Sylla, a dramatic entertainment, 1753, 8vo.

DERWENT, a river of Derbyshire, which rises in the high Peak, flows S. through the middle of the county, and,

passing Derby, empties itself into the Trent, on the borders of Leicestershire.

Derwent, a river of Yorkshire, which rises in the N. riding, and running S. falls into the Ouse, below York.

Derwent, a river of Durham, which forms, for some space, the boundary between that county and Northumberland, and falls into the Tyne, above Newcastle.

Derwent, a river of Cumberland, which, flowing through the lakes of Derwent-water and Bassenthwaite-water, to Cockermouth, enters the Irish Sea, near Workington.

Derwent-water, a lake of Cumberland, in the vale of Keswick. It is three miles in length, and a mile and a half wide. Five islands rise out of this lake, which add greatly to the beauty of the appearance. On one of them is an elegant modern-built house.

DES BARREAUX (James de Vallee, Lord), a French nobleman, and born at Paris in 1602, was, like the English Lord Rochester, a great wit, a great libertine, and a great penitent. He made a vast progress in his studies under the Jesuits, who, perceiving he had a genius capable of any thing, endeavoured to get him into their society; but neither he nor his family would ever listen to the proposal. He did not love them, and used to rail at them in an agreeable manner. He was intimate with Theophile, who was advocate-general, and afterwards president in the parliament of Paris; and, being very handsome in his youth, it is said that Theophile was in love with him, and sometimes even jealous of him. Some pretend, that he abused him; but Des Barreaux's friends have assured us, that he always abhorred that unnatural vice. He was very young when his father procured him the place of a counsellor in the parliament of Paris. His wit was admired there, but he would never report a cause; for he used to say, that it was a sordid occupation, and unworthy of a man of parts, to read wrangling papers with attention, and to endeavour to understand them. He lost that place from the following cause:—Cardinal Richelieu falling in love with the celebrated beauty Marion de Lorme, whose affections were entirely placed on our Des Barreaux, proposed to him by a third hand, that if he would resign his mistress, he should have whatever he should desire. Des Barreaux answered the proposal no otherwise than in a jesting way; feigning all along to believe the cardinal incapable of so much weakness. This enraged the minister so highly, that he persecuted our counsellor as long as he lived, and forced him not only to quit his place, but to leave the kingdom.

As Des Barreaux loved his liberty and his pleasures extremely, he did not find himself unhappy in having quitted the long robe. He made a great number of Latin and French verses, and some very pretty songs: and never pursued any thing but good cheer and diversions. He was vastly entertaining in company, and greatly sought after by all men of wit and taste. He had his particular friends in the several provinces of France, whom he frequently visited; for he took a pleasure in shifting his quarters, according to the seasons of the year. In winter, he went to seek the sun on the coasts of Provence. He passed three of the worst months in the year at Marseilles. The house which he called his favourite was that of the Count de Clermont de Lodeve, in Langnedoc; where, he used to say, good cheer and liberty were on their throne. Sometimes he went to Balzac on the banks of the Charante; but his chief residence was at Chenailles, on the Loire. His general view in these ramblings was to search out the best fruits and the best wines in the climates: however, it must be observed, in justice to him, that the pleasures of the mind, as well as those of the body, were sometimes the occasion of his journeys; as, when he went into Holland, on purpose to see Des Cartes, and to improve by the instructions of that great genius.

His friends do not deny that he was a great libertine; but pretend, that Fame, according to custom, has said more of him than is true, and that, in the latter part of his life, he was convinced of the reality of religion. They say, that he did not disapprove the truths of Christianity, and wished to be fully convinced of them; but he thought nothing was so difficult to a man of wit as to believe. He was born a Catholic, but had not the least faith either in the worship or doctrines of the Romish religion; and he used to say, that if the Scriptures are the rule of our actions and of our belief, there was no better religion than the Protestant. However all this might be, it is certain that, four or five years before his death, he entirely forsook his vicious courses: he paid his debts, and, having never been married, gave up the remainder of his estate to his sisters: reserving to himself for life an annuity of 4000 livres. He then retired to Chalon, on the Soane, which he said was the best and purest air in France, hired a small house; and was visited by the better sort of people, particularly by the bishop, who afterwards spoke well of him. He died in that city, like a good Christian, in 1647, having made a devout sonnet two or three years before his death, which was greatly esteemed.

DESEADA, or Cape Desire, the southern point of the straits of Magellan, in S. America, at the entrance of the S. Sea. Long. 74. 18. W. Lat. 53. 4. N.

DES MAIZEAUX (Peter), secretary of the Royal Society of London, was the son of a French Protestant minister, and born at Auvergne in 1666. He retired early, probably as a refugee, into England; and died there in 1745. He had intimate connections with St. Evremont and Bayle. He gave a very handsome edition of the works of the former, in 3 vols. 4to. with the life of the author prefixed: and he drew up the life of the latter, which was printed before the edition of his Dictionary, in 1730, and separately at the Hague, 1732, 2 vols. 12mo. He published also, in the same year, the Miscellaneous Works of Bayle, in 4 vols. folio. He was the editor of other things; and whatever he published he accompanied with remarks, full of literary anecdotes. He was very exact and curious in his accounts; but somewhat prolix and tedious.

DESTOUCHES (André, Cardinal), a French musician, was born at Paris in 1672. He accompanied Father Tachard to Siam, with a resolution of entering into the society of Jesuits upon his return; but he changed his purpose, and became a soldier. It was in this line of life that he discovered his talents for music; and he quitted soldiery, that he might devote himself entirely to it. He soon gained a vast reputation by his opera of Isé, which the king relished so highly, as to present the composer with 200 louis-d'ors; graciously adding, that no music since Lulli had pleased him so much as his. What was very singular is, that Destouches, when he made this charming piece, knew nothing of composition: but, instead of art, he had genius, and (what is usually the concomitant of genius) a very strong passion for his object. After producing the Isé, he made himself master of rules; but it is said, that they damped his genius, and that none of his compositions afterwards equalled the Isé. He died in 1749, superintendant of the royal band, and inspector-general of the royal academy of music, with a pension of 4000 livres.

Destouches (Philip Nericaut), a French dramatic writer, was born at Tours in 1680, and educated at Paris. His first destination was to the army; but he quitted this service, to attach himself to the Marquis de Puysieux, ambassador of France with the Helvetic body. It was in Switzerland that his talent for theatrical productions first displayed itself; and

his Curieux Impertinent was exhibited there with applauſe. His dramatic productions made him known to the regent, who ſent him to London in 1717, to aſſiſt, in his political capacity, at the negociations then on foot. He ſpent ſeven years thus in London, married a wife, and returned to his country; where the dramatiſt and negociator were well received. The regent had a juſt ſenſe of his ſervices, and promiſed him great things; but dying ſoon after, left Deſtouches the meagre comfort of reflecting, how well he ſhould have been provided for if the regent had lived. Having loſt his patron, he retired to Fortoiſeau, near Melun, as the moſt proper ſituation to make him forget the capriees of fortune. He purchaſed the place; and, cultivating agriculture, philoſophy, and the muſes, abode there as long as he lived. Cardinal Fleury would fain have drawn him out of it, and ſent him ambaſſador to Peterſburg; but Deſtouches would not ſtir: he choſe rather to attend his lands and his woods, and to correct with his pen the manners of his own countrymen, than to go and converſe with the Boyards of Ruſſia. He died in 1754, leaving a daughter and a ſon: the latter, by order of Lewis XV. publiſhed at the Louvre an edition of his father's works, in 4 vols. quarto. Deſtouches had not the gaiety of Regnard, nor the ſtrong warm colouring of Moliere; but he is always polite, tender, and natural.

DETHMOLD, a town of Weſtphalia, on the river Wehera, 15 miles N. of Paderborn. Long. 8. 55. E. Lat. 52. 0. N.

DETROIT, a town of the United States, on the W. ſide of the ſtrait, or river, that forms the communication between the lakes St. Clair and Erie. Long. 83. 2. W. Lat. 42. 22. N.

DEVA, a ſea-port of Spain, in Guipuſcoa, on the bay of Biſcay, 15 miles S.E. of Bilboa. Long. 2. 40. W. Lat. 43. 24. N.

DEVENTO, a town of Bulgaria, with a Greek archbiſhop's ſee, ſeated on the Paniza, 65 miles N.E. of Adrianople. Long. 37. 33. E. Lat. 42. 33. N.

DEVETTO, or ZAGORIA, a town of Turkey in Europe, in Bulgaria, the ſee of a Greek archbiſhop; ſituate near the Black Sea, 58 miles N.E. of Adrianople, and 106 N.N.W. of Conſtantinople. Long. 27. 22. E. Lat. 42. 25. N.

DEVIZES, a borough in Wilts, with a market on Thurſday, and a manufacture of ſerges and other woollen ſtuffs. It ſends two members to Parliament, and is ſeated on an eminence, 24 miles N.W. of Saliſbury, and 89 W. of London. Long. 2. 2. W. Lat. 51. 20. N.

DEVON, a river of Perthſhire, over which, in the beautiful vale of Glendevon, is a great curioſity, called the Rumbling Bridge. It is ſimilar to that over the Braan, and conſiſts of one arch, thrown over a horrible chaſm, worn by the river, about eighty feet deep, and very narrow. In other places, the river has forced its way, in a ſurpriſing manner, through the rocks. At the Caldron-lin, it has worn away the ſofter parts of the ſtone, and formed immenſe pits, into which the water falls with a tremendous noiſe. Below this, the whole river is precipitated in one ſheet, from a height of forty feet.

DEUX PONTS, a town of Germany, in the palatinate of the Rhine, capital of a duchy of the ſame name, ſeated on the Erbach, 49 miles N. by W. of Straſburg, and 50 S.W. of Mentz. Long. 7. 26. E. Lat. 49. 10. N.

DIACOUSTICS. See ACOUSTICS in this SUPPLEMENT.

DIANTHUS (*Encycl.*). Though *carnations* grow freely in almoſt any garden earth, and in it produce beautiful flowers, yet they are generally ſuperior in that of a light loamy nature: and of this kind of ſoil the floriſts generally prepare a kind of compoſt in the following manner, eſpecially for thoſe fine varieties which they keep in pots. A quantity of loamy earth muſt be provided, of a light ſandy temperature, from an upland or dry paſture-field or common, taking the top ſpit turf and all, which muſt be laid in a heap for a year, and turned over frequently. It muſt then be mixed with about one third of rotten dung of old hot-beds, or rotten neats-dung, and a little ſea-ſand, forming the whole into a heap again, to lie three, four, or ſix months, at which time it will be excellent for uſe; and if one parcel or heap was mixed with one of theſe kinds of dungs, and another parcel with the other, it will make a change, and may be found very beneficial in promoting the ſize of the flowers. This compoſt, or any other made uſe of for the purpoſe, ſhould not be ſifted, but only well broken with the ſpade and hands. When great quantities of carnations are required, either to furniſh large grounds, or for market, or when it is intended to raiſe new varieties, it is eaſily effected by ſowing ſome ſeed annually in ſpring, in common earth, from which the plants will riſe abundantly. Several good varieties may alſo be expected from the plants of each ſowing; and poſſibly not one exactly like thoſe from which the ſeed was ſaved. The ſingle flowers are always more numerous than the double ones; but it is from the latter only that we are to ſelect our varieties. The ſeaſon for ſowing the ſeed, is any time from the 20th of March to the 15th of April. The plants generally come up in a month after ſowing: they muſt be occaſionally weeded and watered till July, when they will be fit for tranſplanting into the nurſery beds. Theſe beds muſt be made about three feet wide, in an open ſituation; and taking advantage of moiſt weather, prick the plants therein four inches aſunder, and finiſh with a gentle watering, which repeat occaſionally till the plants have taken good root. Here they muſt remain till September, when they will be ſo well advanced in growth as to require more room; and ſhould then have their final tranſplantation into other three feet wide beds of good earth, in rows nine inches aſunder, where they are to be placed in the order of quincunx. Here they are to remain all winter, until they flower, and have obtained an increaſe of the approved varieties of doubles by layers; and until this period, all the culture they require is, that if the winter ſhould prove very ſevere, an occaſional ſhelter of mats will be of advantage. In ſpring, the ground muſt be looſened with a hoe; they muſt be kept clear from weeds; and when the flower-ſtalks advance, they are to be tied up to ſticks, eſpecially all thoſe that promiſe by their large flower-pods to be doubles.

The only certain method of propagating the double varieties is by layers. The proper parts for layers are thoſe leafy ſhoots ariſing near the crown of the root, which, when about five, ſix, or eight inches long, are of a proper degree of growth for layers The general ſeaſon for this work is June, July, and the beginning of Auguſt, as then the ſhoots will be arrived at a proper growth for that operation; and the ſooner it is done after the ſhoots are ready, the better, that they may have ſufficient time to acquire ſtrength before winter: thoſe laid in June and July will be fit to take off in Auguſt and September, ſo will form fine plants in the month of October. The method of performing the work is as follows:—Firſt provide a quantity of ſmall hooked ſticks for pegs. They muſt be three or four inches long, and their uſe is to peg the layers down to the ground. Get ready alſo in a barrow a quantity of light, rich mold, to raiſe the earth, if neceſſary, round each plant, and provide alſo a ſharp penknife. The work is begun by ſtripping off all the leaves from the body of the ſhoots, and ſhortening thoſe at top an inch or two evenly. Then chooſing a ſtrong joint on the middle of the ſhoot or thereabouts, and on the back or under ſide thereof, cut with the penknife the joint half-way through,

directing the knife upward ſo as to ſlit the joint up the middle, almoſt to the next joint above, by which you form a kind of tongue on the back of the ſhoot; obſerving that the ſwelling ſkinny part of the joint remaining at the bottom of the tongue muſt be trimmed off, that nothing may obſtruct the iſſuing of the fibres; for the layers always form their roots at that part. This done, looſen the earth about the plant; and, if neceſſary, add ſome freſh mold, to raiſe it for the more ready reception of the layers; then with your finger make a hollow or drill in the earth to receive the layer; which, bend horizontally into the opening, raiſing the top upright, ſo as to keep the gaſh or ſlit part of the layer open; and, with one of the hooked ſticks, peg down the body of the layer, to ſecure it in its proper place and poſition, ſtill preſerving the top erect, and the ſlit open, and draw the earth over it an inch or two, bringing it cloſe about the erect part of the ſhoot; and when all the ſhoots of each plant are thus laid, give directly ſome water to ſettle the earth cloſe, and the work is finiſhed. In dry weather the waterings muſt be often repeated, and in five or ſix weeks the layers will have formed good roots. They muſt then be ſeparated with a knife from the old plant, gently raiſed out of the earth with a point of a knife or trowel in order to preſerve the fibrous roots of the layers as entire as poſſible; and when thus taken up, cut off the naked ſticky part at bottom cloſe to the root, and trim the tops of the leaves a little. They are then ready for planting either into beds or pots. In November the fine varieties in pots ſhould be moved to a ſunny, ſheltered, ſituation for the winter; and if placed in a frame, to have occaſional protection from hard froſt, it will be of much advantage. In the latter end of February, or ſome time in March, the layers in the ſmall pots, or ſuch as are in beds, ſhould be tranſplanted with balls into the large pots, where they are to remain for flower. To have as large flowers as poſſible, curious floriſts clear off all ſide-ſhoots from the flower-ſtem, ſuffering only the main or top buds to remain for flowering. When the flowers begin to open, attendance ſhould be given to aſſiſt the fine varieties, to promote their regular expanſion, particularly the largeſt kinds called *burſters*, whoſe flowers are ſometimes three or four inches diameter. Unleſs theſe are aſſiſted by art, they are apt to burſt open on one ſide, in which caſe the flower will become very irregular: therefore, attending every day at that period, obſerve, as ſoon as the calix begins to break, to cut it a little open, at two other places in the indenting at top with narrow-pointed ſciſſars, and hereby the more regular expanſion of the petals will be promoted; obſerving, if one ſide of any flower comes out faſter than another, to turn the pot about, that the other ſide of the flower may be next the ſun, which will alſo greatly promote its regular expanſion. When any fine flower is to be blown as large as poſſible, floriſts place ſpreading paper collars round the bottom of the flowers, on which they may ſpread their petals to the utmoſt expanſion. Theſe collars are made of ſtiff, white paper, cut circular, about three or four inches over, having a hole in the middle to receive the bottom of the flower, and one ſide cut open to admit it. This is to be placed round the bottom of the petals in the inſide of the calix, the leaves of which are made to ſpread flat for its ſupport: the petals muſt then be drawn out and ſpread upon the collar to their full width and extent; the longeſt ones undermoſt, and the next longeſt upon theſe; and ſo on; obſerving that the collar muſt no-where appear wider than the flower; and thus a carnation may be rendered very large and handſome.

Theſe directions will anſwer equally well for the propagation of the pinks and ſweet-williams, though neither of theſe require ſuch nicety in their culture as the carnations.

DIBBLING (*Encycl.*). In the reports of the Society for bettering the Condition of the Poor, is the following extract from an account of the ſuperior advantages of dibbling wheat, or ſetting it by hand, communicated by the Rev. Dr. Glaſſe.

"In the year 1789," "ſays the doctor," "I prevailed with Mr. Joſeph Morland, one of the beſt farmers in my neighbourhood, to try, on a ſmall ſcale, the experiment of ſetting wheat by hand, inſtead of ſowing it. In this mode of agriculture, not more than one buſhel an acre is required; whereas, in ſowing, more than two buſhels muſt be uſed. He tried his experiment upon an acre or two; and, the ſeaſon being favourable, the produce was ſuch as he had never before experienced. It was more than 40 buſhels on an acre; being above a fourth beyond the average crop of that year. The ſtraw was remarkably ſtrong; and the wheat, the fineſt ſample, and of the beſt quality, in the market. The perſons employed in ſetting the wheat, were ſome women, of whoſe diligence and handineſs in ſetting beans, he had the moſt experience. He found that five of theſe women would ſet an acre of wheat in a day. The ſoil he uſed was a ſtrong loam, not without a mixture of gravel in ſome parts of it; and it was in good condition.—The next year he planted four or five acres with ſimilar ſucceſs; and he has ſince continued the practice, though on a ſmall ſcale; his farm conſiſting of graſs land, with a diſproportionate quantity of arable. This year he has planted eight acres; and his example has now produced its effect on moſt of his neighbours; one of whom has, this year, ſet by hand 30 acres of wheat, and another as much as 40 acres.—Mr. Morland calculates his average produce from ſet wheat, for 10 years back (the laſt harveſt excepted) to have been 32 buſhels, or four quarters the acre; and that without any extra manure or dreſſing, beyond what a good practical farmer would generally apply; whereas in that country, where the rent of land is about 20*s.* per acre, no extraordinary manure being uſed in either caſe, the average produce of ſown wheat does not exceed 24 buſhels an acre. There is no other difference between the two modes of planting, except that, in the ſet wheat, the farmer may, if he chooſes, keep his land *perfectly clean*, by uſing a ſmall hoe; and may alſo earth up his wheat, if he wiſhes to do it; and that his ſtraw is heavier and better, and of *much more value*, and the ears much longer, than of ſown wheat. The account current between the two modes of planting 40 acres of wheat, ſtands thus; not to mention the increaſed value of ſtraw, and the ſaving of expence in ſowing.

	£	s	d
Saving of ſeed on 40 acres, one buſhel an acre, at 18*s.* per buſhel	36	0	0
Deduct expence of ſetting ditto at 5*s.* per acre	10	0	0
	26	0	0
Add increaſed produce, being eight buſhels per acre, at 18*s.* per buſhel, on 40 acres	288	0	0
	£314	0	0

"Observations.—Of ſetting wheat by hand the apparent, and ordinary, advantages are theſe:

"1ſt. The original ſaving of expence, and of ſeed; being upon 40 acres, at the preſent price of wheat, a clear advantage of 26*l.*—This is a conſiderable object, in time of ſcarcity; for, ſuppoſing the quantity of land cultivated with wheat in England, were not more than 800,000 acres, and half of it proper for this mode of cultivation, it would amount to 400,000 buſhels of wheat; a circumſtance of no ſmall importance at any time, but particularly at the preſent.

"2d. The increaſe of the average produce of corn, being 320 buſhels upon 40 acres. This increaſe of produce, reckoned

upon 400,000 acres, as before ſtated, would be 400,000 quarters of wheat, or 3,200,000 buſhels.

" 3d. The increaſed value of the ſtraw; which ſtands more firm, and is leſs liable to be lodged. The ſtraw is fairer and larger, and fetches a better price at the market, which is a great benefit in the neighbourhood of the metropolis, and of any large towns.

" 4th. The very uſeful and acceptable employment it affords to the poor, particularly to women and children; and the advantage thereby given to cottagers with large families, and to the public in general, by the conſequential ſaving in the poor rates.

" It ſhould be obſerved, that all kinds of land are not adapted to this mode of huſbandry. The ſoil which Mr. Morland choſe for his firſt experiment, was a ſtrong loam, not without a mixture of gravel in ſome parts of it.—As to the expence of labour, five women will eaſily plant an acre in a day. For the ſetting, no line is neceſſary to be drawn; the women are directed to follow what is called the ſeam of the furrow; and they are deſired to make the holes, at the diſtance of two inches, or rather more, in the row; and not to drop more than two ſeeds in each hole. The rows may be ſix or ſeven inches from each other, which will give the ſeed ample room to tiller.

" If this mode of cultivation were adopted in every kind of land, to which it is ſuited, it would ſave many hundred thouſand buſhels of ſeed a-year; it would make an increaſe of one-fourth upon ſuch average crops, and give healthful and ſatisfactory occupation, and means of ſubſiſtence, to thouſands of women and children, at the dead ſeaſon of the year, when there is a general want of employment. It is at this period that moſt women and children conſider themſelves as laid up for the winter, and become a burthen upon the father of the family, and in many caſes upon the pariſh. The wife is no longer able to contribute her ſhare towards the weekly expences, unleſs (which is ſeldom the caſe) ſhe has any peculiar ſkill in knitting, ſpinning, or ſewing, or other merely domeſtic work.—In a kind of deſpondency ſhe ſits down, unable to contribute any thing to the general fund of the family, and conſcious of rendering no other ſervice to her huſband, except that of the mere care of his family." As a gratifying example of a different kind, Dr. Glaſſe ſtates the caſe of his principal labourer; who, in conſequence of adopting this new mode of huſbandry, earned, in October, 26 ſhillings a-week, by the labour of himſelf, his wife, and child; a benefit on his part, which has been attended by a ſaving to the doctor, on the eight acres ſo cultivated, of above eight buſhels of wheat towards his winter ſupply; with a fair and reaſonable proſpect of an increaſed produce, to add to the general ſtock of the country, and to the reſtoration of plenty at the enſuing harveſt.

Dibbling wheat was not attempted on a large ſcale, till an induſtrious farmer, in the vicinity of Norwich, had began to dibble on leſs than an acre of land. The ſucceſs of this experiment induced others to follow his example, and notwithſtanding the ridicule they incurred for adopting ſo ſingular a practice, their crops were not only larger, but likewiſe ſo much ſuperior to thoſe of others, that dibbling has become the practice of every intelligent agriculturaliſt in Norfolk, whence it has ſpread into ſeveral other counties.

From a concluſive experiment made by the Rev. H. J. Cloſe, of Trimley, near Ipſwich, in the years 1783-4, it appears that drilling or dibbling greatly exceeds the broad-caſt huſbandry, on the beſt cultivated ſoils; and, beſides the increaſed produce of grain, many other advantages ariſe from the former method.

Mr. Cloſe employed the frame for ſetting wheat, repreſented in pl. 17.

This implement is two feet two inches wide, and provided with ſeven tines; but Mr. C. has ſince experienced that a frame of ſimilar width, with five tines only, is preferable to one of ſeven.

The lands on which this method may be practiſed with the greater advantage, are either thoſe after a clover-ſtubble, or where trefoil and graſs-ſeed were ſown in the ſpring before the laſt. Theſe, after the uſual manuring, are once turned over by the plough in an extended flag or turf, at ten inches wide, and the wheat is ſet in the manner already deſcribed. By this mode, three pecks of grain are ſufficient for an acre; which, being immediately buried, is equally ſecured againſt the depredations of vermin, or the power of froſt. The regular manner in which it riſes, affords the beſt opportunity of keeping it clear from noxious plants, by weeding or hand-hoeing.

Dibbling is peculiarly beneficial when corn is dear; and, if the ſeaſon be favourable, may be practiſed with great benefit, both to the public and the farmer: as it ſaves ſix pecks of ſeed-wheat per acre; and, if generally adopted, would of itſelf afford bread for more than half a million of people. It ſhould, however, be obſerved, that in ſeaſons when corn is ſold at a low price, or the autumn unfavourable to the practice, it cannot be practiſed with advantage. Thus, in light lands, a very dry ſeaſon prevents dibbling, becauſe the holes will be filled up as ſoon as the inſtrument is withdrawn. In like manner, on ſtrong and ſtiff clays, if it be very wet, the ſeeds in the holes cannot be properly covered by the buſh-harrow.

DICTYS CRETENSIS *(Encycl.)*. There are two anonymous writers ſtill extant, who pretend to have written of the Trojan war previouſly to Homer; one of whom goes under the name of Dictys Cretenſis, the other under that of Dares Phrygius. Before the hiſtory of Dictys are two prefaces; the firſt of which relates, that Dictys wrote ſix volumes of the Trojan war in Phœnician characters, and in his old age, after he was returned to his own country, ordered them, a little before his death, to be buried with him in a leaden cheſt, or repoſitory, which was accordingly done; that, however, after many ages, and under the reign of Nero, an earthquake happened at Gnoſſus, a city of Crete, which uncovered Dictys's ſepulchre, and expoſed the cheſt; that the ſhepherds took it up, and expecting a treaſure, opened it; and that, finding this hiſtory, they delivered it into the hands of ſomebody, who ſent it to Nero, and he ordered it to be tranſlated, or rather tranſ-charactered, from Phœnician into Greek. From which fine ſtory nothing more has been concluded, than that this hiſtory was forged by ſome of Nero's flatterers, purely to curry favour with him: for he always affected a fondneſs for any thing relating to Trojan antiquities; and it is remarkable that, when Rome was in flames, he rejoiced as having ſeen the deſtruction of Troy. The other preface to Dictys is an epiſtle of L. Septimius, the Latin tranſlator, in which he inſcribes it to Arcadius Ruſſinus, who was conſul in the reign of Conſtantine; and tells him much the ſame ſtory of the hiſtory we have already related. As for Dares Phrygius, who is called by Homer, in the 5th book of the Iliad, a prieſt of Vulcan, he is ſaid to have written a hiſtory of the deſtruction of Troy in Greek, which Ælian affirms to have been extant in his time, and which Photius alſo mentions in his Bibliotheca. The original is loſt; but there is a Latin tranſlation of it extant, which Cornelius Nepos is ſaid to have made.

DIE, a town of France, in the department of Drome. It was lately an epiſcopal ſee, and is ſeated on the Drome, 24 mile S.E. of Valence. Long. 5. 23. E. Lat. 44. 42. N.

DIEBURG, a town of Germany, in the electorate of Mentz, 24 miles E.S.E. of Mentz.

DIEPHOLTZ, a town of Weſtphalia, capital of a county of the ſame name, ſubject to the electorate of Hanover. It is ſeated on the lake Dummer, 30 miles N.W. of Minden. Long. 8. 45. E. Lat. 52. 36. N.

DIERDORF, a town of Weſtphalia, with a caſtle, the reſidence of the counts; ſituate on the Wiedbach, eight miles N.N.E. of Coblentz.

DIERICH, a town of the duchy of Luxemburg, and the capital of a juriſdiction; ſituate on the Semoy, 15 miles N.W. of Treves, and 15 N. of Luxemburg. Long. 5. 52. E. Lat. 50. 5. N.

DIERNSTEIN, a town of the archduchy of Auſtria. Near it is a caſtle, in which Richard I. king of England, was impriſoned. It is 38 miles W.N.W. of Vienna. Long. 15. 55. E. Lat. 48. 30. N.

DIESSENHOFFEN, a conſiderable town of Swiſſerland, in Thurgau, ſeated on the Rhine, 5 miles S. of Schaffhauſen. Long. 8. 42. E. Lat. 47. 35. N.

DIEST, a town of Auſtrian Brabant, on the river Demer, 15 miles N.E. of Louvain. Long. 59. E. Lat. 50. 59. N.

DIET *(Encycl.)*. In Dr. Niſbet's Practical Treatiſe on Diet, we find ſome valuable remarks on the fleſh of fowls and other animals commonly uſed as food. Some of theſe we ſhall ſelect for the benefit of our valetudinary readers.

Fowls.—Theſe afford a more wholeſome and delicate diet than quadrupeds. It is eaſier alſo of digeſtion; but they afford at the ſame time a leſs proportion of real nouriſhment. Nor is their nouriſhment ſo general as that of quadrupeds, ſome parts of them being always tough and inſipid, from their manner of life. Of birds, a greater number of the carnivorous kinds are eaten than of quadrupeds; but they are, however, chiefly thoſe that live on fiſh, from which indeed they acquire a peculiar taſte, but this is by no means ſo unpleaſant as that of carnivorous quadrupeds. The time of uſing fowls requires more to be ſtudied than that of quadrupeds, as they are frequently out of ſeaſon, particularly in ſpring, when they pair; and where they are birds of paſſage, or migrate from one place to another, they require ſome reſidence, or to be in caſe, before they are fit for uſe.

Fowls as well as quadrupeds are much improved in ſize and fatneſs by domeſtication; but this is of two kinds: the firſt is making them familiar, and allowing them to feed as they pleaſe, which in the hen kind is known by what are called barn-door fowls—the other is properly cramming them, that is, ſhutting them up for the ſole purpoſe of feeding. Theſe arts of feeding no doubt give more ſucculence and tenderneſs to the food, and increaſe its alkaleſcency. From giving ſucculency they are an improvement; but from increaſing alkaleſcency, they render the food more unfit for weak ſtomachs and convaleſcents, by whom this ſpecies of food is much uſed, though at the ſame time they render it more eaſy of ſolution. Exerciſe is neceſſary to give perfection to all food, for by this means the fat of the animal is equally diſperſed through the muſcular parts; while, when fatted haſtily, it is accumulated in the cellular membrane. By the domeſtication, alſo, of fowls in general, their peculiar flavour, on which their excellence depends, is leſſened; and by cramming them it becomes entirely loſt. Hence alſo, unleſs their fibres are very tough, roaſting is to be preferred to boiling them, on the ſame account.

Salmon.—The ſalmon is a very extenſive article of food, and is uſed in three ways, either freſh, cured, or ſmoked. It is of a tender ſubſtance, ſufficiently ſucculent and nouriſhing, but at the ſame time ſomewhat oily, and therefore heavy on the ſtomach. It differs in its richneſs and alkaleſcency according to the particular places in which it is taken. When middle-aged it is in moſt perfection, and it ſhould neither be eaten too young nor too old.

Salmon trout differs chiefly in being ſoft and gelatinous.

Pike.—This is a fiſh of prey, and feeds on the ſmaller ſpecies. Hence it is termed the water wolf. Its fleſh is ſhort, compact, and cloſe in its parts. The river pike is the beſt of this ſpecies, and conſidered as the leaſt heating, though ſomewhat hard of digeſtion, and lying heavy on the ſtomach. It differs, however, much in different countries. It is alſo beſt in the winter ſeaſon. This fiſh has been recorded as very long lived; a fact confirmed by the ſtory of the one thrown into a pond by the emperor Frederick the Second, with a braſs ring about its neck, which was caught two hundred and ſixty-two years afterwards. The truth of this, however, may be called in queſtion.

Carp.—The carp is a fiſh very long lived, and was firſt introduced into Britain in 1514. Like the pike, the river carp is the beſt. It often grows to an amazing ſize, and has been known to weigh two hundred pounds weight. It is beſt food in March, May, and June. It is not ſo denſe as the pike, and therefore eaſier of digeſtion. The older it is, it becomes the firmer, better taſted, and more wholſome. From the ſpawn of this fiſh is made the caveare, a diſh much uſed by the Jews. This fiſh can be made to live a conſiderable time out of water, and will even, by a particular mode of treatment, grow fat.

Perch.—The perch is a food ſuperior to the two former, and is of two ſorts, the river and ſea perch. It is of a firm texture, but a tender ſubſtance, eaſily ſoluble, not glutinous, not heating, nor remarkably ſtimulant. When young its flavour is beſt, which it loſes by age, and becomes rather ill-taſted. The beſt for uſe are the middle-aged. They ſhould never be uſed in the months of March or April, which is the ſpawning time. They are beſt caught in clear water, for marſhes and muddy places vitiate their flavour.

Whiting.—The whiting is a ſea fiſh, tender, white, and delicate, with little gluten or viſcidity, and therefore proper for the moſt weakly ſtomachs, conveying little ſtimulus to the ſyſtem. The beſt ſort are ſhort, and they are much valued as an article of food.

Haddock—Is a ſea fiſh, and much reſembles the whiting, but is firmer in its texture, and in general much larger in ſize. It is caught in high perfection in different parts on the coaſt of Britain, particularly in the month of January.

Cod.—The cod is alſo a ſea fiſh, of a more denſe and glutinous texture than the two former, and its delicate parts are the glutinous ones about the head and the ſounds. It is uſed of three kinds—the freſh cod, the green or white cod, and the dried or cured cod—the difference lying in the preparation of the two laſt, the one being ſalted and barrelled for uſe, the other being ſalted, and dried in the ſun, or ſmoked. The green cod generally comes from Newfoundland; the dry cod, again, is taken on the coaſt of Placentia and Scotland. Both theſe kinds require to have their ſalt much extracted, by immerſion in water, before being uſed. The pickle of cod is frequently uſed as an external application of a diſſolving nature.

Eels.—Theſe have no exerciſe, are fat and ſlimy; they contain much nouriſhment, but are difficultly perſpirable; they are well taſted, but, from their viſcidity, are apt to lie heavy on the ſtomach. They are dreſſed in a variety of ways, but are lighteſt when roaſted, and ſhould be well ſeaſoned with condiment, particularly vinegar and horſeradiſh, for when long retained on the ſtomach they become heating and oppreſſive. The beſt kind are taken in clear water. They are very retentive of life, and have been known to live five or ſix days out of water. From the ſkin a mucilage is made, reckoned of ſovereign virtue, by the vulgar, in ſwellings.

Tench.—The tench is a fiſh of a delicate taſte. It feeds generally in muddy places, and is ſaid to be the only fiſh that

the pike ſpares. When it can be procured from clear water the flavour is always ſuperior. It was much under-rated by the ancients, but in modern times it is eſteemed equal to carp. Its name it derives from the peculiarity of its colour.

Trout.—Of this fiſh there are a great variety, but the ſalmon trout is the beſt, being ſoft and gelatinous, and at the ſame time ſomewhat ſtimulant and alkaleſcent. All trout, indeed, are a very putreſcent food, and therefore eaſy of digeſtion. They ſhould be eaten in their freſheſt ſtate, and taken, if poſſible, from running water. They are beſt in ſummer, for then they are in beſt condition, and their flavour moſt delicate.

Corſtorphine Cream.—Beſides cheeſe, another form in which the curd is uſed in one part of Scotland, is in what is termed corſtorphine cream. This is made by filling a veſſel with ſkimmed milk, which has a hole in its bottom ſtopped with a peg; this veſſel is placed within another filled with boiling water; and when this is done, it is allowed to remain in this ſituation for a day or two, according to the ſtate of the weather; at the end of this period a coagulation of the milk has taken place, and the watery part of it ſubſided to the bottom. This watery part is then drawn off by opening the peg at the bottom of the veſſel, and being again ſtopped up, the ſame operation is continued for twenty-four hours longer, when an additional water is again drawn off, and the conſiſtence of the curd is thus rendered pretty thick; it is then agitated briſkly with a wooden ſtick, and made fit for uſe. This form of curd is much uſed in the neighbourhood of Edinburgh; it forms an aliment tolerably nouriſhing, and in ſummer, from its proportion of acidity, is gratefully acid and cooling.

Rice.—This grain is the chief ſupport of the greateſt part of Aſia, is the general vegetable aliment of the Eaſt, and has been even long employed in Europe for the ſame purpoſe. The peculiar qualities of this grain are not eaſily aſcertained. It diſcovers little ſweetneſs, and it is not much diſpoſed either to aceſcency or fermentation. But from its effects it is evident its nouriſhing parts muſt be in great proportion. Of all the grains it is certainly the moſt innocent, and the moſt uſeful in the caſe of invalids: it contains a thin, light and very ſoluble mucilage, which not being ſo diſpoſed to acidity as the other mucilages of grain, is therefore leſs flatulent, and ſits eaſy on the ſtomach. It has been ſuppoſed to poſſeſs ſomething of an aſtringent quality, and has therefore been ordered as a common remedy in bowel complaints; but it ſhews no marks of an aſtringent quality when put to the teſt; and its good effects can, therefore, only ariſe from its demulcent nature, as blunting acrimony, and ſoothing irritation. The nutritious quality of rice has been ſuppoſed by ſome, attended with one noxious quality, viz. being hurtful to the eyes, on no rational or ſatisfactory foundation. The weakneſs of ſight, and blindneſs of the Chineſe, has been indeed aſcribed to the frequent uſe of hot rice; but how this can operate, it is impoſſible to conceive, or in what manner it ſhould differ, boiled, or in this different ſtate, excepting in temperature and ſoftneſs, which can only increaſe its ſolubility in the ſtomach. The ſource of impaired viſion, therefore, is more to be ſought for in the abuſe of venery among that people, with their immoderate indulgence in tea, and in other narcotic and aromatic ſtimulants.

Rice is uſed in a variety of ways—in jelly, or decoction, which is made with it in the ſame way as with barley and oats, or other grain. Its chief conſumption, however, is in puddings, and it is uſed as an ingredient in ſtews. Lately an attempt has been made, by mixing it with wheat, to form it into bread, in the proportion of three parts of wheat, to one of rice; and one peculiar quality it is ſaid to poſſeſs, that its mixture corrects bad wheat flour. In this climate, rice is generally very quickly digeſted, and the return of appetite takes place ſoon after its uſe. In the warmer climates, however, from the relaxed, debilitated ſtate of the ſtomach of the inhabitants, it is found neceſſary, in order to prevent its lying long upon them, to conjoin it with a conſiderable quantity of ſtrong ſpices. This grain is very much uſed in Carolina, and no bad conſequence is found to follow it; a proof of the inſufficient grounds on which its tendency to produce blindneſs is built.

On the whole, this grain, both for extent of produce, its proportion of nouriſhment, and its goodneſs, is preferable to all others; its flour being finer, and its texture more tender than any of them, which is particularly apparent by macerating the different grains in water, for of all of them the rice ſwells to the largeſt ſize; a proof of its parts are more intimately divided.

Potatoe.—As an intermediate ſubſtance between the farinaceous ſeeds and roots, we have placed here, though properly belonging to the roots, the potatoe.

The potatoe was firſt introduced into Europe in 1486, by Sir Francis Drake, and is originally a native of Peru; where, unleſs reared under a particular management, by little expoſure to the ſun, it poſſeſſes much of the quality of the nightſhade, to which ſpecies it belongs. The potatoe is now a root of the firſt importance in Europe, as affording a mild wholſome nouriſhment; and next to the grains, it is moſt uſed of any vegetable production. The attention paid to its cultivation has produced a great many varieties of it; and they may be yet increaſed from the ſeed contained in the apples; but this variety differs only in the proportion each poſſeſſes of its conſtituent parts. The light, mealy potatoes are the beſt. The conſtituent parts of this root, when examined, conſiſt: 1. of a dry powder, or ſtarch, as in grains: 2. a fibrous matter, of a grey colour, ſimilar to the roots of pot-herbs: and 3, a mucilage, reſembling that of the eſculent plants. By the proceſs of boiling, theſe parts become intimately blended, have their ſolubility increaſed, and become eaſier digeſted. This root, in many countries, affords the chief proportion of their nouriſhment; a proof of its wholſomeneſs and alimentary quality, for both men and animals are known to get fat under its uſe; though, in proportion to bulk, it does not afford the ſame quantity of nouriſhment as the grains. From its poſſeſſing ſuch a large proportion of watery parts, nearly one half, it cannot fail to be eaſily digeſted, and to paſs in a very ſhort time into chyle. Hence it is by no means of itſelf a permanent nouriſhment, and the appetite ſooner returns after it than after moſt other kinds of diet. Flatulence and heartburn are alſo very ſeldom known to ariſe from it, though continued in very great quantities; and in many caſes where vegetable diet comes to be preſcribed, it has been the only ſubſtance found to agree. From its conſtituting an article in ſuch general uſe, it has come to be prepared in a variety of forms. It is uſed in bread, its flour is employed in paſtry, and it is alſo converted by the French into a ſago and ſalop.

Though we have mentioned the potatoe as a root, it is not properly the root of the plant, but rather a ſort of underground fruit, produced upon a confined branch. The real roots do not produce potatoes; they only ſerve the purpoſe of drawing nouriſhment from the ſoil, as the leaves above extract it from the atmoſphere. The potatoe below, and the apple above, are in fact the ſame; but being in different elements, they aſſume different appearances. The one ſeems to be intended for the preſervation of the ſpecies, the other for the food of animals. Such is the prolific nature of this vegetable, that from one large potatoe, 8ſt. 8lb. of good ſizeable ones have been produced. As an article of ſuſtenance, the potatoe is greatly recommended by its palatable nature,

and by its being reared at little expence. Hence it is well ſuited as a proviſion for the poor. Potatoes are never unwholſome but from being reared in a bad ſoil, improperly preſerved, or eaten to exceſs; circumſtances which can all be eaſily guarded againſt. Given raw, they have been found highly uſeful in ſcorbutic complaints.

By ſome authors, potatoes have been conſidered as poſſeſſed of noxious qualities. But experience gives no ſanction to this opinion; and had it been juſt, the truth of it muſt have been completely eſtabliſhed long before this time in an article which forms ſo much the diet of the poor in every country, and eſpecially in Ireland, where, on the contrary, the moſt healthy people are reared.

Muſhrooms.—Where muſhrooms prove deleterious, the firſt ſenſations they produce are qualmiſhneſs, which ſoon increaſes to violent ſickneſs: this is ſucceeded by giddineſs, a palpitation of the heart, and fluſhing heat of the ſkin; with more or leſs redneſs of it. Swelling of the face alſo enſues, and ſometimes a ſenſation all over the body, as if a general fulneſs or ſwelling prevailed. The patient ſtares in an unuſual manner. All objects appear different from what they did before, a difficulty of breathing enſues, and the mind is ſtrangely confuſed. Delirium and convulſions have been alſo known as frequent conſequences of this attack. In other caſes where the ſymptoms are mild, and do not appear for a good many hours after eating them, the ſickneſs ends in cholera morbus, on the termination of which, the patient generally falls into a ſound ſleep, or a ſomewhat comatoſe ſtate.

To relieve theſe ſymptoms as ſpeedily as poſſible, the clearing the ſtomach of its noxious contents ſhould be the firſt ſtep; and the beſt emetic for this purpoſe is ten grains of the vitriolated zinc, which may even be repeated if the ſickneſs does not abate. The emetic is then to be ſucceeded by the vegetable acids, which ſhould be given in pretty conſiderable quantity, either in the form of vinegar or lemon-juice. Theſe will be found an antidote againſt what remains of the poiſon.

Tea.—Tea is the dried leaves of a ſhrub, the produce of China and Japan. It is divided into two varieties, green and bohea, which vary ſomewhat in their particular flavour and taſte, though they agree in the general qualities of being ſlightly aſtringent, bitteriſh, and aromatic. In their recent ſtate they are poſſeſſed of a ſtrong, narcotic property, which is carefully diminiſhed by maceration and drying, ſo that the acrid juice in which it reſides comes to be conſiderably diſſipated. They are dried on iron plates, from a part of ſome tincture of which their aſtringent quality is derived; and ſo dangerous are they held by the Chineſe, as not to be uſed for a twelvemonth after they are plucked. Thus only by a preparatory proceſs are they rendered at all fit for the purpoſe of diet.

Tea was firſt imported into Britain about the year 1666, and was confined for ſome time to the tables of the people of faſhion; but in conſequence of the pleaſantneſs of its flavour and its faſcinating effects, it ſoon gained a preference over every other diluent beverage, and came into general uſe. Hence it has ſhared the fate of all articles in univerſal demand. Its qualities have been ſophiſticated, and it has received additions, altering its nature in ſome degree from what it was on its firſt importation. Theſe additions conſiſt, firſt in concealing a deficiency of natural flavour, or aromatic part, by the olla fragrans; ſecondly, from leſs attention being paid to the periods of gathering it; and thirdly, from care being employed in the time of curing it, or preparing it for uſe.

The general effects of no dietetic article are perhaps ſo little determined as thoſe of tea. By one party it is deſcribed as a poiſon, by another it is extolled as a medicine of the firſt virtues. Truth, however, ſeldom lies in extremes; and in order to form a juſt opinion of this important ſubject, we ſhould examine, firſt, its effects in a ſtate of concentration; ſecondly, in the form it is moſt uſed; and thirdly, trace the different ſituations of thoſe who uſe it. With reſpect to the firſt, we find that, formed into an extract, or with its juice inſpiſſated, it has been known to kill in the quantity of a few grains. The diſtilled water has been attended with the ſame fatal conſequences, or, if not extinguiſhing life, it has produced incurable palſy. Even the effluvia of this herb, long ſmelt at, has been known to produce apoplexy; and ſeveral tea-brokers, who are accuſtomed to ſmell every box that is opened, have fallen victims to their profeſſion in this way. Theſe facts then ſufficiently prove the powerful narcotic qualities of this plant, when employed in ſufficient ſtrength, or in a concentrated ſtate. Experiments alſo made with it on ſmall animals have produced the ſame fatal iſſue, and that in a very ſhort ſpace of time after the application of the infuſion. The green tea ſeems alſo the moſt powerful, or poſſeſſes the greateſt proportion of that active principle on which theſe effects depend. Indeed all the high-flavoured teas poſſeſs it in an eminent degree. In the common form of infuſion in which tea is employed for dietetic uſe, none of theſe conſequences ariſe. In the Eaſt it has been uſed in this form from time immemorial; but in England it did not become common till after the reſtoration, when it was introduced at court by Katherine of Portugal. From this time it has gradually come into general uſe, ſo much ſo, that the importation from China in 1777, was upwards of ſixteen millions of pounds, and from that time to the preſent it has increaſed to no leſs than thirty millions. On its firſt uſe, it was generally prepared in decoction, or boiled in a kettle, either in milk or water, the Eaſtern method; but by this preparation its aromatic quality was conſiderably impaired. The infuſion, therefore, in Europe, though different from the Eaſtern method, has been preferred; and by this infuſion its narcotic quality is, perhaps, retained more ſtrongly than when part is diſſipated by boiling.

The excellence of this infuſion will depend on three circumſtances, the degree of heat of the water employed, the ſoftneſs or quality of the water, and the time allotted for the infuſion.

With reſpect to the firſt, the water ſhould always be brought to the boiling point, and continued as nearly as poſſible in that degree of temperature; in regard to the ſecond, the water ſhould be mixed as little as poſſible with any adventitious particles of a ſaline or mineral nature; and with reſpect to the third, the veſſel employed ſhould be ſo large as to keep the infuſion of an equal ſtrength.

The effects of tea drunk in this way are to increaſe the digeſtive action of the ſtomach, and to augment the appetite. Hence it is particularly uſeful where the ſtomach is overloaded, and nouriſhment is taken to exceſs; but in the ſame way, where nouriſhment is deficient, or where the ſtomach is unable to receive it, like all other powerful ſtimulants, it muſt tend to injure the organ, and ſhew all the bad conſequences of its narcotic quality, in exciting various morbid affections of the nervous ſyſtem. It is in this way that its introduction into Europe has proved ſo pernicious to the lower ranks of ſociety. Inſtead of an auxiliary to diet, as it ought to be, it has come to conſtitute the principal part of it, and is drunk at all times of the day, and in ſuch a ſtate of concentration as to act as a real poiſon upon the body. Indeed to this herb, more than to any other cauſe, we may attribute that change in the conſtitution of the inhabitants of this country, which has diſplayed itſelf ſo remarkably within this century. Formerly nervous complaints were little known or underſtood, now they are moſt frequently met with; nor can they be attributed to any other cauſe, as the introduction of no other dietetic article has

been in equal extent within ſuch a ſhort period of time. The higheſt degree of theſe complaints, palſy, we find increaſed as four to one within the laſt thirty years. Hence the uſe of this article requires more caution, and attention to counteract its pernicious conſequences, than any other with which we are acquainted. Theſe conſequences ſteal on by degrees: it affords a beverage faſcinating to the taſte; it excites a momentary hilarity of ſpirits after its uſe, and it is not till after ſome hours of enjoyment of this exhilarating ſtate that the faintneſs and ſinking, correſpondent to the previous excitement, enſue, which calls anew for the ſame repetition of it, or ſome other ſtimulant, to produce a ſimilar effect. The drinking of tea, therefore, ſhould only be conjoined with a due proportion of nouriſhment. Its narcotic effects ſhould be corrected by boiling rather than infuſion; and in ſome countries it is common to correct this effect by its junction with certain aromatic or ſweet herbs. It is rendered grateful to the taſte by the addition of milk and ſugar, which ſhould always bear a greater proportion in the making of it than they at preſent do.

Dr. Niſbet extends his remarks to various other articles of diet, with which it may be the intereſt of many to make themſelves acquainted; for theſe, however, we refer to the doctor's treatiſe.

DIEU (Lewis de), miniſter of Leyden, and profeſſor in the Walloon College of that city, was a man of great abilities, and uncommonly verſed in the Oriental languages. He was born April 7, 1590, at Fluſhing, where his father, Daniel de Dieu, was miniſter. Daniel was a man of great merit, and a native of Bruſſels, where he had been a miniſter 22 years. He removed from thence in 1585, to ſerve the church at Fluſhing, after the Duke of Parma had taken Bruſſels. He underſtood Greek and the Oriental languages; and he could preach with the applauſe of his auditors in German, Italian, French, and Engliſh. The churches of the Netherlands ſent him, in 1588, over to Queen Elizabeth, to inform her of the deſigns of the Duke of Parma, who ſecretly made her propoſals of peace, though the King of Spain was equipping a formidable fleet againſt England.—Lewis ſtudied under Daniel Colonius, his uncle by his mother's ſide, who was profeſſor at Leyden in the Walloon College. He was two years miniſter of the French church at Fluſhing; and might have been court-miniſter at the Hague, if his natural averſion to the manners of a court had not reſtrained him from accepting that place. He thought the poſt which was offered him more proper for a man in years than a ſtudent. The prince commended his modeſty and prudence. He was called to Leyden in 1619, to teach, with his uncle Colonius, in the Walloon College; and he diſcharged the duty of that employment with great diligence till his death, which happened in 1642. He refuſed the poſt of divinity-profeſſor in the new univerſity of Utrecht; and, if he had lived long enough, he would have had the ſame poſt in that of Leyden. He married the daughter of a counſellor of Fluſhing, by whom he had eleven children.

He publiſhed, in 1631, "A Commentary on the Four Goſpels, and Notes on the Acts of the Apoſtles." His firſt care had been to examine the Latin verſions of the "Syriac New Teſtament," made by Tremellius and Guido Fabricius Boderianus; and that of St. Matthew's Goſpel in Hebrew, made by Munſter and Mercerus. He publiſhed alſo the "Revelation of St. John," which he printed both in Hebrew and Syriac characters, with a Latin verſion of his own. He publiſhed the "Hiſtory of the Life of Jeſus Chriſt," written in the Perſian tongue by the Jeſuit Jerom Xavier, with learned notes; and he joined to the original a Latin tranſlation. "The Hiſtory of St. Peter," written in the Perſian language, was alſo publiſhed by him, with a Latin tranſlation and notes. He drew up likewiſe "Rudiments of the Hebrew and Perſian Tongues, and a Parallel of the Grammar of the Oriental Tongues." Some things alſo of ſmaller note were publiſhed by his friends after his death.

DIEUZE, a town of France, in the department of Meurthe, remarkable for wells of ſalt water, which produce much ſalt. It is ſeated on the Scille, 22 miles N.E. of Nanci. Long. 6. 45. E. Lat. 48. 53. N.

DIEXAHEDRIA, in natural hiſtory, a genus of pellucid and cryſtalliform ſpars, compoſed of two pyramids, joined baſe to baſe, without any intermediate column: the diexahedria are dodecahedral, or compoſed of two hexangular pyramids.

DIEZ, St. a town of France, in the department of the Voſges. It had lately a celebrated chapter, whoſe canons were obliged to produce proofs of nobility. It is ſeated on the Meurthe, 30 miles S.E. of Luneville. Long. 7. 4. E. Lat. 48. 20. N.

DIGBY (Sir Everard), an Engliſh gentleman, memorable for the ſhare he had in the powder-plot, and his ſuffering on that account, was deſcended from an ancient family, and born ſome time in 1581. His father, Everard Digby, of Dryſtoke in Rutlandſhire, eſq. was a perſon of great worth and learning, had his education in St. John's College, Cambridge, where he took the degree of M.A. and publiſhed ſeveral treatiſes, ſome on learned, others on curious ſubjects: as, 1. Theoria Analytica, viam ad Monarchiam Scientiarum Demonſtrans, 1579. 2. De Duplici Methodo Libri duo, Rami Methodum Refutantes, 1580. 3. De Arte Natandi, Libri duo, 1587. 4. A Diſſuaſive from taking away the Goods and Livings of the Church. His ſon, of whom we are ſpeaking, was educated with great care, but under the tuition of ſome Popiſh prieſts, who gave him thoſe impreſſions which his father, if he had lived, might probably have prevented; but he died when his ſon was no more than eleven years of age. He was brought very early to the court of Queen Elizabeth, where he was much taken notice of, and received ſeveral marks of her majeſty's favour. On the coming in of King James, he went likewiſe to pay his duty, as others of his religion did: was very graciouſly received; and had the honour of knighthood conferred upon him, being looked on as a man of fair fortune, pregnant abilities, and a court-like behaviour. He married Mary, daughter and ſole heireſs of William Mulſho, eſq. of Gothurſt in Buckinghamſhire, with whom he had a great fortune, which, with his own eſtate, was ſettled upon the children of that marriage. He was drawn in to be privy to the gunpowder-plot; and though he was not a principal actor in this dreadful affair, or indeed an actor at all, yet he offered 1500l. towards defraying the expences of it; entertained Guy Fawkes, who was to have executed it, in his houſe; and was taken in open rebellion with other Papiſts after the plot was detected and had miſcarried. Upon his commitment to the Tower, he perſiſted ſteadily in maintaining his own innocence as to the powder-plot, and refuſed to diſcover any who were concerned in it; but when he was brought to his trial at Weſtminſter, Jan. 27, 1605-6, indicted for being acquainted with and concealing the powder-treaſon, taking the double oath of ſecreſy and conſtancy, and acting openly with other traitors in rebellion, he pleaded guilty. After this, he endeavoured to extenuate his offence; and then requeſted, that, as he had been alone in the crime, he might alone bear the puniſhment, without extending it to his family; and that his debts might be paid, and himſelf beheaded. When ſentence of death was paſſed, he ſeemed to be very much affected; for, making a low bow to thoſe on the bench, he ſaid, "If I could hear any of your lordſhips ſay you forgave me, I ſhould go more cheerfully to the gallows."

To this all the lords anſwered, " God forgive you, and we do." He was, with other conſpirators, upon the 30th of the ſame month, hanged, drawn, and quartered, at the weſt end of St. Paul's church in London; where he aſked forgiveneſs of God, the king, the queen, the prince, and all the parliament; and proteſted, that, if he had known this act at firſt to have been ſo foul a treaſon, he would not have concealed it to have gained a world, requiring the people to witneſs, that he died penitent and ſorrowful for it. Wood mentions a moſt extraordinary circumſtance at his death, as a thing generally known; namely, that when the executioner plucked out his heart, and according to form held it up, ſaying, " Here is the heart of a traitor," Sir Everard made anſwer, " Thou lyeſt." But perhaps, as generally as it was known then, perſons may be found in this incredulous age, that would hardly believe it, even if Wood himſelf had actually aſſerted it.

Sir Everard left at his death two young ſons, afterwards Sir Kenelm and Sir John Digby; and expreſſed his affection towards them by a well-written and pathetic paper, which he deſired might be communicated to them at a fit time, as the laſt advice of their father. While he was in the Tower, he wrote, in juice of lemon or otherwiſe, upon ſlips of paper, as opportunity offered; and got theſe conveyed to his lady by ſuch as had permiſſion to ſee him. Theſe notes, or advertiſements, were preſerved by the family as precious relics; till, in 1675, they were found at the houſe of Charles Cornwallis, Eſq. executor to Sir Kenelm Digby, by Sir Rice Rudd, bart. and William Wogan, of Gray's-Inn, eſq. They were afterwards annexed to the proceedings againſt the traitors, and other pieces relating to the Popiſh plot, printed by the orders of Secretary Coventry, dated Dec. 12, 1678.

Digby (Lord George), an Engliſh nobleman of great parts, was ſon of John Digby earl of Briſtol, and born at Madrid in Oct. 1612. In 1626 he was entered at Magdalen College in Oxford; where he lived in great familiarity with the well-known Peter Heylin, and gave manifeſt proofs of thoſe great endowments, for which he was afterwards ſo diſtinguiſhed. In 1636 he was created M.A. there, juſt after Charles I. had left Oxford; where he had been ſplendidly entertained by the univerſity, and particularly at St. John's College, by Dr. Laud, afterwards Archbiſhop of Canterbury. In the beginning of the long parliament, he was diſaffected to the court, and appointed one of the committee to prepare a charge againſt the Earl of Strafford, in 1640; but afterwards would not conſent to the bill, " not only," as he ſaid, " becauſe he was unſatisfied in the matter of law, but for that he was more unſatisfied in the matter of fact." From that time he became a declared enemy to the parliament, and ſhewed his diſlike of their proceedings in a warm ſpeech againſt them, which he made at the paſſing of the bill of attainder againſt the ſaid earl, in April 1641. This ſpeech was condemned to be burnt, and himſelf, in June following, expelled the Houſe of Commons. Jan. 1641-2, he went on a meſſage from his majeſty to Kingſton upon Thames, to certain gentlemen there, with a coach and ſix horſes. This they improved into a warlike appearance; and accordingly he was accuſed of high-treaſon in parliament, upon pretence of his levying war at Kingſton upon Thames. Finding what umbrage he had given to the parliament, and how odious they had made him to the people, he obtained leave, and a licence from his majeſty, to tranſport himſelf into Holland; whence he wrote ſeveral letters to his friends, and one to the queen, which was carried by a perfidious confidant to the parliament, and opened. In a ſecret expedition afterwards to the king, he was taken by one of the parliament's ſhips, and carried to Hull; but being in ſuch a diſguiſe that not his neareſt relations could have known him, he brought himſelf off very dexterouſly by his artful management of the governor Sir John Hotham. In 1643 he was made one of the ſecretaries of ſtate to the king, and high-ſteward of the univerſity of Oxford, in the room of William lord Say. In the latter end of 1645 he went into Ireland, and expoſed himſelf to great hazards of his life, for the ſervice of the king: from thence he paſſed over to Jerſey, where the Prince of Wales was, and after that into France, in order to tranſact ſome important matters with the queen and Cardinal Mazarine. Upon the death of the king, he was exempted from pardon by the parliament, and obliged to live in exile, till the reſtoration of Charles II. when he was reſtored to all he had loſt, and made knight of the Garter. He became very active in public affairs, ſpoke frequently in parliament, and diſtinguiſhed himſelf by his enmity to Clarendon while Chancellor. He died at Chelſea, March 20, 1676, after ſucceeding his father as Earl of Briſtol.

Many of his ſpeeches and letters are ſtill extant, to be found in our hiſtorical collections. There are alſo letters of his to his couſin Sir Kenelm Digby againſt Popery, mentioned in the preceding article; yet afterwards he became a Papiſt himſelf; which, with ſeveral other inconſiſtencies in his character, has been ſeverely cenſured.

Digby (John), earl of Briſtol, and father of the Lord George Digby, was by no means an inconſiderable man, though checked by the circumſtances of his times from making ſo great a figure as his ſon. He was deſcended from an ancient family at Coleſhill in Warwickſhire, and born in 1580. He was entered a commoner of Magdalen College, Oxford, in 1595; and, the year following, diſtinguiſhed himſelf as a poet by a copy of verſes made upon the death of Sir Hen. Unton, of Wadley in Berks. Afterwards he travelled into France and Italy, and returned from thence perfectly accompliſhed: ſo that, ſoon falling under the notice of King James, he was admitted gentleman of the privy-chamber, and one of his majeſty's carvers, in 1605. February following he received the honour of knighthood; and, in April 1611, was ſent ambaſſador into Spain, as he was afterwards again in 1614. April 1616, he was admitted one of the king's privy-council, and vice-chamberlain of his majeſty's houſehold; and in 1618, was advanced to the dignity of a baron, by the title of Lord Digby, of Sherborne in Dorſetſhire. In 1620 he was ſent ambaſſador to the Archduke Albert, and the year following to Ferdinand the emperor; as alſo to the Duke of Bavaria. In 1622 he was ſent ambaſſador-extraordinary to Spain, concerning the marriage between Prince Charles and Maria daughter of Philip III. and the ſame year was created Earl of Briſtol. Being attacked, after his return to England, by that overbearing man the Duke of Buckingham, he repelled and worſted him; and ſhone greatly among the diſcontented in parliament. But the violences of that aſſembly ſoon diſguſting him, he left them, and became a zealous adherer to the king and his cauſe; for which at length he ſuffered exile, and the loſs of his eſtate. He died at Paris, Jan. 21, 1652-3.

He was the author of ſeveral works. Beſides the verſes above mentioned, he compoſed other poems; one of which, an air for three voices, was ſet by H. Lawes, and publiſhed in his Airs and Dialogues, at London, in 1653. 1. A Tract, wherein are ſet down thoſe Motives and Ties of Religion, Oaths, Loyalty, and Gratitude, which obliged him to adhere unto the King in the late unhappy Wars in England. 2. A Tract, wherein he vindicateth his Honour and Innocency from having in any Kind deſerved that injurious and mercileſs Cenſure, of being excepted from Pardon and Mercy either in Life or Fortunes. 3. An Appendix to the firſt tract. Theſe two tracts which have the general title of his Apology, toge-

ther with the appendix, and two of his ſpeeches in parliament, were printed at Caen, in 1647, and reprinted in 1656. The firſt ſpeech was upon May 20, 1642, concerning an Accommodation of Peace and Union between the King and his two Houſes of Parliament; and the ſecond was upon June 11 following, in vindication of it. There are alſo extant other ſpeeches of his; one particularly at the Council-Table at Oxford in 1642, in Favour of the Continuance of the War with the Parliament. It was ſpoken after Edge-Hill fight, and publiſhed at London the ſame year. He alſo publiſhed at Caen, in 1647, An Anſwer to the Declaration of the Houſe of Commons; Feb. 11, 1648, againſt making any more Addreſſes to the King; and dedicated it to his good countrymen of England, and fellow-ſubjects of Scotland and Ireland. Several letters of this lord are to be found in the Cabala.

Beſides theſe treatiſes in the political way, he was, in the earlier part of his life, the author of a work of a very different nature, namely, a tranſlation of Peter du Moulin's book, entitled, A Defence of the Catholic Faith, contained in the Book of King James againſt the Anſwer of N. Coeffeteau, &c. 1610. He probably undertook this laborious and, as one ſhould think, diſagreeable taſk, at the requeſt of that pedantic and theological monarch; at leaſt, with a view of currying favour with him. The dedication, however, to the king is not in his own name, but in that of J. Sandford, his chaplain.

DIGGES (Leonard), an Engliſh gentleman famous for his mathematical learning, was deſcended from an ancient family, and born at Digges-Court in the pariſh of Barham in Kent; but we know not in what year. He was ſent to Univerſity College in Oxford, where he laid a good foundation of learning; and retiring from thence without a degree, proſecuted his ſtudies, and compoſed the following works: namely, 1. Tectonicum; briefly ſhewing the exact Meaſuring, and ſpeedy Reckoning of all Manner of Lands, Squares, Timbers, Stones, Steeples, &c. 1556, 4to. Augmented and publiſhed again by his ſon Thomas Digges, 1592, 4to.; and reprinted there in 1647, 4to. 2. A geometrical practical Treatiſe, named Pantometria, in three books. This he left in MS. but, after his death, his ſon ſupplied ſuch parts of it as were obſcure and imperfect, and publiſhed it in 1591, folio; ſubjoining, A Diſcourſe geometrical of the five regular and platonical Bodies, containing ſundry theoretical and practical Propoſitions, ariſing by mutual Conference of theſe Solids, Inſcription, Circumſcription, and Transformation. 3. Prognoſtication everlaſting of right good Effect: or, Choice Rules to judge the Weather by the Sun, Moon, and Stars, &c. 1555, 1556, and 1564, 4to. corrected and augmented by his ſon, with divers general tables, and many compendious rules, 1592, 4to. He died about 1574.

DIGGES (Thomas), only ſon of Leonard Digges, after a liberal education, went and ſtudied for ſome time at Oxford; and by the improvements he made there, and the inſtructions of his learned father, became one of the greateſt mathematicians of his age. When Queen Elizabeth ſent ſome forces to aſſiſt the oppreſſed inhabitants of the Netherlands, Digges was appointed muſter-maſter-general of them; by which he had an opportunity of becoming ſkilled in military affairs. Beſides the reviſing, correcting, and enlarging ſome pieces of his father's already mentioned, he wrote and publiſhed the following learned works himſelf: namely, 1. Alæ ſive Scalæ Mathematicæ: or Mathematical Wings or Ladders, 1573, 4to. This book contains ſeveral demonſtrations for finding the parallaxes of any comet, or other celeſtial body, with a correction of the errors in the uſe of the radius aſtronomicus. 2. An arithmetical-military Treatiſe, containing ſo much of Arithmetic as is neceſſary towards Military Diſcipline, 1579, 4to. 3. A geometrical Treatiſe, named Stratioticos, requiſite for the Perfection of Soldiers, 1579, 4to. This was begun by his father, but finiſhed by himſelf. They were both reprinted together in 1590, with ſeveral amendments and additions, under this title: An arithmetical warlike Treatiſe, named Stratioticos, compendiouſly teaching the Science of Numbers, as well in Fractions as Integers, and ſo much of the Rules and Equations algebraical, and Art of Numbers coſſical, as are requiſite for the Profeſſion of a Souldier. Together with the Moderne militaire Diſcipline, Offices, Lawes, and Orders in every well-governed Campe and Armie, inviolably to be obſerved. At the end of this work there are two pieces; the firſt entitled A briefe and true Report of the Proceedings of the Earle of Leyceſter, for the Reilefe of the Towne of Sluce, from his Arrival at Vliſhing, about the End of June 1587, until the Surrenderie thereof 26 Julii next enſuing; whereby it ſhall plainelie appear, his Excellencie was not in anie Fault for the Loſſe of that Towne: the ſecond, A briefe Diſcourſe what Orders were beſt for repulſing of foraine Forces, if at any Time they ſhould invade us by ſea in Kent, or elſewhere. 4. A perfect Deſcription of the celeſtial Orbs, according to the moſt ancient Doctrine of the Pythagoreans, &c. This was placed at the end of his father's Prognoſtication everlaſting, &c. printed in 1592, 4to. 5. A humble Motive for Aſſociation to maintain the Religion eſtabliſhed, 1601, 8vo. To which is added, his Letter to the ſame Purpoſe to the Archbiſhops and Biſhops of England. 6. England's Defence: or, a Treatiſe concerning Invaſion. This is a tract of the ſame nature with that printed at the end of his Stratioticos, and called, A briefe Diſcourſe, &c. It was written in 1599, but not publiſhed till 1686. 7. A Letter printed before Dr. John Dee's Parallaticæ Commentationis praxeoſque nucleus quidam, 1573, 4to. Beſides theſe and his Nova corpora, he had by him ſeveral mathematical treatiſes ready for the preſs; which, by reaſon of lawſuits and other avocations, he was hindered from publiſhing. He died in 1595, but we know not at what age. He married, and had ſons and daughters; of which more will be ſaid in the next article.

DIGGES (Sir Dudley), eldeſt ſon of Thomas Digges, juſt mentioned, was born in 1583; and entered a gentleman-commoner of Univerſity College in Oxford, 1598. Having taken the degree of B.A. in 1601, he went and ſtudied for ſome time at the inns of court; and then travelled beyond ſea, having before received the honour of knighthood. After ſeeing and obſerving much, he returned home, and led a retired life, till 1618; when he was ſent by James I. ambaſſador to the Czar, or Emperor of Ruſſia. Two years after he was commiſſioned with Sir Maurice Abbot to go to Holland, in order to obtain the reſtitution of goods, taken by the Dutch from ſome Engliſhmen, in the Eaſt-Indies. He was a member of the third parliament of James I. which met at Weſtminſter Jan. 30, 1620-1; and was ſo little compliant with the court meaſures, as to be ranked among thoſe whom the king called ill-tempered ſpirits. He was likewiſe a member of the firſt parliament of Charles I. in 1626; and not only joined with thoſe eminent patriots, who were for bringing Villiers duke of Buckingham to an account, but was indeed one of the chief managers in that affair, and ſo very active, that he was committed to the Tower, though ſoon releaſed. He was again member of the third parliament of Charles I. in 1627-8, being one of the knights of the ſhire for Kent; but ſeemed to be more moderate in his oppoſition to the court, than he was in the two laſt, and voted for the diſpatch of the ſubſidies. Nevertheleſs, when any attempts were made upon the liberties of his country, or the conſtitution of parliament, his ſpirits were roufed, and he openly exerted them. In ſhort, he was a

man of such consequence, that the court thought it worth their while to gain him over; and accordingly they tempted him with the advantageous and honourable office of master of the rolls, of which he had a reversionary grant Nov. 29, 1630, and became possessed of it April 20, 1636, upon the death of Sir Julius Cæsar. But he did not enjoy it quite three years; for he died March 8, 1638-9, and his death was reckoned among the public calamities of those times.

He was a worthy good man, and, as a certain writer says, "a great assertor of his country's liberty in the worst of times." He was the author of several performances in the literary way: 1. A Defence of Trade: in a Letter to Sir Thomas Smith, Knt. Governor of the East-India Company, 1615, 4to. After his death, there was printed under his name, 2. A Discourse concerning the Rights and Privileges of the Subject, in a Conference desired by the Lords, and had by a Committee of both Houses, April 3, 1628; 1642, 4to. 3. He made several speeches upon various occasions, inserted in Rushworth's Collections, and Ephemeris Parliamentaria. 4. He collected the letters that passed between the Lord Burleigh, Sir Francis Walsingham, and others, about the intended marriage of Queen Elizabeth with the Duke of Anjou, in 1570, and with the Duke of Alençon, in 1581. They were published in 1655, folio. The publisher, who signs himself A. H. says in the preface, that "this piece was never intended for the press, but had slept long amongst the papers of Sir Dudley Digges, a personage of known wisdom and integrity, and who understood well the value of this manuscript, which had nothing forged or suppositious in it.

Sir Dudley had a brother Thomas, and a son Dudley, who were both learned men and authors. His brother Thomas was educated in University College, Oxford, took the degree of B.A. in 1606, removed to London; and then, travelling beyond sea, studied in foreign universities: from whence returning a good scholar, and an accomplished person, he was created M.A. in 1626. He translated from Spanish into English, Gerardo, the Unfortunate Spaniard, 1622, 4to. written by Goncalo de Cespedes: and, from Latin into English verse, Claudian's Rape of Proserpine, 1617, 4to. He died in 1635, being accounted a good poet and orator; and a great master of the English, French, and Spanish languages.

His son Dudley, who was his third son, was also of University College, Oxford, where he took the degree of B.A. in 1631-2; and the year after was elected fellow of All-Souls College. He took a master's degree in 1635; and became a good poet and linguist, and a general scholar. He died in 1643; having distinguished himself only by the two following productions: 1. An Answer to a printed book entitled Observations upon some of his Majesty's late Answers and Expresses, Oxon, 1642. 2. The Unlawfulness of Subjects' taking up Arms against their Sovereign in what Case soever, with Answers to all Objections, Lond. 1643, 4to.

Digges (West), was a celebrated comedian, formerly of the Haymarket, and for some time manager of the Edinburgh theatre. This gentleman is frequently spoken of in Mrs. Bellamy's Memoirs. He performed latterly in Dublin, and became useful to the Irish manager by giving him secret instructions; he was suddenly seized with a paralytic stroke, which rendered him incapable of following his profession. Necessity now obliged him to play the sycophant off the stage, and become entirely the manager's instrument: this procured him an allowance, but, at the same time, the envy and ill-will of all the company. His first appearance upon the stage was at Dublin in 1749. He died at Cork in 1786.

DIGITALIS (*Encycl.*). The following observations on the medical use and effects of the digitalis purpurea are extracted from an essay of Dr. Mease, resident physician at the port of Philadelphia.

The purple fox-glove, he says, is a medicine which, for some time, stood high in the list of the materia medica, but for various reasons appears to have, in some measure, lost the character once formed of it.—The causes influencing the success of the *digitalis*, may be referred to the following heads: 1. The *season of the year in which the plant is collected* will have a very considerable influence on the effects produced on the system. 2. The *part of the plant employed* ought likewise to be attended to, when forming a judgment of its virtues. 3. A frequent cause of the failure of the *digitalis* may be attributed to the careless mode of preparing it for use. 4. The *adulteration of the plant* with other vegetables. 5. The various modes of exhibiting this medicine; and 6. The *particular condition* of *the patient* at the *time* of its *exhibition*.

Dr. Mease very judiciously comments upon each of these particulars, and more at large upon the last. He examines with some acuteness the different opinions of physicians relative to this subject, and illustrates them with his own observation and experience on the effects of this powerful plant.—As a specimen of his method of reasoning, we shall quote the following remarkable passage:

"To account for the success of this remedy in dropsies, and diseases of too much action in the arterial system, is readily done. But, to reconcile the opposite testimony of Dr. Withering and others, with respect to their different success in dropsies of too little action, is very difficult: nay, to reconcile the contrary advice of Dr. Withering himself, who recommends the digitalis in mania and hemoptoë, 'with a *bounding pulse*,' and in dropsies with a *weak* one, is impossible. And here I may repeat a remark I formerly made, viz. 'That a medicine whose primary operation is the reduction of the force of the arterial system, when this is so intimately connected with the general strength of the body, should only succeed in those cases where the latter is considerably exhausted, appears not only to be paradoxical, but ill agrees with the uniformity observed in the operations of nature, in other parts of the animal œconomy.' It is incumbent on Dr. Withering to account for this apparent opposition in his own sentiments, and to satisfy the doubts of physicians, arising from the action of the remedy being directly contrary to the principles upon which alone certain dropsies can be cured. I may also remark, that it is much to be wished, physicians were more accurate in noting the state of their patient's system, at the time of prescribing this and other remedies; and also the state of the pulse at the same time, with its frequency; which, though so constantly stated, is of far less consequence in determining the situation of the system, as to the important point of the existence or absence of the inflammatory disposition, than the former. We should thus arrive with more certainty at the *true* virtues of a medicine, and be able to reconcile the contradictory accounts of physicians, respecting its utility in the same disease."

These *golden* remarks cannot be too *often* and too *seriously* repeated, particularly to the junior class of medical practitioners.—Our author quotes a striking passage from a letter of Dr. Withering to Dr. Woodville, published in the *Medical Botany* of the latter, in which the inattention of physicians, in the exhibition of *digitalis*, is severely censured, and he concludes with the following practical hints:

"It may not be improper to add some cautions and observations upon the use of digitalis, not mentioned in the above paper, for the information of those who may not have seen Dr. Withering's work, and may wish to exhibit the medicine.

"The doctor defires the medicine to be given in the doſes in an infuſion of the plant, which he prefers to every other form, and directs one drachm of the dried leaves to be infuſed for four hours in half a pint of boiling water, adding to the ſtrained liquor half an ounce of any ſpirituous water, and an ounce of this infuſion to be given twice a-day to an adult. If the patient be ſtronger than uſual, or the ſymptoms very urgent, this doſe may be given once in eight hours; and, on the contrary, in many inſtances, half an ounce at a time will be quite ſufficient. (This method of exhibiting the medicine ought to be continued until it either acts on the kidneys or ſtomach, pulſe or bowels: to be ſtopped upon the firſt appearance of any of theſe effects; the patient to drink freely during its operation.) But, without attending to this rule, I have known the digitalis preſcribed in the various forms of decoction, pills made with ſoap, and in powder mixed with prepared chalk or magneſia; and though the two laſt ſubſtances may not act in any oppoſite way, yet they may divide the particles, and by clogging them, prevent application to the ſtomach, and thus diminiſh its activity. A tedious decoction will diſſipate the virtue of many plants leſs volatile than digitalis; but a ſlight one will no doubt injure it, and ought therefore never to be employed. Pills are often made up with ſuch ſubſtances, as render them ſoluble with difficulty. If we even ſuppoſe ſoap free from this objection, we nevertheleſs do not know what ſecret effects may be produced by it, on particular ſtomachs, to interrupt the action of the medicine; and certainly it will not be ſo readily applied to that organ, as in a watery form.

"In caſe of *aſcites* and *anaſarca*, when the patient is weak, and the evacuation of the water rapid, the uſe of a proper bandage is indiſpenſably neceſſary. If the water ſhould not be wholly evacuated, it is beſt to allow an interval of ſeveral days, before the medicine be repeated, in order that food and tonics may be exhibited.

"The flow of urine will often precede, ſometimes accompany, and frequently follow the ſickneſs at ſtomach, at the diſtance of ſome days, and not unfrequently be checked by the medicine, eſpecially if given in too large doſes. The ſickneſs will ſometimes ceaſe, and recur again as violent as before, and will continue to recur for three or four days, at more diſtant intervals. Theſe ſufferings ſeldom occur, and are no objection to the uſe of digitalis, neither is the ſtone in the bladder."

Dr. Beddoes, who has written much on the properties of digitalis, ſays, "within three years I have ſeen many ſcores of phthiſical invalids from among the poorer claſſes. I have always had, cloſe at hand, a number of opulent patients of the ſame deſcription. Each claſs has, in fact, lain before me, almoſt as conveniently for compariſon, as the objects of his attention lie before a ſcholar occupied in collating a ſet of manuſcripts. In general, where I had all poſſible evidence of the exiſtence of tubercles, the exhibition of digitalis has been perfectly ſucceſsful. If I ſpecify that it has ſucceeded in three ſuch caſes out of five, I believe I much underrate the proportion of favourable events. With regard to the poor, who apply for relief in ſickneſs, there exiſts a perpetual cauſe of uncertainty. Their attendance ſlackens as their health improves; and they are apt to diſappear upon complete recovery; nor is it always eaſy to find them out by enquiry. In the richer claſs I have found the proportion of fortunate caſes more conſiderable than I have ſtated; and where digitalis alone fails, ſucceſs is ſometimes obtained by helps, of which I ſhall ſpeak before quitting the ſubject.

"When ulceration has ſucceeded to interior diſorganization, the greater difficulty of cure has appeared to me very ſtrongly marked. Why this ſhould be, is eaſily comprehended from general analogy: its full illuſtration, by tracing the diverſity of animal actions ſtep by ſtep, I relinquiſh to thoſe who may think they underſtand the nature of phthiſical ulceration, and the effect of the particular ſituation which the ulcers occupy. Entire failure has appeared to me, on the one hand, moſt frequent in the needieſt poor; and on the other, in thoſe females of higher life, who, from tranſmitted feebleneſs, and the want of air and exerciſe, of wholeſome hunger and digeſtion, appear more like the ſhadows of human beings, than ſubſtantial compounds of fleſh, blood, and bone. And as one means for the conciliation of contradictory teſtimonies, reſpecting the effect of digitalis in confirmed or ulcerated conſumption, I adhere to the opinion expreſſed in the Weſt-country Contributions, 1799, pp. 534—5: viz. that robuſtneſs of conſtitution is peculiarly favourable to the action of digitalis in this diſeaſe."

Three caſes of pulmonary affection are detailed, in which digitalis produced evident benefit. The caſe of Dr. Briggs is well worthy of notice; it is accurately drawn up by that phyſician himſelf, and the diſeaſe was evidently incipient tubercular phthiſis.

On the mode of exhibition of digitalis Dr. Beddoes obſerves, "when the mild exhibition of digitalis produces no good effect, and the patient is not greatly reduced, I have occaſionally found it uſeful to adminiſter it in nauſeating or in ſickening doſes. In a few caſes the purulent expectoration has been leſſened at every ſickneſs, and under the uſe of intermediate ſmall doſes has failed to return to its former quantity.

"I have very frequently employed digitalis externally; but never alone. I am not, therefore, able to ſpeak with confidence of the effects of this manner of uſing it. In caſes where the common mode fails, I purpoſe to try friction vigorouſly, and hope ſometimes to ſucceed. I imagine ſome analogy of operation between ſickneſs from digitalis and ſickneſs from ſailing. The perſons, in whom I have ſeen conſumption conſiderably mitigated, and the very few whom I have known perfectly cured, by a ſea voyage, have not, any of them, belonged to the more puny diviſion of the conſumptive. And I apprehend delicate females, affected by this diſeaſe, rarely experience great relief from ſea ſickneſs. I do not, however, feel myſelf entitled to advance an opinion on this point. I merely offer a conjecture, principally wiſhing to excite the attention of obſervers."

And again, "when fox-glove is deficient in operation, I have found the conjunction of opium in large doſes, of bitters and ſquills, powerful auxiliaries. I have often joined with it hyoſcyamus and cicuta."

The following obſervations are of conſiderable importance: "When digitalis has failed altogether in incipient conſumption, I have occaſionally found calomel ſucceed in a few inſtances." And, "I have ſometimes given the hydrargyrus cum creta, and ſometimes the ſimple mercurial pill; inſtead of calomel, without any variation in the effect. And I have of late often joined one or the other with digitalis.

"There is a ſtate of confirmed conſumption, in which, if an auxiliary to digitalis of given operation could be diſcovered, ſome lives would be ſaved. The ſtate I allude to is of this nature. In ſome inſtances, when the fox-glove has removed the hectic fever, and greatly reduced the expectoration and cough, the decline ſhall become almoſt imperceptible; the patient frequently appearing chlorotic, but being really phthiſical, as the event moſt commonly, and ſometimes diſſection, has evinced. During this almoſt ſtationary period, the organs of ſanguification appear inert; and the deficient production of blood (into which the chyle is probably converted in the lungs)

ſufficiently accounts for that conſumption of the body which denominates the diſorder. This defect of ſanguification explains the emaciating proceſs, when there is no exceſs of action either in the capillaries or other parts of the vaſcular ſyſtem, nor any apparent drain, or elſe leſs evacuation than exiſts in caſes where there is no emaciation. Thoſe principles which enter into new combination during muſcular contraction, being derived from the blood, and blood not being formed in ſufficient quantity, the ſubſtance of the body will be waſted by the mere vital movements. Neither will the fat be replaced as faſt as it is abſorbed; and ſo of other parts. In phthiſical children, where the attractions on which growth (or longitudinal extenſion of parts) depends, do not ceaſe, though probably ſolids very different in conſtitution from the healthy ſolids are formed, it ſhould ſeem that emaciation ought to go on with peculiar rapidity, if other circumſtances were alike."

In his attempts to account for the "mode in which digitalis operates," the author ſeems to have adopted that theory which is known in this country by the name of *chemical phyſiology*. He ſays, "at preſent I can only enuntiate an opinion, reſerving full diſcuſſion to a future occaſion. To whatever organ medicinal application is made, I conſider the applied ſubſtance as a chemical compound. The organs themſelves I conſider likewiſe as chemical compounds, extremely variable, and of a peculiar nature for the time being. We know that certain changes in thoſe organic compounds, which are firſt affected, will produce ſucceſſive changes in connected parts, till perhaps the whole frame undergoes a change in its compoſition, and conſequently in its actions. Some effects of theſe changes will be manifeſt; others more obſcure; and others not aſcertainable by any of our preſent methods of obſervation.

"There is nothing in all this peculiar to the beings which we uſually denominate organized. Alterations in any body will produce alterations in a ſeries of adjacent bodies to an indefinite extent. The changes produced by the burning of a candle may be traced far into the ſublunary ſyſtem; and by help of pretty cloſe analogies, they may be purſued into a more remote region of the univerſe. In organized bodies, if ſecondary effects are more ſudden or more ſenſible than in moſt others, this is owing to the cloſe connection of their members, and to the eaſily variable conſtitution of each member. By virtue of their connection, the members of the galvanic piles, at preſent known, ſeem to influence one another as readily as the bodily organs; but being ſimilarly conſtituted, there is preſented no diverſity but in the degree of operation."

Conceding to this opinion the merit of conſiderable ingenuity, we cannot, at the ſame time, allow it to contain an accurate generalization of the phenomena already known relating to organized nature.

The different branches of human knowledge can only be conſidered as connected expreſſions of facts following, in their arrangement, either the order of nature, or ſtrict and obvious analogies; and, by the common conſent of philoſophers, they have been diſtinguiſhed from each other by appropriate names. The phenomena relating to mechanics have been ſuppoſed to be diſtinct from the phenomena of chemiſtry; and as yet it would be conſidered as raſh to claſs the galvanic facts as ſimple chemical changes: why then ſhould we, in direct contradiction to the adopted modes of nomenclature, attempt to identify the powers producing living action, which are, with regard to us, unknown, with the agencies of organic matter, which are obvious and aſcertained? It is ſurely better to confeſs our total ignorance of the laws of life, than to form obſcure generalizations founded upon looſe analogies concerning them; as in the one caſe we give full liberty to the inventive powers of the human mind; but, in the other, we limit its exertions to a particular object, by holding up to view a theory which is moſt probably falſe, and concerning which it is nevertheleſs compelled to reaſon.

Indeed, after the firſt enuntiation, Dr. Beddoes himſelf ſeems to have been fully aware of the danger and difficulty of ſyſtematizing concerning the organized nature. He ſays, "again, we can ſcarce be ſaid to have advanced a ſtep in vital chemiſtry. We are not acquainted with the conſtitution of any one organ in any one of its conditions. We know nothing of the difference between the ſeveral conditions compatible with life. How, therefore, the recipient and the received body modify each other in the firſt inſtance, remains a perfect myſtery. Nor are we better informed as to many of the conſequences of the primary modifications. Of ſome our ſenſes may occaſionally inform us; and would inform us of more, if they were more aſſiduouſly and advantageouſly applied. But we ſhall moſt groſsly deceive ourſelves, if we imagine that ſuch obſervations as we at preſent take, can ever amount to a theory or ſyſtematical body of facts. They are, perhaps, almoſt remote-effects, and therefore, relatively to us, uncertain—the more remote, the more uncertain; becauſe, of the parts progreſſively affected, if any one, unknown to the obſerver, be in a different ſtate at different times, or in different perſons, the effect that has previouſly taken place, and is again expected, may fail to appear. Our judgment, however, reſpecting the character of medical agents muſt abide by effects, thus remote and uncertain."

The experiments made by Mr. King, on the comparative action of opium and digitalis on cold-blooded animals, which follow theſe preliminary obſervations, were well contrived, and their reſults are curious and worthy of attention. The account of them will not admit of abridgment; and we muſt content ourſelves with giving Dr. Beddoes's generalization of facts concerning the mode of operation of digitalis, which, in ſome meaſure, is founded upon them.

"1. Digitalis, in a certain doſe, will increaſe the action of the arterial ſyſtem.

"2. It will increaſe the digeſtive power of the ſtomach, when that is impaired.

"3. It will often induce ſleep, like opium.

"4. Like opium, in an over-doſe it occaſions languor and exceſſive ſenſibility, headach, dimneſs of viſion, nauſea, and bilious vomiting.

"5. It almoſt immediately produces great excitement in frogs, ſomewhat as opium does; and produces certain other effects, ſimilar to thoſe of opium."

DIGNAN, a town of Venetian Iſtria, three miles from the gulf of Venice. Long. 13. 5. E. Lat. 45. 10. N.

DIGNITY (*Encycl.*). To thoſe who ſtudy human nature, there is a point which has always appeared intricate: how comes it that generoſity and courage are more eſteemed, and beſtow more dignity, than good-nature, or even juſtice; though the latter contribute more than the former to private as well as to public happineſs? This queſtion, bluntly propoſed, might puzzle even a philoſopher; but, by means of the foregoing obſervations, will eaſily be ſolved. Human virtues, like other objects, obtain a rank in our eſtimation, not from their utility, which is a ſubject of reflection, but from the direct impreſſion they make on us. Juſtice and good-nature are a ſort of negative virtues, that ſcarce make any impreſſion but when they are tranſgreſſed: courage and generoſity, on the contrary, producing elevated emotions, enliven greatly the ſenſe of a man's dignity, both in himſelf and in others; and for that reaſon, courage and generoſity are in higher regard than the other virtues mentioned: we deſcribe them as grand and elevated, as of greater dignity, and more praiſe-worthy.

This leads us to examine more directly emotions and paſſions with reſpect to the preſent ſubject: and it will not be difficult to form a ſcale of them, beginning with the meaneſt, and aſcending gradually to thoſe of the higheſt rank and dignity. Pleaſure felt as at the organ of ſenſe, named *corporeal pleaſure*, is perceived to be low; and when indulged to exceſs, is perceived alſo to be mean: for that reaſon perſons of any delicacy diſſemble the pleaſure they take in eating and drinking. The pleaſures of the eye and ear, having no organic feeling, and being free from any ſenſe of meanneſs, are indulged without any ſhame: they even riſe to a certain degree of dignity when their objects are grand or elevated. The ſame is the caſe of the ſympathetic paſſions: a virtuous perſon behaving with fortitude and dignity under cruel misfortunes, makes a capital figure; and the ſympathiſing ſpectator feels in himſelf the ſame dignity. Sympathetic diſtreſs at the ſame time never is mean: on the contrary, it is agreeable to the nature of a ſocial being, and has general approbation. The rank that love poſſeſſes in the ſcale, depends in a great meaſure on its object: it poſſeſſes a low place when founded on external properties merely; and is mean when beſtowed on a perſon of inferior rank without any extraordinary qualification: but when founded on the more elevated internal properties, it aſſumes a conſiderable degree of dignity. The ſame is the caſe of friendſhip. When gratitude is warm, it animates the mind; but it ſcarce riſes to dignity. Joy beſtows dignity when it proceeds from an elevated cauſe. If we can depend upon induction, dignity is not a property of any diſagreeable paſſion: one is ſlight, another ſevere; one depreſſes the mind, another animates it; but there is no elevation, far leſs dignity, in any of them. Revenge, in particular, though it inflame and ſwell the mind, is not accompanied with dignity, not even with elevation: it is not however felt as mean or grovelling, unleſs when it takes indirect meaſures for gratification. Shame and remorſe, though they ſink the ſpirits, are not mean. Pride, a diſagreeable paſſion, beſtows no dignity in the eye of a ſpectator. Vanity always appears mean, and extremely ſo where founded, as commonly happens, on trivial qualifications.

We proceed to the pleaſures of the underſtanding, which poſſeſs a high rank in point of dignity. Of this every one will be ſenſible, when he conſiders the important truths that have been laid open by ſcience: ſuch as general theorems, and the general laws that govern the material and moral worlds. The pleaſures of the underſtanding are ſuited to a man as a rational and contemplative being, and they tend not a little to ennoble his nature; even to the Deity he ſtretcheth his contemplations, which, in the diſcovery of infinite power, wiſdom, and benevolence, afford delight of the moſt exalted kind. Hence it appears, that the fine arts, ſtudied as a rational ſcience, afford entertainment of great dignity; ſuperior far to what they afford as a ſubject of taſte merely.

But contemplation, however in itſelf valuable, is chiefly reſpected as ſubſervient to action; for man is intended to be more an active than a contemplative being. He accordingly ſhews more dignity in action than in contemplation: generoſity, magnanimity, heroiſm, raiſe his character to the higheſt pitch: theſe beſt expreſs the dignity of his nature, and advance him nearer to divinity than any other of his attributes.

Having endeavoured to aſſign the efficient cauſe of dignity and meanneſs, by unfolding the principle on which they are founded, we proceed to explain the final cauſe of the dignity or meanneſs beſtowed upon the ſeveral particulars above mentioned, beginning with corporeal pleaſures. Theſe, as far as uſeful, are, like juſtice, fenced with ſufficient ſanctions to prevent their being neglected: hunger and thirſt are painful ſenſations; and we are incited to animal love by a vigorous propenſity: were corporeal pleaſures dignified over and above with a place in a high claſs, they would infallibly overturn the balance of the mind, by outweighing the ſocial affections. This is a ſatisfactory final cauſe for refuſing to theſe pleaſures any degree of dignity: and the final cauſe is not leſs evident of their meanneſs, when they are indulged to exceſs. The more refined pleaſures of external ſenſe, conveyed by the eye and the ear from natural objects and from the fine arts, deſerve a high place in our eſteem, becauſe of their ſingular and extenſive utility: in ſome caſes they riſe to a conſiderable dignity; and the very loweſt pleaſures of the kind are never eſteemed mean or groveling. The pleaſure ariſing from wit, humour, ridicule, or from what is ſimply ludicrous, is uſeful by relaxing the mind after the fatigue of more manly occupation: but the mind, when it ſurrenders itſelf to pleaſure of that kind, loſes its vigour, and ſinks gradually into ſloth. The place this pleaſure occupies in point of dignity, is adjuſted to theſe views; to make it uſeful as a relaxation, it is not branded with meanneſs; to prevent its uſurpation, it is removed from that place but a ſingle degree: no man values himſelf for that pleaſure, even during gratification; and if it have engroſſed more of his time than is requiſite for relaxation, he looks back with ſome degree of ſhame.

In point of dignity, the ſocial emotions riſe above the ſelfiſh, and much above thoſe of the eye and ear: man is by his nature a ſocial being; and to qualify him for ſociety, it is wiſely contrived, that he ſhould value himſelf more for being ſocial than ſelfiſh.

The excellency of man is chiefly diſcernible in the great improvements he is ſuſceptible of in ſociety: theſe, by perſeverance, may be carried on progreſſively, above any aſſignable limits; and even abſtracting from revelation, there is great probability, that the progreſs begun here will be completed in ſome future ſtate. Now, as all valuable improvements proceed from the exerciſe of our rational faculties, the author of our nature, in order to excite us to a due ſenſe of theſe faculties, hath aſſigned a high rank to the pleaſures of the underſtanding: their utility, with reſpect to this life as well as a future, entitles them to that rank.

But as action is the aim of all our improvements, virtuous actions juſtly poſſeſs the higheſt of all the ranks. Theſe, we find, are by nature diſtributed into different claſſes, and the firſt in point of dignity aſſigned to actions that appear not the firſt in point of uſe: generoſity, for example, in the ſenſe of mankind is more reſpected than juſtice, though the latter is undoubtedly more eſſential to ſociety; and magnanimity, heroiſm, undaunted courage, riſe ſtill higher in our eſteem: the reaſon of which is explained above.

DILIGENCE, in Scots law, ſignifies either that care and attention which parties are bound to give, in implementing certain contracts or truſts, and which varies according to the nature of the contract. Or it ſignifies certain forms of law, whereby the creditor endeavours to operate his payment, either by affecting the perſon or eſtate of the debtor.

DILLA, Mount, a remarkable promontory of the coaſt of Malabar, 20 miles N. by W. of Tillicherry. Long. 75. 2. E. Lat. 12. 1. N.

DIMOTUC, a town of Romania, with a Greek archbiſhop's ſee; ſeated on a mountain, ſurrounded by the Meriza, 12 miles S.W. of Adrianople. Long. 26. 15. E. Lat. 41. 35. N.

DINANT, a town of France, in the department of the North Coaſt, ſeated on a craggy mountain, at the foot of which is the river Rance, 20 miles S. of St. Malo. Long. 1. 58. W. Lat. 48. 20. N.

DINANT, a town of Germany, in the biſhopric of Liege, with a caſtle, ſeated near the Meuſe, 12 miles S. of Namur. Long. 4. 51. E. Lat. 50. 17. N.

DINASMONDY, a town in Merionethſhire, with a market on Friday, 18 miles S. of Bala, and 196 N W. of London. Long. 3 40. W. Lat 52. 37. N.

DINCHURCH, a village in Kent, in Romney Marſh, three miles N.E of Romney. Here are kept the records of the Marſh; and the court is held by the lords of the Marſh, and the members of the corporation, who are appointed by ſtatute, 33 Edward III. to regulate all affairs concerning the Marſh.

DINCKELSPIL, a free imperial town of Suabia. It has a great and a little council: the former is a mixture of Papiſts and Lutherans; but the little one are all Papiſts. It carries on a trade in cloth and reaping-hooks, and is ſeated on the Wernitz, 37 miles S.W. of Nuremberg. Long. 10. 20. E. Lat. 49. 0. N.

DINGELFING, a town of Lower Bavaria, ſeated on the Iſer, 20 miles N.E. of Landſchut. Long. 12. 36. E. Lat. 48. 40. N.

DINGLE, a ſea-port of Ireland, in the county of Derry, ſeated in Dingle Bay, four miles W. of Limerick. Long. 8. 40. W. Lat 52. 42. N.

DIO CASSIUS, a famous Greek hiſtorion, a native of Nicea, a city of Phrygia, was governor of Pergamus and Smyrna, and commanded in Africa and Pannonia. In the year 229, he was raiſed by Alexander Severus to the dignity of conſul; but not being agreeable to the troops, was obliged to retire to the place of his birth, where he ended his days. He compoſed a Roman Hiſtory in Greek, a part of which only has been handed down to us. He is accuſed of partiality againſt Pompey, Cicero, Seneca, and ſeveral other great men. He is chiefly eſteemed for the ſpeeches he puts into the mouths of Agrippa and Mecænas, when Auguſtus adviſed with them whether he ſhould preſerve the empire, or reſtore the ancient government

DIOCLESIAN. The bloody perſecutions of the Chriſtians, in the time of this emperor, forms a chronological æra, called the *æra of Dioclèſian*, or of the martyrs. The cauſes of a ſuppoſed extinction of Chriſtianity at that period, having been the ſubject of ſome literary controverſy, the following remarks on the ſubject, which appeared in the Britiſh Magazine for 1800, may not be unacceptable to many of our readers.

Let it be ſuppoſed, ſays the writer, that the Chriſtian religion, inſtead of obtaining a deciſive and laſting victory over Paganiſm, in the reign of Conſtantine the Great, was itſelf totally annihilated by the perſecution, commonly called the Dioclefian. In order to a more complete inverſion of the fact, let it be further ſuppoſed, that the progreſs of this religion, immediately upon its firſt promulgation, was exceedingly rapid, and that it gradually declined under ſucceſſive perſecutions, till it became extinct under that which has been mentioned. This period is fixed upon for the final overthrow of Chriſtianity, becauſe it ſupplies the moſt adequate cauſe of the ſuppoſed event, which comes neareſt in point of time to the oppoſite of the real one.

The patrons and adherents of the triumphant religion would, without doubt, aſcribe the deſtruction of an enemy, once ſo formidable, to the miraculous interpoſion of the deities whom they worſhipped. Not to interfere with this opinion, it may yet be allowed to the philoſopher, whoſe province it is to trace or ſupply the latent and intricate connection between cauſes and effects, to confine his conſideration to thoſe *natural and ſecondary cauſes*, which may be ſuppoſed to have at leaſt contributed to the production of the extraordinary and important event. And it does not appear that any cauſes of that deſcription can be aſſigned with greater probability than the *five following*; 1. the inflexible, and, if we may uſe the expreſſion, intolerant zeal of the Chriſtians; 2. the doctrine of a future life; 3. the miraculous powers aſcribed to the primitive church; 4. the pure and auſtere morals of the Chriſtians; 5. the union and diſcipline of the Chriſtian republic.

I. No qualities could be imagined more directly calculated to fruſtrate the attempts of the primitive Chriſtians than the inflexibility, and, if we may uſe the expreſſion, the intolerance, of their zeal. Their ſyſtem of proſelytiſm was fundamentally erroneous. The religion which they propoſed was indeed ſo far of a general nature, that none were excluded from the benefit of it: it was intended for a common bleſſing. Yet, with all this liberality, Chriſtianity was, in the ſtricteſt ſenſe, and to the laſt degree, an unſocial religion. It would neither accommodate itſelf to the reigning ſuperſtitions, nor would it admit any aſſociation with them. It was determined to ſtand alone; and wherever it prevailed, it muſt prevail upon the ruins of all other ſyſtems. With ſuch pretenſions, the heralds of the Goſpel could not reaſonably hope for a favourable reception. Their apparent arrogance could only ſerve to provoke the indignation of thoſe whom they endeavoured to convert; and the zeal with which they proſecuted their cauſe, eſpecially if it were ſo extravagant as has with great confidence been aſſerted, would, *according to the natural courſe of things*, have a direct tendency to defeat their object*.

II. The doctrine of a future ſtate of retribution, of reward to the good, and of puniſhment to the wicked, was by no means a peculiar doctrine of Chriſtianity. Heatheniſm had its Elyſium and its Tartarus. The natural apprehenſion, however, with reſpect to a future ſtate, had produced in the majority of the civiliſed Gentiles, the common people as well as the higher ranks of the philoſophers, a diſbelief and contempt of the doctrine;—at leaſt, of that part which relates to future puniſhment†. Socrates, Cicero, and Seneca, admitted only the alternative of the mortality of the ſoul, or of its future enjoyment or happineſs‡. Chriſtianity came forward to revive the exploded doctrine: it arrayed the happineſs of the righteous with new glories, and conferred new terrors upon the place of puniſhment. But the heathens had given up their Elyſium, and the ſpiritual heaven of the Chriſtians was not more alluring: they had ſucceeded in diſſipating the dread of their Tartarus, and it was not to be expected that they ſhould tamely ſubmit to the freſh impoſition of the doctrine, rendered more formidable both by the evidence which ſupported it, and by the additional horrors with which it was attended.

III. A claim to miraculous powers, when conſidered as a natural cauſe, muſt be underſtood of thoſe which are unjuſtly pretended to; or, which are falſe: for real miracles are a ſupernatural cauſe, and are only compatible with a true religion. Miracles, thus explained, were nothing new to the heathens. Their own religion was founded upon them. Neither were

---

* For the indignation of the heathens againſt the Jews on account of the inſociability of their religion, ſee Joſephus cont. Apion, lib. 2. §. 7. For the ſame fact, more eſpecially with reſpect to the Chriſtians, ſee Warburton's Divine Legation, book 2. § 6.

† This is proved with triumphant evidence by Leland, in his Advantage and Neceſſity, &c. book 3. ch. 8.

‡ Apologia Socratis, § 22. Cicero de Senectute, ſub finem. Seneca, Ep. 24.

they averſe to admit the claims of Chriſtianity. But then they expected, they thought themſelves entitled to, a return of the compliment. When, therefore, they found that the religion propoſed to their acceptance, inſtead of being flattered, or even contented with this honour, aſpired to ſovereign and excluſive dominion, its arrogant pretenſions would naturally excite the indignation of the votaries of heatheniſm. And the leſs able they were to aſcribe to impoſture the miracles to which it pretended, the more violent would be their prejudices, and the more extravagant their reſentment.

IV. While the religion of the Chriſtians was calculated to make them benefactors to the world, by engaging them in the practice of the whole circle of duty, to God, their neighbour, and themſelves, they nevertheleſs conſidered that part of it which concerns the ſupreme Being as paramount to all the reſt, and in every caſe of competition entitled to the preference. From this principle flowed their purity, and what is denominated their auſterity. It was a principle which they held in common with Socrates*. But, however reaſonable, it could never fail to give offence; and it has always been obſerved, that a conſpicuous moral ſuperiority, on account of the reproof which it conveys to the generality, is almoſt ſure to create enemies †. Nor is there any hatred ſo virulent as that which has an unjuſt foundation ‡. Even the fortitude which the Chriſtians diſplayed in their martyrdom, could not eſcape a ſiniſter interpretation. It was branded as obſtinacy §. And then, inſtead of conciliating the compaſſion, or exciting the admiration of the heathens, it only ſerved for a more ſpecious pretence of proſecuting the perſecution of theſe unhappy ſufferers with increaſed ſeverity. Such were the fruits of the virtues of the primitive Chriſtians.

V. The Romans, who valued themſelves principally upon their knowledge of the art of government, would behold with extreme jealouſy the riſe and eſtabliſhment of an independent and increaſing ſociety within the boſom of their own dominions—an *imperium in imperio* ||. Nor would the aſſumption of the character of religion in any way abate this jealouſy; of which their treatment of the Bacchic myſteries at Rome is a remarkable inſtance ¶. When, therefore, the converts to Chriſtianity had, in the time of Nero, according to Tacitus**, become a vaſt multitude, and, in the exulting language of Tertullian, had filled every part of the empire††, it was not to be expected that the rulers of that empire would behold with indifference a ſociety, however peaceable the ſpirit of its inſtitution, and the conduct of its members, which their principles or their prejudices could only diſpoſe them to look upon as a conſpiracy. It was the fact. And the cauſes which have been mentioned, uniting their influence with this, produced that ſeries of progreſſive perſecutions, which had for their object not only the ſubjugation, but the extermination and deſtruction of Chriſtianity.

When Chriſtianity had thus armed againſt itſelf, the power and policy of a mighty empire, the jealouſy of its magiſtracy, both ſupreme and ſubordinate, the intereſts of its prieſthood, the virulent and well-diſciplined rancour of its philoſophers, and the furious paſſions of a ſuperſtitious and inflamed populace, it were juſtly to be eſteemed a miracle, if a religion, of which non-reſiſtance was the moſt ſpecious reproach, ſhould eſcape the deſtruction with which it was threatened.

Such are the natural cauſes by which the event here ſuppoſed may be accounted for. Nor will the objection, that preciſely the ſame cauſes have been aſſigned for a fact directly the oppoſite‡‡, have any weight with the philoſopher, who is ſatisfied that the *flexibility* of an argument, as it enlarges the ſphere of its operation, and gives it liberty to act in any direction, is rather a recommendation than a diſparagement to it. And it can with as little reaſon be expected, that he who is ſo juſtly offended at the *obſtinate inflexibility* of the Chriſtian, will ſo far loſe ſight of the conſiſtency of his character, as to regard it with greater indulgence, even though *truth herſelf* ſhould venture to aſſume it.

DIONYSIUS (Areopagita), was born at Athens, and educated there. He went afterwards to Heliopolis in Egypt; where, if we may believe ſome writers of his life, he ſaw that wonderful eclipſe which happened at our Saviour's paſſion, and was urged by ſome extraordinary impulſe to cry out, *Aut Deus patitur, aut cum patiente dolet*; "Either God himſelf ſuffers, or condoles with him who does." At his return to Athens he was elected into the court of Areopagus, from whence he derived his name of *Areopagite*. About the year 50 he embraced Chriſtianity; and, as ſome ſay, was appointed firſt biſhop of Athens by St. Paul. Of his converſion we have an account in the 17th chapter of the Acts of the Apoſtles.—He is ſuppoſed to have ſuffered martyrdom; but whether under Domitian, Trajan, or Adrian, is not certain. We have nothing remaining under his name, but what there is the greateſt reaſon to believe ſpurious.

DIONYSIUS (Biſhop of Corinth), flouriſhed under the reigns of Marcus Antoninus and Commodus; and is ſuppoſed to have ſuffered martyrdom about the year 178. We know little more of him than what appears from ſome of his epiſtles, preſerved by Euſebius: from which we learn, that he was not only very diligent in his paſtoral care over the flock committed to him, but that he extended his care likewiſe to the inhabitants of all other countries and cities. He wrote a letter to the Lacedæmonians, in which he exhorts them to peace and concord: another to the Athenians, in which he recommends purity of faith and evangelical holineſs: a third to the Nicomedians, to bid them beware of the hereſy of Marcion: a fourth to the churches of Crete: a fifth to the churches of Pontus: a ſixth to the Gnoſſians, in which he admoniſhes Pinytus, their biſhop, not to impoſe too ſeverely upon the brethren the heavy burthen of continence, but to conſider the frailties and infirmities of the fleſh. He wrote alſo a ſeventh letter to the Romans, in which he mentions the famous epiſtle of Clemens to the Corinthians; which, as we learn from him,

was wont, at that time, to be publicly read in their churches. But none of theſe letters are now extant.

Dionysius (Biſhop of Alexandria), was born a Heathen, and of an ancient and illuſtrious family. He was a diligent enquirer after truth, which he looked for in vain among the ſects of philoſophers; but at laſt found it in Chriſtianity, in which he was probably confirmed by his preceptor Origen. He was made a preſbyter of the church of Alexandria in 232; and, in 247, was raiſed to that ſee upon the death of Heracles. When the Decian perſecution aroſe, he was ſeized by the ſoldiers and ſent to Tapoſiris, a little town between Alexandria and Canopus; but he eſcaped without being hurt, of which there is a marvellous account in the fragments of one of his letters, which Euſebius has preſerved. He did not come off ſo well under the Valerian perſecution, which began in 257: for then he was forcibly hurried off in the midſt of a dangerous illneſs, and baniſhed to Cephrus, a moſt deſert and uncultivated region of Lybia, in which terrible ſituation he remained for three years. Afterwards, when Gallienus publiſhed an edict of toleration to the Chriſtians, he returned to Alexandria, and applied himſelf diligently to the offices of his function, as well by converting heathens, as by ſuppreſſing heretics. The Novatian hereſy he laboured to put a ſtop to; he endeavoured to quiet the diſpute, which was riſen to ſome height, between Stephen and Cyprian, concerning the rebaptization of heretics: but he attempted both theſe things with Chriſtian moderation and candour. For it muſt be acknowledged to his credit, that he ſeems to have poſſeſſed more of that ſpirit of gentleneſs and meekneſs, than was uſually to be found in thoſe primitive and zealous times. A little before his death he was called to a ſynod at Antioch, to defend the divinity of Jeſus Chriſt againſt Paul of Samoſata, who was biſhop of Antioch: but he could not appear by reaſon of his great age and infirmities. He wrote a letter however to that church, in which he explained his own opinion of the matter, and refuted Paul: whom he thought ſo very blameable for advancing ſuch an error, that he did not deign to ſalute him even by name. He died in the year 267; and, though his writings were very numerous, yet ſcarce any of them are come down to us, except ſome fragments preſerved by Euſebius.

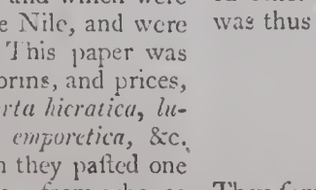
DIOPHANTUS, a celebrated mathematician of Alexandria, reputed to have been the inventor of algebra. When he lived, is not known: ſome have placed him before Chriſt, and ſome after, with equal uncertainty. He wrote 13 books of arithmetic; which the aſtronomer Regiomontanus tells us, are ſtill preſerved in MSS. in the Vatican library: Meziriac's edition of ſeven of theſe books has been ſeveral times reprinted, with notes and illuſtrations.

DIPLOMATICS (*Encycl.*). In order to underſtand the nature of diplomas, and manuſcripts, and to diſtinguiſh the authentic from the counterfeit, it is neceſſary to know that the paper of the ancients came from Egypt, and was formed of thin leaves or membranes, taken from the branches of a tree named *Papyrus*, or *Biblum Ægyptiacum*, and which were paſted one over the other with the ſlime of the Nile, and were preſſed and poliſhed with a pumice-ſtone. This paper was very ſcarce; and it was of various qualities, forms, and prices, which they diſtinguiſhed by the names of *charta hieratica, luria, auguſta, amphitheatrica, ſaitica, tanirica, emporetica*, &c. They cut this paper into ſquare leaves, which they paſted one to the other, in order to make rolls of them: from whence an entire book was called *volumen*, from *volvendo*; and the leaves of which it conſiſted, *paginæ*. Sometimes, alſo, they paſted the leaves all together by one of their extremities, as is now practiſed in binding; by this method they formed the back of a book, and theſe the learned call *cordices*. They rolled the volume round a ſtick, which they named *umbilicus*; and the two ends that came out beyond the paper, *cornua*. The title, wrote on parchment, in purple characters, was joined to the laſt ſheet, and ſerved it as a cover. They made uſe of all ſorts of ſtrings or ribbands, and even ſometimes of locks, to cloſe the book; and ſometimes alſo it was put into a caſe. But there is not now to be found, in any library or cabinet whatever, any one of theſe volumes. We have been aſſured, however, by a traveller, that he had ſeen ſeveral of them in the ruins of Herculaneum; but ſo damaged, the paper ſo ſtiff and brittle, by the length of time, that it was impoſſible to unrol them, and conſequently to make any uſe of them; for on the firſt touch they fell into ſhatters. We ſhall ſpeak hereafter of thoſe books they call *codices*.

We are ignorant of the preciſe time when our modern paper was invented; and when they began to make uſe of pens in writing, inſtead of the ſtalks of reeds. The ink that the ancients uſed, was not made of vitriol and galls, like the modern, but of ſoot. Sometimes alſo they wrote with red ink made of vermilion; or in letters of gold, on purple or violet parchment. It is not difficult for thoſe who apply themſelves to this ſtudy, to diſtinguiſh the parchment of the ancients from that of the moderns, as well as their ink and various exterior characters: but that which beſt diſtinguiſhes the original from the counterfeit, is the writing or character itſelf; which is ſo diſtinctly different from one century to another, that we may tell with certainty, within about 40 or 50 years, when any diploma was written. There are two works which furniſh the cleareſt lights on this matter, and which may ſerve as ſure guides in the judgments we may have occaſion to make on what are called ancient diplomas. The one is the celebrated treatiſe on the Diplomatic, by F. Mabillon; and the other, the firſt volume of the Chronicon Gotvicenſe. We there find ſpecimens of all the characters, the flouriſhes, and different methods of writing, of every age. For theſe matters, therefore, we muſt refer our readers to thoſe authors; and ſhall here only add, that

All the diplomas are wrote in Latin, and conſequently the letters and characters have a reſemblance to each other: but there are certain ſtrokes of the pen which diſtinguiſh not only the ages, but alſo the different nations; as the writings of the Lombards, French, Saxons, &c. The letters in the diplomas are alſo uſually longer, and not ſo ſtrong as thoſe of manuſcripts. There has been alſo introduced a kind of court-hand, of a very diſproportionate length, and the letters of which are called *Exiles litteræ, criſpæ ac protractiores*. The firſt line of the diploma, the ſignature of the ſovereign, that of the chancellor, notary, &c. are uſually wrote in this character.

The ſignature of a diploma conſiſts either of the ſign of the croſs, or of a monogram or cipher, compoſed of the letters of the names of thoſe who ſubſcribed it. The initial letters of the name, and ſometimes alſo the titles, were placed about this croſs. By degrees the cuſtom changed, and they invented other marks; as for example, the ſign of Charlemagne was thus:



They ſometimes added alſo the dates and epoch of the ſignature, the feaſts of the church, the days of the calendar, and other like matters. The ſucceſſive corruption of the Latin language, the ſtyle and orthography of each age, as well as their different titles and forms; the abbreviations, accentua-

tion, and punctuation, and the various methods of writing the diphthongs; all these matters united, form so many characters and marks by which the authenticity of a diploma is to be known.

The seal annexed to a diploma was anciently of white wax, and artfully imprinted on the parchment itself. It was afterward pendent from the paper, and inclosed in a box or case, which they called *bulla*. There are some also that are stamped on metal, and even on pure gold. When a diploma bears all the characters that are requisite to the time and place where it is supposed to be written, its authenticity is not to be doubted: but, at the same time, we cannot examine them too scrupulously, seeing that the monks and priests of former ages have been very adroit in making of counterfeits; and the more, as they enjoyed the confidence of princes and statesmen, and were even sometimes in possession of their rings or seals.

With regard to manuscripts that were wrote before the invention of printing, it is necessary (1) to know their nature, their essential qualities, and matter; (2) to be able to read them freely, and without error; (3) to judge of their antiquity by those characters which we have just mentioned with regard to the diplomas; and (4) to render them of use in the sciences. As there are scarce any of the ancient codes now remaining (see par. 2.) wrote on the Egyptian paper, or on wood, ivory, &c. we have only to consider those that are written on parchment or vellum *(membraneos)*, and such as are wrote on our paper *(chartaceos)*. The former of these are in most esteem. With regard to the character, these codes are written either in square and capital letters, or in half square, or round and small letters. Those of the first kind are the most ancient. There are no intervals between the words, no letters different from the others at the beginning of any word, no points, nor any other distinction. The codes which are wrote in letters that are half square, resemble those we have in Gothic characters, as well for the age as the form of the letters. Such as are wrote in round letters are not so ancient as the former, and do not go higher than the ninth or tenth century. These have spaces between the words, and some punctuation. They are likewise not so well wrote as the preceding, and are frequently disfigured with comments. The codes are divided, according to the country, into Lombard, Italian, Gaulic, Franco-Gaulic, Saxon, Anglo-Saxon, &c.

In the ancient Greek books, they frequently terminated the periods of a discourse, instead of all other division, by lines; and these divisions were called, in Latin, *versus*, from *vertendo*: for which reason these lines are still more properly named *versus* than *lineæ*. At the end of a work, they put down the number of verses of which it consisted, that the copies might be more easily collated: and it is in this sense we are to understand Trebonius, when he says, that the pandects contain 150,000 *pæne versuum*. These codes were likewise *vel probæ vel deterioris notæ*, more or less perfect, not only with regard to the calligraphy or beauty of the character, but to the correction of the text also.

It is likewise necessary to observe, in ancient codes, the abbreviations, as they have been used in different centuries. Thus, for example, A. C. D. signifies, Aulus Caius Decimus; Ap. Cn. Appius Cncius; Aug. Imp. Augustus Imperator. The characters that are called *notæ*, are such as are not to be found in the alphabet; but which, notwithstanding, signify certain words. All these matters are explained in a copious manner by Vossius, and in the Chronicon Gotvicense. Lastly, the learned divide all the ancient codes into *codices minus raros, rariores, editos, & anecdotos*. The critical art is here indispensably necessary: its researches, moreover, have no bounds; and the more, as the use of it augments every day, by the discoveries that are made in languages, and by the increase of erudition.

DISENTIS, a town of Switzerland, capital of a jurisdiction of the same name, in the country of the Grisons, with an abbey founded in the seventh century. It is situate near the sources of the Rhone, 10 miles S.S.W. of Ilantz.

DISMAL SWAMP, a marshy tract on the coast of N. Carolina, 50 miles long and 30 broad. It occupies the whole country between Albemarle Sound and Pamlico Sound.

DISPOSITION, in Scots law, is that deed or writing which contains the seale or grant of any subject: when applied to heritable subjects, it in some cases gets the name of *charter*, which differs from a disposition in nothing else than a few immaterial forms.

DISS, a town in Norfolk, with a market on Friday. It is seated on the river Waveney, on the side of a hill; and at the W. end of the town is a large muddy lake, abounding with eels. Here are manufactures of sail-cloth, linen cloth, hose, and stays. It is 19 miles S. of Norwich, and 92 N.N.E. of London. Long. 1. 9. E. Lat. 52. 25. N.

DISSEN, or TISSEN, a town of Germany, in the bishopric of Osnabrug, where are salt works belonging to the Elector of Hanover. It is 16 miles S.E. of Osnabrug.

DISSENTERS (*Encycl.*). The first dissenters from the establishment were called PURITANS, and generally adopted the presbyterian form of church government. Robert Brown, a disaffected minister, in the reign of Elizabeth, instituted a new sect, which afterwards rose into considerable consequence, under the title of INDEPENDENTS. The presbyterians at present are but very few; for most, if not all the dissenting congregations in England, are independent of any synodical assembly. There is another numerous and respectable class of dissenters called baptists, but a consideration of their state and principles already appears in another place.

At the time of the act of uniformity in 1662, and for many years afterwards, the non-conformists or dissenters were doctrinally Calvinists. About the close of the last century, Arianism began to shew itself among them, and when Dr. Clarke started the controversy on the Trinity, it spread more rapidly among the dissenters than in the established church. Most of the considerable congregations declined from the Calvinistical sentiments of their ancestors, and fell into Arian or Socinian principles. Some, however, while they adopted the Arminian doctrines, admitted that of the trinity, though it is doubtful whether most of these were not Semi-arians. All those who thus gave up the creed of the old nonconformists have assumed the title of rational dissenters, because they assert the full use of human reason on matters of faith. Socinianism was rather a private matter of opinion among particular ministers and others, till Dr. Lardner openly espoused it. Dr. Priestley's zeal and talents gave it considerable circulation; and the secession of Mr. Lindsey from the established church gave rise to a Socinian congregation in Essex-street, wherein a liturgy altered from that of the church of England is used. This congregation is now under the care of Dr. Disney, another clergyman who has seceded from the church on account of his principles. The number of Socinians, however, is far from being large; and the meeting in Essex-street is but thinly attended. Since the rise of methodism many independent congregations have returned to Calvinistic principles, and many new places of worship have been erected for those of that persuasion. Several of the preachers in Mr. Wesley's and Mr. Whitfield's connections, and also those who were brought up at the expence of the late Countess of Huntingdon, have forsaken the itinerant course of life, and settled as ministers of congregations on the independent plan. It happens that among these, few are found who possess the ad-

vantages of education; but they in general appear earneſt in their manner, and ready in their eloquence. The plain and familiar mode of addreſs ſeems beſt ſuited to common hearers, and in this reſpect the man of moderate talents may poſſeſs ſuperior advantages to the man of erudition. The ſyſtem of the rational Chriſtians is indifferently calculated to operate upon the minds of the ordinary part of mankind; and thoſe of a more aſſuming intellect will only be prepared by it for the reception of poſitive infidelity.

Dr. Prieſtley, before his departure for America, lamented greatly the rapid decline of Socinianiſm; and there is no ground to believe that the caſe has been altered ſince. Yet the diſſenters at large, it is imagined, have not decreaſed. If old congregations have diſſolved, new ones have ariſen of a different complexion; and it deſerves remark, that many who acquired religious ſentiments and habits of ſerioufneſs by attending ſome favourite and popular preacher in the eſtabliſhment, have forſaken the church on his death, and joined the diſſenters. This circumſtance has often happened, and is generally owing to the doctrine preached by the ſucceeding miniſter being different from that to which the people have been long accuſtomed. Much, indeed, may be attributed to the capriciouſneſs of hearers; but, in general, perſons of a ſerious turn, who have been in conſtant attendance on the ſervice of the church, will not leave it without ſome reaſon of this ſort.

The diſſenters have lately diſtinguiſhed themſelves by inſtituting, in conjunction with the methodiſts, a miſſionary ſociety. The deſign of propagating the goſpel is doubtleſs highly commendable, and forms, in fact, a Chriſtian duty. But in this, as in all other great undertakings, much prudence, wiſdom, and humility, are requiſite. Whether theſe have been evidenced in this famous project is a matter of ſome queſtion. Paſſing by all the intermediate regions of barbariſm, the managers of this inſtitution directed their firſt attention to the diſtant iſles of the ſouthern ocean. The perſons ſent out on this arduous work were moſtly mechanics, and ſuch as had little acquaintance with human nature, the various cuſtoms and characters of mankind, and the arts of inſinuating addreſs, calculated to effect a great change in the manners of the people to whom they were ſent. Some diſappointment attended this firſt miſſion; but in another which was afterwards undertaking among the Hottentots, by the Dutch, from the cape of Good Hope (under the direction of the London ſociety), great ſucceſs, it is ſaid, has been experienced, and there is a proſpect of much good being done in that quarter. There is evidently, however, much of oſtentation in the procedure of this ſociety. Their journals are publiſhed in a moſt pompous manner, and an elegant print has been engraved repreſenting the interview of the miſſionaries at Otaheite with the chiefs. This conduct is ridiculous before the event of the miſſion is exactly known, and that cannot be expected ſuddenly to take place. Theſe gentlemen ſeem to think that the divine power and direction are ſurely on their ſide, and, therefore, that they have no reaſon to doubt of ſucceſs. This is not acting as the apoſtles did, nor in the manner which their Maſter commanded them.

The ſame zealous perſons have recently been ſtirred up to undertake what they call miſſions at home; and, in conſequence, many itinerant preachers have gone into various parts of the country. This may, in ſome caſes, do good, but the ſcheme ought to put the clergy on their guard; and the only way by which they can counteract the itinerants is to outpreach, out-live, and out-labour them. The care and faithfulneſs of the eſtabliſhed miniſters will ſoon render the officiouſneſs of the others of none effect. The principal ſeminaries of education for the miniſtry among the diſſenters are at Hackney, Northampton, Mancheſter, Homerton, Wrexham (Denbighſhire), Swanſea (South Wales), Hoxton, Taunton, and Daventry.

DIVING (*Encycl.*). The following deſcription of a ſub-marine veſſel, or *diving-machine*, invented by Mr. Buſhnell, of Connecticut, is given in the Tranſactions of the American Philoſophical Society.

The external ſhape of the ſub-marine veſſel bore ſome reſemblance to two upper tortoiſe ſhells of equal ſize, joined together; the place of entrance into the veſſel being repreſented by the opening made by the ſwell of the ſhells, at the head of the animal. The inſide was capable of containing the operator, and air ſufficient to ſupport him thirty minutes without receiving freſh air. At the bottom, oppoſite to the entrance, was fixed a quantity of lead for ballaſt. At one edge, which was directly before the operator, who ſat upright, was an oar for rowing forward or backward. At the other edge was a rudder for ſteering. An aperture, at the bottom, with its valve, was deſigned to admit water, for the purpoſe of deſcending; and two braſs forcing-pumps ſerved to eject the water within, when neceſſary for aſcending. At the top, there was likewiſe an oar, for aſcending or deſcending, or continuing at any particular depth. A water-gauge, or barometer, determined the depth of deſcent, a compaſs directed the courſe, and a ventilator within ſupplied the veſſel with freſh air, when on the ſurface.

The entrance into the veſſel was elliptical, and ſo ſmall as barely to admit a perſon. This entrance was ſurrounded with a broad elliptical iron band, the lower edge of which was let into the wood of which the body of the veſſel was made, in ſuch a manner, as to give its utmoſt ſupport to the body of the veſſel againſt the preſſure of the water. Above the upper edge of this iron band there was a braſs-crown, or cover, reſembling a hat with its crown and brim, which ſhut watertight upon the iron band: the crown was hung to the iron band with hinges, ſo as to turn over ſidewiſe, when opened. To make it perfectly ſecure when ſhut, it might be ſcrewed down upon the band by the operator, or by a perſon without.

There were in the braſs crown three round doors, one directly in front, and one on each ſide, large enough to put the hand through. When open they admitted freſh air; their ſhutters were ground perfectly tight into their places with emery, hung with hinges, and ſecured in their places when ſhut. There were likewiſe ſeveral ſmall glaſs windows in the crown, for looking through, and for admitting light in the day-time, with covers to ſecure them. There were two air pipes in the crown. A ventilator within drew freſh air through one of the air pipes, and diſcharged it into the lower part of the veſſel; the freſh air introduced by the ventilator expelled the impure light air through the other air pipe. Both air pipes were ſo conſtructed, that they ſhut themſelves whenever the water roſe near their tops, ſo that no water could enter through them, and opened themſelves immediately after they roſe above the water.

The veſſel was chiefly ballaſted with lead fixed to its bottom; when this was not ſufficient, a quantity was placed within, more or leſs, according to the weight of the operator; its ballaſt made it ſo ſtiff, that there was no danger of overſetting. The veſſel with all its appendages, and the operator, was of ſufficient weight to ſettle it very low in the water. About two hundred pounds of the lead, at the bottom for ballaſt, would be let down forty or fifty feet below the veſſel; this enabled the operator to riſe inſtantly to the ſurface of the water, in caſe of accident.

When the operator would deſcend, he placed his foot upon the top of a braſs valve, depreſſing it, by which he opened a large aperture in the bottom of the veſſel, through which the water entered at his pleaſure; when he had admitted a ſuffi-

cient quantity, he deſcended very gradually; if he admitted too much, he ejected as much as was neceſſary to obtain an equilibrium, by the two braſs forcing pumps, which were placed at each hand. Whenever the veſſel leaked, or he would aſcend to the ſurface, he alſo made uſe of theſe forcing pumps. When the ſkilful operator had obtained an equilibrium, he could row upward, or downward, or continue at any particular depth, with an oar, placed near the top of the veſſel, formed upon the principle of the ſcrew, the axis of the oar entering the veſſel; by turning the oar one way he raiſed the veſſel, by turning it the other way he depreſſed it.

A glaſs tube eighteen inches long, and one inch in diameter, ſtanding upright, its upper end cloſed, and its lower end, which was open, ſcrewed into a braſs pipe, through which the external water had a paſſage into the glaſs tube, ſerved as a water-gauge or barometer. There was a piece of cork, with phoſphorus on it, put into the water-gauge. When the veſſel deſcended the water roſe in the water-gauge, condenſing the air within, and bearing the cork, with its phoſphorus, on its ſurface. By the light of the phoſphorus, the aſcent of the water in the gauge was rendered viſible, and the depth of the veſſel under water aſcertained by a graduated line.

An oar, formed upon the principle of the ſcrew, was fixed in the fore part of the veſſel; its axis entered the veſſel, and being turned one way, rowed the veſſel forward, but being turned the other way rowed it backward; it was made to be turned by the hand or foot.

A rudder, hung to the hinder part of the veſſel, commanded it with the greateſt eaſe. The rudder was made very elaſtic, and might be uſed for rowing forward. Its tiller was within the veſſel, at the operator's right hand, fixed, at a right angle, on an iron rod, which paſſed through the ſide of the veſſel; the rod had a crank on its outſide end, which commanded the rudder, by means of a rod extending from the end of the crank to a kind of tiller, fixed upon the left hand of the rudder. Raiſing and depreſſing the firſt-mentioned tiller turned the rudder as the caſe required.

A compaſs marked with phoſphorus directed the courſe, both above and under the water; and a line and lead ſounded the depth when neceſſary.

The internal ſhape of the veſſel, in every poſſible ſection of it, verged towards an ellipſis, as near as the deſign would allow, but every horizontal ſection, although elliptical, yet as near to a circle as could be admitted. The body of the veſſel was made exceedingly ſtrong; and to ſtrengthen it as much as poſſible, a firm piece of wood was framed, parallel to the conjugate diameter, to prevent the ſides from yielding to the great preſſure of the incumbent water, in a deep immerſion. This piece of wood was alſo a ſeat for the operator.

Every opening was well ſecured. The pumps had two ſets of valves. The aperture at the bottom, for admitting water, was covered with a plate, perforated full of holes to receive the water, and prevent any thing from choaking the paſſage, or ſtopping the valve from ſhutting. The braſs valve might likewiſe be forced into its place with a ſcrew, if neceſſary. The air pipes had a kind of hollow ſphere, fixed round the top of each, to ſecure the air-pipe valves from injury: theſe hollow ſpheres were perforated full of holes, for the paſſage of the air through the pipes: within the air-pipes were ſhutters to ſecure them, ſhould any accident happen to the pipes, or the valves on their tops.

Wherever the external apparatus paſſed through the body of the veſſel, the joints were round, and formed by braſs pipes, which were driven into the wood of the veſſel, the holes through the pipes were very exactly made, and the iron rods, which paſſed through them, were turned in a lathe to fit them; the joints were alſo kept full of oil, to prevent rust and leaking. Particular attention was given to bring every part, neceſſary for performing the operations, both within and without the veſſel, before the operator, and as conveniently as could be deviſed; ſo that every thing might be found in the dark, except the water-gauge and the compaſs, which were viſible by the light of the phoſphorus, and nothing required the operator to turn to the right hand, or to the left, to perform any thing neceſſary.

The inventor next purſues the ſubject under the following heads:—

1. Deſcription of a magazine, and its appendages, deſigned to be conveyed by the ſub-marine veſſel to the bottom of a ſhip.—In the fore part of the brim of the crown of the ſubmarine veſſel, was a ſocket, and an iron tube, paſſing through the ſocket; the tube ſtood upright, and could ſlide up and down in the ſocket, ſix inches: at the top of the tube was a wood-ſcrew, fixed by means of a rod, which paſſed through the tube, and ſcrewed the wood-ſcrew faſt upon the top of the tube: by puſhing the wood-ſcrew up againſt the bottom of a ſhip, and turning it at the ſame time, it would enter the planks; driving would alſo anſwer the ſame purpoſe; when the wood-ſcrew was firmly fixed, it could be caſt off by unſcrewing the rod, which faſtened it upon the top of the tube.

Behind the ſub-marine veſſel was a place, above the rudder, for carrying a large powder magazine; this was made of two pieces of oak timber, large enough, when hollowed out, to contain 150 pounds of powder, with the apparatus uſed in firing it, and was ſecured in its place by a ſcrew, turned by the operator. A ſtrong piece of rope extended from the magazine to the wood-ſcrew above mentioned, and was faſtened to both. When the wood-ſcrew was fixed, and to be caſt off from its tube, the magazine was to be caſt off likewiſe by unſcrewing it, leaving it hanging to the wood-ſcrew; it was lighter than the water, that it might riſe up againſt the object, to which the wood-ſcrew and itſelf were faſtened.

Within the magazine was an apparatus, conſtructed to run any propoſed length of time, under twelve hours; when it had run out its time, it unpinioned a ſtrong lock reſembling a gun lock, which gave fire to the powder. This apparatus was ſo pinioned, that it could not poſſibly move, till, by caſting off the magazine from the veſſel, it was ſet in motion.

The ſkilful operator could ſwim ſo low on the ſurface of the water, as to approach very near a ſhip, in the night, without fear of being diſcovered, and might, if he choſe, approach the ſtem or ſtern above water, with very little danger. He could ſink very quickly, keep at any depth he pleaſed, and row a great diſtance in any direction he deſired, without coming to the ſurface, and when he roſe to the ſurface, he could ſoon obtain a freſh ſupply of air, when, if neceſſary, he might deſcend again, and purſue his courſe.

2. Experiments made to prove the nature and uſe of a ſubmarine veſſel.—The firſt experiment made was with about two ounces of gunpowder, which were exploded four feet under water, to prove to ſome of the firſt perſonages in Connecticut that powder would take fire under water.

The ſecond experiment was made with two pounds of powder, incloſed in a wooden bottle, and fixed under a hogſhead, with a two-inch oak plank between the hogſhead and the powder; the hogſhead was loaded with ſtones as deep as it could ſwim; a wooden pipe deſcending through the lower head of the hogſhead, and through the plank, into the powder contained in the bottle, was primed with powder. A match put to the priming, exploded the powder, which produced a very great effect, rending the plank into pieces; demoliſhing the hogſhead; and caſting the ſtones and the ruins of the

hogſhead, with a body of water, many feet into the air, to the aſtoniſhment of the ſpectators. This experiment was likewiſe made for the ſatisfaction of the gentlemen above mentioned.

There were afterwards made many experiments of a ſimilar nature, ſome of them with large quantities of powder; they all produced very violent exploſions, much more than ſufficient for any purpoſe had in view.

In the firſt eſſays with the ſub-marine veſſel the inventor took care to prove its ſtrength to ſuſtain the great preſſure of the incumbent water, when ſunk deep, before he truſted any perſon to deſcend much below the ſurface: and he never ſuffered any perſon to go under water without having a ſtrong piece of rigging made faſt to it, until he found him well acquainted with the operations neceſſary for his ſafety. After that he made him deſcend, and continue at particular depths, without riſing or ſinking, row by the compaſs, approach a veſſel, go under her, and fix the wood-ſcrew mentioned before, into her bottom, &c. until he thought him ſufficiently expert to put any deſign into execution.

It required many trials to make a perſon of common ingenuity a ſkilful operator: the firſt employed was very ingenious, and made himſelf maſter of the buſineſs, but was taken ſick in the campaign of 1776, at New York, before he had an opportunity to make uſe of his ſkill, and never recovered his health ſufficiently afterwards.

3. Experiments made with a ſub-marine veſſel.—After various attempts to find an operator to his wiſh, Mr. Buſhnell ſent one, who appeared more expert than the reſt, from New York, to a fifty-gun ſhip, lying not far from Governor's Iſland. He went under the ſhip, and attempted to fix the wooden ſcrew into her bottom, but ſtruck, as he ſuppoſes, a bar of iron, which paſſes from the rudder hinge, and is ſpiked under the ſhip's quarter. Had he moved a few inches, which he might have done, without rowing, he would probably have found wood where he might have fixed the ſcrew; or, if the ſhip were ſheathed with copper, he might eaſily have pierced it: but not being well ſkilled in the management of the veſſel, in attempting to move to another place, he loſt the ſhip; after ſeeking her in vain, for ſome time, he rowed ſome diſtance, and roſe to the ſurface of the water, but found day-light had advanced ſo far, that he durſt not renew the attempt. The adventurer ſaid that he could eaſily have faſtened the magazine under the ſtem of the ſhip, above water, as he rowed up to the ſtern, and touched it before he deſcended. Had he faſtened it there, the exploſion of 150 pounds of powder (the quantity contained in the magazine), muſt have been fatal to the ſhip. In his return from the ſhip to New York, he paſſed near Governor's Iſland, and thought he was diſcovered by the enemy on the iſland; being in haſte to avoid the danger he feared, he caſt off the magazine, as he imagined it retarded him in the ſwell, which was very conſiderable. After the magazine had been caſt off one hour, the time the internal apparatus was ſet to run, it blew up with great violence.

Afterwards, there were two attempts made in Hudſon's river, above the city, but they effected nothing. One of them was by the afore-mentioned perſon. In going towards the ſhip, he loſt ſight of her, and went a great diſtance beyond her: when he at length found her, the tide ran ſo ſtrong, that, as he deſcended under water, for the ſhip's bottom—it ſwept him away. Soon after this, the enemy went up the river, and purſued the boat which had the ſub-marine veſſel on board; and ſunk it with their ſhot. "Though," ſays Mr. Buſhnell, "I afterwards recovered the veſſel, I found it impoſſible, at that time, to proſecute the deſign any further. I had been in a bad ſtate of health, from the beginning of my undertaking, and was now very unwell; the ſituation of public affairs was ſuch, that I deſpaired of obtaining the public attention, and the aſſiſtance neceſſary. I was unable to ſupport myſelf, and the perſons I muſt have employed, had I proceeded. Beſides, I found it abſolutely neceſſary, that the operators ſhould acquire more ſkill in the management of the veſſel, before I could expect ſucceſs: which would have taken up ſome time, and made no ſmall additional expence. I therefore gave over the purſuit for that time, and waited for a more favourable opportunity, which never arrived."

4. Other experiments made with a deſign to fire ſhipping.—In the year 1777, Mr. Buſhnell made an attempt from a whale-boat againſt the Cerberus frigate, then lying at anchor between Connecticut river and New London, by drawing a machine againſt her ſide, by means of a line. The machine was loaded with powder, to be exploded by a gun-lock, which was to be unpinioned by an apparatus, to be turned by being brought along-ſide of the frigate. This machine fell in with a ſchooner at anchor, aſtern of the frigate, and concealed from his ſight. By ſome means or other it was fired, and demoliſhed the ſchooner and three men; and blew the only one left alive over-board, who was taken up very much hurt.

After this he fixed ſeveral kegs under water, charged with powder, to explode, upon touching any thing, as they floated along with the tide: he ſet them afloat in the Delaware, above the Engliſh ſhipping at Philadelphia, in December, 1777. "I was unacquainted," ſays he, "with the river, and obliged to depend upon a gentleman very imperfectly acquainted with that part of it, as I afterwards found. We went as near the ſhipping as he durſt venture; I believe the darkneſs of the night greatly deceived him, as it did me. We ſet them adrift, to fall with the ebb, upon the ſhipping. Had we been within ſixty rods I believe they muſt have fallen in with them immediately, as I deſigned; but, as I afterwards found, they were ſet adrift much too far diſtant, and did not arrive until after being detained ſome time by froſt, they advanced in the day-time, in a diſperſed ſituation, and under great diſadvantages. One of them blew up a boat with ſeveral perſons in it, who imprudently handled it too freely, and thus gave the Britiſh that alarm which brought on *the battle of the Kegs*."

DIU, an iſland at the entrance of the gulf of Cambay, in the Deccan of Hindooſtan, three miles long and one broad. On it is a large fortified town of the ſame name, built of free-ſtone and marble; and it contains ſome fine churches, erected by the Portugueſe, about the time they took poſſeſſion of the iſland in 1515. The trade of the town, once ſo important, is almoſt entirely removed to Surat. It is 180 miles W. by S. of Surat, and 200 N.W. of Bombay. Long. 69. 52. E. Lat. 20. 43. N.

DIURESIS (from ουρον, *urine*). An exeretion of urine.

DIXAN, the firſt town in Abyſſinia, on the ſide of Taranta. It is built on the top of a conical hill; a deep valley ſurrounds it like a trench, and the road winds ſpirally up the hill till it ends among the houſes. The inhabitants conſiſt of Moors and Chriſtians, whoſe only trade is the ſelling of children. The Chriſtians bring ſuch as they have ſtolen in Abyſſinia to Dixan, where the Moors receive them, and carry them to a market at Maſuah, whence they are ſent to Arabia or India. The prieſts of the province of Tigre are openly concerned in this infamous traffic. Long. 40. 7. E. Lat. 14. 57. N.

DIXMUDE, a town of Auſtrian Flanders, which has been often taken, the laſt time by the French in 1794. It is cele-

brated for its excellent butter, and ſeated on the river Yperlee, ten miles N.W. of Ypres. Long. 2. 57. E. Lat. 51. 2. N.

DIZIER, St. a town of France, in the department of Upper Marne, ſeated on the Marne, where it begins to be navigable for boats, fifteen miles S.E. of Vitri-le-François. Long. 4. 54. E. Lat 48. 35. N.

DNIEPER, anciently the Boriſthenes, a large river of Ruſſia, which riſes in the government of Smolenſko, and flowing in a ſoutherly direction, enters the Black Sea, between Cherſon and Oczakow. From its ſource to its mouth, it now flows entirely through the Ruſſian dominions; and through this whole courſe, of above 800 miles, its navigation is only once interrupted by a ſeries of cataracts, which begin below the mouth of the Samara, and continue for above forty miles; but theſe may be paſſed in ſpring, without much hazard, even by loaded barks. In other ſeaſons of the year, the goods are landed at Kemenſk, oppoſite the mouth of the Samara, and tranſported forty miles by land to Kitchkaſe, ſix miles from the fortreſs of Alexandrowſk, where they are again embarked, and deſcend the ſtream to Cherſon.

DNIESTER, a fine river, which riſes in Galicia, in Auſtrian Poland, and viſits Chockzim, dividing Podolia from Moldavia; it then ſeparates Beſſarabia from the Ruſſian government of Catharinenſlaf, and having watered Bender, falls into the Black Sea, between the mouths of the Dnieper and the Danube.

DOBELIN, a town of Courland, twenty miles S.W. of Mittau. Long. 23. 35. E. Lat. 56. 28. N.

DOBRZIN, a town of Poland, in Maſovia, capital of a territory of the ſame name, ſeated on a rock, near the Viſtula, fourteen miles N.W. of Plockſko. Long. 19. 5. E. Lat. 52. 54. N.

DOCKUM, a town of the United Provinces, in W. Frieſland, at the mouth of the river Ee, ten miles N.E. of Lewarden. Long. 5. 41. E. Lat. 53. 18. N.

DODART (Denys), phyſician of Lewis XIV. and member of the French Academy of Sciences, was born at Paris in 1634. Among other things, he is the author of a Statica Medicina Gallica: and he greatly cultivated the theory of inſenſible perſpiration, treading cloſely in the ſteps of Sanctorius. He made the following experiment upon himſelf. Upon the firſt day of Lent 1677, he weighed 116 pounds and one ounce; after undergoing the diſcipline and abſtinence of Lent, he weighed, on Eaſter Eve, no more than 107 pounds and twelve ounces. He loſt during this ſeaſon, therefore, eight pounds and five ounces. Theſe attentions he is ſaid to have continued for 33 years. He died in 1707, univerſally regretted. He was, ſays Fontenelle, of a moſt religious and ſerious character, yet not auſtere and ſombrous. Guy Patin, who was as covetous of elogies, as he was prodigal of ſatire, called him *monſtrum ſine vitio*, a prodigy of wiſdom and ſcience without any defect.

Claude Dodart, his ſon, who was alſo firſt phyſician to the king, died at Paris in 1720, and left Notes ſur l'Hiſtoire Générale des Drogues, par Pierre Pomey.

DODSWORTH (Roger), ſon of Matthew Dodſworth, regiſtrar of York cathedral, and chancellor to Archbiſhop Matthews, was born July 24, 1585, at Newton-Grange, in the pariſh of St. Oſwald, in Rydale, Yorkſhire: he was a man of wonderful induſtry, but leſs judgment; always collecting and tranſcribing, but never publiſhed any thing. He was eſteemed as an indefatigable collector of the antiquities of York, who undertook and executed a work, which, to the antiquaries of the preſent age, would have been the ſtone of Tydides. One hundred and twenty-two volumes of his own writing, beſides original MSS. which he had obtained from ſeveral hands, making all together 162 volumes folio, now lodged in that grand repoſitory of our ancient muniments the Bodleian Library at Oxford, are laſting memorials what this country owes to him, as the two volumes of the Monaſticon (which though publiſhed under his and Dugdale's names conjointly, were both collected and written totally by him) will immortaliſe that extenſive induſtry which has laid the whole kingdom under obligation. The patronage of General Fairfax preſerved this treaſure, and bequeathed it to the library where it is now lodged. Fairfax preſerved alſo the fine windows of York cathedral; and when St. Mary's tower, in which were lodged innumerable records, both public and private, relating to the northern parts, was blown up during the ſiege of York, he gave money to the ſoldiers who could ſave any ſcattered papers, many of which are now at Oxford; though Dodſworth had tranſcribed and abridged the greateſt part before. Fairfax allowed Dodſworth a yearly ſalary to preſerve the inſcriptions in churches.

Fairfax died in 1671; his nephew Henry Fairfax, Dean of Norwich, gave Roger Dodſworth's 160 volumes of collections to the univerſity of Oxford; but the MSS. were not brought thither till 1673, and then in wet weather, when Wood with much difficulty obtained leave of the vice-chancellor to have them brought into the muniment-room in the ſchool-tower, and was a month drying them on the leads. Dodſworth died in Auguſt 1654, and was buried at Rufford, Lancaſhire.

DOEL, a town of Dutch Flanders, on the river Scheld, oppoſite Lillo, nine miles N.W. of Antwerp. Long. 4. 15. E. Lat. 51. 17. N.

DOG (*Encycl.*). By ſtat. 38 Geo. III. c. 41. ſ. 2. there ſhall be paid, from and after April 5, 1798, in lieu of the old duties repealed, the following rates and duties for every dog of the ſeveral deſcriptions herein-after mentioned, kept by or for the uſe of any perſon:

Number of dogs.	Duties payable for each dog.
For every greyhound, hound, pointer, ſetting dog, ſpaniel, lurcher, or tarrier, and for every dog of whatever deſcription or denomination the ſame may be, where any perſon ſhall keep two or more dogs - - -	£.0 6 0
For any dog (not being a greyhound, hound, ſetting dog, ſpaniel, lurcher, or terrier) kept by or for the uſe of any perſon inhabiting a dwelling-houſe, aſſeſſed to any of the duties on houſes, windows, or lights, or on inhabited houſes, where one ſuch dog and no more ſhall be kept by or for the uſe of ſuch perſon -	£.0 4 0

The ſaid duties to be paid by the perſons reſpectively keeping ſuch dogs, or for whoſe uſe the ſame ſhall be kept, and to be ſubject to all the exemptions contained in any act in force; and alſo to the regulations contained in the act of the 36th George III. which act contains the following proviſions:—

1ſt, That the duty ſhall not extend to dogs not ſix months old, the proof of which is to lie on the owner, on an appeal to the commiſſioners.

2dly, If any perſon ſhall be deſirous of compounding for the number of hounds by him kept, and ſhall give notice thereof to the collector, and ſhall pay within thirty days after April 5, yearly, the ſum of 24l. ſuch perſon ſhall not be liable to be aſſeſſed in reſpect of any hounds by him kept in the preceding year; and if they are kept in two or more pariſhes, he ſhall give notice in which pariſh ſuch compoſition is intended to be made. 38 Geo. III. c. 41. ſ. 2.

DOGADO, a province of the late Venetian ſtates, in

which is the capital. It is bounded on the E. by the gulf of Venice, on the S. by Polesino, on the W. by Paduano, and on the north by Trevisano. It comprehends many small islands near it, called the LAGUNES OF VENICE.

DOGGET (Thomas), an author and an actor, was born in Castle-street, Dublin, and made his first theatrical attempt on the stage of that metropolis; but not meeting with the encouragement there that his merit undoubtedly deserved, he came over to England, and entered himself in a travelling company, but from thence very soon was removed to London, and established in Drury-Lane and Lincoln's-Inn-Fields theatres, where he was universally liked in every character he performed, but shone in none more conspicuously than those of Fondlewife in the Old Batchelor, and Ben in Love for Love, which Mr. Congreve, with whom he was a very great favourite, wrote in some measure with a view to his manner of acting.

In a few years after he removed to Drury-Lane theatre, where he became joint-manager with Wilks and Cibber, in which situation he continued, till on a disgust he took in the year 1712, at Mr. Booth's being forced on them as a sharer in the management, he threw up his part in the property of the theatre, though it was looked on to have been worth 1000l. per annum. He had, however, by his frugality, saved a competent fortune to render him easy for the remainder of his life, with which he retired from the hurry of business in the very meridian of his reputation. As an actor he had great merit, and his contemporary Cibber informs us that he was the most original and the strictest observer of nature, of any actor of his time. His manner, though borrowed from none, frequently served for a model to many; and he possessed that peculiar art which so very few performers are masters of, viz. the arriving at the perfectly ridiculous, without stepping into the least impropriety to attain it. And so extremely careful and skilful was he in the dressing of his characters to the greatest exactness of propriety, that the least article of what he wore seemed in some measure to speak and mark the different humour he presented;—a necessary care in a comedian, in which many performers are but too remiss. He died Sept. 22, 1721.

Dogget, in his political principles, was a "Whig up to the head and ears;" and so strictly was he attached to the interests of the house of Hanover, that he never let slip any occasion that presented itself of demonstrating his sentiments in that respect. One instance, among others, is well known, which is, that the year after George I. came to the throne, this performer gave a waterman's coat and silver badge, to be rowed for by six watermen, on the 1st day of August, being the anniversary of that king's accession to the throne. And at his death bequeathed a certain sum of money, the interest of which was to be appropriated annually, for ever, to the purchase of a like coat and badge, to be rowed for in honour of that day. Which ceremony is every year performed on the 1st of August, the claimants setting out on a signal given at that time of the tide when the current is strongest against them, and rowing from the Old Swan near London-Bridge, to the White Swan at Chelsea.

As a writer, Dogget has left behind him only one comedy, which has not been performed in its original state for many years, entitled, The Country Wake. C. 1696, 4to. It has been altered however into a ballad farce, which frequently makes its appearance under the title of, Flora, or Hob in the Well.

DOL, a town of France, in the department of Isle and Vilaine. It was lately an episcopal see, and is situate in a morass, five miles from the sea, and 21 S.E. of St. Malo. Long. 1. 41. W. Lat. 48. 33. N.

DOLCE-AQUA, a town of Piedmont, capital of a marquisate of the same name, with a castle. It is seated on the Nervia, five miles N. of Vintimiglia. Long. 7. 42. E. Lat. 43. 58. N.

DOLCIGNO, a strong town of Albania, with a bishop's see, a good harbour, and a citadel. It is seated on the Drino, 10 miles S.E. of Antivari. Long. 19. 20. E. Lat. 42. 12. N.

DOLE, a town of France, in the department of Jura, seated on the river Doubs, 35 miles S.W. of Besançon. Long. 5. 38. E. Lat. 47. 6. N.

DOLET (Stephen), a very learned man, and memorable for being burnt at Paris for his opinions in religion, was born at Orleans in 1508. He applied himself to reform the French language, and polish it from the barbarity with which it was incrusted; nay, what is more, as Baillet tells us, he thought himself destined by Heaven to this task, and set himself to compose some treatises on the matter; but the public, it seems, was not disposed to listen to his pretended vocation. He wrote some Latin and French verses, which in Bayle's judgment are not amiss; for as to the severity and contempt with which Julius Scaliger treated him and his poetry, it has no weight with Bayle, who imputes it to a private motive of resentment, which Scaliger had conceived against Dolet, for interfering with him in defending the Ciceronians against the ridicule of Erasmus. Dolet's attempts to promote good literature gained him a great share in the affection of Castellan, who was a very learned prelate, and much beloved by Francis I. whose natural son, by the way, Dolet is said to have been; though Bayle is of opinion, that Francis was too young, when Dolet was born, to have been his father. We must not forget to observe, that Dolet, though a learned man and an author, was in the mean time a printer and bookseller at Lyons, and printed some of his own writings. He would have printed the French translation of most of Plato's works, which he himself had made, if he had lived; this translation however he must have made from the Latin, which he understood well, and not from the Greek, which he is said not to have understood at all. The first time he was imprisoned for religion, his friend Castellan interceded for him, and got him released, upon his promising to be a good Catholic. But Dolet relapsing into his former licentious way, nobody durst appear for him when he was imprisoned the second time: so that, being abandoned to the fury of the inquisitors, he was condemned to be burnt to death for atheism, and not for Lutheranism as some have declared: this punishment he underwent August 3, 1546, which was the day of his nativity. A letter was published by Almeveloeen, in his Amœnitates Theologico-Philologicæ, printed at Amsterdam in 1694, which testifies, that Dolet recommended himself to the holy Virgin, and to St. Stephen, a little before he was strangled, but these kind of testimonies are much to be suspected.

DOLGELLY, a town in Merionethshire, with a market on Tuesday. It is seated on the river Avon, in a vale so called, and at the foot of the great rock Cader-Idris, which is extremely high. It has a good manufacture of Welsh cotton, and is 31 miles N.W. of Montgomery, and 205 of London. Long. 9. 48. W. Lat. 52. 42. N.

DOLLART BAY, a large gulf, separating E. Friesland, in Germany, from Groningen, one of the United Provinces.

DOMAZLIZE, a town of Bohemia, in the circle of Pilsen, remarkable for a battle fought between the crusaders and the Hussites in 1466, to the great disadvantage of the former. It was taken by the Swedes in 1541. It is seated on the river Cadbuza, 17 miles S. of Pilsen.

DOMBACA, a ſmall iſland near the coaſt of Ava, in the Bay of Bengal. Long. 94. 35. E. Lat. 17. 32. N.

DOMBES, a late principality and ſmall country of France, in Burgundy, of which Trevoux was the capital. It is now part of the department of Ain.

DOMBROWAZ, a town of Poland, in the palatine of Lemberg, 60 miles S.W. of Lemberg.

DOMFRONT, a town of France, in the department of Orne, ſeated on a craggy rock, which has a large cleft from the ſummit to the baſe, through which flows the little river Varenne. It is 35 miles N.W. of Alençon. Long. 0. 43. W. Lat. 48. 38. N.

DOMICILE, in Scots law, is the dwelling-place where a perſon lives with an intention to remain.

DOMINIUM EMINENS, in Scots law, that power which the ſtate or ſovereign has over private property, by which the proprietor may be compelled to ſell it for an adequate price where public utility requires.

DOMINIUM *Directum*, in Scots law, the right which a ſuperior retains in his lands, notwithſtanding the feudal grant to his vaſſal.

DOMINIUM *Utile*, in Scots law, the right which the vaſſal acquires in the lands by the feudal grant from his ſuperior.

DOMINO, ST. one of the Tremiti Iſlands, in the gulf of Venice, 15 miles from the coaſt of Naples.

DOMITZ, a town of Mecklenberg Schwerin, with a fort, ſeated at the confluence of the Elbe and Elve, 25 miles S. of Schwerin. Long. 11. 41. E. Lat. 53. 15. N.

DOMMEL, a river of Brabant, which receives the Aa below Bois-le-Duc, and then falls into the Meuſe.

DOMO-D'OSSOLA, a town of Italy, in the duchy of Milan, with a caſtle, ſeated on the Toſa, at the foot of the Alps, 20 miles N. of Varallo.

DOMPAIRE, a town of France, in the department of the Voſges, formerly the reſidence of the kings of Auſtraſia and dukes of Lorrain, 10 miles W.N.W. of Epinal.

DOMREMY-LA-PUCELLE, a village of France, in the department of Meuſe, remarkable for the birth of Joan of Arc, the Maid of Orleans. It is ſeated on the Meuſe, five miles from Neufchateau.

DON, a river in Yorkſhire, which waters Sheffield, Rotheram, and Doncaſter, and joins the Aire near its termination with the Ouſe.

DONAGHADEE, a ſea-port of Ireland, in the county of Down, 20 miles W. by S. of Port Patrick, in Scotland, between which two places a packet-boat ſails every day.

DONATUS (JEROM), a nobleman of Venice, who died in the beginning of the 16th century. He was very uſeful to his country; ſerved it as a commander more than once: and was the means of reconciling that republic and pope Julius II. though he had the misfortune to be carried off by a violent fever at Rome before the treaty was concluded between them. He was alſo a man of learning: and publiſhed a tranſlation of Alexander Aphrodiceus de Anima. His letters are likewiſe well written; which made Eraſmus ſay of him, that he was capable of performing any thing in the way of learning, if his mind had not been diſſipated by other employments. Pierius Valerianus has placed him in the liſt of unfortunate learned men, for which he gives three reaſons: firſt, becauſe his domeſtics obeyed him ill; ſecondly, becauſe he did not live to ſee the happineſs which would ariſe to his country from the concluſion of his treaty; thirdly, becauſe a great many books, which he had written to immortaliſe his name, remained unpubliſhed. Now, as it ſeems to us, the firſt of theſe grievances might have been redreſſed; the ſecond was no grievance at all, ſince he had actually attained his point; and, thirdly, we cannot think it any misfortune to a dead man, that ſuch a number of ſyllables, as uſed to compoſe his name, are no longer put together and ſounded amongſt the living.

DONAUESCHINGEN, or DONESCHINGEN, a town of Suabia, in the principality of Furſtenburg. It is the chief reſidence of the prince; in the court-yard of whoſe palace are ſome ſprings, collected in a reſervoir about 30 feet ſquare, from which iſſues a little brook; and though the rivulets Bribach and Brege, uniting below the town, are far more conſiderable than this ſtream, which flows into them ſoon after their junction, yet has this alone the honour of being called the head of the Danube.

DONCHERRY, a town of France, in the department of Ardennes, ſeated on the Meuſe, three miles from Sedan. Long. 5. 2. E. Lat. 49. 42. N.

DONEGAL, a county of Ireland, in the province of Ulſter, 68 miles long and 44 broad; bounded on the E. by Londonderry and Tyrone, on the W. and N. by the ocean, and on the S. by Fermanagh and the bay of Donegal. It contains 40 pariſhes, and ſends 12 members to parliament. It is in general a champaign country, and abounds with harbours.

DONEGAL, a town of Ireland, capital of a county of the ſame name, ſeated on the bay of Donegal, 10 miles N. of Ballyſhannon. Long. 7. 47. W. Lat. 54. 42. N.

DONERAILE, a town of Ireland, in the county of Cork. Near it are quarries of beautiful variegated marble. It is ſituate on the Awbeg, 19 miles N.W. of Cork, and 113 S.W. of Dublin. Long. 8. 42. W. Lat. 52. 5. N.

DONGALA, or DONCALA, a town of Nubia, with a caſtle. It contains 10,000 houſes of wood, and is ſeated on the Nile, among mountains, 150 miles N. of Sennar. Long. 30. 35. E. Lat. 21. 0. N.

DONJON, a town of France, in the department of Allier, 24 miles S.E. of Moulins. Long. 3. 42. E. Lat. 46. 21. N.

DONZY, a town of France, in the department of Nievre, 22 miles N. of Nevers. Long. 3. 14. E. Lat. 47. 22. N.

DOOAB, or DOABAH, a fertile tract of Hindooſtan Proper, between the Ganges and Jumna, and formed by the confluence of thoſe rivers. It is ſo named by way of eminence; the word ſignifying a tract of land formed by the approximation of two rivers. The principal part of it is ſubject to the nabob of Oude.

DOON, LOCH, a lake of Ayrſhire, in the diſtrict of Kyle, ſix miles in length, and of conſiderable breadth. On an iſland in this lake ſtands Balloch Caſtle.

DOON, a river of Scotland, which iſſues from Loch Doon, and taking a N.W. direction, divides the diſtrict of Kyle from Carrick, the ſouthern diviſion of Ayrſhire, and falls into the frith of Clyde.

DOOR-CLOSER, a machine or contrivance, calculated to be morticed into the bottom of a door, in order to keep the wind from coming in, and ſo that the door may yet paſs freely over the carpet, &c. It is ſhewn in Plate 20, where,

Fig. 1. repreſents the machine laid open to ſhew the work.

Fig. 2. the ſame repreſented as if the door were ſhut.

a, A ſpring, which, when the door is open, by compreſſing the inner ends of the rods, *bb*, turning on the centres, *cc*, cauſe the outer ends to riſe along with the ſlip of wood, *d*, by which the door may paſs over the carpet; *e* is the end of one rod, which, when ſhut againſt the ſtrikening-plate, *f*, on the door-poſt, cauſes the ſlip of wood, *d*, to cloſe on the floor, and prevent any wind coming underneath the door.

DORAN, a town of Arabia, in Yemen, 28 miles S. of Sanaa. Long. 44. 4. E. Lat. 14. 55. N.

DORAT, a town of France, in the department of Upper

Vienne, ſeated on the Abran, near its junction with the Sevre, 25 miles N. of Limoges. Long. 1. 24. E. Lat. 46. 12. N.

DORCHESTER, a town in Oxfordſhire, which was a ſtation of the Romans, and ruined in the wars with the Danes. It was a biſhop's ſee, till 1086, when William the Conqueror tranſlated it to Lincoln; and it had five ſtately churches, though now but one. It gives the title of baron to the family of Carleton, and is ſeated on the Tame, 10 miles S E. of Oxford, and 49 W.N.W. of London. Long. 1. 0. W. Lat. 51. 39. N.

DORDOGNE, a department of France, which includes the late province of Perigord. It receives its name from a river, which riſes in the mountains of Auvergne, and falls into the Garonne, near Bourdeaux.

DORN, a village in a detached part of Worceſterſhire, three miles S.E. of Camden in Glouceſterſhire. The Roman foſſiway runs through it. There are evident tokens of its antiquity, and of its having been a Roman colony; abundance of coins, both Roman and Britiſh, having been found here.

DORNBURG, a town of Upper Saxony, in the principality of Weimar, 14 miles E. of Weimar.

DORNOCH, the county-town of Sutherlandſhire, at the entrance of a frith of the ſame name, over which it has a ferry to Tain. It is a ſmall place, and half in ruins, but was the reſidence of the biſhops of Caithneſs. Part of the cathedral ſerves for the pariſh church; the other part is in ruins. It is 40 miles N.E. of Inverneſs. Long. 3. 48. W. Lat. 57. 52. N.

DORPT, or Dorpat, a town of Livonia, on the Ember, between the lakes Woſero and Pepas, 60 miles S. of Narva. Long. 27. 52. E. Lat 58. 18. N.

DORSTEN, a town of Germany, in the circle of Lower Rhine. Though ſtrong, it was ſeveral times taken and retaken by the Swedes and Heſſians during the long war of Germany. It is ſeated on the Lippe, 30 miles N. of Duſſeldorf, and 31 S.W. of Munſter. Long. 6. 50. E. Lat. 51. 42. N.

DOUBLE-EMPLOYMENT (*Encycl.*). With reſpect to what M. D'Alembert adds in his Elements of Muſic, p. 80, and which he repeats in the Encyclopédie, article Double-emplai, viz. that the chord of the ſeventh *re fa la ut*, though we ſhould even regard it only as an inverſion of *fa la ut re*, cannot be followed by the chord *ut mi ſol ut*; "I cannot (ſays Rouſſeau) be of his opinion in this point.

"The proof which he gives for it is, that the diſſonance *ut* of the firſt chord cannot be reſolved in the ſecond; and this is true, ſince it remains in its place: but in this chord of the ſeventh *re fa la ut*, inverted from this chord of the ſuperadded ſixth *fa la ut re*, it is not the *ut*, but the *re*, which is the diſſonance; which, of conſequence, ought to be reſolved in aſcending upon *mi*, as it really does in the ſubſequent chord; ſo that this procedure in the baſs itſelf is forced, which, from *re*, cannot without an error return to *ut*, but ought to aſcend to *mi*, in order to reſolve the diſſonance.

"M. D'Alembert afterwards ſhews, that this chord *re fa la ut*, when preceded and followed by that of the tonic, cannot be authoriſed by the double-employment: and this is likewiſe very true; becauſe this chord, though figured with a 7, is not treated as a chord of the ſeventh, neither when we make our entrance to it, nor our exit from it; or at leaſt that it is not neceſſary to treat it as ſuch, but ſimply as an inverſion of the ſuperadded ſixth, of which the diſſonance is the baſs: in which caſe we ought by no means to forget, that this diſſonance is never prepared. Thus, though in ſuch a tranſition the double-employment is not in queſtion, though the chord of the ſeventh be no more than apparent, and impoſſible to be reſolved by the rules, this does not hinder the tranſition from being proper and regular, as I have juſt proved to theoriſts, and as I ſhall immediately prove to practical artiſts, by an inſtance of this tranſition; which certainly will not be condemned by any one of them, nor juſtified by any other fundamental baſs except my own. (See the Muſical Dictionary, Plate D, fig. 14.)

"I acknowledge, that this inverſion of the chord of the ſixth ſuperadded, which transfers the diſſonance to the baſs, has been cenſured by M. Rameau. This author, taking for a fundamental chord the chord of the ſeventh, which reſults from it, rather choſe to make the fundamental baſs deſcend diatonically, and reſolve one ſeventh by another, than to unfold this ſeventh by an inverſion. I had diſſipated this error, and many others, in ſome papers which long ago had paſſed into the hands of M. D'Alembert, when he was compoſing his Elements of Muſic; ſo that it is not his ſentiment which I attack, but my own opinion which I defend."

For what remains, the double-employment cannot be uſed with too much reſerve, and the greateſt maſters are the moſt temperate in putting it in practice.

DOUBLET (*Encycl.*). The manner of making doublets is as follows:

Let the cryſtal or glaſs be firſt cut by the lapidaries in the manner of a brilliant, except that, in this caſe, the figure muſt be compoſed from two ſeparate ſtones, or parts of ſtones, formed in the manner of the upper and under parts of a brilliant, if it was divided in an horizontal direction, a little lower than the middle. After the two plates of the intended ſtone are thus cut, and fitted ſo exactly that no diviſion can appear when they are laid together, the upper part muſt be poliſhed ready for ſetting; and then the colour muſt be put betwixt the two plates by this method. "Take of Venice or Cyprus turpentine two ſcruples; and add to it one ſcruple of the grains of maſtich choſen perfectly pure, free from foulneſs, and previouſly powdered. Melt them together in a ſmall ſilver or braſs ſpoon ladle, or other veſſel, and put to them gradually any of the coloured ſubſtances below mentioned, being firſt well powdered; ſtirring them together as the colour is put in, that they may be thoroughly commixed. Warm then the doublets to the ſame degree of heat as the melted mixture; and paint the upper ſurface of the lower part, and put the upper one inſtantly upon it, preſſing them to each other, but taking care that they may be conjoined in the moſt perfectly even manner. When the cement or paint is quite cold and ſet, the redundant part of it, which has been preſſed out of the joint of the two pieces, ſhould be gently ſcraped off the ſide, till there be no appearance of any colour on the outſide of the doublets: and they ſhould then be ſkilfully ſet; obſerving to carry the mounting over the joint, that the upper piece may be well ſecured from ſeparating from the under one."

The colour of the ruby may be beſt imitated, by mixing a fourth part of carmine with ſome of the fineſt crimſon lake that can be procured.

The ſapphire may be counterfeited by very bright Pruſſian blue, mixed with a little of the above-mentioned crimſon lake, to give it a caſt of the purple. The Pruſſian blue ſhould not be very deep-coloured, or but little of it ſhould be uſed: for otherwiſe, it will give a black ſhade that will be injurious to the luſtre of the doublets.

The emerald may be well counterfeited by diſtilled verdigreaſe, with a little powdered aloes. But the mixture ſhould not be ſtrongly heated, nor kept long over the fire after the verdigreaſe is added: for the colour is to be ſoon impaired by it.

The reſemblance of the garnet may be made by dragon's blood; which, if it cannot be procured of ſufficient brightneſs, may be helped by a very ſmall quantity of carmine.

The amethyſt may be imitated by the mixture of ſome

Pruſſian blue with the crimſon lake; but the proportions can only be regulated by directions, as different parcels of the lake and Pruſſian blue vary extremely in the degree of ſtrength of the colour.

The yellow topazes may be counterfeited by mixing powdered alocs with a little dragon's blood, or by good Spaniſh anotto: but the colour muſt be very ſparingly uſed, or the tinge will be too ſtrong for the appearance of that ſtone.

The chryſolite, hyacinth, vinegar garnet, eagle marine, and other ſuch weaker or more diluted colours, may be formed in the ſame manner, by leſſening the proportions of the colours, or by compounding them together correſpondently to the hue of the ſtone to be imitated; to which end it is proper to have an original ſtone, or an exact imitation of one, at hand when the mixture is made, in order to the more certain adapting the colours to the effect deſired: and when theſe precautions are taken, and the operation well conducted, it is practicable to bring the doublets to ſo near a reſemblance of the true ſtones, that even the beſt judges cannot diſtinguiſh them, when well ſet, without a peculiar manner of inſpection.

DOUBS, a department of France, including part of the late province of Franche Comté. It is ſo named from a river which falls into the Rhone.

DOUE, a ſmall town of France, in the department of Maine and Loire. It has one of the fineſt fountains in France; and near it is a vaſt Roman amphitheatre, cut out of the ſolid rock. It had, in the time of the monarchy, a conſiderable manufacture of druggets and tammies. It is nine miles S.W. of Saumer.

DOVE, a river in Derbyſhire, which riſes in the Peak, parts the county from Staffordſhire, and falls into the Trent, four miles N. of Burton.

DOVEDALE, one of the moſt romantic ſpots in Derbyſhire, in the neighbourhood of Aſhborn. Here the river Dove runs in a chaſm between precipitous rocks.

DOUERO, or DOURO, a river of Spain, which riſes in Old Caſtile, in the mountains of Urbion, runs W. by ſeveral towns, and croſſing Portugal, falls into the Atlantic Ocean, near Oporto.

DOUGLAS, CAPE, a lofty promontory, on the W. coaſt of America, within the entrance of Cook's Inlet. Its ſummit appears above the clouds, forming two very high mountains. Long. 153. 30. W. Lat. 58. 56. N.

DOUGLAS (Gavin), biſhop of Dunkeld in Scotland, was the third ſon of Archibald earl of Angus, and born in the year 1474. Where he was educated, is not known; but it is certain that he ſtudied theology: a ſtudy, however, which did not eſtrange him from the muſes; for he employed himſelf at intervals in tranſlating into beautiful verſe the poem of Ovid *de Remedio Amoris*. The advantages of foreign travel, and the converſation of the moſt learned men in France and Germany, to whom his merit procured the readieſt acceſs, completed his education. With his ſuperior recommendations and worth, it was impoſſible he could remain unnoticed. His firſt preferment was to be provoſt of the collegiate church of St. Giles in Edinburgh; a place, at that time, of great dignity and revenue. In the year 1514, the queen mother, then regent of Scotland, appointed Douglas, abbot of Aberbrothock, and ſoon after archbiſhop of St. Andrew's; but, the queen's power not being ſufficient to eſtabliſh him in the poſſeſſion of that dignity, he relinquiſhed his claim in favour of his competitor Foreman, who was ſupported by the pope. In 1515 he was by the queen appointed biſhop of Dunkeld; and that appointment was ſoon after confirmed by his holineſs Leo X. Nevertheleſs it was ſome time before he could obtain peaceable poſſeſſion of his ſee. The duke of Albany, who in this year was declared regent, oppoſed him becauſe he was ſupported by the queen; and, in order to deprive him of his biſhopric, accuſed him of acting contrary to law in receiving bulls from Rome. On this accuſation he was committed to the caſtle of Edinburgh, where he continued in confinement above a year; but the regent and the queen being at laſt reconciled, he obtained his liberty, and was conſecrated biſhop of Dunkeld. In 1517 he attended the duke of Albany to France; but returned ſoon after to Scotland. In 1521, the diſputes between the earls of Arran and Angus having thrown the kingdom into violent commotion, our prelate retired to England, where he became intimately acquainted with Polydore Virgil the hiſtorian. He died in London, of the plague, in 1522; and was buried in the Savoy.

He wrote, 1. The Palace of Honour: a moſt ingenious poem under the ſimilitude of a viſion; in which he paints the vanity and inconſtancy of all worldly glory. It abounds with incidents, and a very rich vein of poetry. The palace of happineſs, in the picture of Cebes, ſeems to be the ground-work of it.—2. Aureæ Narrationes: a performance now loſt; in which, it is ſaid, he explained, in a moſt agreeable manner, the mythology of the poetical fictions of the ancients.—3d Comœdiæ aliquot Sacræ: none of which are now to be found. 4. Thirteen Bukes of Eneades, of the famoſe Poet Virgil, tranſlatat out of Latin verſes into Scottiſh metre, every buke having its particular prologe. Imprinted at Lond. 1553, in 4to.; and reprinted at Edinburgh 1710, in folio.—The laſt is the moſt eſteemed of all his works. He undertook it at the deſire of Lord Henry Sinclair, a munificent patron of arts in thoſe times: and he completed it in 18 months; a circumſtance which his admirers are too fond of repeating to his advantage. David Hume of Godſcroft, an author of uncommon merit, and an admirable judge of poetry, gives the following teſtimony in his favour: "He wrote (ſays he), in his native tongue, divers things; but his chiefeſt work is his tranſlation of Virgil, yet extant, in verſe: in which he ties himſelf ſo ſtrictly as is poſſible; and yet it is ſo well expreſſed, that whoſoever will eſſay to do the like, will find it a hard piece of work to go through with it. In his prologues before every book where he hath his liberty, he ſheweth a natural and ample vein of poetry, ſo pure, pleaſant, and judicious, that I believe there is none that hath written before or ſince, but cometh ſhort of him."

It has been ſaid, that he compiled an hiſtorical treatiſe De Rebus Scoticis; but no remain of it hath deſcended to the preſent times.

DOULAINCOURT, a town of France, in the department of Upper Marne, 10 miles S.W. of Joinville.

DOURAK, a town of Perſia, near the confluence of the Euphrates and Tigris, remarkable for the reed of which they make pens. Long. 56. 57. E. Lat. 32. 15. N.

DOURDAN, a Town of France, in the department of Seine and Oiſe, with a manufacture of ſilk and worſted ſtocking. It is ſeated on the Orge, 25 miles S. W. of Paris. Long. 2. 10. E. Lat. 48. 35. N.

DOURLACH, a town of Suabia, capital of Baden Dourlach. It was burnt by the French in 1689. The inhabitants are Proteſtants. It is ſeated on the Gieſſen, 12 miles S. of Philipſburg. Long. 9. 28. E. Lat. 49. 2. N.

DOURLENS, or DOULENS, a town of France, in the department of Somme, with two citadels. It is ſeated on the Autie, 15 miles N. of Amiens. Long. 2. 23. E. Lat. 50. 10. N.

DOUSA (Janus), a very learned man, was born of a noble family at Nortwick in Holland, in 1545. He loſt his parents when very young, and was ſent to ſeveral ſchools; to one at Paris, among the reſt, where he made a great progreſs in Greek and Latin learning. When he had finiſhed his educa-

tion, he returned to his own country, and married; and though he was ſcarcely grown up, he applied himſelf to affairs of ſtate, and was ſoon made a curator of the banks and ditches, which poſt he held above twenty years, and then reſigned it. Douſa was not only a ſcholar and a ſtateſman, but likewiſe a ſoldier; and he behaved himſelf ſo well in that capacity at the ſiege of Leyden 1574, that the Prince of Orange thought he could commit the government of the town to none ſo properly as to him. In 1575 the univerſity was founded there, and Douſa made firſt curator of it; which place he was very fit for, as well on account of his learning, as for his other deſerts. His learning was indeed prodigious; and he had ſuch a memory, that he could at once give an anſwer to any thing that was aſked him, relating to ancient or modern hiſtory, or, in ſhort, to any branch of literature. He was, ſays Melchior Adam, and Thuanus ſays the ſame, a kind of living library; the Varro of Holland, and the oracle of the univerſity of Leyden. His genius lay principally towards poetry, and his various productions in that way were numerous; and what ſeems remarkable enough, he compoſed the annals of his own country, which he had collected from the public archives, in verſe. He wrote alſo a great many things in the critical way; as, notes upon Horace, Salluſt, Plautus, Petronius, Catullus, Tibullus, &c. His moral qualities are ſaid to have been no leſs meritorious, than his intellectual and literary; for he was modeſt, humane, benevolent, and open. He was admitted into the ſupreme aſſembly of the nation, where he kept his ſeat, and diſcharged his office worthily, for the laſt thirteen years of his life. He died in 1604, and his funeral oration was made by Daniel Heinſius.

He left four ſons behind him; the eldeſt of which, Janus Dauſa, would, had he lived, have been a more extraordinary man than his father. Joſeph Scaliger called him the ornament of the world; and ſays, that in the flower of his age he had reached the ſame maturity of wiſdom and erudition, as others might expect to reach after a life ſpent in ſtudy. Grotius alſo aſſures us, that his poems exceeded thoſe of his father; and that he aſſiſted his father in compoſing the Annals of Holland. He was born in 1572; and before he was well out of infancy, became, through the great care of his father, not only a good linguiſt and poet, but alſo a good philoſopher and mathematician. To all this he afterwards added an exquiſite knowledge of the civil law and of hiſtory. Beſides a great many poems, which he compoſed in a very tender age, we have notes and obſervations which he made upon ſeveral Latin poets. Thoſe upon Plautus were the produce of his 16th year; and he was not above 19 when he publiſhed his book De Rebus Cœleſtibus, and his Panegyric upon a Shadow. His commentaries upon Catullus, Tibullus, and Propertius, were publiſhed the ſame year. His extraordinary fame and merit cauſed him to be made preceptor to the Prince of Orange, and afterwards firſt librarian of the univerſity of Leyden. He died at the Hague, in his return from Germany; very immaturely, for his death happened in 1597, when he had not quite completed his 26th year.

Douſa's three other ſons, George, Francis, and Theodorus, were all of them men of learning, though not ſo much above the common rate as Janus was. George was a good linguiſt; travelled to Conſtantinople; and publiſhed a relation of his journey, with ſeveral inſcriptions which he found there and elſewhere. Alſo, in 1607, he printed George Cedrenus's book, entitled, De Originibus urbis Conſtantinopolitanæ, with Meurſius's notes upon it. Francis was far from wanting learning: for, in 1600, he publiſhed the epiſtles of Julius Cæſar Scaliger; his annotations upon Ariſtotle's Hiſtory of Animals; and ſome fragments of Lucilius, with notes of his own upon them. Theodorus, lord of Barkenſtyen, publiſhed the Chronicon of George Logotheta with notes, in 1614; and, in 1638, wrote a treatiſe, called Farrago Ethica variarum Linguarum, variorumque auctorum, &c.

DOWLATABAD, formerly called Amednagur, a province of the Deccan of Hindooſtan. It is bounded on the N. by Candeiſh and Malway, on the W. by the Gauts, on the S. by Viſiapour and Golconda, and on the E. by Berar. Aurungabad is the capital.

Dowlatabad, a fortreſs in the Deccan of Hindooſtan, 15 miles N.W. of Aurungabad. In the neighbourhood are the pagodas of Elora, moſt of which are cut out of the natural rock. Long 76. 0. E. Lat. 19. 55. N

DRABICIUS (Nicholas), a celebrated enthuſiaſt, was born about 1587, at Stranſnitz in Moravia, where his father was burgomaſter. He was admitted miniſter in 1616, and exerciſed his function at Drakotutz; and, when he was obliged to ſeek a retreat in foreign countries, on account of the ſevere edicts of the emperor againſt the Proteſtant religion, he retired to Leidnitz, a town in Hungary, in 1629. Having no hopes of being reſtored to his church, he turned woollen-draper; in which occupation his wife, who was the daughter of one, was of great ſervice to him. Afterwards he forgot the decorum of his former character ſo much that he became a hard drinker; but the other miniſters, juſtly diſpleaſed at his conduct, informed their ſuperiors of it, who, in a ſynod which was called in Poland, examined into the affair. Here it was reſolved, that Drabicius ſhould be ſuſpended from the miniſtry, if he did not live in a more edifying manner; and this obliged him to behave himſelf with more decency.

When he was upwards of 50 years of age, he commenced prophet. He had his firſt viſion in the night of Feb. 23, 1638, and the ſecond in the night of Jan. 23, 1643. The firſt viſion promiſed him in general great armies from the North and Eaſt, which ſhould cruſh the houſe of Auſtria; the ſecond declared particularly, that Ragotſki, prince of Tranſylvania, ſhould command the army from the Eaſt, and ordered Drabicius to inform his brethren, that God was about to reſtore them to their own country, and to revenge the injuries done to his people; and that they ſhould prepare themſelves for this deliverance by faſting and prayer. He received orders to write down what had been revealed to him; and to begin in the manner of the ancient prophets, "The words of the Lord came unto me." His viſions, however, were not paid much regard to at firſt. Theſe two were followed by many others in the ſame year 1643; and there was one, which ordered, that he ſhould open the whole affair to Comenius, who was then at Elbing in Pruſſia. One of his viſions in 1644 aſſured him, that the imperial troops ſhould not deſtroy the refugees. They committed great ravages upon the territories of Ragotſki, plundered the town of Leidnitz, and beſieged the caſtle. Drabicius ſhut himſelf up there, and did not depend ſo entirely upon the Divine aſſurances, as to think human means unneceſſary. He even ſet his hand to the work: and fired one of the cannon himſelf. The Imperialiſts raiſed the ſiege; but ſoon after, beſieged the place again, and took it. The refugees were plundered, and Dabricius fell into the hands of the Imperialiſts. This did not prevent him from going to Ragotſki, and telling him, Aug. 1645, that God commanded him to deſtroy the houſe of Auſtria and the pope; and that, "if he refuſed to attack that neſt of vipers, he would draw down upon his family a general ruin, which ſhould not ſpare even him that piſſeth againſt the wall." The prince already knew, that Drabicius had aſſumed the character of a prophet: for Drabicius, according to the repeated orders which he had received in his extaſies, had ſent him a copy of his revelations, which Ragotſki threw into the fire. The death of that prince, in Oct. 1647, plunged Drabicius into extreme ſorrow; who

was in the utmoſt fear, leſt his revelation ſhould vaniſh into ſmoke, and himſelf be expoſed to ridicule. But he had one extatic conſolation, which re-animated him; and that was, that God would ſend him Comenius, to whom he ſhould communicate his writings. Comenius, having buſineſs in Hungary in 1650, ſaw Drabicius there, and his prophecies; and made ſuch reflections as he thought proper, upon the viſion's having for three years before promiſed Drabicius, that he ſhould have Comenius for a coadjutor. Muſt it not ſeem ſtrange, that Sigiſmond Ragotſki, being urged by Drabicius to make war againſt the emperor, and by his mother to continue in peace with him, could not tell what to do, being attacked on both ſides with terrible threats? Drabicius denounced againſt him the judgments of the Almighty, in caſe of peace; and his mother threatened him with her curſe, in caſe of war. Should not the prince have followed where reaſon and good policy would have led, and have left theſe mad people to have raved as long as they pleaſed, each in their own way? He ſat down however in the utmoſt perplexity, recommended himſelf to the prayers of Drabicius and Comenius, and kept himſelf quiet till his death.

June 1654. Drabicius was reſtored to his miniſtry, and his viſions preſented themſelves more frequently than ever; ordering from time to time, that they ſhould be communicated to his coadjutor Comenius, that he might publiſh them to all nations and languages, and particularly to the Turks and Tartars. Comenius found himſelf embarraſſed between the fear of God, and that of men: he was apprehenſive, that by not printing the revelations of Drabicius he ſhould diſobey God, and that by printing them he ſhould expoſe himſelf to the ridicule and cenſure of men. He took a middle way: he reſolved to print them, and not to diſtribute the copies; and upon this account, he entitled the book, Lux in Tenebris. But his reſolution to conceal this light under a buſhel did not continue long: it gave way to two remarkable events, which were taken for a grand criſis, and the unravelling of the myſtery. One of theſe events was the irruption of George Ragotſki into Poland: the other, the death of the emperor Ferdinand III. But theſe events, far from anſwering the predictions, ſerved only to confound them. Ragotſki periſhed in his deſcent upon Poland; and Leopold king of Hungary was elected emperor in the room of his father Ferdinand III. by which election, the houſe of Auſtria was almoſt reſtored to its former grandeur, and the Proteſtants in Hungary abſolutely ruined. Drabicius was the greateſt ſufferer by this; for the court of Vienna, being informed that he was the perſon who founded the trumpet againſt the houſe of Auſtria, ſought means to puniſh him, and, as it is ſaid, ſucceeded in it. What became of him, we cannot learn: ſome ſay, that he was burnt for an impoſtor and falſe prophet; others, that he died in Turkey, whither he had fled for refuge: but neither of theſe accounts is certain.

The Lux in Tenebris was printed by Comenius at Amſterdam in 1657; and contains not only the revelations of our Drabicius, but thoſe alſo of Chriſtopher Kotterus, and of Chriſtina Poniatovia. Comenius publiſhed an abridgment of it in 1660, with this title, Revelationum divinarum in Uſum Sæculi noſtri factarum Epitome: that is, An Epitome of the divine Revelations communicated for the Uſe of this our Age. He reprinted the whole work, with this title, Lux è Tenebris novis Radiis aucta, &c. Theſe new rays were a ſequel of Drabicius's revelations, which extended to the year 1666.

DRACHENFELS, a town of Germany, in the electorate of Cologn, with a citadel, ſeven miles N.N.W of Lintz.

DRAG-CART, an invention of Lord Somerville, which promiſes to be eminently uſeful to the farmers of this country. The following deſcription of it and of the method of adjuſting the centre of gravity of the load, is publiſhed in the Communications of the Honourable Board of Agriculture.

Fig. 1, in Plate 24, is a perſpective-view of a cart, for a ſingle horſe, calculated to carry 35 cwt.; in the front of which is repreſented the method of adjuſting the poſition of the centre of gravity of the load, to prevent its preſſing too much on the cattle in going down hill, the front of the cart being elevated by means of a toothed rack ſcrewed to the front of the cart, and worked by a pinion, and the handle *a* immediately connected with the ſhaft *e*. By means of this pinion and racks, the front of the carriage is elevated more or leſs, in proportion to the declivity of the hill, by which means the weight of the load is made to bear more on the axis, and leſs on the horſe.

On the ſide-view of the cart is repreſented the manner of applying the *friction-drag*, which is made to preſs, more or leſs, on the ſide of the wheel, according to the ſteepneſs of the deſcent: *b b*, is the friction-bar, or drag; one end of which is connected with the tail of the cart by a ſmall chain, and the other end to the front, by means of a toothed-rack *b d*, which catches on a ſtaple in the front of the cart, by which the friction-bar may be made to preſs on the ſide of the wheel, more or leſs, at the diſcretion of the driver; the notches of teeth in this rack ſhould be as cloſe to each other as circumſtances will permit.

The friction-bar is here applied lower upon the wheel than was at firſt purpoſed, in order to divide the preſſure and friction more equally on the oppoſite ſide of the wheel, ſo that the preſſure on each is diminiſhed; the riſk of over-heating and deſtroying the friction bars is alſo rendered leſs than if the whole preſſure was applied in one point at the top of the wheel.

Fig. 2, in Plate 24, is a view of a drag-cart calculated to carry 25 cwt.

As the advantages of the friction-drag have been fully ſtated in Mr. Cumming's obſervations on wheel-carriages, it would be ſuperfluous to repeat them here.

By an attentive compariſon of carts drawn by ſhafts with thoſe drawn by the yoke and bows, the ſuperiority of the pole to the ſhafts *, and the advantage of making the cattle draw by the yoke, in preference to drawing by the forehead, become evident.

When cattle draw by the ſhafts (the one before the other), it is impoſſible for the driver to know that each exerts an equal force, ſo as to contribute equally to the draught; but when they draw by the pole and yoke, the point of draught being in the middle of the yoke, when the beaſt draws equally, the yoke will ſtand ſquare with the pole, and the poſition of the yoke will always enable the driver to diſcover the defaulter, and to bring it to a proper exertion: it is this harmony of draught, and equality of exertion, that gives ſo great an advantage to drawing by the yoke, that it is ſcarcely poſſible to ſay what weight of a load too good large oxen can draw on a level road. The powers of cattle drawing by the forehead, on Lord Shannon's eſtate, are recorded by Mr. Young and Mr. Billingſley: an ox of the late Mr. Tatterſall, near Ely, drew four ton of wood on a level ſurface without apparent difficulty. What then might not be expected from the equal exertions of two ſuch powerful animals, acting at the equal ends of the ſame yoke!

WHEEL-DRAG, an implement of iron, which, being chained to the wheel of a cart or waggon, ſupports it while the horſes ſtop upon a hill. See CART, *Supp.* and Pl. 19.

* The apparatus for adjuſting the centre of gravity of the load may in ſuch caſe be fixed to the pole of the cart, in the ſame manner as above deſcribed to be fixed on the ſhaft.

DRAGOMESTRO, a town of European Turkey, in Livadia, taken by the Venetians in 1684, but abandoned ſoon after. It is 44 miles W.N.W. of Lepanto.

DRAGUIGNAN, a town of France, in the department of Var, 10 miles N.W. of Frejus. Long. 6. 35. E. Lat. 43. 31. N.

DRAIN (*Encycl.*). The following ſketch of the drainage and improvement of a marſh, near Marazion in Cornwall, deſcribing a peculiar mode of taking off the water, and ſecuring the land from the overflowing of the ſea, by Mr. Richard Moyle, of Marazion, is taken from the Communications to the Board of Agriculture.

A piece of land called the marſh, or bog, near Marazion in Cornwall, containing thirty-ſix ſtatute acres, has, from time immemorial, been covered with two or three feet of water, and which, at ſpring-tides, was overflowed with the ſea, by means of a river which paſſed through the land. This ground looks towards the ſouth, and is ſeparated from the ſea by a long ſkirting of ſand of about ſeventeen acres, over which the turnpike road paſſes towards Penzance, on its moſt elevated part: on the north of the marſh lies ſome croft ground (*i. e.* higher and not ſubject to inundations), which gradually riſes as it retires from the bog, ſo that the marſh is ſurrounded on the north and ſouth by elevated ſpots; and the water on its ſurface uſually crept away to the ſea by means of a river, through which the water at high ſpring-tides always had acceſs. From the depreſſed ſituation of this marſh, it was impoſſible to take off all the ſurface water through the river, and recourſe was had, for this purpoſe, to a ſquare wooden pipe of nine inches diameter, which was introduced at that part of the ſhore called half-ebb, and which was eight feet lower than the ſurface of the marſh. This pipe was introduced through the ſandy ſoil, in ſome places twenty-four feet deep, till it arrived at the ſouth part of the bog, where it was found to be ſix feet under the ſurface. At this place a reſervoir of eighteen feet ſquare, and eight feet deep, was immediately cut out; and the water draining from the marſh, during the time the tide was in, was received in the reſervoir, and diſcharged when the tide was out, through the pipe with great velocity. The ſea, at high water, covers this pipe with nine or ten feet of water: a long trench, of three feet deep and five wide, was extended from this place, eaſt and weſt, on the ſouth ſide of the bog, for its whole length, bordering on the ſandy ſoil; and at the diſtance of every ſixty yards, a ſimilar trench was cut up directly north towards the croft, which divided the whole marſh into oblong ſquare fields. By the means of theſe trenches, or open drains, the whole ſurface water was conveyed directly to the reſervoir, and thence to the ſea. The pipe at both its extremities was guarded with valves, which ſhut at the approach of the tide; and during its flowing, the water accumulated about two, or two and a half feet high in the reſervoir; and as the ſea retires, the collected water runs off without any interruption, till the next return of the tide: the pipe is covered with the ſea ſix hours in every twelve. This ſingular mode of drainage anſwers uncommonly well, and has never once failed in five years: the extremities of the pipe have alſo iron bars placed before them, to prevent the intruſion of extraneous bodies. As ſoon as the ſurface water was removed, a ſtrong embankment of turf was made on the ſouth and eaſt ſides, to prevent the overflowing of the tides; and the water, which formerly diffuſed itſelf over the whole of this ground, was collected into a river, and carried to the ſea on the outſide of this embankment. In cutting the open drains, a pot of copper coins, containing about a thouſand, was diſcovered three feet under the ſurface, and which appeared to belong to the Emperor Victorinus, who reigned in the third century. Theſe coins were much injured by the corroſion of the ſalt water; but ſeveral were ſtill perfect enough to trace the outlines of the Emperor. As ſoon as the evaporation had aſſiſted the conſolidation of the ſurface, the air, within a mile of the marſh, became ſo ſtrongly impregnated with a ſulphureous ſmell, as to render the place quite obnoxious to paſſengers.

On examining the different ſtrata, we found that two feet and a half of the ſurface conſiſted of mud and a peaty ſubſtance, moſt ſtrongly interwoven with the roots of goſs (*arundo phragmites*) and common ruſhes, which were the only ſubſtance that grew ſpontaneouſly on its ſurface; below this, was a ſtratum of three feet and a half of pure peat, of a very inflammable nature, and which ſeems to have extended over twenty acres of the marſh: under the peat lay a bed of ſand, from four to ſix feet deep; from which we may conjecture that the whole was formerly an arm of the ſea, and that the dropping of vegetables, and depoſition of mud (which poſſibly formed the peat), had gradually expelled the ſea; except at ſpring-tides. This ſtratum of ſand does not appear to be the original bed of the ſea; for, on ſtreaming for tin, another floor from ſix to ten feet deeper was diſcovered, conſiſting of round ſmooth pebbles, and gravelly ſubſtances, containing tin; among which were willow trees and hazel nuts, in the moſt perfect ſtate.

The *mode of improvement* adopted was the following:—The ſurface was pared and burned; and after repeated ploughings, &c. for two years, large bodies of clay, with manure, were then carried on its ſurface, and a ſlight crop of white oats with ever-graſs (ray), common and Dutch clover, ſown in the ſpring. The ſaltneſs of this ground was ſo very powerful for the firſt three years, as to deſtroy every crop; on the fourth, the land began to vegetate partially; but on the fifth, or preſent year, 1798, every part ſeems to be quite alive; ſo that every kind of vegetable now flouriſhes with great luxuriancy. It has afforded this ſummer very good crops of hay, and an abundant and rich paſture, with a proſpect of improvement the next ſeaſon. The expences of draining this ground, with trenching, paring, ploughing, burning, and manuring it, with the failure of three years' crops, amount to a very conſiderable ſum; and this diſtreſſing circumſtance is increaſed, on its being only a leaſehold for three lives.

The ſandy land has been partly incloſed, and covered with large bodies of clay and manure; it has afforded remarkably fine crops of turnips, and the graſs of this ſeaſon has been very luxuriant. The crofty land on the north (twenty-two acres) has been all cultivated, firſt with potatoes, and afterwards ſown with wheat, barley, oats, and turnips, and produced very good crops.

The whole of this improved ground has been productive of conſiderable advantages to the public, particularly to the poor. Four hundred perſons yearly receive turf from it; two hundred and fifty are fed moſt plentifully with potatoes, which are planted here by very poor people, who are, in conſequence of having land given them, become uncommonly induſtrious; and the whole neighbourhood, by its drainage, have got rid of low nervous fevers and agues, with which it was continually peſtered.

The whole ground under improvement conſiſts of ſeventy-five acres, of which thirty-ſix are marſh, twenty-two croft, and ſeventeen of ſand. In 1798, forty acres were under different crops; *viz.* wheat two acres and a half, barley nine, oats eight, turnips two, potatoes five, hay and paſture thirteen and a half.

On the ſides of every open trench is planted a row of quick-ſets, interſperſed with a few planes and pineaſtres. Theſe are defended from the cattle and blights by means of a temporary turf hedge, and promiſe to afford a pleaſing diviſion of the land

in a few years. To every inclosure of the marsh a part of the rising ground of the croft is annexed to accommodate cattle in wet seasons.

In the year 1798 this land was visited and examined on the spot as to the facts, by Sir John Call, and the above particulars given him by the proprietor.

We shall conclude this article with an account of the effect of a luxuriant weed, called by botanists the *Equisetum Palustris*, upon drains. Sir Joseph Banks, in a letter to the Secretary of the Board of Agriculture, communicates the following particulars:

"Few objects of agricultural utility," says the Baronet, "have ever interested me so much, and I have no hesitation in saying that none are, in my opinion, so interesting to the increasing prosperity of the landed interest of this kingdom, as the theory of draining whole districts, by tapping the mother springs that overflow their surface, and conducting drains through the principal valleys, so contrived as not only to render the boggy parts of them sound land, but also to free the sides of the hills which form them, from all out-bursts of water.

"Mr. Elkington is certainly the father of this system of drainage, but Mr. Farey has perfectly comprehended all the works done by that gentleman, for the Duke of Bedford, and in the mode of conducting the operations now carrying on, has, in some instances, excelled them, founding his practice on an extensive and enlightened theory, applicable to all valley bogs, in the drainage of which, it appears to me almost impossible that his method should fail, under any circumstances.

"One thing, however, has occurred, in the short experience of the Woburn operations (about five years), which appears to me of consequence enough to warrant the trouble this will give to you and the Board. Some bogs, drained by under drains made at a great expence through the most miry parts of them, appeared at first perfectly dry, but have since been found to grow by degrees less and less so. On examination, these drains have been found more or less choked up by a plant vegetating within them, and forming both stems and roots, the whole several yards in length, intercepting the course of the water, weakening the current by degrees, and at last wholly choking up the drain.

"This plant is the *equisetum palustris*, a weed common in moorish and swampy places, but hitherto little noticed by naturalists; its root, or rather its stem under ground, is a yard or more in length, and in size like packthread; from this, a root of twice the size of the stem runs horizontally in the ground, taking its origin from a lower root, which strikes downwards perpendicularly to a depth I have not hitherto been able to trace, as thick as a small finger; this perpendicular root forms in some places beds, which occupy a large portion of the more solid part of a peaty bog, as may be seen in some parts of the banks of the Duke's open drains.

"As the bud by which the plant appears to renew itself in spring, is situated on the horizontal root, a yard or more in depth, the shoot must, in its progress upwards, be liable to meet with under drains, and penetrate into them, through the openings left for the passage of the water. When once entered, nature, which has given to the plant the power of piercing the soil upwards from a great depth, enables it to live in the confined atmosphere of a drain, where, as it is continually drawn forward by the current, the joints lengthen themselves beyond their natural dimensions; hence it is probable that when drains choked with it, are taken up and carefully examined, the length of the plants will be found very much to exceed those I have observed."

The author hopes that this will lead to further discussion, and to the discovery of a remedy for this evil, which seems likely to put a stop to the practice of draining bogs, where this mischievous plant grows, by under drains. It is necessary for the evil to be known, in order that those who possess bogs that have become miry after being drained, may be apprised of an evil, which can certainly be cured by the simple expedient of casting the under drains into open ones.

Common earth-drains are sometimes dug two or three spits deep, with a broad spade, the bottom is taken out with a narrow one, and filled with stones.—Sometimes a furrow is drawn with a plough, and cleared by a common spade: the draining instrument fig. 1, Plate 17, is then introduced to the depth of 18 inches from the surface; afterwards taking out the loose mold with the scoop fig. 2.

Hollow drains, without stones, have been tried on stiff lands: they are made narrow at the bottom, and covered half way up with sods, or square pieces of the surface-sward, resting on ledges cut for that purpose.

It is much to be lamented, that we possess, in this cold climate, no grain similar to *rice*, that would grow in watery grounds which cannot be drained, nor indeed any esculent roots or foliage, except water-cresses. In such situations, some plants may perhaps be cultivated with profit to the proprietor, as the *festuca fluitans*, or floating fescue; *callitriche*, or star-grass, or star-wort; to which may be added the *orchis*, for the purpose of making salep, by drying the peeled roots in an oven. If these plants should not completely succeed, other vegetables of quick growth may be raised for manures, such as the *typha*, or cat's-tail; the *caltha*, or marsh-marigold, &c.; which should be mown twice a-year, while they are young, and abound with saccharine and mucilaginous matter, ready to pass into fermentation.

DRAKE (James), a celebrated political writer and physician, was born at Cambridge, in 1667; and, at 17, admitted a member of that university, where he soon distinguished himself by his uncommon parts and ingenuity. Some time before the Revolution, he took the degree of B. A. and after that of M. A. but, going to London, in 1693, and discovering a particular genius to the study of physic, he was encouraged in the pursuit of it by Sir Thomas Millington, and the most eminent members of the college of physicians. In 1696 he took the degree of doctor in that faculty; and was soon after elected F. R. S. as likewise of the college of physicians. But whether his own inclination led him, or whether he did it purely to supply the defects of a fortune, which was not sufficient to keep him a proper equipage as a physician in town, he applied himself to writing for the booksellers. In 1697 he was concerned in the publication of a pamphlet, entitled, Commendatory Verses upon the Author of Prince Arthur and King Arthur. In 1702 he published, in 8vo. The History of the last Parliament, begun at Westminster Feb. 10, in the 12th year of King William, A.D. 1700. This created him some trouble; for the House of Lords, thinking it reflected too severely on the memory of King William, summoned the author before them in May 1702, and ordered him to be prosecuted by the attorney-general; who brought him to a trial, at which he was acquitted the year following.

In 1704, being dissatisfied with the rejection of the bill to prevent occasional conformity, and with the disgrace of some of his friends who were sticklers for it, he wrote, in concert with Mr. Poley, member of Parliament for Ipswich, The Memorial of the Church of England; humbly offered to the Consideration of all true Lovers of our Church and Constitution, 8vo. The treasurer, Godolphin, and the other great officers of the crown in the Whig interest, being therein severely reflected on, were so highly offended at the publication of it, that they represented it to the queen as an insult upon her honour, and intimation that the church was in danger under her administration. Accordingly her Majesty took no-

tice of it in her ſpeech to the enſuing parliament, Oct 27, 1705; and was addreſſed by both houſes upon that occaſion. Soon after, the queen, at the petition of the Houſe of Commons, put out a proclamation for diſcovering the author of the Memorial; but no diſcovery could be made. The parliament was not the only body that ſhewed their reſentment to this book; for the grand jury of the city of London having preſented it at the ſeſſions, as a falſe, ſcandalous, and traiterous libel, it was forthwith burnt in the ſight of the court then ſitting, and afterwards before the Royal Exchange, by the hands of the common hangman. But though Drake then eſcaped, yet as he was very much ſuſpected of being the author of that book, and had rendered himſelf obnoxious upon other accounts to perſons then in power, occaſions were ſought to ruin him if poſſible; and a newſpaper he was publiſhing at that time under the title of Mercurius Politicus, afforded his enemies the pretence they wanted. For, taking exception at ſome paſſages therein, they proſecuted him in the Queen's-Bench in 1706. His caſe was argued at the bar of that court April 30; when, upon a flaw in the information, the trial was adjourned, and in November following the doctor was acquitted; but the government brought a writ of error. The ſeverity of this proſecution, joined to repeated diſappointments and ill uſage from ſome of his party, is ſuppoſed to have flung him into a fever, of which he died at Weſtminſter, March 2, 1706-7, not without violent exclamations againſt the rigour of his proſecutors. The Memorial was reprinted in 8vo. in 1711, with an introductory preface containing the author's life and death.

Beſides the performances already mentioned, he made an Engliſh tranſlation of Herodotus, which was never publiſhed. He wrote a comedy, called, The Sham-Lawyer, or the Lucky Extravagant; which was acted at the Theatre-Royal in 1697. It is chiefly borrowed from two of Fletcher's plays, namely, The Spaniſh Curate, and Wit without Money. He was the editor of Hiſtoria Anglo-Scotica; or, an impartial Hiſtory of all that happened between the Kings and Kingdoms of England and Scotland, from the Beginning of the Reign of William the Conqueror to the Reign of Queen Elizabeth, 1703, 8vo. But whatever merit there might be in his political writings, or however they might diſtinguiſh him in his life-time, he is chiefly known now by his medical works: by that New Syſtem of Anatomy particularly, which was finiſhed a little before his deceaſe, and publiſhed in 1707, with a preface by W. Wagſtaffe, M. D. and reader of anatomy at Surgeons-Hall.

Drake (Francis), a ſurgeon at York, and an eminent antiquary, was much eſteemed by Dr. Mead, Mr. Folkes, the two Mr. Gales, and all the principal members of the Royal and Antiquarian Societies. He publiſhed, in 1736, Eboracum; or, the Hiſtory and Antiquities of the City of York, from its Original to the preſent Time; together with the Hiſtory of the Cathedral Church, and the Lives of the Archbiſhops of that See, &c. By Francis Drake of the City of York, Gent F. R. S. and Member of the Society of Antiquaries in London; a copy of which, with large MS. additions by the author, is in the hands of his ſon, the Rev. William Drake, F. A. S. late maſter of the free-ſchool at Felſted in Eſſex, and, in 1783, vicar of Iſleworth, Middleſex, who has diſtinguiſhed himſelf by ſeveral curious articles in the Archæologia, IV. 143, V. 137, 139, and would republiſh his father's book if the plates could be recovered. A metzotinto print of Mr. Drake, by Val. Green, was publiſhed in 1771, from a picture by N. Drake, with this inſcription: Franc. Drake, Armiger, Eboracenſis, Reg. Soc. necnon Antiqu. Socius.

Drake (Samuel), was fellow of St. John's College, Cambridge, and contemporary with the above Dr. Drake, who publiſhed in 1729, in folio, a fine edition of Archbiſhop Parker's work, De Antiquitate Britannicæ Eccleſiæ, & Privilegiis Eccleſiæ Cantuarienſis, cum Archiepiſcopis ejuſdem LXX. The archbiſhop's own edition, publiſhed by himſelf in 1572, was exactly followed, which contained not only the lives of the archbiſhops, but alſo a catalogue of the chancellors, vice-chancellors, proctors, and commencers in the univerſity of Cambridge, from the year 1500 to 1571, with many other matters relating to that univerſity. The copies of the archbiſhop's edition almoſt all varying from one another, the correcteſt was made the text, and the variations of the reſt were taken notice of. Copper-plates were taken, by the beſt hand, of all the arms, frontiſpieces, and other decorations, in the edition of 1572.

DRAMA (*Encycl.*). To what has been already offered under this head, we purpoſe to add a brief hiſtory of the *German* Drama.

The German theatre continued a long time an object of little curioſity to other nations. It was about the year 1760 that the Arminius of Schlegel was tranſlated into the French language; and about the ſame period the Death of Adam, by Klopſtock, alſo appeared in the ſame tongue. In the year 1769 was publiſhed at Amſterdam, a volume, entitled, *Théâtre Allemand, ou Recueil de diverſes Pièces traduites de l'Allemand, en Proſe et en Vers, avec des Remarques: par C. D.* This volume compriſes the Cato of Gottſched; the Falſe Devotee, an excellent comedy by Gellert; and the Sick Woman, an interlude, by the ſame. The tranſlator has prefixed ſome curious introductory matter, concerning the hiſtory of the German ſtage, to which the following remarks are greatly indebted.

The hiſtory of the German theatre may be divided into four periods.

PERIOD I.

Germany, like the other countries of Chriſtendom, had its myſteries, or religious plays. The knights of the Teutonic order had recourſe ſometimes to dramatic exhibitions, in order to explain the myſteries of the faith to the rude underſtandings of the inhabitants of Courland and Livonia. It is not a little remarkable that Hroſwitha, a German nun, about the year 950, compoſed not only religious dramas, but ſome plays in imitation of Terence. They were printed at Nuremberg, A.D. 1500, in a very ſcarce folio volume, ornamented with wooden plates. Whether this attempt excited any imitators, muſt be left to the inveſtigation of German antiquaries.

PERIOD II.

In the ſixteenth century, the religious plays gave way to a kind of moral farces. Hans Sachſen is the earlieſt German dramatiſt, in his native language, whoſe name merits record. He was a ſhoemaker of Nurenberg, and has rivalled the famous Lopez de Vega, in the aſtoniſhing multitude of his dramatic performances.

PERIOD III.

A company of Dutch comedians paſſing into Germany, about the year 1620, operated the firſt reform in the German theatre. The Dutch had, at that time, made conſiderable progreſs in the dramatic art, and their theatre was on a reſpectable footing. They taught the Germans greater regularity and ſkill in the conſtruction of the drama. Yet the Dutch tragedy was then very atrocious and ſanguinary, and was intermingled with groſs buffoonery; and their comedy was little better than an unnatural farce. In the latter department, Veiſs was one of the moſt celebrated writers of Germany.

Nevertheleſs, the Germans to this day boaſt of John Opitz, Andrew Gryphius, and Gaſper de Lohenſtein. Riccoboni, in his *Recherches ſur les différents Théâtres de l' Europe*, has given a liſt of their pieces, which may be conſulted by the curious reader. Opitz is regarded as a father of German poetry: he wrote a didactic treatiſe on the drama; and compoſed lyric poems and operas. National vanity has compared Gryphius to Shakſpeare; and with more juſtice to Corneille, whom he ſomewhat reſembles in the pomp of his verſe, the depth of his thought, and the abundance of maxims and political diſcourſe. To Shakſpeare he can only be compared on account of the inequality of his ſcene. When Lohenſtein is paralleled with Seneca, we ſufficiently diſcover that he is only the ſkeleton of a dramatic author.

About this time pantomime alſo began to appear on the German ſtage; but their Harlequin bore as little reſemblance of the Italian gentleman without bones, as a bear does of a monkey. They called him *hans vourſt*, in plain Engliſh, jack-pudding. Mr. Addiſon has remarked, that moſt nations have expreſſed their delight in this witty perſonage, by beſtowing upon him the appellation of their favourite food. In one inſtance, however, he is unfortunate, by ſuppoſing that the Dutch term correſponds with our *pickled herring*; whereas, in the original, *pickel heeren* implies a facetious little maſter.

PERIOD IV.

At length the German drama gradually became worthy of attracting the attention of Europe. Gottſched, anxious to redeem his country from dramatical barbariſm and low buffoonery, about the year 1740 produced his Cato, conſtructed in imitation of the French regular drama. This tragedy deſerves, however, very little praiſe; it is feeble and languid; faults not to be redeemed by the merit of regularity. Not contented with exerciſing his pen in this laudable deſign, he uſed his perſonal influence and advice; and the theatre of Leipſic, where he reſided, became one of the beſt in Germany. A remarkable circumſtance relative to that theatre muſt not be omitted: it is ſaid, that for ſome time the company of actors there conſiſted of only one family; the father being manager, while the mother, the ſons, the daughters, and the ſons-in-law, ſhared the labours of the ſtage; and gave complete ſatisfaction to an audience not accuſtomed to ſevere criticiſm, nor diſpoſed to exchange their cheap and eaſy pleaſure for the vanity of finding fault.

Prior to this epoch, people of rank and taſte had been accuſtomed to attend only the French and Italian repreſentations; leaving the German drama to the *Bourgeoiſie*, to whoſe uneducated taſte its plain morality and groſs buffoonery were adapted. But when Gottſched had been followed by Bodmer, Schlegel, Gellert, Klopſtock, and others, who either produced original pieces, or good tranſlations from the Dutch, the Italian, the Daniſh, and the Engliſh, and particularly from the French, the caſe became changed; and the German ſtage began to ſhare the favour of the noble, the opulent, and the learned. By degrees the French drama, which had at firſt delighted by its regularity of plot, and artificial concatenation of ſcenes, began to diſguſt by its monotony; and the Engliſh theatre, which, with leſs regularity and art, preſents far more variety and animation, obtained the preference. Almoſt the whole plays of Shakſpeare were clothed in the Teutonic language; and even feeble transfuſions of his wonderful page obtained the warm applauſe of a foreign audience.

Miraturque novos fructus, et non ſua poma.

To the plays of Shakſpeare, and the novels of Richardſon, modern German dramatiſts appear to be deeply indebted: but it is not the intention of this ſlight eſſay to criticiſe the late celebrated productions of the German theatre, many of which have been tranſlated into Engliſh, and have become generally known. It is ſufficient to have arranged theſe few notices, concerning the origin and progreſs of the German drama.

When Gottſched was endeavouring to reform the German drama, about the year 1740, he aſked one of the actors why they never repreſented any of the plays of Gryphius, a grave writer, and good dramatiſt, of the preceding century? The actor anſwered that ſuch pieces could not be endured, becauſe they were in verſe, were too ſerious, and had not one buffoon to divert an audience!

When the Germans began to tranſlate plays from the Engliſh, their moſt favourite pieces were our domeſtic tragedies, ſuch as the Orphan, the Gameſter, &c. &c. The German language ſeems more adapted to this kind of compoſition, than to the heroic and ſublime.

The German Theatre, by Gottſched, was publiſhed betwixt the years 1746 and 1750, in 6 vols. 8vo. The firſt volume begins with a tranſlation of the Thoughts of the great Fenelon, upon the dramatic Art: but perhaps the diſcourſe of Corneille upon the three Unities ought to have been preferred. Many of the pieces are tranſlated from the French; ſuch as the Miſanthrope of Moliere, which is diſfigured with the ceremonious expreſſion of the Germans, and the Cid of Corneille. Some are from the Daniſh; for inſtance, the Political Pewterer by the celebrated Holberg, a piece ſomewhat ſimilar to our Upholſterer. The Drummer of Addiſon is given in the ſecond volume: and few original pieces of conſequence appear till we come to the fourth volume, which contains the Arminius of Schlegel; and the Unequal Marriage, a comedy, by Madame Gottſched, &c. In the ſame volume is the Baniſa of Grimm, a piece that deſerves to be better known. The ſcene is laid in Pegu in Aſia; and the ſtage effect, and cataſtrophe, are conceived, and expreſſed, with great vigour. The fifth and ſixth volumes are wholly filled with original German productions, of various merit.

All plays, ſay the ancient critics, muſt be either tragedy or comedy. Shakſpeare, or ſome other about his age, however, added to theſe, hiſtory and tragi-comedy. Theſe terms need no explanation. Modern times have invented the Comédie larmoyante, which is cenſured for producing the contrary effect to that which is peculiarly the province of comedy. This cannot be denied; but it is a great miſtake to conſider the tears ſhed at theſe repreſentations as ariſing from grief, and perhaps it is this miſtake which has occaſioned the cenſure.

Tears are the natural conſequence of being ſtrongly affected, from whatever cauſe ariſing. We weep at Sealand's diſcovery of his daughter, and at the reconciliation of Lord and Lady Townly; but they are not tears of ſorrow; therefore the ſenſation is as far diſtant from tragedy as comedy, but may, by accident, belong to either.

Modern times have alſo given birth to the ſentimental comedy, which is ſtill further removed from this ſpecies of the drama; for a grave, moral, or religious thought, is much leſs connected with comedy than a tender incident: indeed, as it never has the effect of fairly growing out of the piece, it may be conſidered as perfectly out of place.

Many of the German pieces, but eſpecially the play of *Lovers' Vows*, cannot be made to belong to either of theſe claſſes. The character of Agatha is as much tragic as Jane Shore, and yet it is not a tragedy. Amelia is much more comic than many of our comic characters, and yet it is not a comedy. The incidents all tend to fill the mind with thoſe ſenſations which produce tears; but yet we cannot call it a crying comedy, and moſt certainly theſe tears cannot with

propriety be referred to tragic feelings, nor are we ſatisfied to call it a tragi-comedy. It is, in our opinion, a new ſpecies of drama, and this is eaſier ſaid than to define its principles. The author poſſibly might wiſh to give a ſtory with ſuch tender ſentiment, ſuch tragic adventure, and ſuch comic character, as might naturally belong to it, and held tragedy and comedy equally from his deſign. If we judge from immediate perception, we find a great deal to commend, and but little to cenſure.

It may not be improper to add to the many modern variations from the ancient drama, that union of romance, magic, muſic, and ſpectacle, which at preſent has taken ſuch firm poſſeſſion of the ſtage as almoſt to exclude the old tragedy and comedy. If amuſement be the end of theatrical repreſentations, it is undoubtedly beſt attained by a variety of attraction. If feelings of a better ſort are to be gratified, it muſt be by the drama as it was invented by the Greeks, continued by the Romans, and practiſed, with many improvements, on the theatres of modern Europe.

DRAMBURG, a town of Germany, in Upper Saxony, 40 miles S.S.E. of Colberg, and 118 N.E. of Berlin.

DRAPER (Sir William), was a gentleman who diſtinguiſhed himſelf much in the war that was conducted with ſuch ſpirit and ſucceſs by Pitt. He is ſuppoſed to have received his grammar learning at Eton, and to have completed his education at the King's College, Cambridge. After going through the regular gradations of ſervice, he was employed about the period of the capture of Fort St. David's, to raiſe a regiment of foot (the 79th) to ſerve in the Eaſt Indies. The regiment was ſoon completed at Chelmsford, in Eſſex; and Colonel Draper, while the regiment lay in that town, exhibited the model of an excellent officer, not merely by the ſtricteſt attention to military evolutions and diſcipline, but by taking care to inculcate in his men a becoming reverence for the Supreme Being, as well as of the neceſſity of a life of ſobriety and decorum. That they might not want, moreover, the beſt means of inſtruction, he purchaſed, at his own expence, a large number of bibles and common-prayers, to be diſtributed among them. In 1759 he behaved with the greateſt gallantry at Madras; and to his efforts, in conjunction with thoſe of Colonel Laurence and Major Brereton, the raiſing of the ſiege of that important fortreſs was owing. In 1760 he returned to England; and, in 1761, he was promoted to the rank of brigadier-general in the expedition againſt Belleiſle. Being ſent again to the Eaſt Indies, he conducted, in conjunction with Admiral Corniſh, the expedition againſt Manilla, the capital of the Philippine Iſlands, which ſurrendered on the 6th of October, 1763, and was preſerved from plunder by a ranſom of four millions of dollars, which, however, the Spaniards never paid. The colours taken at this place were preſented to King's College, Cambridge, and hung up, with proper ſolemnity, in its beautiful chapel. The ſervices of Colonel Draper were rewarded by a red ribband; and, upon the reduction of his regiment, the 79th, which had ſerved ſo glorioufly in the Eaſt Indies, his majeſty, unſolicited, gave him the 16th regiment of foot as an equivalent. This he reſigned to Colonel Giſborne, for his half pay, 1200l. Irith annuity. In 1769 we find him a literary character engaged in defence of his friend the Marquis of Granby, in a conteſt with the celebrated political writer Junius. Unequal perhaps to his antagoniſts, he claimed nevertheleſs the praiſe of excellence in this kind of writing. In October of the ſame year, he made a voyage to South Carolina for the recovery of his health, and took that opportunity of making the tour of North America. He married, in this year, Miſs De Lancey, the daughter of the chief juſtice of New-York. She died, July 1773, leaving him a daughter, born in 1773, who ſurvived her father and enjoyed an ample fortune which came to her from her mother's relations. In 1779, Sir William Draper, having then the rank of lieutenant-general, was appointed lieutenant-governor of Minorca. During the ſiege of that important place, he was unfortunately upon ill terms with the governor-general Murray, and, upon their return to England, the conqueror of Manilla exhibited 29 charges againſt the gallant veteran of Quebec. The court-martial deemed 27 frivolous and groundleſs, and for the other two the governor was ordered to be reprimanded; which order was remitted, and Sir William Draper then ordered to make an apology to the general for having inſtituted the trial againſt him: this Sir William did, and afterwards lived in retirement at Bath. He died January 8, 1787.

DRAWING (*Encycl.*). The following is extracted from the ſpecification of a patent granted to Mr. Gueſt, of Portſmouth, for his invention of certain boxes of a new conſtruction, of various forms and ſizes, to contain materials and other neceſſary articles for drawing and painting, to be arranged on ſcientific principles. It is dated June 2, 1801, and runs thus:

"My ſaid invention conſiſts of a new box or boxes, and materials, for painting and drawing, and my new manner of arranging the pallet of colours, and certain new materials that are to be contained therein, by which the art of drawing or painting in colours will be rendered more ſimple and generally uſeful, is deſcribed as follows.

"The boxes, of whatever ſize or ſhape or material they may be made, are to be ſo formed as to contain, with convenience, either a round, or ſquare, or oval, or any other ſhaped piece of marble, or wood, or metal, or ſtone, or porcelain, or pottery, or glaſs, or other proper material or compoſition, or combination of materials of any kind, either coated or plain; which piece of marble, or wood, or metal, or ſtone, or porcelain, or pottery, or glaſs, or other material, is *abſolutely neceſſary for or to* my new arrangement of the pallet of colours, and which I ſhall hereafter, in this ſpecification, call by the name of a *pallet of colours*. And the box or boxes will be made ſubſervient to it, and ſo contrived, that this *pallet of colours* will be ſometimes fitted in the top or cover, or in a drawer, either in the front, end, or ſide, or ſome other convenient place, for the purpoſe of receiving it, but in ſuch a manner that this *pallet of colours* may be eaſily removed, if wanted for uſe, by the artiſt or perſon, drawing or painting; and that the colours are to be arranged or fixed on, or let into it, by certain places being made or ſunk into the pallet to receive them; and theſe places will ſometimes be of a long ſquare, or of an oval or a round, or indeed any other ſhape that may be found beſt adapted for the purpoſes intended, by which means the colours are guarded from all dirt or duſt, they cannot be miſplaced, the artiſt has no occaſion to apply to a plate or other material to rub his colours on when uſed, the pallet on which they are arranged and fixed ſerving for that purpoſe, and which may be eaſily cleaned, when neceſſary, with a damp ſponge. The colours are to be fixed, or let into the pallet, ſo as not to be removed, or to fall out, which is done by firſt caking them in the uſual manner, and afterwards faſtening them in, while damp, by ſome mucilaginous mixture, ſuch as gum-water, or any other that will not injure them. It is hardly neceſſary to obſerve, that of whatever material the pallet be made, it ſhould be preſented in an unglazed or unpoliſhed ſtate: thus, if made of marble or other ſtone, it ſhould be left as ſmooth as poſſible, but unpoliſhed. If of wood, it muſt be coated with a compoſition of oil, flake white, and calx of tin, or any other compoſition that will anſwer the purpoſe of reſiſting the penetration of water, and left as ſmooth as poſſible, but not poliſhed nor glazed. If of metal,

it ſhould be enamelled, and ground ſmooth, but left with a tooth, and without poliſh. If of porcelain, to be left in the biſcuit ſtate. If of glaſs, it ſhould, in the vitrification, be mixed with the calx of tin, or any other material that will make an opaque white enamel of it, and when made of the proper ſhape, it ſhould be ground, and left without poliſh. Let it be obſerved, that I do not wiſh to ſtate that the colours may not be mixed on glazed or poliſhed ſubſtances, but unglazed and unpoliſhed bodies for that purpoſe are much ſuperior.

"The convenience and utility of this *pallet of colours* every experienced and profeſſional man will ſee; and it will remove the inconvenience above mentioned, which the younger practitioners have hitherto laboured under. The colours will likewiſe be arranged, and fixed on or into the pallet, in the following order, according to the *principia optica, viz.* The three original colours, yellow, red, and blue, will be fixed on or into the pallet, and ſo arranged as to ſhew their intermediate ſhades, *viz.* from yellow, the degrees of orange to red; from red the degrees of purple to blue, with the different degrees of green and the browns reſulting from a mixture of the three original colours: which arrangements will include every poſſible tone or tint that can be preſented to the eye, and the colours and tints will be arranged on or in the pallet, ſo that the numbers 1, 2, 3, &c. will indicate the tone or tint of each, and may be called yellow, orange, red, purple, blue, green, and brown, &c. without any reference to the original name of any particular pigment or chemical preparation at preſent in uſe, unlike the preſent method, which by naming the pigment contrary to its real tone or colour (though the experienced artiſt may remove the difficulties from himſelf), ſerves only to miſlead the ſtudent, and thoſe not previouſly acquainted with the uſe of colours, without conveying any idea of the tone or tint of colour wanted; but by the above arranged pallet of colours the maſter is eaſed, the ſtudent improved, and a rational and ſimple theory will go hand in hand with the practical part. The colours in the larger boxes, and on the larger pallets, will likewiſe be divided into *tranſparent, or glazing*, and *opaque, or body colours*. The tranſparent being fixed on, or let into one ſide, and the opaque on or into the other ſide of the pallet, to prevent confuſion. And the tranſparent and opaque colours are to be arranged in the ſame manner with regard to the degrees of tone and ſituation, which will enable the artiſt to produce the effect he wiſhes, according to his ſtyle or mode of practice with the opaque; and he may, by turning his pallet, enrich and glaze his painting with the tranſparent colours without rendering them foul or muddy."

Having deſcribed the nature of his invention, as regards the boxes, and the *arrangement of the pallet of colours*, Mr. Gueſt proceeds to ſtate the means of rendering his invention ſtill more convenient to the public, in adding to the boxes ſuch articles as will ſupply the artiſt with every utenſil and material that he can want; but in this it is not neceſſary we ſhould follow him.

DRAYTON, a town in Shropſhire, with a market on Wedneſday, ſeated on the river Torn, which ſeparates this county from Staffordſhire. It is 17 miles N.E. of Shrewſbury, and 154 N.W. of London. Long. 2. 22. W. Lat. 52. 54 N.

DRENTELBURG, a town of Germany, in the principality of Heſſe, 18 miles N.N.W. of Caſſel, and 32 E.S.E. of Paderborn. Long. 8. 57. E. Lat. 51. 23. N.

DRESDEN (*Encycl.*). J. G. Lipſius has publiſhed a deſcription of the gallery of antiques, at Dreſden, in a quarto volume of 526 pages, with thirty pages of tables and ten plates. The origin of this gallery is as old as the reign of Auguſtus, elector of Saxony, by whoſe order, medals, and other remains of antiquity, were purchaſed in 1560. Under his ſucceſſors, this collection continued to increaſe, till by the munificent exertions of ſeveral ſovereigns it became of the higheſt value and importance. Till the year 1785, the collection lay ſcattered in different pavilions of the large garden, where it was very ill arranged, and in ſuch a ſtate as to be of very little uſe to artiſts. The preſent elector, therefore, aſſigned a place for it in the Japaneſe palace, and enriched it with ſeveral new and valuable acquiſitions. M. Wacker, the inſpector of this gallery, had made out a deſcription of every thing it contains; but as he died before it was publiſhed, M. Lipſius made uſe of his manuſcript for the work there announced, and which muſt be of great utility to artiſts and amateurs, as the ten plates at the end of the volume exhibit plans on which the different articles are indicated by letters correſponding to the deſcriptions.

DRESSERUS (Matthew), a learned German, was born at Erfort, the capital of Thuringia, in 1536. The firſt academical lectures which he heard, were thoſe of Luther and Melancthon, at Wittemberg; but he had not the advantage of them long, becauſe the air of that country not agreeing with his conſtitution, he was obliged to return to Erfort, where he ſtudied Greek. When he had taken the degree of M.A. in 1559, he read lectures in rhetoric at home, and afterwards taught polite literature and the Greek tongue in the college of Erfort. When he had gone on in this way ſixteen years in his own country, he was invited to Jena, to ſupply the place of Lipſius, as profeſſor of hiſtory and eloquence. He pronounced his inaugural oration in 1574, which was afterwards printed with other of his orations. Some time after, he went to Meiſſen, to be head of the college there; and having continued there ſix years, he obtained, in 1581, the profeſſorſhip of polite learning in the univerſity of Leipſic; and a particular penſion was ſettled on him to continue the Hiſtory of Saxony. Upon his coming to Leipſic, he found dreadful diſputes among the doctors. Some endeavoured to introduce the ſubtleties of Ramus, rejecting the doctrine of Ariſtotle, while others oppoſed it; and ſome were deſirous of advancing towards Calviniſm, while others would ſuffer no innovations in Lutheraniſm. Dreſſerus deſired to avoid both extremes: and becauſe the diſpute concerning the novelties of Ramus greatly diſturbed the philoſophical community, he was very ſolicitous to keep clear of it. But the electoral commiſſary diverted him from his pacific deſign; and he became the moſt zealous oppoſer of Ramiſm that ever was known in that country.

Dreſſerus ſpent the remainder of his life at Leipſic, where he died in 1607. He married in 1565; and, becoming a widower in 1598, he married again two years after. He was a man of great induſtry, and not eaſily tired with applying, as he ſhewed at Erfort; for he brought all his colleagues, who, except one, were Roman-catholics, to conſent, that the confeſſion of Augſburg and Hebrew ſhould be taught in the univerſity. He was the author of ſeveral works, which now are not uſeful or curious enough to deſerve a particular account.

DRIESSEN, a town of Germany, in the new march of Brandenburg, with a ſtrong fort, on the river Warta, 20 miles E. of Landſperg. Long. 15. 43. E. Lat. 52. 53. N.

DRINAWARD, a town of Turkey in Europe, in Servia. It ſtands on a ſmall iſland formed by the Drino, on the confines of Boſnia.

DRINKER (Edward), was born on the 24th of December 1680, in a ſmall cabin near the preſent corner of Walnut and Second ſtreets in the city of Philadelphia. His parents came from a place called Beverly, in Maſſachuſet's Bay. The banks of the Delaware, on which the city of Philadelphia

now ſtands, were inhabited, at the time of his birth, by Indians, and a few Swedes and Hollanders. He often talked to his companions of picking wortleberries, and catching rabbits, on ſpots now the moſt populous and improved of that city. He recollected the ſecond time William Penn came to Pennſylvania, and uſed to point to the place where the cabin ſtood, in which he and his friends that accompanied him were accommodated upon their arrival. At twelve years of age he went to Boſton, where he ſerved an apprenticeſhip to a cabinet-maker. In the year 1745 he returned to Philadelphia with his family, where he lived till the time of his death. He was four times married, and had eighteen children, all of whom were by his firſt wife. At one time of his life he ſat down at his own table with fourteen children. Not long before his death he heard of the birth of a grand-child to one of his grand children, the fifth in ſucceſſion from himſelf.

He retained all his faculties till the laſt years of his life; even his memory, ſo early and ſo generally diminiſhed by age, was but little impaired. He not only remembered the incidents of his childhood or youth, but the events of later years, and ſo faithful was his memory to him, that his ſon ſaid that he never heard him tell the ſame ſtory twice, but to different perſons and in different companies. His eye-ſight failed him many years before his death, but his hearing was uniformly perfect and unimpaired. His appetite was good till within a few weeks before his death. He generally ate a hearty breakfaſt of a pint of tea or coffee, as ſoon as he got out of his bed, with bread and butter in proportion. He ate likewiſe at eleven o'clock, and never failed to eat plentifully at dinner of the groſſeſt ſolid food. He drank tea in the evening, but never ate any ſupper. He had loſt all his teeth thirty years before his death (his ſon ſays, by drawing exceſſive hot ſmoke of tobacco into his mouth); but the want of ſuitable maſtication of his food did not prevent its ſpeedy digeſtion, nor impair his health. Whether the gums, hardened by age, ſupplied the place of his teeth in a certain degree, or whether the juices of the mouth and ſtomach became ſo much more acrid by time, as to perform the office of diſſolving the food more ſpeedily and more perfectly, is not known; but it has been often obſerved, that old people are more ſubject to exceſſive eating than young ones, and that they ſuffer fewer inconveniences from it. He was inquiſitive after news in the laſt years of his life; his education did not lead him to increaſe the ſtock of his ideas in any other way. But it is a fact well worth attending to, that old age, inſtead of diminiſhing, always increaſes the deſire of knowledge. It muſt afford ſome conſolation to thoſe who expect to be old, to diſcover, that the infirmities to which the decays of nature expoſe the human body, are rendered more tolerable by the enjoyments that are to be derived from the appetite for intellectual food.

Drinker was remarkably ſober and temperate. Neither hard labour, nor company, nor the uſual afflictions of human life, nor the waſtes of nature, ever led him to an improper or exceſſive uſe of ſtrong drink. For the laſt twenty-five years of his life he drank twice every day a draught of toddy, made with two table-ſpoonfuls of ſpirit in half a pint of water. His ſon, a man of 59 years of age, declared he had never ſeen him intoxicated. The time and manner in which he uſed ſpirituous liquors, contributed to lighten the weight of his years, and probably to prolong his life.

He enjoyed an uncommon ſhare of health, inſomuch that in the courſe of his long life he was never confined more than three days to his bed. He often declared that he had no idea of that moſt diſtreſſing pain called the head ach. His ſleep was interrupted a little in the laſt years of his life with a defluxion in his breaſt, which produced what is commonly called the old man's cough.

The character of this aged citizen was not ſummed up in his negative quality of temperance; he was a man of a moſt amiable temper; old age had not curdled his blood; he was uniformly cheerful and kind to every body; his religious principles were as ſteady as his morals were pure; he attended public worſhip above thirty years in the Rev. Dr. Sproat's church, and died in a full aſſurance of a happy immortality. The life of this man is marked with ſeveral circumſtances which perhaps have ſeldom occurred in the life of an individual: he ſaw and heard more of thoſe events which are meaſured by time, than have ever been ſeen or heard by any man ſince the age of the patriarchs; he ſaw the ſame ſpot of earth in the courſe of his life covered with wood and buſhes, and the receptacle of beaſts and birds of prey, afterwards become the ſeat of a city, not only the firſt in wealth and arts in the new, but rivalling in both many of the firſt cities in the old world. He ſaw regular ſtreets where he once purſued a hare; he ſaw churches riſing upon moraſſes, where he had often heard the croaking of frogs; he ſaw wharfs and warehouſes where he had often ſeen Indian ſavages draw fiſh from the river for their daily ſubſiſtence; and he ſaw ſhips of every ſize and uſe in thoſe ſtreams where he had been uſed to ſee nothing but Indian canoes; he ſaw a ſtately edifice filled with legiſlators on the ſame ſpot, probably, where he had ſeen an Indian council fire; he ſaw the firſt treaty ratified between the newly-confederated powers of America and the ancient monarchy of France, with all the formalities of parchment and ſeals, on the ſame ſpot, probably, where he once ſaw William Penn ratify his firſt and laſt treaty with the Indians without the formalities of pen, ink, or paper; he ſaw all the intermediate ſtages through which a people paſs from the moſt ſimple to the moſt complicated degrees of civilization; he ſaw the beginning and end of the empire of Great Britain in Pennſylvania.

He had been the ſubject of ſeven crowned heads, and afterwards died a citizen of the newly-created republic of America, Nov. 17, 1782, aged 102.

DRINO, a river of Turkey in Europe, which has its ſource on the frontiers of Albania, and falls into the bay of Drino, in the gulf of Venice.

DRINO, a ſea-port of Turkey in Europe, on a bay of the ſame name, in the gulf of Venice, 50 miles S.E. of Raguſa. Long. 10. 19. E. Lat. 42. 48. N.

DROME, a department of France, including part of the late province of Dauphiny. It is ſo called from a river of the ſame name.

DRONERO, a town of Piedmont, ſeated at the foot of the Alps, on the river Macra, over which is a bridge of prodigious height, 14 miles S.S.W. of Saluzzo.

DRONFIELD, a town in Derbyſhire, with a market on Thurſday. It is ſituate at the edge of the Peak, in ſo wholeſome an air, that the inhabitants commonly live to a great age; and it is therefore much reſorted to, and has many fine buildings. It is 28 miles N. of Derby, and 155 N.N.W. of London. Long. 1. 25. W. Lat. 53. 18. N.

DRONTHEIM, a city of Norway, capital of a government of the ſame name, with an archbiſhop's ſee, and a good harbour. It carries on a great trade; is almoſt ſurrounded by the ſea and the river Piddet; and it is 270 miles N.W. of Stockholm. Long. 11. 9. E. Lat. 63. 26. N.

DROSENDORF, a town of the Archduchy of Auſtria, on the Taya, 46 miles N.W. of Vienna. Long. 15 38. E. Lat. 48. 45. N.

DROSSEN a town of Germany, in the new march of

Brandenburg, 12 miles S.E. of Cuſtrin, and 14 E. of Frankfort on the Oder.

DROWNED LANDS, a valuable tract of about 50,000 acres, in the ſtate of New York, on the N. ſide of the mountains, in Orange County. The waters which deſcend from the ſurrounding hills, being ſlowly diſcharged by the river Wallkill, cover theſe vaſt meadows every winter, and render them extremely fertile; but they expoſe the inhabitants in the vicinity to intermittents. The river Wallkill, which paſſes through this extenſive tract, and falls into Hudſon's River, is, in the ſpring, very plentifully ſtored with large eels.

DROWNING (*Encycl.*). To what has been ſaid already, we think it of importance to add Dr. Cullen's obſervations on this ſubject.—"With reſpect," ſays he, "to the particular means to be employed for the recovery of drowned perſons, it is to be obſerved, in the firſt place, That ſuch as were recommended and practiſed, upon a ſuppoſition that the ſuffocation was occaſioned by the quantity of water taken into the body, and therefore to be evacuated again, were very unhappily adviſed. The hanging up of perſons by the heels, or ſetting them upon the crown of the head, or rolling the body upon a caſk, were generally practiſed, upon a ſuppoſition altogether falſe; or upon the ſuppoſition of a caſe which, if real, is apprehended to be irrecoverable. At the ſame time, theſe practices were always attended with the danger of burſting ſome veſſels in the brain or lungs, and of rendering thereby ſome caſes incurable, that were not ſo from the drowning alone. All ſuch practices, therefore, are now very properly diſapproved of and forbid.

"In thoſe caſes in which the body has not been long in the water, and in which therefore the natural heat is not entirely extinguiſhed, nor the irritability of the moving fibres very greatly impaired, it is poſſible that a good deal of agitation of the body may be the only means neceſſary to reſtore the action of the vital organs; but in other caſes, where the heat and irritability have ceaſed to a greater degree, it is to me very doubtful, if much agitation can be ſafe, and if any degree of it can be uſeful, till the heat and irritability are in ſome meaſure reſtored. In all caſes, any violent concuſſion cannot be ſafe, and, I believe, is never neceſſary. It may be proper here to obſerve alſo, that, in tranſporting the body from the place where it is taken out of the water, to the place where it may be neceſſary for applying the proper means of its recovery, all poſtures expoſing to any improper compreſſion, as that of the body's being carried over a man's ſhoulder, are to be avoided. The body is to be kept ſtretched out, with the head and upper parts a little raiſed; and care is to be taken to avoid the neck's being bent much forward. In this manner, laid upon one ſide, and upon ſome ſtraw in a cart, it may be moſt properly conveyed; and the agitation which a pretty briſk motion of the cart may occaſion, will, in moſt caſes, do no harm.

"From the account I have given above of the cauſes, or of the appearances, of death, in drowned perſons, it is evident, that the firſt ſtep to be taken for their recovery is to reſtore the heat of the body, which is abſolutely neceſſary to the activity of the moving fibres. For this purpoſe, the body, as ſoon as poſſible, is to be ſtripped of its wet clothes, to be well dried, and to be wrapped up in dry, and (if poſſible) warm, coverings: and it is to be wiſhed, in all caſes, as ſoon as the report of a perſon's being drowned is heard, that blankets ſhould be immediately carried to the water-ſide; ſo that, as ſoon as the body is got out of the water, the change of covering juſt now mentioned may be inſtantly made; or, if the body has been naked when drowned, that it may be immediately dried, and defended againſt the cold of the air. Beſides covering the body with blankets, it will be further of advantage, if it can be done without loſs of time, to cover the drowned body with a warm ſhirt or waiſtcoat immediately taken from a living perſon.

"When, at the time of a perſon being drowned, it happens that the ſun ſhines out very hot, I think there can be no better means of recovering the heat, than by expoſing the naked body, in every part, to the heat of the ſun; while, at the ſame time, all other means neceſſary or uſeful for the recovery of life are alſo employed.

"When the heat of the ſun cannot be employed, the body ſhould be immediately tranſported to the neareſt houſe that can be got convenient for the purpoſe: the fitteſt will be one that has a tolerably large chamber, in which a fire is ready, or can be made; and, if poſſible, the houſe ſhould afford another chamber, in which alſo a fire can be provided.

"When the drowned body is brought into ſuch houſe, and care is at the ſame time taken that no more people are admitted than are abſolutely neceſſary to the ſervice of the drowned perſon, every endeavour muſt be immediately employed for recovering the heat of the body, and that by different meaſures, as circumſtances ſhall direct.

"If, in the neighbourhood of the place, there be any brewery, diſtillery, dyery, or fabric, which gives an opportunity of immediately obtaining a quantity of warm water and a convenient veſſel, there is nothing more proper than immerſing the body in a warm bath. Even where a ſufficient quantity of warm water cannot be had at once, the bath may be ſtill practiſed, if the accident has happened in or very near a town or village, when a great many fires may be at once employed in heating ſmall quantities of water; for in this way the neceſſary quantity may be ſoon obtained. To encourage this practice, it is to be obſerved, That one part of boiling water is more than ſufficient to give the neceſſary heat to two parts of ſpring or ſea water, as it is not proper to apply the bath at firſt very warm, nor even of the ordinary heat of the human body, but ſomewhat under it; and, by the addition of warm water, to bring it gradually to a heat very little above it.

"If the drowned body be of no great bulk, it may be conveniently warmed by a perſon's lying down in bed with it, and taking it near to their naked body, changing the poſition of it frequently, and at the ſame time chaffing and rubbing with warm clothes the parts which are not immediately applied to their warm body.

"If none of theſe meaſures can be conveniently practiſed, the body is to be laid upon a bed before a moderate fire, and frequently turned, to expoſe the different parts of it; and thus, by the heat of the fire gradually applied, and by rubbing the body well with coarſe towels, or other cloths well warmed, pains are to be taken for reſtoring its heat. This will be promoted by warm cloths applied and frequently renewed under the hams and arm pits; and by hot bricks, or bottles of warm water, laid to the feet.

"In the practice of rubbing, it has been propoſed to moiſten the cloths applied with camphorated ſpirits, or other ſuch ſtimulating ſubſtances: but I think this muſt prove an impediment to the rubbing; and I would not recommend any practice of this kind, except, perhaps, the application of the volatile ſpirit of ſal ammoniac to the wriſts and ankles only.

"For recovering the heat of the body, it has been propoſed, to cover it all over with warm grains, aſhes, ſand, or ſalt; and where theſe, ſufficiently warm, are ready at hand, they may be employed; but it is very ſeldom they can be ob-

tained, and the application might often interfere with other meaſures that may be neceſſary. All therefore that I can propoſe, with reſpect to the uſe of theſe, is to obſerve, that bags of warm and dry ſalt may be amongſt the moſt convenient applications to the feet and hands of drowned perſons: and the quantity neceſſary for this purpoſe may be got pretty quickly by heating the ſalt in a frying-pan over a common fire.

" While theſe meaſures are taking for recovering the heat, means are at the ſame time to be employed for reſtoring the action of the moving fibres. It is well known, that the inteſtines are the parts of the body which, both from their internal ſituation and peculiar conſtitution, retain the longeſt their irritability; and therefore, that, in drowned perſons, ſtimulants applied may have more effect upon the inteſtines than upon other parts. The action, therefore, of the inteſtines is to be ſupported or renewed as ſoon as poſſible; as the reſtoring and ſupporting the action of ſuch a conſiderable portion of moving fibres as thoſe of the inteſtines, muſt contribute greatly to reſtore the activity of the whole ſyſtem.

" For exciting the action of the inteſtines, the moſt proper mean is, the application of their ordinary ſtimulus of dilatation; and this is moſt effectuallly applied, by forcing a quantity of air into them by the fundament. Even the throwing in cold air has been found uſeful: but it will certainly be better if heated air can be employed; and further, if that air can be impregnated with ſomething which, by its acrimony, alſo may be powerful in ſtimulating the inteſtines.

" From all theſe conſiderations, the ſmoke of burning tobacco has been moſt commonly applied, and has upon many occaſions proved very effectual. This will be moſt properly thrown in by a particular apparatus, which, for other purpoſes as well as this, ſhould be in the hands of every ſurgeon; or at leaſt ſhould, at the public expence, be at hand in every part of the country where drownings are likely to happen. With regard to the uſe of it, I have to obſerve, that till the tobacco is kindled in a conſiderable quantity, a great deal of cold air is blown through the box and tube; and as that, as hinted above, is not ſo proper, care ſhould be taken to have the tobacco very well kindled, and to blow through it very gently, till the heated ſmoke only paſſes through. If, upon certain occaſions, the apparatus referred to ſhould not be at hand, the meaſure however may be executed by a common tobacco pipe, in the following manner: A common clyſter-pipe that has a bag mounted upon it, is to be introduced into the fundament, and the mouth of the bag is to be applied round the ſmall end of a tobacco-pipe. In the bowl of this, tobacco is to be kindled; and, either by a playing card made into a tube and applied round the mouth of the bowl, or by applying upon this the bowl of another pipe that is empty and blowing through it, the ſmoke may be thus forced into the inteſtines, and, in a little time, in a conſiderable quantity.

" If none of theſe means for throwing in the ſmoke can be employed, it may be uſeful to inject warm water to the quantity of three or four Engliſh pints. This may be done by a common clyſter-bag and pipe, but better by a large ſyringe; and it may be uſeful to diſſolve in the water ſome common ſalt, in the proportion of half an ounce to an Engliſh pint; and alſo, to add to it ſome wine or brandy.

" While theſe meaſures for recovering the heat of the body and the activity of the moving fibres are employed, and eſpecially after they have been employed for ſome time, pains are to be taken to complete and finiſh the buſineſs, by reſtoring the action of the lungs and heart.

" On this ſubject, I am obliged to my learned and ingenious colleague, Doctor Monro, who has made ſome experiments for aſcertaining the beſt manner of inflating the lungs of drowned perſons. By theſe experiments he finds it may be more conveniently done by blowing into one of the noſtrils, than by blowing into the mouth. For blowing into the noſtril, it is neceſſary to be provided with a wooden pipe, fitted at one extreinity for filling the noſtril, and at the other for being blown into by a perſon's mouth, or for receiving the pipe of a pair of bellows, to be employed for the ſame purpoſe. Dr. Monro finds, That a perſon of ordinary ſtrength can blow into ſuch a pipe with a ſufficient force to inflate the lungs to a conſiderable degree; and thinks the warm air from the lungs of a living perſon will be moſt conveniently employed at firſt; but when it is not ſoon effectual in reſtoring the reſpiration of the drowned perſon, and that a longer continuation of the inflation is neceſſary, it may be proper to employ a pair of bellows, large enough at once to contain the quantity of air neceſſary to inflate the lungs to a due degree.

" Whether the blowing-in is done by a perſon's mouth, or by bellows, Dr. Monro obſerves, that the air is ready to paſs by the gullet into the ſtomach; but that this may be prevented, by preſſing the lower part of the larynx backwards upon the gullet. To perſons of little knowledge in anatomy, it is to be obſerved, that the preſſure ſhould be only upon the cricoid cartilage, by which the gullet may be ſtraightened, while the paſſage through the larynx is not interrupted.

" When, by blowing thus into the noſtril, it can be perceived, by the raiſing of the cheſt or belly, that the lungs are filled with air, the blowing-in ſhould ceaſe; and, by preſſing the breaſt and belly, the air received into the lungs ſhould be again expelled; then the blowing and expulſion ſhould be again repeated: and thus the practice is to be continued, ſo as to imitate, as exactly as poſſible, the alternate motions of natural reſpiration.

" It is hardly neceſſary to obſerve, that when the blowing into the noſtril is practiſed, the other noſtril and the mouth ſhould be accurately cloſed.

" If it ſhould happen, that, in this practice, the air does not ſeem to paſs readily into the lungs, Doctor Monro informs me, it is very practicable to introduce directly into the glottis and trachea a crooked tube, ſuch as the catheter uſed for a male adult. For this he offers the following directions: The ſurgeon ſhould place himſelf on the right ſide of the patient; and, introducing the fore finger of his left hand at the right corner of the patient's mouth, he ſhould puſh the point of it behind the epiglottis; and uſing this as a directory, he may enter the catheter, which he holds in his right hand, at the left corner of the patient's mouth, till the end of it has paſſed beyond the point of his forefinger; and it is then to be let fall, rather than puſhed into the glottis; and through this tube, by a proper ſyringe applied to it, air may be with certainty blown into the lungs. I obſerve, that ſome ſuch method had been propoſed by Monſ. Le Cat in France; but I have not learned that it has ever been put in practice, and I am afraid it may be attended with ſeveral difficulties, and muſt be left to the diſcretion of ſurgeons, who may be properly provided and inſtructed for this purpoſe.

" For throwing air with more certainty into the lungs, it has been propoſed to open the windpipe in the ſame manner as is done in the operation which the ſurgeons call *bronchotomy*, and by this opening to blow into the lungs; and when the blowing into the noſtril does not ſeem to ſucceed, and a ſkilful operator is at hand, I allow that the meaſure may be tried; but I can hardly ſuppoſe, that it will be of any advantage when the blowing-in by the noſtril has entirely failed.

" It is to be hoped, that by blowing into the lungs one way or other, even a quantity of water which had been taken into the lungs may be again waſhed out; and the ſame ſeems to

be the only effectual means of waſhing out that frothy matter which is found to fill the lungs of drowned perſons, and which proves, if I miſtake not, the moſt common cauſe of their mortal ſuffocation. This practice, therefore, is to be immediately entered upon, and very aſſiduouſly continued for an hour or two together.

" I have now mentioned the meaſures chiefly to be purſued and depended upon for the recovery of drowned perſons; but muſt ſtill mention ſome others that may prove conſiderable helps to it.

" One of theſe is, the opening the jugular veins to relieve the congeſtion, which almoſt conſtantly occurs in the veins of the head, and is probably a frequent cauſe of the death of drowned perſons. For relieving this congeſtion, the drawing ſome blood from the jugulars, very early, may certainly be of ſervice; and it will be particularly indicated by the livid and purple colour of the face. It may even be repeated, according to the effect it ſeems to have in taking off that ſuffuſion; but when the drowned perſon is in ſome meaſure recovered, and ſome motion of the blood is reſtored, it will be proper to be very cautious in making this evacuation, and at leaſt to take care not to puſh it ſo far as to weaken too much the recovering, but ſtill weak, powers of life.

" Another meaſure for recovering the activity of the vital principle, is the application of certain ſtimulants to the more ſenſible parts of the body, ſuch as holding the quick-lime ſpirit of ſal ammoniac to the noſe, or putting a little of it upon a rag into the noſtrils. It has been uſual to pour ſome liquids into the mouth; but it is dangerous to pour in any quantity of liquid, till it appear that the power of ſwallowing is in ſome meaſure reſtored.

" When a ſurgeon is at hand, and is provided with proper apparatus, a crooked pipe may be introduced into the gullet; and by this a gill or two of warm wine may be poured down into the ſtomach, and probably with advantage. But when no ſuch apparatus is at hand, or ſurgeon to employ it, and the power of ſwallowing is ſtill doubtful, the trial of pouring liquids into the mouth ſhould be made by a ſmall quantity of warm water alone; and when, from ſuch trial, the power of ſwallowing ſhall appear to be recovered, it may then be allowable to favour the further recovery of the perſon, by pouring in ſome wine or brandy.—In ſhort, till ſome marks of the recovery of ſwallowing and reſpiratian appear, it will not be ſafe to apply any ſtimulants to the mouth, excepting that of a few drops of ſome acrid ſubſtance to the tongue, and which are not of bulk enough to ſlide back upon the glottis: I can think of no ſtimulant, more conveniently and ſafely to be applied to the mouth and noſtrils, than a moderate quantity of tobacco-ſmoke blown into them.

" Though I do not imagine that drowned perſons are ever hurt by the quantity of water taken into their ſtomach, yet, as a ſtimulus applied to the ſtomach, and particularly as the action of vomiting proves a ſtimulus to the whole ſyſtem, I can have no objection to the French practice of throwing in an emetic as ſoon as any ſwallowing is reſtored. For this purpoſe, I would ſucceſſively throw in ſome tea-ſpoonfuls of the ipecacuanha wine; and, when it does not interfere with other neceſſary meaſures, the ſauces may be gently irritated by an oiled feather thruſt into them.

" With regard to the ſtimulants, I muſt conclude with obſerving, That when a body has lain but for a ſhort time in the water, and that therefore its heat and irritability are but little impaired, the application of ſtimulants alone has been often found effectual for the recovery: but, on the contrary, when the body has lain long in the water, and the heat of it is very much extinguiſhed, the application of any other ſtimulants than that of tobacco-ſmoke to the inteſtines can be of very little ſervice; and the application of others ought never to interfere with the meaſures for recovering heat and the motion of reſpiration.

" With reſpect to the whole of theſe practices, I expect, from the principles upon which they are in general recommended, it will be underſtoed, that they are not to be ſoon diſcontinued, though their effects do not immediately appear. It is obvious, that, in many caſes, it may be long before the heat of the body, and the activity of the vital principle, can be reſtored, although, in a longer time, it may very poſſibly be accompliſhed. In fact, it has often happened, that though means, employed for one hour, have not ſucceeded, the ſame continued for two or more hours, have, at length, had the wiſhed-for effects. It ſhould therefore be a conſtant rule, in this buſineſs, that the proper means ſhould be employed for ſeveral hours together; unleſs it happen, that, while no ſymptoms of returning life appear, the ſymptoms of death ſhall, at the ſame time, go on conſtantly increaſing.

" In the whole of the above I have kept in view chiefly the caſe of drowned perſons: but it will be obvious, that many of the meaſures propoſed will be equally proper and applicable in other caſes of ſuffocation; as thoſe from ſtrangling, the damps of mines, the fumes of charcoal, &c.; and a little attention to the difference of circumſtances will lead to the meaſures moſt proper to be employed."

Mr. Hunter, in the before-mentioned paper, differs pretty conſiderably from De Haen and Dr. Cullen. He obſerves, that when aſſiſtance is ſoon called in after immerſion, blowing air into the lungs will in ſome caſes effect a recovery; but when any conſiderable time has been loſt, he adviſes ſtimulant medicines, ſuch as the vapour of volatile alkali, to be mixed with the air; which may eaſily be done, by holding ſpirits of hartſhorn in a cup under the receiver of the bellows. And, as applications of this kind to the olfactory nerves tend greatly to rouſe the living principle, and put the muſcles of reſpiration into action, it may probably, therefore, be moſt proper to have air impregnated in that manner, thrown in by the noſe. To prevent the ſtomach and inteſtines from being too much diſtended by the air ſo injected, the larynx is directed to be gently preſſed againſt the œſophagus and ſpine. But having detailed, in our original article, the means to be employed for the recovery of the drowned, we ſhall here cloſe this part of the ſubject, and proceed to deſcribe the implements repreſented in Pl. 25. to be employed in *ſearching for the bodies of drowned perſons* when ſunk in the water.

Fig. 1, Is a forked inſtrument with blunt points, for making a ſuperficial ſearch after the drowned body, and ſounding the particular ſituation in which it ſunk.

Fig. 2, A ladder with a long, jointed handle, and which we have already mentioned (*Supp.* p. 403), when treating of the Ice-boats: a model of theſe boats may be inſpected in the Repoſitory of the " Society for the Encouragement of Arts, Manufactures," &c. Adelphi, London.

Fig. 3, An *extractor*, or a linked pair of tongs, which in the plate appears cloſed; but, on immerſing it into water, opens by its own weight, as well as by the ſliding down of the iron ring *o* from the part marked *x* to that of *u*. It may again be cloſed, by pulling the double rope faſtened to the ring *o*, which is thus ſhifted upward from *u* to *x*: by means of expanding the iron arms *n n*, which are likewiſe connected with this ring, the mouth or flaps of the inſtrument *r r* may be ſhut: and to prevent their opening till required, the two ropes are firmly tied round the iron bolt *s s*; in which ſituation they remain till the body is extracted.—This inſtrument, together with that repreſented, Fig. 1, coſt about 2l. at Hamburgh.

Great attention is required in preſerving them from the effects of ruſt; and, independently of the weight of iron-work, fig. 3 is perhaps the moſt complete piece of machinery that can be contrived for this purpoſe.

Deſcription of the Engraving in which the "Implements of reſtoration from drowning" *are repreſented* (Pl. 25).

Fig. 1, A pair of bellows with two ſeparate bags, ſo contrived that by opening them, when applied to the noſtrils or mouth of a patient, one bag will be filled with common air, and the other with the mephitic air extracted from the lungs; and, by ſhutting them again, pure atmoſpheric air will be introduced into theſe organs, and that drawn out conſequently diſcharged into the room. Thus, the artificial breathing may be continued, while the other operations on the ſurface of the body are carried on; which could not be conveniently done, if the muzzle of a common pair of bellows were introduced into the noſtril.

a, Is an intermediate board, but which admits of no communication between the two bags. In the external board of each ſide, there is the uſual hole, marked *b*, provided with a valve; and the cylindrical part through which the air is expelled in common bellows, is here ſoldered to a copper box, within which two other valves are applied to the tubes conducting the air. The cover *d* of this box, which may be unſcrewed by means of an interpoſed leather ring, is almoſt of the ſhape of a funnel, to the neck of which is faſtened a flexible tube *e* made of varniſhed ſilk cloth, and a ſpiral wire that forms the cavity. To the extremity of this tube is attached a ſmall ivory pipe *f*, the front of which may either be tubular and round, for introducing it into the noſtril; or flat, like the top-piece of a clarionet, if it be intended for the mouth. The valves (which cannot be repreſented in a plate) conſiſt of ſtiffened taffety. and are ſo arranged, that the correſponding ones ſtand in an inverted order. If, therefore, both bags of the bellows be expanded, *two* of the valves open themſelves towards the internal part of the machine: one of theſe is fixed to one of the ſide-boards, but the other is within the box, on the mouth of the conducting tube belonging to the oppoſite bag of the bellows. By this contrivance, the air enters both bags of the bellows at the ſame time, and is, on compreſſion, again expelled by means of two other valves, which open from within toward the external parts. Both bags of the bellows terminate below the valve in one principal tube of communication; becauſe, though the action of both bellows is *ſimultaneous*, the ſtream of air, conformably to the arrangement before pointed out, can only enter, and eſcape, *alternately*.—In uſing this machine, the ſmall ivory pipe is applied either to one of the noſtrils, or put into the mouth: in the former caſe, the other noſtril and the mouth muſt be cloſed; in the latter, both noſtrils. When the bellows are ſet in action, one of the bags receives a column of atmoſpheric air through its valve; while the other, by means of its flexible tube and its valve, extracts a portion of air from the lungs. But, if the bellows are again ſhut, one of the bags parts with the impure gas drawn out of the pulmonary veſſels; and the ſecond conveys pure atmoſpheric air to the organs of reſpiration. By properly repeating this alternate proceſs, the patient may again be enabled to exerciſe the important function of breathing. As, however, a precipitate and irregular method of proceeding might be productive of injury, this delicate operation ought to be performed by perſons who are acquainted with the mechaniſm of reſpiration.—In ſome caſes, where the patient has, for a conſiderable time, lain under water, or was afterwards neglected for want of due aſſiſtance, it would be deſirable to introduce into his lungs *oxygen*, or pure vital dephlogiſticated air, inſtead of that of the common atmoſphere; as the latter is generally more or leſs corrupted on ſuch occaſions by the breath of many perſons in the ſame room. For this purpoſe, may be uſed a bladder, marked *g*, which is provided with a cock and pipe fitted or ſcrewed to the board of the inſpiring valve and bag of the bellows. If, therefore, after opening the cock, the machine is ſet in motion, it will extract the pure air contained in the bladder, and, on the ſubſequent compreſſion of the bellows, force it into the lungs of the patient.

Fig. 2, A machine for injecting the ſmoke of tobacco by way of clyſter, in thoſe deſperate caſes which require the application of this remedy. It conſiſts of a pair of bellows, to the muzzle of which is fitted a metal box, *a*, provided with a ring, in the middle of which it may be unſcrewed, and again cloſed, after being filled with tobacco, and ſet on fire: the pipe *c* (which, by miſtake, is repreſented with a ſharp point in our plate, but ſhould be perfectly round and blunt at the top) of the flexible tube *b*, is introduced into the fundament; and thus, by means of the bellows *d*, the ſmoke is forced into the rectum.

Fig. 3, A bier of wicker-work, in the form of a ſlanting, oblong baſket, for conveying the body of the drowned, in a poſture ſomewhat raiſed. This ſimple contrivance has the advantage, that the water may eaſily run off, while the patient is carried: and, as many unfortunate perſons are materially injured by rough treatment, before they arrive at a houſe of reception, ſo that their recovery is thus often fruſtrated, we recommend the univerſal adoption of this uſeful implement. It coſts at Hamburgh only ten marks currency, or about 15s.

Fig. 4, The *Warming Machine* of block tin, or other metal, was originally invented by Mr. Harvey, of London, who ſuggeſted it to our Royal Humane Society, and it was ſubſequently improved by M. Braaſch, an ingenious mechanic of Hamburgh. Its object is to procure an uniform degree of warmth, throughout the apparatus, in the moſt expeditious manner, by filling the hollow or double bottom and ſides of the whole implement with boiling water.—*a* is the body of the machine, ſeven feet long, and made of ſolid pieces of block-tin, to prevent the neceſſity of ſoldering them, and conſequently the formation of iron-ruſt: it reſts on two wooden legs *f f*, and may be eaſily carried by the handle *g g*. The water is poured in through both funnels *d*, *d*, in order to warm it more ſpeedily; and each of theſe is provided with a ſtopper (as repreſented in the plate, ſuſpended on a chain), with a view to prevent, if neceſſary, too ſudden evaporation and cooling of the water:—*h* is the intermediate ſpace between the two metallic plates, producing a vacuum of $2\frac{1}{2}$ inches, in which the fluid is diffuſed over the whole machine;—*b* is a wooden deſk to ſupport the head of the patient, and to protect it from the immediate contact with the heated parts; but, on the oppoſite end of the machine, there is an enlarged intermediate ſpace, *c*, for holding ſuch a quantity of water and vapours as will procure an additional, or at leaſt a more permanent, degree of heat towards the lower extremities, than to the trunk of the body. For diſcharging the water, when it is not wanted, or changing it when too cold, there is a cock at *e*. The hollow ſides of this machine are about twelve inches high; and in order to enſure an uniform warmth, the body apparently dead ſhould be placed on a ſtraw mattreſs, and tucked in with blankets. A pailful of water is required to fill the whole machine, as a ſmaller quantity would warm the ſides only for a ſhort time, by means of the vapour.

It deſerves to be remarked, that this ingenious contrivance may alſo be uſed for a *warm bath*; for which purpoſe, the inner ſpace in which the body lies, ſhould be ſupplied with water. The whole apparatus, in its preſent improved ſtate,

made of *copper*, coſts at Hamburgh about 200 marks, or from 14 to 15l.

Laſtly, we cannot conclude this ſubject without affording the reader a view of the different articles belonging to a complete cheſt of inſtruments, and other materials, employed in the various proceſſes for recovering ſuſpended animation from drowning. The merit of theſe inſtitutions in England, is due to Drs. Cogan and Hawes, the founders of the Royal Humane Society at London; but the improved arrangement of the cheſt now to be deſcribed, together with the choice of internal and external remedies, were made by a reſpectable ſurgeon at Deptford, Mr. Kite, in 1788, though conſiderably extended in 1790, by Mr. Redlich, medical practitioner of reſpectability at Hamburgh. This gentleman is likewiſe one of the moſt active members of the Humane Society in that city, and has offered the following articles for ſixty-five marks, or about four guineas and a half. His complete cheſt contains:

A ſmall bottle of rectified ſpirit of wine.
Ditto, white-wine vinegar.
Ditto, ſweet oil.
Ditto, white French brandy.
Ditto, volatile ſal ammoniac.
Ditto, vitriolic æther.
Ditto, muſtard-ſeed.
A machine for injecting the ſmoke of tobacco.
A leather tube, together with a pair of bellows, for inflating the lungs.
Another tube of leather, for introducing medicines into the ſtomach.
A ſmall ſyringe for clearing the throat of mucus.
Three woollen covers or blankets.
Four bruſhes, and ſix woollen cloths, for performing friction.
Several emetics.
Two lancets for blood-letting.
One pound of tobacco.
A roller and cuſhion, to be uſed in venæſection.
Two quills, a ſponge, and ſome lint.
A pocket-knife.
An apparatus for ſtriking fire.
Chamomile and elder-flowers.
Common ſalt:—and a printed copy (in German) of rules and directions for treating the drowned.

Conceiving that a cheſt containing all theſe articles could not be purchaſed in London for leſs than double the price above ſtated, beſide the additional trouble of procuring them, we have borrowed this account from our reſpectable fellow-labourer, the Editor of the Domeſtic Encyclopædia; eſpecially as the commercial intercourſe between Hamburgh and this country is daily increaſing.

On Thurſday, 15th October, 1801, trial was made on the river Thames, off Greenwich Hoſpital, in preſence of ſeveral reſpectable gentlemen, of a copper tube, invented by Lawrence Collin, brazier and tinman, for floating the heavieſt perſon, though unacquainted with ſwimming, having his feet at reſt, while the arms might be freely uſed out of the water. The inſtrument can be fixed by any perſon on himſelf in about half a minute, and keeps him upright in the water, ſo as to have the full uſe of his hands; and he may either float on his ſide, back, or belly, with his hands and feet at reſt, or take a ſitting poſture, with his legs at right angles to his body. This inſtrument, which is called a *collinette*, may be made portable of copper, tin, or leather. The weight of the copper one, with which the late ſucceſsful trial was made, was about five pounds; but if leather can be well manufactured ſo as to reſiſt the fluid and retain atmoſpheric air, it would be ſo light, that no perſon going on an excurſion on the water would be without one of them. In caſes of ſhipwreck, many lives that would otherwiſe periſh would be ſaved, ſince a dozen or twenty of theſe inſtruments might facilitate the means of extending ropes to a lee-ſhore, and thereby ſave a numerous crew. A certificate was given to the ingenious inventor by the gentlemen before whom the trial was made.

DRUMBOTE, a town of Ireland, in the county of Monaghan, eight miles W. of Dundalk. Long. 6. 31. W. Lat. 54. 10. N.

DRUMLANRIG, a town in Dumfrieſhire, in the diſtrict of Nithſdale; remarkable for a wood of oak ſix miles in length. Here is a noble ſeat of the Duke of Queenſbury, ſkreened by woody hills, and adorned with beautiful gardens. In one of the parks here, Mr. Gilpin ſaw a few of the wild cattle which anciently inhabited the woods of Scotland. Drumlanrig is ſeated on the river Nith, 13 miles N. of Dumfries. Long. 3. 31. W. Lat. 55. 25. N.

DRUNKENNESS (*Encycl.*). To ſave the lives of perſons who are in danger of dying from having drank large draughts of any ſpirituous liquors, Dr. Houlſton recommends *diluting it in the ſtomach* by pouring in, through a tin tube, or even a common funnel, carefully paſſed into the *throat*, large quantities of water.

DRUSENHEIM, a fortified town of France, in the department of Lower Rhine, ſeated on the river Moter, near the Rhine, five miles S.E. of Haguenau.

DRYDEN (John). Notwithſtanding we have already introduced the life of this great poet in our third volume, and that at ſome length, the following account of his life and writings, extracted from Mr. Malone's recent publication of Dryden's Critical and Miſcellaneous proſe Works, abounds with ſo many curious circumſtances, not recorded by any other of his biographers, that we are tempted to preſent it to our readers without alteration.

In whatever point of view he is contemplated, whether as a poet, a critic, or a man, the character of Dryden is highly intereſting, and the labour undertaken for the purpoſe of making him better known, is entitled to the moſt grateful conſideration. Mr. Malone's account of this diſtinguiſhed ornament of Britiſh literature is a ſpecimen of laudable exactneſs, the fruit of an unwearied ſolicitude to render the deſire of deſcribing elegantly ſubſervient to the neceſſity of recording truly. The diligence employed in tracing genealogies, comparing dates, and ſearching amid the records of public offices, has afforded a topic for the ſarcaſms of ſome men whoſe vivacity outruns their judgment; but thoſe who know how to appreciate truth, and who feel its importance in matters apparently minute, will diſcriminate between raillery and argument, and not ſuffer the momentary illuſion of a fanciful image to divert their attention from thoſe objects which, in biography and criticiſm, afford the greateſt, perhaps the only genuine, ſatisfaction. To narrate on truſt, and repeat, without any other novelty than that of expreſſion, the hackneyed fallacies of preceding writers, is indeed a mean ſervility; but if, in order to avoid this diſgrace, a writer of more judgment and induſtry takes the pains to explore thoſe receſſes in which truth lies concealed, his meed of fame ought to be commenſurate with the extent of his labour: the duſt which affords occaſion to ſneer, conſtitutes rather a title to glory; nor can the laurel be ignobly worn which is tarniſhed with the duſt of Shakſpeare and of Dryden. It is not the intention of this eſſay to criticiſe Mr. Malone's work, but as the account of Dryden, which he has ſupplied, corrects many miſſtatements received by Dr. Johnſon, and adopted by his ſucceſſors, and records many new facts, it would have appeared unjuſt to omit that laudatory notice which the ſubject ſo fairly claimed. Let it not, however, be conſidered that the errors of Johnſon

are irreverently mentioned. Mr. Malone is ſo perfectly ſenſible of the great talents of that illuſtrious biographer, that he has purpoſely avoided all critical diſcuſſion of the merits of Dryden, from a conviction that ſuch an examination may be well diſpenſed with, after Dr. Johnſon's elaborate and admirable diſquiſition; than which a more beautiful and judicious piece of criticiſm, perhaps, has not appeared ſince the days of Ariſtotle. On the ſubject of Johnſon's miſtakes, Mr. Malone thus expreſſes himſelf:—"When I mention theſe ſlight inaccuracies of Dr. Johnſon, for whom perſonally when living I had the greateſt reſpect and veneration, and for whoſe writings I have the higheſt admiration, I hope not to be miſunderſtood. Such trivial errors can diminiſh little from the value of his incomparable Lives of the Poets, and, as I have elſewhere obſerved, but wiſh to repeat it here, are merely ſpecks in the fineſt body of criticiſm extant in any language."

John Dryden was the eldeſt ſon of Eraſmus, third ſon of Sir Eraſmus Driden*, bart. and Mary, daughter of the Rev. Henry Pickering. The time of his birth is uncertain, it is commonly ſuppoſed to have been the 9th† of Auguſt, 1631, but the date thus aſſumed reſts only a miſtake in the quarto edition of Pope, publiſhed in 1735, where the inſcription on Dryden's tomb is erroneouſly given. Nor is the account correct which ſtates the ſtock of his family to have been in the county of Huntingdon: it was in Cumberland. The place of his birth was Aldwincle, in Northamptonſhire. He received the firſt rudiments of learning at Tichmarſh, and probably was indebted for part of his education to the ſchool at Oundle. From one of theſe ſeminaries he was removed to Weſtminſter, where he was admitted a king's ſcholar, under the tuition of the celebrated Dr. Buſby; he was contemporary with Locke, South, Dr. Henry Stubbe, Dr. Walter Pope, Dr. John Mapletoft, Henry Bagſhaw, and Edward Bagſhaw. While at Weſtminſter he gave proof of his extraordinary talent, by tranſlating the third ſatire of Perſius for a Thurſday night's exerciſe; but the tradition which aſſigns to him the celebrated pentameter on the miracle of changing water into wine,

"Lympha pudica Deum, vidit et erubuit."

is unfounded. The line is found, with a ſlight variation, in an epigram on the ſubject by Richard Craſhaw, publiſhed in his Epigrammata Sacra, 1634‡. At Weſtminſter, Dryden, in 1649, made his firſt attempt in Engliſh poetry, by a copy of verſes on the death of Lord Haſtings, which are diſgraced by the conceits uſually found in the poetry of that period.

He was elected to one of the ſcholarſhips of Trinity College, Cambridge, where he was admitted the 11th of May, 1650, and matriculated the 6th of July. In the ſame year, he wrote ſome commendatory verſes, prefixed to the poems of John Hoddeſdon§. It is erroneouſly aſſerted that Dryden obtained no degree; he was made a bachelor at the regular time in January 1653-4, and in 1657 was made maſter of arts, but did not obtain a fellowſhip in his college. It has excited ſurpriſe that his name is not found in any of the Cambridge verſes compoſed in his time on public occaſions, but that ſenſation is removed by the accuracy of Mr. Malone; from him we learn, that only one general collection of verſe was iſſued out by the univerſity of Cambridge during the unfortunate and diſgraceful period of Dryden's being a member. It appeared in Auguſt or September, 1654, under the title of Oliva Pacis, &c. To this volume Dryden might have been expected to contribute, but his father died in June, 1654, and the neceſſity of attending him during his laſt illneſs, and the coincidence of the academic vacation, account for his apparent omiſſion of an opportunity to diſplay his poetic talent.

The patrimony to which he now ſucceeded, did not induce him to abandon his ſtudies. He returned to the univerſity, but his habits and modes of life cannot be aſcertained. In all probability the fair ſex, who even at ſeventy "ſtill inſpired his wit," then claimed much of his attention, and gave occaſion to ſome productions of his muſe, which are now loſt. Mr. Malone has recovered a letter written about the year 1655, to Honour Dryden, the poet's couſin, containing a copy of amatory verſes, diſtinguiſhable only for thoſe conceits which were the vice of the age.

In 1657, after reſiding ſeven years at Cambridge, he removed to London. On the credit of one of that hoſt of foes whom his ſubſequent celebrity excited, it has been believed that he quitted the univerſity from fear of being expelled for a libel on a nobleman's ſon, but there is no evidence of this fact, nor any probability in the circumſtances by which it is ſupported. He had ſtaid at the univerſity three years beyond the uſual period, and had reaſon to expect advancement from the influence of his relation Sir Gilbert Pickering, who was extremely intimate with Oliver Cromwell.

What benefits he derived from this connection are not known; the death of the Protector deſtroyed his proſpects, and gave a ſubject to his muſe. He produced "Heroic Stanzas on the Death of Oliver Cromwell," which were publiſhed ſeparately in the beginning of 1659, and afterwards united with the verſes of Waller and Sprat on the ſame occaſion. Like many other panegyriſts of the uſurper, he with equal facility paid homage to the reſtored monarch, and in 1660 publiſhed Aſtræa redux, a Poem on the happy Reſtoration of his moſt ſacred Majeſty. Both theſe productions gave promiſe of greater efforts.

Dryden is repreſented by his enemies to have been now a mere literary drudge under Herringman the bookſeller, and to have been reduced to dine at a three-penny ordinary, till raiſed to affluence by his connection with Sir Robert Howard; but this account is obviouſly fictitious, founded only on the circumſtances of his intimacy with Howard, to whoſe poems, printed for Herringman in 1660, he prefixed ſome encomiaſtic verſes. His own fortune was ſufficient to preſerve him from a ſtate ſo abject. It was probably through Sir Robert that Dryden became acquainted with Lady Elizabeth Howard, daughter of Thomas earl of Berkſhire, whom he married about the year 1665. The libellers of the poet have aſſerted that the circumſtances attending this match were not honourable to either party. Johnſon repeats the allegation, but evidence of a better kind is not found, and the proof reſts principally on the ſarcaſms with which the poet occaſionally aſſailed the marriage ſtate.

In 1661 he addreſſed A Panegyric to the King on his Coronation, and on New Year's-day, 1662, An encomiaſtic Poem to the Lord Chancellor Clarendon. In 1663 he prefixed ſome elegant lines to his friend Dr. Charleton's Ac-

* Dryden changed the orthography of the family name; for ſome time he wrote it Dreyden: this licence gave great offence to his relatives.

† Anderſon ſays 6th Auguſt.

‡ See Andrews's Anecdotes, p. 290.

§ They are not noticed by Johnſon. Anderſon mentions them in his Life of Dryden, but they are not found among the poems Mr. Malone has given them, p. 14.

count of Stonehenge. A tribute was paid to his rising reputation, by electing him a member of the newly-instituted Royal Society, 19th November, 1662.

We now enter on Dryden's dramatic career: Eusden, Gildon, Jacob, and others, have expressed surprise at his tardiness in beginning, as he produced no play till after he had attained his thirtieth year. But these persons did not reflect that from 1640 to 1660 plays were not permitted, and Dryden himself informed a more attentive perusér, that in the very year of the restoration he began his first play, The Duke of Guise. This piece being shewn to his friends, was not deemed sufficiently correct for representation, and, therefore, it was kept back for some years.

In February 1662-3, his first play, The Wild Gallant, was put on the stage. It was only saved from total condemnation by the Countess of Castlemaine, afterwards Duchess of Cleveland, to whom he addressed some verses on the occasion.

Mr. Malone divides Dryden's dramatic life into four periods: 1. From his outset as a play-writer to the temporary suspension of dramatic exhibitions in 1665. 2. From their revival to the time when the king's theatre was destroyed by fire in 1671-2. 3. From that era to 1682, when he discontinued writing for the stage. 4. From 1690 to 1694, in which period his last five plays were produced. In the first period, besides the Wild Gallant, Dryden wrote The Rival Ladies, in 1663; he assisted Sir Robert Howard in the Indian Queen, and wrote the Indian Emperor, acted in 1664-5.

The plague broke out soon afterwards, and in consequence of that, and the fire in 1666, dramatic entertainments were suspended for eighteen months. During this interval, Dryden married, and resided principally in the country. Here he amused himself by writing his elegant Essay of Dramatic Poesy; it is a colloquy between Eugenius, Crites, Lisideius, and Neander. By Eugenius was represented Charles lord Buckhurst, afterwards earl of Dorset; Crites was Sir Robert Howard; Lisideius, Sir Charles Sidley (commonly called Sedley), transposed from Sidleyius; and Neander, Dryden himself. In this retirement he seems to have projected, and perhaps written, his poem in quatrains, called Annus mirabilis, which was published in 1667. He also wrote Secret Love, or the Maiden Queen, and revised his unsuccessful drama, The Wild Gallant.

Soon after the recommencement of dramatic exhibitions in London, Dryden took a more secure method of obtaining emolument than the patronage of any individual, however elevated by rank or fortune, could afford; that of contracting with the king's theatre for an annual stipend, on condition of furnishing a certain number of plays in each year. The emolument was agreed to be one share and a quarter, out of twelve shares and three quarters, into which the theatrical stock was divided; the number of plays to be supplied was not four, as Johnson, misled, perhaps, by the Key to the Rehearsal, has stated, nor two, as Cibber has advanced, but three. The mistakes which have prevailed respecting this contract, have given rise to many stories of Dryden's writing for bread, and producing three, four, and even six, plays in a year. Malone, by a more accurate investigation, disproves these fallacies: between 1667 and 1674, that is, in about seven years, Dryden produced but ten plays; and if the examination is extended to a later period, December 1682, it will be found that in sixteen years he had written but eighteen. The era of his greatest exertion seems to have been from 1667 to 1670; in which period probably he wrote five or six plays. This statement is important to the fame of Dryden, for his facility and elegance of composition are recorded by so many indisputable facts, that they can derive no advantage from fiction.

On the death of Sir William d'Avenant, April 7th, 1668, Dryden was made Laureat, but not immediately, as has been supposed; he did not obtain the appointment till the 18th of August, 1670. The death of James Howell in 1666, occasioned a vacancy in the office of Historiographer, which was also conferred on Dryden. The patent granted him the salary of 200l. a-year retrospectively from Midsummer 1668, with the privilege of receiving each year a butt of canary wine from the king's cellars at Whitehall.

The conduct of Dryden and Sir Robert Howard towards each other is considered, by Dr. Johnson, as not easily to be explained. They disagreed on the subject of writing plays in rhyme; and as the contest was carried on with great earnestness in several publications, a degree of rancour ensued, but the interposition of friends and the placability of Dryden, facilitated a reconciliation, and they continued ever after on good terms.

From the re-opening of the theatres in the beginning of the year 1667, to the middle of 1670, Dryden produced five original plays, and two in which he was assisted by others. The five are: The Maiden Queen; The Mock Astrologer; Tyrannic Love, or the Royal Martyr; and the Conquest of Grenada, in two parts. The others are, The Tempest, altered from Shakspeare, in conjunction with d'Avenant; and Sir Martin Mar-all, translated from the French by the Duke of Newcastle, and revised for the stage by Dryden.

He was now sufficiently eminent to be an object of envy, and on the 7th of December, 1671, the Rehearsal was produced. This play was the joint production of George Villiers duke of Buckingham; Martin Clifford, master of the Charter-house; Butler, Sprat, and others; and is stated to have engaged their attention for ten years. An examination of its merits would extend this sketch to too great a length, and may, therefore, occupy a separate paper. It is a mistake that the success of the Rehearsal banished plays in rhyme from the stage; they continued to be acted for many years, and several pieces condemned in it were afterwards revived with applause.

Dryden, though he never answered the Rehearsal, had the good sense and forbearance not to oppose the current, and in 1672 produced two comedies, Marriage à la Mode, and The Assignation, or Love in a Nunnery; the first was successful, the latter damned. In 1673, he wrote Amboyna, for the purpose of exasperating the nation against the Dutch. After the production of these pieces the author seems to have suspended his dramatic labours, for The State of Innocence, published in 1674, could not have been intended for a stage exhibition. It is said that before he entered on this task, Dryden waited on Milton, and asked leave to turn his poem into rhyme; "Aye," said the blind bard, "you may *tag* my verses if you please."

As the State of Innocence only employed a month, Dryden had full leisure for the composition of Aurengzebe, which was acted in 1675. Charles II. perused the piece in manuscript, and "the most considerable event of it was modelled by his royal pleasure." In 1676 and 1677 he was engaged in writing All for Love, and the comedy of Limberham. All for Love, Dryden says, was the only play he wrote for himself, the rest were given to the people. Limberham expired on the third night: various reasons are alleged for its want of success; the author attributes it to his having "expressed too much of the vices it decries;" Langbaine suggests that it was condemned for exposing the *keeping* part of the town. It has also been affirmed that in the character of Limberham, Dryden had Lord Shaftesbury particularly in view, and his partisans contributed to its fate.

Dryden's contract with the king's company was dissolved about this time, in consequence of disagreements, the causes of

which cannot now be diſcovered. Limberham was acted by the rival company, as well as Œdipus, written in conjunction with Lee, about 1679, and Truth found too late, altered from Shakſpeare's Troilus and Creſſida. His next play, The Spaniſh Friar, was acted with great ſucceſs about February 1681-2. The two companies of players, called the King's and Duke's, now united, and Dryden furniſhed a prologue and an epilogue on their opening the theatre, 16th November, 1682. On the 30th was performed The Duke of Guiſe, of which Lee contributed two-thirds. The ſubject of this play was political, and the aim of it, to form a parallel between the leaguers of France and the Scottiſh covenanters. For ſome time after this, Dryden was chiefly occupied in political controverſy: this, therefore, terminates the third portion of his dramatic life.

In this period Dryden was at firſt patroniſed, and afterwards perſecuted, by the fickle and profligate Rocheſter, who raiſed up as rivals Otway, Settle, and Crowne. Dryden's ſenſibility was excited to a degree which prudence did not juſtify by the temporary ſucceſs of Settle's Empreſs of Morocco, in contributing to which, Rocheſter contrived to occaſion ſome perſonal affronts to the laureat. After his controverſy with Settle, a ſufficient ſpecimen of which is preſerved by Johnſon, Dryden, in conjunction with the Duke of Buckingham, wrote An Eſſay on Satire, in which Rocheſter was treated with great ſeverity. In revenge, on the 18th of December, 1679, he cauſed Dryden to be way-laid, and cudgelled, as he was returning home from Will's, through Roſe-ſtreet, Covent-garden. As Loniſe de Querouaille, ducheſs of Portſmouth, was alſo mentioned in terms of great contempt in this production, ſhe is ſuppoſed to have joined with Rocheſter in his revenge.

The conſtant labour in which he was engaged for the theatres, hindered Dryden from turning any great portion of his attention to productions either in poetry or proſe which were not of a dramatic form. From the year 1667 to 1680 he wrote only a few papers of verſes, and tranſlated two epiſtles of Ovid—Canace to Macareus, and Dido to Æneas; to which may be added, that from Helen to Paris, which he engliſhed in conjunction with Lord Mulgrave. He often lamented his ſervile drudgery, and traced the plan of two epic poems, either of which would not only have immortaliſed the author, but have been an ineſtimable addition to the ſtock of Britiſh literature. The ſubject propoſed for the one was the Conqueſt of the Saxons by King Arthur; the other that of Edward the Black Prince ſubduing Spain, and reſtoring it to Don Pedro, the lawful ſovereign. This noble deſign he was never ſufficiently at eaſe to execute.

In 1681 he relieved and diverſified his dramatic purſuits by that exquiſite political ſatire, Abſalom and Achitophel, which he is ſaid to have undertaken at the expreſs deſire of the king, and calculated to have completed in nine months. It was read with ſuch avidity, that in four years ſix editions were publiſhed; a prodigious circulation in thoſe days. In the ſecond edition, twelve new lines were added to the character of Shafteſbury, in which he was praiſed for his integrity and diſcernment as chancellor. This circumſtance gave riſe to a report, that the poet received a bribe for his complaiſance; and others aſſert that he was actuated by gratitude for Shafteſbury's liberality in nominating his ſon to a ſcholarſhip in the Charter-houſe, without any ſolicitation. This ſtory is diſproved by the laudable diligence of Mr. Malone, who has aſcertained that Dryden's ſon was not admited at the Charter-houſe till after Shafteſbury's death, and then, at the recommendation of the king. The added lines were, in fact, a mere amplification of the ſame thought leſs clearly expreſſed in the firſt edition of the poem.

On the 24th of November, 1681, the Grand Jury at the Old Bailey returned *ignoramus* on the bill preſented againſt Shafteſbury, and he was taken from the Court-houſe with ſhouts of applauſe, which laſted for an hour. To perpetuate their triumph on this occaſion, his adherents ſoon afterwards employed George Bower, an able ſculptor, to engrave a medal in commemoration of that event, which gave riſe to Dryden's poem, entitled The Medal, or a Satire againſt Sedition. The king ſuggeſted the ſubject, while walking in the Mall with Dryden, and made him a preſent of a hundred broad pieces when it was finiſhed. It was compoſed with vigour and poignancy, equal to Abſalom and Achitophel.

While he attacked with ſuch vigour and ſucceſs, Dryden was neceſſarily expoſed to the efforts of many opponents. A poem, entitled Dryden's Satire to his Muſe, which appeared about this period, is ſaid to have given him ſome uneaſineſs. The author was never aſcertained: it was aſcribed to Lord Somers, but he diſclaimed all knowledge of it. Among the foremoſt of Dryden's avowed adverſaries, was Shadwell, a poet of very little talent, and who had been in ſome degree protected by the poet-laureat, for whom he frequently avowed his friendſhip. In his former ſatires, Dryden took no notice of the inferior retainers of the whig party, but, at length, rouſed by repeated injuries, he diſcharged his reſentment againſt Shadwell, in the poem called Mac Flecknoe; an admirable ſatire, which afforded him an ample triumph over his corpulent antagoniſt, and afterwards formed the model of the Dunciad. This poem was publiſhed the 4th of October, 1682. It has been erroneouſly aſſerted by Dryden's biographers, Dr. Johnſon not excepted, that this poem proceeded from the poet's reſentment at being ſucceeded in the laureatſhip by Shadwell, but it was publiſhed upwards of ſix years before that event took place. Although he might ſeem in this great effort to have exhauſted the whole quiver of ſatire, he returned to the charge in leſs than a month, and in the ſecond part of Abſalom and Achitophel, which was publiſhed November the 10th, 1682, expoſed Shadwell, under the name of Og, to additional contempt, with every grace of variety, and the ſame charms of novelty, which characteriſed his firſt attack. Under the appellations of Doeg, Judas, and Ben Jochanan, he ſtigmatiſed Settle, Ferguſon, and Samuel Johnſon, and at the ſame time puniſhed three or four ſcribblers of inferior note. All theſe characters are wrought with no leſs felicity than thoſe of Zimri and Achitophel. The reſt of the poem, which has great merit, is written by Tate.

In the ſame month, Dryden produced his Religio Laici, a ſenſible and well-written poem, highly deſerving attentive and frequent peruſal. At this period began his intimacy with Southerne, which ended only with his life. He was alſo conſtantly attached to the unfortunate Lee, who was generally called by his contemporaries, "Honeſt Nat Lee," and after his inſanity, "Poor Nat Lee." Having now diſcontinued writing for the ſtage, and the ſtate of the exchequer not permitting a regular diſcharge of his ſtipend, Dryden became ſeriouſly diſtreſſed, and addreſſed Lawrence earl of Rocheſter, to remove at once his apprehenſions of poverty, by aſſigning to him a place in the cuſtoms or the exciſe, but, to the diſgrace of the age, neither his poetry nor his loyalty were ſufficient recommendations to enſure ſucceſs.

Yet did he not reſign himſelf to unmanly deſpair, or permit his enemies to triumph over the miſery reſulting from an union of poverty and indolence. He tranſlated, by the king's command, De Maimbourg's Hiſtory of the League, which appeared in 1684; and, in the mean time, wrote a Preface and Life of the Author to a new tranſlation of Plutarch's Lives, which was then undertaken by a number of perſons. He alſo, in 1683-4, publiſhed the firſt volume of his Miſcellanies, containing tranſlations of detached pieces, from Virgil, Horace, and Theocritus, and ſome of his ſmaller poems, together with

occaſional prologues and epilogues already publiſhed. Early in 1685 he publiſhed a ſecond volume of Miſcellanies.

A few days afterwards he was deprived of his gracious protector and patron, Charles II. whoſe death he conſecrated in a pindaric ode, or elegy, called, Threnodia Auguſtalis. Before this event, Dryden had finiſhed a political opera, called Albion and Albanius; it was rehearſed before the king, who expreſſed himſelf highly pleaſed, and the poet probably formed great expectations from its ſucceſs. It was afterwards performed, but always unfortunate. On the ſixth night, the 13th of June, 1685, during the repreſentation, news arrived that the Duke of Monmouth was landed in the weſt; the playhouſe was immediately deſerted, and the piece was not again produced *.

Soon after King James the Second's acceſſion, Dryden was converted to popery. The bulk of mankind, ever happy to credit ſuch allegations as tend to diminiſh the pride of genius, have imputed this change to ſordid motives, but there is no reaſon for ſuch a charge. In the early part of his career, Dryden, like his contemporaries, laughed at religion and derided prieſts. When he wrote Religio Laici, he was advanced in years, but ſeems rather to have been impreſſed with the grand truths of Chriſtianity, than attached to any particular church; the poem was rather occaſional than the fruit of long premeditation, as it was addreſſed to a friend who had recently tranſlated Father Simon's Critical Hiſtory of the Old Teſtament. In the reign of King Charles, religion was left to make its own impreſſion on the minds of individuals, but after the acceſſion of James, converts were aſſiduouſly ſought, and no means were left for evading religious diſcuſſion. Dryden's wife was ſuſpected to be a papiſt; her brother Charles, the ſecond earl of Berkſhire, undoubtedly was one; and thus ſurrounded and biaſſed, it is not ſurpriſing that the poet, now firſt called upon to chooſe a creed, choſe that of Rome. He could not have done ſo on ſpeculative probabilities, and of certain reward he does not appear to have had a promiſe. He knew how great a triumph he was going to afford his enemies, but yet purſued the dictates of his conſcience: he might, after the Revolution, have retained the ſituation of Laureat and Hiſtoriographer, and have inſured ſplendid patronage by a time-ſerving re-converſion, but conſtantly refuſed to do any thing derogatory to his principles, or injurious to his honour.

Dryden's attachment, at a period when the Duke of York was very unpopular, entitled him to expect from his acceſſion to the throne the proviſion he had before ſolicited. But he only obtained a penſion of one hundred pounds a-year, which was granted by letters patent dated the 4th of March, 1685-6. About this time he wrote his much-admired Ode on the death of Mrs. Anne Killegrew, and a Poem to Northleigh, author of the Parallel.

He alſo entered into a controverſy with Dr. Stillingfleet, in defence of a paper, written by Anne Hyde, ducheſs of York, in vindication of her change of religion; and he is ſaid to have entertained a deſign of tranſlating Monſ. Varilla's Hiſtory of Hereſies, but to have abandoned it.

In 1687 Dryden publiſhed The Hind and the Panther, the longeſt of his original poems. It was read with avidity, and ſpeedily went through three or four editions. It is an allegorical dialogue between the churches of Rome and England, repreſented by two beaſts, the firſt milk-white, unſpotted, and unchanged; the other beauteous, but ſpotted. The thought was not fortunate, though the poem contains many beauties. Such an argument conducted by ſuch perſonages afforded a fine ſubject for ridicule; and one of the happieſt efforts in this way was The Country Mouſe and City Mouſe, tranſverſed from the Hind and the Panther. This was the production of Charles Montague, afterwards earl of Halifax, and Matthew Prior, but chiefly the latter: Dryden felt this attack with great ſenſibility, and was the more hurt as it proceeded from two young men whom he had always treated with great civility.

During the latter years of King James, and immediately after the Revolution, Dryden ſeems to have relaxed in his efforts; he did not publiſh ſo much; but probably perceiving himſelf to be unpopular, and the ſeaſon unfit, he preferred a delay, which would be ultimately beneficial. In 1687 he wrote his firſt Ode on St. Cecilia's day, which was ſet to muſic by Giovanni Baptiſta Draghi; and in June, 1688, produced Britannia Rediviva, an ode on the birth of the prince, afterwards known by the title of the Pretender. In the ſame or the preceding year, he wrote, in Hudibraſtic verſe, and with great vigour and ſprightlineſs, An Epiſtle to Sir George Etherege, on his being appointed envoy to Ratiſbon. He was alſo a ſubſcriber to the folio edition of Milton, publiſhed in 1688, by Jacob Tonſon, and ſupplied that elegant Epigram which has ever ſince accompanied the picture of the author of Paradiſe Loſt.

After the Revolution, an oath became neceſſary to be taken by thoſe who hold certain offices; Dryden could not take this oath, and was therefore deprived of his places of Laureat and Hiſtoriographer, which he had the mortification to ſee beſtowed on Shadwell.

He was now compelled again to direct his attention to the theatre, and in 1690 produced Don Sebaſtian, which was acted with great ſucceſs. In the ſame year he brought out Amphytrion, altered from Plautus and Moliere, which was equally well received. King Arthur was written before the death of Charles II. but not acted till 1691; it was ſet to muſic by Purcell, and formed a popular entertainment: it ſtill keeps poſſeſſion of the ſtage, under the name of Arthur and Emmeline. In the ſummer of 1691; Dryden was employed in writing the tragedy of Cleomenes; but being prevented by illneſs from finiſhing it, he conſigned it to the care of his friend Southerne, and it was acted in May 1692. About December 1693, he concluded his dramatic labours with Love Triumphant, a tragi-comedy, which was damned on the firſt repreſentation.

Having thus quitted the ſtage, of which, with only a few intervals, he had kept poſſeſſion one-and-thirty years, producing ſeven-and-twenty pieces, which included every ſpecies of dramatic compoſition †; he was compelled for the laſt ten years of his life to exert himſelf with increaſed activity to keep off poverty, the bittereſt enemy of genius. In 1691 he wrote a Preface to Walſh's Dialogue on Women, and an Elegy on the Death of the Counteſs of Abingdon, whom he had never ſeen, but whom he celebrated under the name of Eleanora. In 1692, aſſiſted by his two ſons and ſome of the contemporary poets, he gave to the world a complete tranſlation of Juvenal and Perſius; and he wrote for his friend Sir Henry Shere, who had tranſlated Polybius, a Life of that hiſtorian. In 1693 he publiſhed his third Miſcellany, and appears to have tranſlated from the Greek, the poem of Hero and Leander, but it was not printed, and the manuſcript cannot be found. He

* Dr. Johnſon has inadvertently transferred this anecdote to a piece afterwards written by Dryden, called Prince Arthur; the miſtake was noticed by Anderſon.

† To this muſt be added, that in the courſe of his life he wrote near a hundred Prologues and Epilogues of extraordinary merit.

alſo aſſiſted Congreve, to whom he was much attached, in preparing the Old Bachelor for repreſentation, and wrote a commendatory copy of verſes on the Double Dealer. In 1694, Tonſon publiſhed a volume under the title of the Annual Miſcellany, to which Dryden contributed only a verſion of the third Georgic of Virgil and an Epiſtle to Kneller.

He now commenced his moſt arduous literary labour, the complete tranſlation of Virgil. Many efforts were made to induce him to undertake this taſk, and the nation ſeemed to conſider its honour intereſted in the event: Mr. Gilbert Dolben gave him the various editions of his author; Dr. Knightly Chetwood furniſhed him with the Life of Virgil, and the Preface to the Paſtorals; and Addiſon ſupplied the arguments of the ſeveral books, and an Eſſay on the Georgics. The firſt lines of this great poet which he tranſlated, he wrote with a diamond on a pane of glaſs in one of the windows of Cheſterton-houſe, in Huntingdonſhire, the reſidence of his kinſman and nameſake, John Driden, eſq. The verſion of the firſt Georgic and a great part of the laſt Æneid was made at Denham-Court, in Buckinghamſhire, the ſeat of Sir William Bowyer, baronet: and the ſeventh Æneid was tranſlated at Burleigh, the noble manſion of the Earl of Exeter. Theſe circumſtances endear thoſe places to the votaries of the muſes, and give them a kind of celebrity which neither the beauties of nature nor the exertions of art can beſtow. The work was printed by ſubſcription, as Paradiſe Loſt had been ſome years before, and Wood's Athenæ Oxonienſis in 1691. Dryden completed this great taſk in three years, and not in ſix, as Pope has aſſerted. For this tranſlation, which Pope with juſtice pronounced the moſt noble and ſpirited tranſlation that he knew in any language, Dryden acquired, at the utmoſt, but 1396l. 12s. 6d. Swift, who hated Dryden, though he might have derived honour from their relationſhip, decries him for dedicating the different parts of his works to three ſeveral patrons. The practice was not new; as Spenſer, Chapman, Fuller, and others, had done the ſame. Dryden has been often cenſured for the praiſes which he laviſhed on his patrons, but that was the vice of the times. Every dedicator did the ſame, and Dryden in that inſtance, as in moſt others, ſhewed a pre-eminence in facility and elegance. Tonſon was extremely anxious that the Æneid ſhould be dedicated to King William, and made the engraver who retouched the old plates uſed by Ogilby, always repreſent the hero with a hooked noſe*; but the poet, perſevering in his attachment to King James, refuſed to offer incenſe to his ſucceſſor. The tranſlation was publiſhed in July 1697, and the whole impreſſion was ſold, and a new edition demanded, in the courſe of a year.

From the time employed in this great work, Dryden borrowed two months in 1695, to tranſlate Du Freſnoy's Art of Painting, and in the ſame year he wrote An Ode on the Death of Purcell. In the next year he wrote the Life of Lucian, to be prefixed to a tranſlation of his works, which was not publiſhed till after Dryden's death.

In 169-, at the ſolicitation of the ſtewards of the Anniverſary Muſical Feſtival, he wrote the celebrated ode called Alexander's Feaſt, a poem which tranſcends all praiſe, and places the Britiſh lyric poetry above that of any other nation. It does not, however, appear to be true, that it was compoſed and finiſhed at one ſitting; nor is this circumſtance neceſſary to inſure our admiration of a poem which alone would have ſufficed to immortaliſe its author. It was firſt compoſed by Jeremiah Clarke, afterwards by Clayton, and laſtly by Handel.

In March 1697-8, Jeremy Collier, a non-juring clergyman, publiſhed his Short View of the Immorality and Profaneneſs of the Britiſh Stage, in which he pointedly attacked Dryden, Congreve, and Vanburgh. The two latter defended themſelves; but Dryden, with great candour, acknowledged ſuch parts of his works as were reprehenſible, and merely advanced circumſtances in extenuation. He at this time meditated a tranſlation of Homer, and by the experiment of the firſt Iliad was led to believe the Grecian bard a poet more according to his genius than Virgil.

In the middle of 1698 he began to moderniſe Chaucer, and having completed two thirds of his undertaking, contracted in the ſpring of 1699 to furniſh his bookſeller with ten thouſand verſes for three hundred pounds. The accompliſhment of this taſk gave to the public that beautiful collection of poetry known by the name of Dryden's Fables, which was publiſhed in March 1699-1700. About this time one of his friends having reviſed Fletcher's Pilgrim for the ſtage, ſtipulated that Dryden ſhould have the benefit of the third night's performance, which was allowed, in conſequence of his ſupplying a prologue and epilogue, a dialogue between two mad lovers, and other additions.

Conceiving that the ſeventeenth century ended with the year 1699, Dryden wrote a ſecular maſque to be preſented at the end of this play, which was to have been performed on the 25th of March, the day when the new year then began. If Dryden was miſtaken in this particular, he did not live to ſee the eighteenth century. He had for ſome years been haraſſed with the gravel and gout, and in December 1699 was afflicted with an eryſipelas in one of his legs. He recovered ſufficiently to reſume his labours, but in March and April was again confined, and in conſequence of neglecting an inflammation in one of his feet a mortification enſued. He refuſed to ſubmit to an amputation, and having taken an affectionate leave of his friends, died with perfect compoſure, and in the profeſſion of the Roman-catholic religion, on the 1ſt of May, 1700.

He was interred in Weſtminſter-abbey, after laying in ſtate ten days, on Monday, the 13th of May; his funeral was ſplendid, and moſt honourably attended†. A monument was

---

* This circumſtance gave riſe to the following Epigram, which is preſerved among the Harleian MSS. in the Britiſh Muſeum:

"To be publiſhed in the next edition of Dryden's Virgil:

Old Jacob, by deep judgment ſway'd,
To pleaſe the wiſe beholders,
Has plac'd old Naſſau's hook-nos'd head
On poor Æneas' ſhoulders.

To make the parallel hold tack,
Methinks there's little lacking;
One took his father pick-a-pack,
And t'other ſent his packing."

† An account was printed thirty years after his death, of a ſcene of riot and indecorum excited by Lord Jefferies, but this is proved to be a mere fiction, invented by a Mrs. Elizabeth Thomas, better known by the name of Corinna, who founded her narrative on a letter of Farquhar. The unravelling of this invention does great credit to Mr. Malone's ſagacity, and merits peruſal as an antidote againſt literary credulity.

erected by Sheffield duke of Buckingham, in 1720, with a ſhort Latin inſcription.

Soon after Dryden's death, Henry Playford, a publiſher of muſic, ſolicited the followers of the muſes to expreſs their ſorrow for the loſs of ſo great a poet, and was, in leſs than two months, enabled to publiſh a collection of Engliſh and Latin verſes, under the title of Luctus Britannici, or the Tears of the Britiſh Muſes for the Death of John Dryden. This was preceded or followed by ſeveral ſeparate elegies, and a collection of plaintive verſes, entitled the Nine Muſes, written by nine ladies.

In perſon, Dryden was ſhort and fat, with a florid complexion. He is ſuppoſed by Mr. Malone not to have been ſo entirely deficient in talents for converſation as is generally believed. His being a conſtant frequenter of Will's coffee-houſe, in Ruſſel-ſtreet, Covent-garden, is too well known to be circumſtantially repeated. He lived in Gerard-ſtreet; his houſe was the fifth on the left hand in coming from little Newport-ſtreet. His predilection for aſtrology is mentioned by all his biographers *, and he had ſome faith in oneirocriticiſm, or the prognoſtication of future events by dreams.

Dryden does not appear to have been happy in marriage, which, conſidering the acknowledged ſweetneſs and placability of his diſpoſition, could hardly be conſidered his fault. His wife was remarkable for a waywardneſs of temper, which ended in a total derangement of intellect, and in that ſtate ſhe ſurvived till the year 1714. By this lady, Dryden had three ſons, Charles, John, and Eraſmus Henry, all of them fine, ingenious, and accompliſhed gentlemen.

The education of theſe three young men, in which their father was honourably liberal, occaſioned many of the complaints of poverty found in his works, for a more ſelfiſh man might have accumulated conſiderable ſums with the ſame advantages. His paternal eſtate was worth 40l. a-year. On his marriage with Lady Elizabeth Howard, an eſtate in Wiltſhire was ſettled on her, which is computed at 60l. a-year. From the theatre his emoluments may be calculated at 100l. and during his contract at 200l. a-year. In 1670 he was made poet-laureat and hiſtoriographer, and from that period to the end of 1676, his income was about 557l. per annum, equal to, at leaſt, 1500l. in theſe times. From 1685 to 1689 he derived nothing from the ſtage, but his ſalary was increaſed to 300l. and that, with his own eſtates augmented by the death of his mother, made 420l or full 1200l. a-year. In Auguſt 1689 his diſtreſs truly began; for being then deprived of his places, his revenue was reduced to 120l. a-year, with contingent acceſſions derived from his literary exertions, or the benevolence of his patrons. But diſtreſs could never make him deviate from the honourable firmneſs of his principles, though a proſpect of immediate reward preſented itſelf as a motive. "The court," he ſays in a letter to Mrs. Steward, dated 7th November, 1699, "rather ſpeaks kindly of me, than does any thing for me, though they promiſe largely; and perhaps they think I will advance as they go backward; in which they will be much deceived, for I can never go an inch beyond my conſcience and honour. If they will conſider me as a man who has done my beſt to improve the language, and eſpecially the poetry, and will be content with my acquieſcence under the preſent government, and forbearing ſatire on it, that I can promiſe, becauſe I can perform it; but I can neither take the oaths, nor forſake my religion."

This copious extract will place many points of Dryden's character and literary hiſtory in a new light, and ſufficiently excuſe us with the reader for introducing it: but an ample fund of information and delight awaits the readers of Mr. Malone's elegant publication; the biography abounds in anecdote, and juſt and uſeful diſcuſſion; and the proſe of Dryden is enriched with notes remarkable for learning, good taſte, and critical acumen.

DUAREN (Francis), profeſſor of civil law at Bourges, was born at St. Brien, a city of Bretagne in France, 1509. He was the ſon of John Duaren, who exerciſed a place of judicature in Bretagne; which place he ſuccceded his father in, and performed the functions of it for ſome time. He read lectures on the Pandects at Paris, in 1536; and, among other ſcholars, had three ſons of the learned Budæus. He was ſent for to Bourges in 1538 to teach civil law, three years after Alciat was retired; but quitted his place in 1548, and went to Paris, in order to frequent the bar: for he was very deſirous to join the practice to the theory of the law. He attended the bar of the parliament of Paris, but conceived a prodigious averſion to the chicanery of the court: diſguſted therewith, Duaren had great reaſon to rejoice at the advantageous offers made him by the Ducheſs of Berri, ſiſter of Henry II. which gave him a favourable opportunity to retire from the bar, and to reſume with honour the employment he had at Bourges. He returned to his profeſſorſhip of civil law there, in 1551; and no profeſſor, except Alciat, had ever ſo large a ſtipend in the univerſity, as himſelf. He ſeems to have deſerved it: for to his honour it may be ſaid, that he was the firſt of the French civilians who cleared the civil-law chair from the barbariſm of the gloſſators, in order to introduce the pure ſources of the ancient juriſprudence. He was indeed unwilling to ſhare this honour with any perſon; and therefore viewed with an envious eye his colleague Eguinard Baron, who blended likewiſe polite literature with the ſtudy of the law. This jealouſy prompted him to write a book, in which he endeavoured to leſſen the eſteem the world had for his colleague; however, after the death of Baron, he ſhewed himſelf one of the moſt zealous to immortalize his memory, and erected a monument in honour of the deceaſed at his own expence. He had other colleagues, who revived his uneaſineſs. He could not behold without pain the great reputation of Balduinus or Baudouin, who was younger than himſelf; and, after he was delivered from that thorn, he perceived, that Cujacius, who ſucceeded Baudouin, had ſtill greater merit. He did not at all love this new-comer; and there aroſe between them ſuch diſputes, that the conſequences of them might have occaſioned great diſorders in the univerſity of Bourges. if Cujacius had not left the field, and retired to Valence, in order to teach civil law there.

He died in 1559, without having ever married. He had great learning and an excellent judgment, but a very bad memory; ſo that he was obliged always to read his lectures from his notes. His Treatiſe of Benefices, which he publiſhed in 1550, rendered him ſuſpected of hereſy; and it was inſerted in the Index Expurgatorius at Rome. Baudouin treated him as a prevaricator and diſſembler, and reproached him with being a plagiary from Calvin, in his book relating to the prieſthood: which reproach Baudouin is ſuppoſed to have caſt upon him, in order to expoſe him to the rage of perſecutors. Duaren was highly incenſed at it, and complained by letter, as well as by word of mouth, to Calvin, who pacified him.

A collection of his works was made in his life-time, and printed at Lyons in 1554: but, after his death, another edition more complete was publiſhed in 1579, under the inſpec-

* He calculated the nativity of one of his ſons, but the prognoſtic founded on it, and its ſubſequent verſification, are fictions of Corinna.

tion of Nicholas Ciſner, who had been his ſcholar, and was afterwards profeſſor of civil law at Heidelberg, which contains: 1. Commentaria in varios Titulos Digeſti et Codicis. 2. Diſputationum Anniverſariarum, Libri duo. 3. De Jure Accreſcendi, Libri duo. 4. De Ratione docendi diſcendique Juris. 5. De Juriſdictione et Imperio. 6. Apologia adverſus Euguinarium Baronem. 7. De Plagiariis. This Bayle calls "a curious treatiſe, but too ſhort for ſo copious a ſubject." 8. In Conſuetudines Feudorum Commentarius. 9. De ſacris Eccleſiæ Miniſteriis ac Beneficiis. 10. Pro Libertate Eccleſiæ Gallicanæ adverſus Artes Romanas Defenſio. 11. Epiſtola ad Sebaſt. Albeſpinam, Regis Galliæ Oratorem. 12. Epiſtola de Franciſco Balduino. 13. Defenſio adverſus Balduini Sycophante Maledicta.

DUBLIN (*Encycl.*) In the beginning of the year 1797, an act of parliament was paſſed in Ireland, for the regulation of the Dublin houſe of induſtry. It had been under the direction of the corporation for the relief of the poor in Dublin; conſiſting of the principal officers of ſtate, the aldermen of the city, and others, in all about 200 governors; a number, which promiſed very little regular attention, and afforded no perſonal reſponſibility. Count Rumford had, in May 1796, viſited Dublin, at the inſtance of Mr. Secretary Pelham; and had concerted with him the neceſſary arrangements, for the improvement of the eſtabliſhment, and for the correction of the exiſting defects. By the new act (which was brought into the Iriſh houſe of commons by Mr. Pelham in the enſuing ſeſſion) the conduct of the inſtitution was confided to ſeven acting governors, or directors, to be annually elected by, and out of, the members of the corporation.

The average number of the perſons then in the houſe exceeded 1700. Theſe were formed into claſſes, according to their ages, conduct, abilities, and other peculiar circumſtances; and from among them was ſelected a *claſs of merit* (lodged and fed apart from the others) conſiſting of thoſe who had diſtinguiſhed themſelves by ſuperior induſtry, by moral and regular conduct, and by obedience to the rules of the houſe.

Each claſs was placed under the immediate ſuperintendance of one of the directors; who engaged to pay daily attention to it, and to make his report regularly to the board: ſo that a regiſter was obtained of the circumſtances and conduct of all the perſons in the houſe; a line was drawn between the idle vagrant and the diſtreſſed manufacturer; their wants were accurately known, and immediately attended to.—For the religious duties of the poor, there were two chaplains on the eſtabliſhment; one a Proteſtant, the other a Roman-catholic.

Many perſons had originally entered the houſe with an expectation of receiving better and more food, *without any labour*, than what they could have obtained *by their induſtry* out of the houſe. In order to diminiſh the effect of this potent encouragement to idleneſs (the inconvenience of which is not confined to the city of Dublin excluſively) the directors recurred to the principle, which had been acted upon at Hamburgh, and which has been ſtated in a preceding Report. They reduced the *ordinary* diet of the houſe below what any induſtrious labourer, out of the houſe, could obtain by his earnings at the loweſt rate of wages: at the ſame time, in order that the poor perſons upon the eſtabliſhment might *enjoy* the profits of their work, in the manner moſt pleaſant and moſt advantageous to themſelves, the directors opened a ſhop in the houſe; where every article of reaſonable luxury, and innocent gratification, is ſold at prime coſt, upon a plan ſimilar to that of the ſhop eſtabliſhed at Mongewell by the Biſhop of Durham; an account whereof is given in another place.

The expence of the diet of the houſe had been very great. This had been occaſioned, partly by the kind of food with which they had been ſupplied, and partly by the peculation of the perſons employed. In order to correct the latter, the following mode of diſtribution has been adopted: the head porter, every morning early, returns to the ſecretary the number to be provided with food for the day. The ſecretary then calculates the quantity neceſſary to be iſſued from the ſtores; and the ſeveral officers acknowledge the receipt in paſs books, which being compared once a week with the ſteward's ſtore book, the balance is aſcertained.

The directors alſo adopted a cheaper and more nutritive ſyſtem of diet. An ox-head ſtew, and ſoups prepared upon Count Rumford's principle (ſee Soup), have been diſtributed to the poor: and the practice which exiſted among them, of exchanging their bread for whiſkey, has been put an end to; the bread being now mixed with the ſoup, before the diſtribution.—The improvement in the health of the poor, in conſequence of the new ſyſtem, has been almoſt commenſurate to the increaſed economy of the houſe: the expence of diet for the half-year from Midſummer 1797 (when the new regulations took place), being very little more than half, and the proportionate mortality in the houſe leſs than three-fifths, of what they had been in the preceding half year.

In promoting the health and the economy of the houſe, the directors have alſo had the benefit of Count Rumford's aſſiſtance. His double boilers, with cloſe covers, have been put up under his direction. He has invented, and conſtructed in one of their lumber rooms, *a perpetual oven*, which would be very uſeful in all our public eſtabliſhments. It occupies a circular ſpace, about 7 feet in diameter, in the centre of the room; and contains ſix cells for baking bread, or dreſſing food, all heated by one ſmall fire, and ready in ſucceſſion (or at the ſame time if wanted) for baking or for any operation of cookery.

What Count Rumford has done for warming and ventilating their larger rooms, is very deſerving of imitation. There are two fire-places, one in the office of the maſter of the work, the other in the hall of merit; with flues extending horizontally, at the height of five feet from the floor, to a chimney in the centre. Theſe communicate a ſufficient and equable degree of heat, through the two great dining halls. Two of Count Rumford's louvres * carry off the vitiated air; and a freſh ſupply of *atmoſpheric* air is ob-

* Theſe louvres ought to be uſed, not only in houſes of induſtry, manufactories, and gaols, but in all crowded rooms, where thoſe who have the misfortune to be confined in them, ſuffer extremely both in health and ſpirits, by exhauſted and corrupted air. They are made on a very ſimple conſtruction; and they not only act very powerfully, and are eaſily regulated, but their action may be totally ſuſpended at pleaſure. They are ſo conſtructed, that every wind that blows, acts at the ſame time, both by *compreſſion* and by *exhauſtion*, to ventilate the apartments with which they communicate. Part of thoſe put up by Count Rumford at Dublin, were intended for a long garret over the hall. This garret, which was fitted up as a dormitory for ſome of their moſt induſtrious children, was ſo very low, that thoſe who were deſtined to ſleep in it, would certainly have felt the want of freſh air, had not ſome extraordinary means been uſed to procure a ſupply of it. The neceſſary ventilation is obtained by means of three ſix-ſided vertical wooden tubes, which, paſſing through the roof of the building, project 3 or 4 feet above it, and communicate with the room below. By two of theſe tubes, placed at the two ends of the dormitory, and terminating in two long wooden

tained by ſmall apertures, which are made at the bottom of the ſide walls, and covered with perforated boxes.

Difficulties have always exiſted with regard to the mode of ſupplying the neceſſitous poor with clothing. Where it is given *gratuitouſly and indiſcriminately*, it is neither ſufficiently valued, nor properly preſerved; it is *often* commuted for ſpirituous liquors, and it *always* has a tendency to relax induſtry. By the regulations adopted at Dublin, the clothing of all perſons capable of labour, is to be ſupplied ſolely from their own exertions. At the ſame time, inſtead of *one ſixth*, their former allowance, they have *two-thirds of all their earnings*; the remaining third being deemed nearly ſufficient to defray the expence of machinery and ſuperintendence. As an additional encouragement, they whoſe clothing is furniſhed by their own induſtry, are permitted to have one day in the week to go out and viſit their friends; the indulgence being, in their caſe, not liable to the general objection, that, while they were out of the houſe, they often made away with part of their clothes.

The labour of the directors of the houſe of induſtry at Dublin, has been extremely diminiſhed by a proper diſtribution of attention, of authority, and of reſponſibility; by the power being placed in very few hands, *and by each director having the whole merit of his own perſonal exertions.* But, where there is much miſery * and depravity to correct, which appears to have been the caſe with the paupers on this eſtabliſhment, it is requiſite that prudence, activity, firmneſs, and perſeverance, ſhould all be employed, as they have been in this inſtance, much to the honour of the directors.

It muſt give great ſatisfaction to every one, who is aware that religion, morality, induſtry, and prudence, have, like the arts, a common bond of union, and produce their full effects in thoſe inſtances only where they act in concert, to obſerve, that in this eſtabliſhment, where there are ſo many Roman-catholics, objects of its protection, there is a prieſt of their own perſuaſion, provided for their religious improvement.—No reform of the poor can be *completely* brought about, without the aid of *religion*.—This muſt be the *foundation* of every thing effectual, to be done for them:—the *ſuperſtructure* ſhould be aid, encouragement, and diſtinction.

In reſpect alſo of that ſuperſtructure, the arrangement in the Dublin houſe of induſtry is wiſe and judicious. The aid and encouragements given to induſtry, in this inſtance, have exceeded thoſe of any ſimilar eſtabliſhment. But the peculiar feature of the inſtitution, is *the diſtinction of claſſes*, particularly that of the ſeparate and favoured *claſs of merit*;—which muſt, gradually, become an object of ambition to every perſon in the houſe, to the amendment even of the moſt idle, and the moſt profligate.

The regulation which fixes (as at Hamburgh) their ſtandard of the common diet, below what may be obtained by the earnings of the induſtrious labourer out of the houſe, is deſerving of obſervation, and of imitation in England. Much injury is done to the ſpirit and feelings of the Engliſh cottager, not merely by the wanton and oſtentatious profuſeneſs of the rich and vain, but alſo by the groſs and offenſive waſte that is apparent in moſt of our workhouſes and public charities.

It is no ſmall merit in the directors (we wiſh we could offer our public eſtabliſhments in England the ſame tribute of commendation), that they have readily adopted the improvements ſuggeſted by Count Rumford; and, by attention and proper management, have given them their due ſucceſs. They have taken the full benefit of his aſſiſtance in reſpect of the diet of the houſe—of the boilers and oven which he has conſtructed for them—and of the economical mode which he has ſuggeſted of warming and purifying the air of their larger rooms. The introduction of his improvements into *all our public eſtabliſhments*, particularly thoſe improvements which contribute to temper and ſweeten the air in crowded buildings, would be an important and national benefit. Indeed, we are unreaſonable enough to wiſh, that the other claſſes of ſociety in England, inſtead of being kept from the habitations of the poor by their want of cleanlineſs, and by the dread of offenſive or contagious air, would exert themſelves effectually in aſſiſting and enabling them to correct the evil.

It muſt be a ſubject of real ſatisfaction to every well-wiſher to his country, that, in the courſe of the preceding ſpring, a ſociety has been formed at Dublin, *for promoting the comforts of the poor*; the Preſident of which is the Marquis Cornwallis, the Lord Lieutenant of that kingdom; the ſix Vice-preſidents, the Chancellor, the Speaker, and four other perſons of the firſt rank; and the 34 members of the committee, ſome of the moſt reſpectable characters in that country.

In their account of the plan and regulations of the ſociety, they ſtate, that ſome individuals having obſerved with pleaſure the progreſs of a ſociety, inſtituted in England in the year 1796, "*for bettering the condition, and increaſing the comforts of the poor*," were encouraged by their ſucceſs to form themſelves into a ſociety, founded upon ſimilar principles, to be

---

boxes, which are bored full of ſmall holes, and reſt on the floor of the room, freſh atmoſpheric air from without is *forced* into the room, while the foul air is carried off by means of the third tube, placed over the middle of the room, with its lower opening even with the ceiling. This tube is furniſhed with a regiſter, or damper. The whole of this machinery is made of wood; and as no part of it is moveable, except the regiſter, it is not expenſive, nor liable to be put out of order.

* It is hardly poſſible to enter into a detail of the late improvements in the Dublin houſe of induſtry, without adverting to the general ſituation of the lower claſs of our fellow-ſubjects in Ireland. Much, indeed, has been recently done by individuals, in particular diſtricts; by Mr. Pelham, in encouraging the induſtry and good habits of the poor in the vicinity of Dublin, and in introducing a friendly communication between them and their more opulent neighbours; and by the Speaker, Mr. Foſter, in the promotion of agriculture, manufactures, and commerce. Theſe are of the higheſt order of national improvement; and afford a fair proſpect, that what is ſo well begun, will be purſued with that energy and perſeverance, which the importance of the ſubject demands.—The diſadvantages of many of the poor in Ireland, originate in want of education, in a total ignorance of the comforts of life, and a conſequent indifference about them. With ſuch perſons, the ſpur that ſhould impel them to action, and *the bond that ſhould connect them with ſociety*, are wanting. Having neither property, nor the means of preſerving it—conſiſting in the mildneſs of the climate, in the fertility of the ſoil, and in the facility of obtaining thoſe mere neceſſaries of exiſtence with which they are acquainted—what ſecurity can their country poſſeſs for conduct, what impulſe to induſtry and exertion?—The neceſſary remedies—the introduction of a proper ſyſtem of education, of habits of cleanlineſs, and of a taſte for the comforts of life, as applied to food, habitation, and clothes;—the extending of the power of acquiring property, and the means of preſerving it;—the promoting of more connection, and more intercourſe of kindneſs and benevolence, between the different ranks of life:—theſe are meaſures, which require *ſuperior talents and induſtry* to arrange and conduct;—meaſures, eſſential, not merely to the proſperity of Ireland, but, at the preſent criſis, to the ſecurity of Great Britain.

denominated "*the ſociety for promoting the comforts of the poor.*"—That the general object of the ſociety (being the ſame as the declared object of the Engliſh ſociety) is to collect and circulate ſuch uſeful and practical information, derived from experience, reſpecting the circumſtances and ſituation of the poor, and the moſt effectual means of meliorating their condition, as may induce and enable all well-diſpoſed perſons to unite in the promotion of meaſures ſo important to the happineſs and welfare of the community at large.—That they are determined ever to keep in view this principle—"that the beſt relief the poor can receive, is from themſelves; and that the moſt effectual method of improving their condition, is by the encouragement of *induſtry, prudence, and cleanlineſs:*" and they truſt that the local experience of humane individuals, whether employed for the encouragement of induſtry and increaſe of comfort, for the prevention and relief of diſtreſs, or for the general improvement of the morals and condition of the lower claſſes, being thus collected, and afterwards diffuſed over the kingdom at large, will animate and inſtruct the nation in the purſuit of theſe important objects.

Their regulations do not materially differ from thoſe of the Engliſh ſociety.—See SOCIETY, in this SUPPLEMENT.

It cannot but be flattering to the latter, to ſee another inſtitution, profeſſedly originating out of the ſucceſs attending its progreſs, founded in a neighbouring iſland, on the ſame principles, and under the higheſt patronage.

Nothing can be more honourable to this country, than the diſpoſition ſo generally prevalent amongſt individuals in the higher orders of ſociety, to exert themſelves for the benefit of the poorer claſſes of their fellow-ſubjects; and nothing can be of greater importance, than to give this diſpoſition a proper direction, that the efforts of beneficence may not be defeated, by a miſapplication of its aſſiſtance.

The knowledge required for this purpoſe muſt be the reſult of experience, to which nothing can more certainly lead, than inveſtigations how the comforts of the poor may be beſt promoted; not by relaxing their induſtry, or weakening their habits of frugality, but by ſtrengthening and increaſing the motives to both; for "if the manner in which relief is given, is not a ſpur to induſtry, it becomes, in effect, a premium to ſloth and profligacy."

The reports of the London ſociety prove, that the object, though difficult of attainment, is not impracticable:—that the means for this purpoſe may be ſo adapted, as to relieve the poor, and excite their induſtry; to increaſe their means of ſubſiſtence, and yet encourage economy, and render the effects of liberality ſubſervient to the beſt of moral uſes, that of promoting good habits.

Every new inſtitution having the ſame objects in view, muſt in its progreſs augment the general maſs of experimental information; and whilſt we anticipate with pleaſure the proſpect of our own gains in this reſpect, from the eſtabliſhment of the Dublin ſociety, we cannot but participate the ſatisfaction which the poor of that country muſt feel, from the public demonſtration which this eſtabliſhment affords, of a general attention to their intereſts, and an anxiety to promote their comforts; nor could any more effectual means be deviſed to conciliate their affections.

The comparative experience, which will be found in the reports of ſimilar ſocieties in different countries, muſt lead to important and beneficial concluſions. The ſame modes of relieving the induſtrious poor, are not adapted to all ſtates and ſituations, although the principle which ſhould govern the application of them cannot be varied. Much has been done, and more may be ſucceſsfully performed by the efforts of individuals in England, in correcting the prejudicial effects of the poor laws, workhouſes, mendicity, &c. and in Ireland the field appears to be equally extenſive for the exertions of individual benevolence.

Amongſt other recent improvements calculated to encourage induſtry and promote good habits among the poor in this city, is a ſociety of farmers, who confer rewards on thoſe who exert themſelves in the labours of agriculture.

At a quarterly meeting of the farmers' ſociety, eſtabliſhed by Mr. Pelham, for the diſtrict of Caſtleknock, Blancherſtown, and Porterſtown, near Dublin, held in March 1798, the following premiums were offered to labourers and their families within the diſtrict.

Premiums propoſed by the Farmers' Society for the Union of Caſtleknock, for the year 1798.

	£.	s.	d.
1. To the beſt ploughman with oxen - -	2	2	0
2. To ditto, with horſes - - - -	2	2	0
The qualifications neceſſary to gain the above premiums, to be ſettled by a committee appointed for that purpoſe.			
3. To the labourer who ſhall appear to have brought up the greateſt number of legitimate children in the habits of induſtry to the age of twelve years - - - - - - - -	2	2	0
4. To the labourer, for the next greateſt number	1	11	6
5. To the labourer, for the third greateſt number	1	1	0
6. To the labourer in farming, who ſhall have lived the greateſt number of years (not leſs than five) in the ſame ſervice, and behaved with ſobriety, honeſty, and induſtry, during that time, and who ſhall produce a ſatisfactory certificate from his maſter, of ſuch continued good behaviour - -	2	2	0
7. To the dairy-maid, who ſhall have lived the greateſt number of years under the above conditions	1	1	0
8. To the wife or widow of a labourer or manufacturer, who ſhall have done the greateſt number of days' work in huſbandry - - - - -	1	1	0
9. To ditto, for the next greateſt number -	0	10	6
The above Premiums not to exceed 3d. a-day for the firſt, nor 2d. a-day for the ſecond.			
10. To ſix labourers, who ſhall obtain from their reſpective clergymen and employers, certificates of their being moſt attentive to religious duties, the moſt ſober, honeſt, and induſtrious, and in every reſpect the beſt-conducted labourers within the union	3	3	0
11. To ſix boys and ſix girls, who ſhall be returned from the ſchool of Caſtleknock, Blancherſtown, and Porterſtown, as being the moſt attentive to learning, and the beſt-behaved children of ſaid ſchools -	3.	3	0
The certificates to be ſigned by the maſters, and counterſigned by their reſpective clergymen; theſe premiums to be given in books or clothes.			
12. Reſolved, that we will every year give the ſum of one guinea, to purchaſe uſeful tracts for each of the three ſchools in the union - - - -	3	3	0
The tracts to be choſen by a committee appointed for the purpoſe: an examination to be held, and premiums given to ſuch of the ſcholars as ſhall give the beſt account of ſaid tracts.			
13. To three boys and three girls, under the age of twelve years, who ſhall appear to the ſociety by certificates from their employers, to have earned the moſt money in the year in country buſineſs -	3	3	0
14. To the ſame number of boys and girls, from twelve to ſixteen years old, under the ſame conditions - - - - - - - -	3	3	0
The firſt premium not to exceed 2d. nor the other 3d. per day.			

	£.	s.	d.
15. To three labourers, or widows of labourers, who ſhall be returned, by inſpectors appointed for the purpoſe, as having kept their children, cabbins, and gardens, in the neateſt, cleanlieſt, and moſt decent order (gentlemen's lodge excepted), one guinea for each diviſion of the union - - - - -	3	3	0
16. To the wife or widow of a labourer, who ſhall (with the aſſiſtance of her children, under the age of ſixteen years) have ſpun the greateſt quantity of linen or woollen yarn, and prepared the ſame for the loom, within the year - - - - - -	1	1	0
17. To ditto, for the next greateſt quantity -	0	15	0
18. To ditto, for the third greateſt quantity -	0	10	6
19. To the wife or widow of a labourer, who with the aſſiſtance of her children under ſixteen years of age, ſhall have knit the greateſt number of pairs of ſtockings within the year - - - - -	1	1	0
20. To ditto, for the next greateſt number -	0	15	0
21. To ditto for the third greateſt number -	0	10	6
The quantity of yarn, and number of pairs of ſtockings, to be certified on oath.			
22. To three labourers, who ſhall be returned by judges appointed for the purpoſe, as being the moſt expert and handy in the different works of huſbandry, viz. ditching, draining, thatching, plaſhing hedges, &c. (ploughing excepted) - - -	3	3	0
Total of premiums - -	£. 40	7	0

The premiums for ploughing, ditching, draining, and for handy labourers, &c. to be determined by a committee appointed for that purpoſe.

Premiums No. 1, 2, 3, 4, 5, 6, 7, and 22, to be determined the laſt Monday in June, 1798: all claims for ſaid premiums to be ſent in to the ſecretary, on or before the 11th of June, 1798. The other premiums require a year for their determination; which year begins the 1ſt of April, 1798, and ends the 1ſt of April, 1799. All claims for ſaid premiums to be ſent in to the ſecretary, on or before the 1ſt of April, 1799, and to be determined at the quarterly meeting of the ſociety, on the laſt Monday in June following.

The beneficial tendency of the meaſures adopted by this ſociety, for encouraging the virtues of the poor, is ſo obvious, and the expediency and utility of them ſo apparent, that it is difficult to ſuggeſt any obſervation on the ſubject, which the good ſenſe and intelligence of the reader will not have already anticipated. No accumulation of criminal law, no penalties on imprudence and idleneſs, no repairs of the ſtocks and the cage, no additions to our gaols and houſes of correction—in ſhort, no ſeverity of puniſhment, though it may in ſome degree deter from crimes, can ever produce, among the great maſs of the people, any increaſe of energy and good habits, which will bear a compariſon with that which muſt neceſſarily ſpring from the judicious and benevolent encouragement afforded to their poor neighbours, in this inſtance, by the Iriſh gentlemen and farmers.

There is ſo little trouble, expence, or difficulty in the meaſure, that we may venture *to call upon* the inhabitants of our different pariſhes and diſtricts, as they regard either their own intereſt or the welfare of others, to imitate this uſeful example; and generally to adopt a plan, the good effects of which muſt be unqueſtionable. There are ſeveral ſocieties in England, which have done very eſſential ſervice to their neighbourhoods, by embracing part of theſe objects: but the framer of theſe reſolutions has contrived, in this inſtance, to awaken at once *all orders and all ages* of the labouring poor in his neighbourhood; and, by the kindeſt and moſt acceptable incitement to action, to ſtimulate them *all* to progreſs and perſeverance in thoſe courſes of life, which will prove moſt uſeful and moſt beneficial to themſelves and their country.

DUCHAL (James), a learned miniſter among the Diſſenters, was born in Ireland in 1697. He had his early education under the direction of an uncle; his preparatory ſtudies were greatly aſſiſted by the well-known and juſtly-admired Mr. Abernethy; and he finiſhed his courſe of ſtudy at the univerſity of Glaſgow: which, in teſtimony of his merit, conferred on him the degree of D.D. He reſided for ten or eleven years at Cambridge, as the paſtor of a ſmall congregation there; where he enjoyed his beloved retirement, the advantage of books, and of learned converſation, which he improved with the greateſt diligence. On Mr. Abernethy's removal from Antrim, he ſucceeded him in that place; and, on the death of the ſaid worthy perſon, was choſen to be miniſter to the Proteſtant Diſſenting congregation of Wood-ſtreet, Dublin. In this ſituation he continued to his death; which happened in 1761.

It is very remarkable, and worth recording, that, during his reſidence here, when he was in the decline of life, of a valetudinary habit, and had frequent avocations in the way of his profeſſion, he compoſed and wrote ſermons to an amount almoſt beyond belief; more, it appears on the beſt computation, than 700. From this maſs, a collection was taken after his death, and publiſhed in 3 vols. 8vo. in 1764. They are moſtly on new and uncommon ſubjects; and a vein of ſtrong manly ſenſe and rational piety runs through the whole.

During his life, he publiſhed a volume of excellent diſcourſes on the preſumptive arguments in favour of the Chriſtian religion: and many occaſional tracts both in England and Ireland.

DUCHAT (Jacob le), a Frenchman, diſtinguiſhed among the literati, was born at Metz in 1658. He was trained to the law, and followed the bar, till the Reformed were driven out of France, by the revocation of the edict of Nantz. In 1701 he ſettled at Berlin; became a member of the Academy of Sciences; and died there in 1735. He was regarded as a very learned perſon, yet is diſtinguiſhed as an editor, rather than an author. He had, it ſeems, a great taſte for the ancient French writers; and gave new editions of the Menippean Satires, of the Works of Rabelais, of the Apologie for Herodotus, by Henry Stephens, &c. all accompanied with remarks of his own. He held a correſpondence with Bayle, whom he furniſhed with many particulars for his Dictionary. After his death was publiſhed a "Ducatiana," at Amſterdam, in 1738, 2 vols. 12mo.

DUCK (Arthur), a civilian, was born in Devonſhire in 1580, of a conſiderable family; and at fifteen years of age became a ſtudent at Exeter College in Oxford, where he took a degree in arts in 1599. From thence he removed to Hart-hall, and afterwards was elected fellow of All-Souls; but his genius leading him to the ſtudy of the civil law, he took his other degrees in that faculty. He travelled into France, Italy, and Germany; and, after his return, was made chancellor of the dioceſe of Bath and Wells. He was afterwards made chancellor of London, and at length maſter of the Requeſts; but the confuſions, which were then beginning, probably hindered him from riſing higher. In 1640 he was elected burgeſs for Minehead in Somerſetſhire, and ſoon after ſiding with King Charles in the time of the rebellion, became a great ſufferer in the fortunes of his family. In 1648 he was ſent for by his majeſty to Newport in the Iſle of Wight, to be aſſiſting in his treaty with the commiſſioners from the parliament; but, that treaty taking no effect, he retired to his habitation at Chiſwick near London, where he died in 1649. He was an excellent civilian, a tolerable poet, eſpecially

in his younger days, and very well verſed in hiſtory, eccleſiaſtical as well civil. He left behind him "Vita Henrici Chichele, &c." and "De Uſu & Anthoritate Juris Civilis Romanorum in Dominiis Principum Chriſtianorum:" a very uſeful and entertaining work, which has been printed ſeveral times at home and abroad. He was greatly aſſiſted in this work by the learned Dr. Gerard Langbaine.

DUCK CREEK, a town of the ſtate of Delaware, which carries on a conſiderable trade with Philadelphia. It is 12 miles N. W. of Dover.

DUDLEY (Robert), baron of Denbigh, and earl of Leiceſter, ſon to John duke of Northumberland, and brother to Ambroſe earl of Warwick, before mentioned, was born about 1532; and coming early into the ſervice and favour of King Edward, was knighted in his youth. June 1550 he eſpouſed Amy, daughter of Sir John Robſart, at Sheen in Surrey, the king honouring their nuptials with his preſence; and was immediately advanced to conſiderable offices at court. In the firſt year of Mary, he fell into the ſame misfortunes with the reſt of his family; was impriſoned, tried, and condemned; but pardoned for life, and ſet at liberty in October 1554. On the acceſſion of Elizabeth, he was immediately entertained at court as a principal favourite: he was made maſter of the horſe, inſtalled knight of the Garter, and ſworn of the privy-council, in a very ſhort time. He obtained moreover prodigious grants, one after another, from the crown: and all things gave way to his ambition, influence, and policy. In his attendance upon the queen to Cambridge, the higheſt reverence was paid him: he was lodged in Trinity College, conſulted in all things, requeſts made to the queen through him; and, Auguſt 10, 1564, he on his knees entreated the queen to ſpeak to the univerſity in Latin, which ſhe accordingly did. At court, however, Thomas earl of Suſſex ſhewed himſelf averſe to his counſels, and ſtrongly promoted the overture of a marriage between the queen and the Archduke Charles of Auſtria; as much more worthy of ſuch a princeſs, than any ſubject of her own, let his qualities be what they would. This was reſented by Dudley, who inſinuated, that foreign alliances were always fatal; that her ſiſter Mary never knew an eaſy minute after her marriage with Philip: that her majeſty ought to conſider, ſhe was herſelf deſcended of ſuch a marriage as by thoſe lofty notions was decried: ſo that ſhe could not contemn an alliance with the nobility of England, but muſt at the ſame time reflect on her father's choice, and her mother's family. This diſpute occaſioned a violent rupture between the two lords, which the queen took into her hands, and compoſed; but without the leaſt diminution of Dudley's aſcendancy, who ſtill continued to ſolicit and obtain new grants and offices for himſelf and his dependants, who were ſo numerous, and made ſo great a figure, that he was ſtyled by the common people "The Heart of the Court."

To give ſome colour to theſe marks of royal indulgence, which, indeed, ſeemed to require an oſtenſible motive, the queen propoſed him as a ſuitor to Mary queen of Scots; promiſing to that princeſs all the advantages ſhe could expect or deſire, either for herſelf or her ſubjects, in caſe ſhe conſented to the match. The ſincerity of this was ſuſpected at the time, when the deepeſt politicians believed that, if the Queen of Scotland had complied, it would have ſerved only to countenance the preferring him to his ſovereign's bed. The Queen of Scots rejected the propoſal in a manner that, ſome have thought, proved as fatal to her, as it had done to his own lady, who was ſuppoſed to be ſacrificed to his ambition of marrying a queen. The death of this unfortunate perſonage happened September 8, 1560, at a very unlucky juncture for his reputation; becauſe the world at that time conceived it might be much for his conveniency to be without a wife, this iſland having then two queens, young, and without huſbands. The manner too of this poor lady's death, which was by a fall from a high ſtation, filled the world with great conſternation.

Sept. 1564, the queen created him baron of Denbigh, and, the day after, earl of Leiceſter, with all the pomp and ceremony imaginable; and, before the cloſe of the year, he was made chancellor of Oxford, as he had been ſome time before high-ſteward of Cambridge. His great influence in the court of England was not only known at home, but abroad, which induced the French king, Charles IX. to ſend him the order of St. Michael, then the moſt honourable in France; and he was inſtalled with great ſolemnity in 1565. About 1572, it is ſuppoſed that the earl married Douglas, baroneſs-dowager of Sheffield: which, however, was managed with ſuch privacy, that it did not come to the queen's ears, though a great deal of ſecret hiſtory was publiſhed, even in thoſe days, concerning the adventures of this unfortunate lady. We call her unfortunate, becauſe, though the earl had actually married her, and there were legal proofs of it, yet he never would own her as his wife. Some of the wits in Queen Elizabeth's court, after the earl's public marriage with the Counteſs-dowager of Eſſex, ſtyled theſe two ladies, Leiceſter's two Teſtaments; calling Lady Douglas the Old, and Lady Eſſex the New Teſtament. The earl, in order to ſtifle this affair, propoſed every thing he could think of to Lady Douglas Sheffield, to make her deſiſt from her pretenſions: but, finding her obſtinate, and reſolved not to comply with his propoſals, he attempted to take her off by poiſon. It is however beyond all doubt, that the earl had by her a ſon, Sir Robert Dudley, of whom we have ſpoken elſewhere, and to whom, by the name of his *baſe ſon*, he left the bulk of his fortune; and alſo a daughter

In 1576 happened the death of Walter earl of Eſſex, which drew upon Lord Leiceſter many ſuſpicions, eſpecially after his marriage with the Counteſs of Eſſex was declared; as it was two years after. For, in 1578, when the Duke of Anjou preſſed the match that had been propoſed between himſelf and the queen, his agent, believing Lord Leiceſter to be the greateſt bar to the duke's pretenſions, informed the queen of his marriage with Lady Eſſex; upon which her majeſty was ſo enraged, that, as Camden relates, ſhe commanded him not to ſtir from the caſtle of Greenwich, and would have committed him to the Tower, if ſhe had not been diſſuaded from it by the Earl of Suſſex. Lord Leiceſter being now in the very height of power and influence, many attempts were made upon his character, in order to take him down: and, in 1584, came out a moſt virulent book againſt him, commonly called Leiceſter's Commonwealth. The drift of it was to ſhew, that the Engliſh conſtitution was ſubverted, and a new form imperceptibly introduced, to which no name could be ſo properly given, as that of a Leiceſtrian Commonwealth. To make this paſs the better, the earl was repreſented as an atheiſt in point of religion, a ſecret traitor to the queen, an oppreſſor of her people, an inveterate enemy to the nobility, a complete monſter with regard to ambition, cruelty, and luſt; and not only ſo, but as having thrown all offices of truſt into the hands of his creatures, and uſurped all the power of the kingdom. The queen, however, did not fail to countenance and protect her favourite; and, to remove as much as poſſible the impreſſion this bitter performance was ſure to make upon the vulgar, cauſed letters to be iſſued from the privy-council, in which all the facts contained therein were declared to be abſolutely falſe, not only to the knowledge of thoſe who ſigned them, but alſo of the queen herſelf. Nevertheleſs, this book was univerſally read, and the contents of it generally received for true; and

the great ſecrecy with which it was written, printed, and publiſhed, induced a ſuſpicion, that ſome very able heads were concerned either in drawing it up, or at leaſt in furniſhing the materials. It is not well known what the original title of it was, but ſuppoſed to be A Dialogue between a Scholar, a Gentleman, and a Lawyer; though it was afterwards called Leiceſter's Commonwealth. It has been ſeveral times reprinted, particularly in 1600, 8vo. in 1631, 8vo. the running-title being A Letter of State to a Scholar of Cambridge; in 1641, 4to. and 8vo. with the addition of Leiceſter's Ghoſt; and again in 1706, 8vo. under the title of Secret Memoirs of Robert Dudley, Earl of Leiceſter, with a preface by Dr. Drake, who pretended it to be printed from an old manuſcript. The deſign of reprinting it in 1641, was, to give an ill impreſſion of the government of Charles I. and the like was ſuppoſed to be the deſign of Dr. Drake in his publication. Indeed, it may be conſidered as a ſtanding check upon all overgrown miniſters, and governments by faction.

Dec. 1585, Lord Leiceſter embarked for the Proteſtant Low-countries, whither he arrived in quality of governor. At this time the affairs of thoſe countries were in a perplexed ſituation; and the States thought that nothing could contribute ſo much to their recovery, as prevailing upon Queen Elizabeth to ſend over ſome perſon of great diſtinction, whom they might ſet at the head of their concerns, civil and military: which propoſition, ſays Camden, ſo much flattered the ambition of this potent earl, that he willingly conſented to paſs the ſeas upon this occaſion; as being well aſſured of moſt ample powers. Before his departure, the queen admoniſhed him to have a ſpecial regard to her honour, and to attempt nothing inconſiſtent with the great employment to which he was advanced: nevertheleſs, ſhe was ſo diſpleaſed with ſome proceedings of his and the States, that the year after ſhe ſent over very ſevere letters to them, which drew explanations from the former, and deep ſubmiſſions from the latter. He returned to England, Nov. 1585; and, notwithſtanding what was paſt, was well received by the queen. What contributed to make her majeſty forget his offence in the Low-countries, was the pleaſure of having him near her, when ſhe wanted his counſel extremely: for now the affair of Mary queen of Scots was upon the carpet, and the point was, how to have her taken off with the leaſt diſcredit to the queen. The earl thought it beſt to have her poiſoned; but that ſcheme was not found practicable, ſo that they were obliged to have recourſe to violence. The earl ſet out again for the Low-countries in June 1587; but, great diſcontents ariſing on all ſides, was recalled in November. Camden relates, that on his return, finding an accuſation preparing againſt him for mal-adminiſtration there, and that he was ſummoned to appear before the council, he privately implored the queen's protection, and beſought her "not to receive him with diſgrace upon his return, whom at his firſt departure ſhe had ſent out with honour; nor bring down alive to the grave, whom her former goodneſs had raiſed from the duſt." Theſe expreſſions of humility and ſorrow wrought ſo far upon her, that he was admitted into her former grace and favour.

In 1588, when the nation was alarmed with the apprehenſions of the Spaniſh armada, Lord Leiceſter was made lieutenant-general, under the queen, of the army aſſembled at Tilbury. This noble perſonage ſtood high in the favour of his miſtreſs to the laſt: for he died this year, Sept. 4, at his houſe at Cornbury in Oxfordſhire, while he was upon the road to Kenilworth. His corpſe was removed to Warwick, and buried there in a magnificent manner. He is ſaid to have inherited the parts of his father. His ambition was great, but his abilities ſeem to have been greater. He was a finiſhed courtier in every reſpect; and managed his affairs ſo nicely, that his influence and power became almoſt incredible. He had a competent knowledge of the Latin tongue, and was thoroughly verſed in the French and Italian.

DUDLEY, a town in Worceſterſhire, with a market on Saturday, and a great manufacture of nails and other iron-wares. There is a church at each end of the longeſt ſtreet. It is 10 miles N. W. of Birmingham and 120 of London. Long. 2. 0. W. Lat. 52. 33. N.

DUFFET (Thomas). This author was a milliner in the New-Exchange; but, his genius leading him to dramatic poetry, he wrote ſeveral pieces for the ſtage, which at firſt met with good ſucceſs, but afterwards ſunk into contempt and oblivion. Traveſtie and burleſque will ever create a laugh; but, however intended, can never do any eſſential hurt to performances of real worth; nor could The Mock Tempeſt, Pſyche, or Empreſs of Morocco, leſſen, in the opinion of the judicious, the value of the originals on which they are founded. The pieces Mr. Duffet has left behind him, the beſt of which were thoſe which met with the worſt ſucceſs, are ſix in number. They are enumerated in the Biographia Dramatica.

DUGARD (William), an eminent ſchool-maſter and learned man, was the ſon of Henry Dugard, a clergyman, and born at Bromſgrove in Worceſterſhire in 1606. He was inſtructed in claſſical learning at a ſchool in Worceſter; and from thence ſent, in 1622, to Sidney College, Cambridge. In 1626 he took the degree of B.A. and that of M.A. in 1630. Soon after he was appointed maſter of Stamford-ſchool in Lincolnſhire; from whence, in 1637, he was elected maſter of the free-ſchool in Colcheſter. He reſigned the care of this ſchool Jan. 1642-3; and, May 1644, was choſen head-maſter of Merchant-Taylors' ſchool in London. This ſchool flouriſhed exceedingly under his influence and management; but for ſhewing, as was thought, too great an affection to the royal cauſe, and eſpecially for being concerned in printing Salmaſius's defence of Charles I. he was deprived of it Feb. 1649-50, and impriſoned in Newgate; his wife and ſix children turned out of doors; and a printing-office, which he valued at a thouſand pounds, ſeized. That he was very well affected to Charles I. and to the royal intereſt, appears from a curious regiſter he kept of his ſchool, which is ſtill extant in Sion-College library, wherein are entered two Greek verſes, on the beheading of that monarch, to this effect: "Charles, the beſt of kings, is fallen by the hands of cruel and wicked men, a martyr for the laws of God and of his country." There are alſo two more Greek verſes on the burial of Oliver Cromwell's mother in Weſtminſter Abbey to this effect: "Here lieth the mother of a curſed ſon, who has been the ruin of two kings, and of three kingdoms." However, it was not for theſe verſes that he was diſmiſſed the ſchool, but for being concerned in printing Salmaſius's book.

Being ſoon releaſed from this confinement, he opened, April 1650, a private ſchool on Peter's-hill, London; but, in September, was reſtored to his former ſtation, by means of the ſame council of ſtate who had cauſed him to be removed. There he continued with great ſucceſs and credit, till about 1661; when he was diſmiſſed for breaking ſome orders of the Merchant-Taylors, though he had been publicly warned and admoniſhed of it before. He preſented a remonſtrance to them upon that occaſion, but to no purpoſe; whereupon he opened a private ſchool in Coleman-ſtreet, July 1661, and, by March following, had gathered an hundred and ninety-three ſcholars: ſo great was his reputation, and the fame of his abilities. He lived a very little while after, dying in 1662. He gave by will ſeveral books to Sion-College library. He publiſhed ſome few pieces for the uſe of his ſchools; as,

1. Lexicon Græei Teſtamenti Alphabeticum; unà cum Explicatione Grammaticâ Vocum ſingularum, in uſum Tironum, Necnon Concordantiâ ſingulis dictionibus appoſitâ, in uſum Theologiæ Candidatorum, 1660. 2. Rhetorices compendium, 8vo. 3. Luciani Samoſatenſis dialogorum ſelectorum libri duo. A. G. Dugardo recogniti, et variis collatis exemplaribus, multo caſtigatius quam ante editi. Cum interpretatione Latina, multis in locis emendata, et ad ealcem adjecta, 8vo. 4. A Greek Grammar.

DUGUET (James-Joſeph), a French writer, and author of almoſt twenty works in the French language, was born in 1649, and became a prieſt of the Oratory. In 1685 he quitted the Oratory, and went to Bruſſels to his great friend Arnauld: but, the air of this place not agreeing with him, he returned the ſame year to France, and lived a very retired life in the midſt of Paris. He afterwards lived with preſident Le Menars. His oppoſition to the Bull Unigenitus, and his attachment to the doctrine of his friend Queſnel, occaſioned him much trouble, by obliging him often to ſhift his quarters. He was in Holland, at Troyes, and Paris; but there was a ſweetneſs and moderation in his make, which kept him always tranquil. He died at Paris in 1733. All his works are upon ſubjects of theology and piety, except De l'Education d'un Prince; firſt printed in 4to. and afterwards in 4 vols. 12mo. with his life prefixed by Abbé Goujet. The ſtyle of Duguet is clear, pure, and elegant, but too diffuſe.

DUINS, or Doino, a ſea-port of Germany, in the duchy of Carniola, eight miles N. W. of Trieſt. Long. 13. 46. E. Lat. 45. 55. N.

DUISBURGH, a town of Weſtphalia, in the duchy of Cleves, with a univerſity; ſeated on the Roer, near the Rhine, 12 miles N. of Duſſeldorff. Long. 6. 50. E. Lat. 51. 22. N.

DUITZ, or Duytz, a town of Weſtphalia, on the E. ſide of the Rhine, oppoſite Cologne, It is chiefly inhabited by Jews, who are not allowed to dwell at Cologne, or even enter that city without permiſſion.

DUKE (Richard), was bred at Weſtminſter and Cambridge, and was ſome time tutor to the Duke of Richmond. He appears from his writings to have been well qualified for poetical compoſitions: and, conſcious of this when he left the univerſity, he enliſted himſelf among the wits. He was the familiar friend of Otway, and was engaged, among other popular names, in the tranſlations of Ovid and Juvenal. In his Review, though unfinithed, are ſome vigorous lines. With the wit he ſeems to have ſhared the diſſoluteneſs of the times; for ſome of his compoſitions he muſt have reviewed himſelf with deteſtation in his later days, when he publiſhed thoſe ſermons which Fenton has commended. In 1683, being then M. A. and fellow of Trinity College in Cambridge, he wrote a poem on the marriage of Lady Anne with George prince of Denmark. He took orders, and being made prebendary of Glouceſter, became a proctor in convocation for the church, and chaplain to Queen Anne. In 1710 he was preſented by the Biſhop of Wincheſter to the wealthy living of Witney in Oxfordſhire, which he enjoyed but a few months. Feb. 10, 1711, having returned from an entertainment, he was found dead the next morning.

DUKE OF YORK'S ISLAND, an iſland in the S. Pacific Ocean, diſcovered by commodore Byron in 1765, lying N. of the Friendly Iſlands. The ground was covered by land-crabs, but no other animal was ſeen. Long. 172. 30. W. Lat. 8. 0. S.

Duke of York's Island, an iſland in the S. Pacific Ocean, about 10 miles long, lying between Lord Howe's Group and the S.E. point of New Ireland. The natives go entirely naked; are ſtout, well made, and of a light copper colour: their hair is woolly, but they dreſs it with greaſe and powder, and make it hang ſtraight. Their huts are neatly made, chiefly of bamboo, and placed under the ſhade of cocoa-nut trees, with a fence before them, within which the plantain, banana, yam, ſugar-cane, &c. are cultivated. The iſland is a perfect garden, and produces, beſides the plants above mentioned, betel-nut, mangoes, bread-fruit, and guavas. Here are alſo dogs, hogs, poultry, and ſome ſpices. The nutmeg was ſeen by Captain Hunter, who anchored in Port Hunter Bay, in this iſland, in May 1791. Long. 152. 42. E. Lat. 4. 7. S.

DULAS, a village on the N.E. ſide of the iſle of Angleſey, much frequented on account of the corn and butter trade; and for fern-aſhes. Near it is a red ochrey earth, and veins of lead ore.

DULCIGNO, a town of Turkey in Europe, in Albania, on the coaſt of the Adriatic, with a good harbour, 15 miles S.W. of Scutari. Long. 18. 56. E. Lat. 42. 23. N.

DULDERSTADT, a town of Germany, in the duchy of Brunſwick, ſubject to the elector of Mentz, ſeated on the Whipper, 15 miles E. of Gottingen, and 130 N.E. of Mentz. Long. 10. 14. E. Lat. 51. 28. N.

DULMEN, a town of Weſtphalia, in the biſhopric of Munſter, 18 miles S.W. of Munſter. Long. 7. 4. W. Lat. 51. 47. N.

DULVERTON, a town in Somerſetſhire, with a market on Saturday, ſeated on a branch of the Ex, 24 miles E. of Barnſtaple, and 164 W. by S. of London. Long. 3. 30. W. Lat. 51. 3. N.

DULWICH, a village in Surrey, five miles S. of London. It is famous for a college, founded by Edward Alleyn, a principal performer of Shakſpeare's plays, in the reign of Elizabeth. He called it The College of God's Gift, and endowed it for a maſter, warden, and four fellows; three of whom were to be divines, and the fourth an organiſt; for ſix poor men and ſix poor women, and for 12 poor boys, to be educated by two of the fellows. The maſter and warden are always to be of the name of Alleyn or Allen, and to be ſingle men.

DUMARING, a town of the iſland of Borneo, on the E. coaſt. Long. 117. 30. E. Lat. 2. 10. N.

DUMBLANE, a village in Perthſhire, remarkable for a battle, called the battle of Sheriff-muir, between the Duke of Argyle and the rebel Earl of Mar, in 1715. At the upper end of the village is a ruinous cathedral. It is 30 miles N.W. of Edinburgh.

DUMFRIES, a town of Virginia, on the N. ſide of Quantico Creek, four miles above its entrance into the Potomac. It is 185 miles S.W. of Philadelphia. Long. 77. 26. W. Lat. 38. 36. N.

DUN, a town of France, in the department of Meuſe, ſituate on the Meuſe, 15 miles N.N.W. of Verdun.

DUNAMOND, a town of Ruſſia, in the government of Riga. It formerly belonged to the duchy of Courland, but was taken by the Swedes in their wars with the Poles. In 1700 it was taken by the Poles, but was retaken the next year, by Charles XII. In 1710 it was taken by the czar, Peter the Great. It is ſituate at the mouth of the Dwina, 15 miles N.W. of Riga, and 20 N. of Mittau. Long. 23. 41. E. Lat. 57. 5. N.

DUNEBURG, a town of Livonia, on the Dwina, 90 miles S.E. of Riga. Long. 27. 0. E. Lat. 56. 8. N.

DUNGENESS, a cape on the coaſt of Kent, eight miles S. by W. of Romney. Long. 0. 59. E. Lat. 50. 52. N.

DUNLEER, a borough of Ireland, in the county of Louth, ſeven miles N. of Drogheda.

DUNLOP, ſometimes pronounced Delep, a village in Ayrſhire, in the diſtrict of Cunningham, celebrated for rich and delicate cheeſe.

DUNNINGTON, a town in Lincolnſhire, with a market on Saturday, 27 miles S.E. of Lincoln, and 111 N. of London. Long. 0. 7. W. Lat. 52. 55. N.

DUNNOSE, a cape on the S. ſide of the Iſle of Wight. Long. 116. W. Lat. 50. 33. N.

DUNSE, a town in Berwickſhire, ſituated between the forks of the rivers Blackadder and Whiteadder, in a rich and fertile country, 12 miles W. of Berwick upon Tweed. Long. 2. 5. W. Lat. 55. 46. N.

DUNSTER, a town in Somerſetſhire, with a market on Friday, and a harbour on the Briſtol Channel. It has a caſtle on a ſteep knoll; and at one corner of the terrace is an ancient turret, ſuppoſed to be a part of the original caſtle, built in the time of the Conqueror. A priory ſtood on the N.W. ſide of the caſtle, the church of which now ſerves for the pariſh church. It is 20 miles N.W. of Taunton, and 158 W. of London. Long. 3. 41. W. Lat. 51. 13. N.

DUNWICH, a borough in Suffolk, with a market on Saturday. It is ſeated at the top of a looſe cliff, and was formerly a biſhop's fee, but it is now only the remains of a town, all but two pariſhes being waſhed away by the ſea. It ſends two members to parliament, and is 24 miles S. of Yarmouth, and 99 N. of London. Long. 1. 55. E. Lat. 52. 21. N.

DUPORT (James), a learned Engliſh divine, and particularly ſkilled in the Greek language, was born in the beginning of the 17th century, and educated at Cambridge; in which univerſity he was afterwards choſen Greek profeſſor, and maſter of Magdalen College. He was preferred at length to the deanery of Peterborough, and died in 1680. He left behind him ſeveral learned works, amongſt which is a Latin verſion of the Pſalms. His Gnomologia Homeri cum duplice paralleliſmo, viz. ex ſacra ſcriptura et gentium ſcriptoribus, printed at Cambridge, in 1660, ſhews his extenſive reading, and great knowledge of the Greek tongue, and was then deemed very uſeful for the underſtanding of that poet. In 1712, when Theophraſtus's Characters were publiſhed by Needham, there were printed along with them ſome lectures of Profeſſor Duport upon the firſt ſixteen characters, the fifth excepted. Theſe lectures had lain in the library of More biſhop of Ely for many years, and were at firſt ſuppoſed to have been drawn up by the learned Stanley, who wrote The Lives of the Greek Philoſophers; but, upon their being communicated, they were ſoon known to belong to Profeſſor Duport, and to be what he had read to his pupils at Cambridge, during the time of the great rebellion.

DUQUELLA, a province of Morocco, about 80 miles long and 60 broad, exceedingly fertile in corn and paſture.

DURAMPOUR, a town of the Deccan of Hindooſtan, in the province of Guzarat, 45 miles S.S.E. of Surat, and 96 N.N.E. of Bombay. Long. 73. 14. E. Lat. 20. 32. N.

DURANCE, a river of France, which is formed near Briançon, of the rivulets Dure and Ance, and watering Embrun, Tallard, Siſteron, Monoſque, and Cavillon, falls into the Rhone, below Avignon.

DURANGO, a populous town of Spain, in Biſcay, 14 miles S.E. of Bilboa. Long. 2. 56. W. Lat. 43. 18. N.

DURANGO, a town of New Spain, in New Biſcay, with a biſhop's ſee, and good ſalt-works, in a fertile country. Long. 105. 0. W. Lat. 24. 50. N.

DURAZZO, a village of Albania, with a Greek archbiſhop's ſee. It has a ruined fortreſs, and a good harbour on the gulf of Venice, 50 miles N. of Valona. Long. 19. 19. E. Lat. 41. 54. N.

DURBY, a town of French Luxemburgh, capital of a county of the ſame name, ſeated on the Outre, 20 miles S. of Liege. Lon. 5. 28. E. Lat. 58. 18. N.

DURCKEIM, a town of Germany in the palatinate of the Rhine, 12 miles N.E. of Neuſtadt. Long. 8. 21. E. Lat. 49. 26. N.

DURELL (John), a celebrated divine, was born in the iſle of Jerſey in 1626, and ſent to Merton College in Oxford when he was fifteen years old: but when that city came to be garriſoned for Charles I. and the ſcholars took arms for him, he left it, at the end of two years, and went to France; where, at Caen in Normandy, he was admitted to the degree of maſter of arts in 1644. Afterwards he returned to his own country: but driven from thence a ſecond time, he received epiſcopal ordination at Paris, in the chapel of Sir Richard Brown, his majeſty's then reſident in France, from the hands of Thomas biſhop of Galloway, about 1651; ſo that, as Wood ſays, being a native of Jerſey, ordained in France, and by a Scotch biſhop, did make ſome doubt whether he was, what he calls himſelf in his books, "eccleſiæ Anglicanæ preſbyter." Soon after he was invited by the Reformed Church at Caen, by an expreſs on purpoſe, to come and ſupply the place of the famous orientaliſt and critic Samuel Bochart, who was then going into Sweden upon an invitation from Queen Chriſtina; and by the Landgrave of Heſſe, to preach in French at his highneſs's court: but it happened, that he could not accept of either of theſe invitations, being made chaplain to the Duke de la Force, father to the Princeſs of Turenne. Upon the reſtoration of Charles II. he returned to England; and was very inſtrumental in ſetting up the new epiſcopal French church at the Savoy in London. In 1663 he had a prebend conferred upon him in the church of Saliſbury, another ſoon after in that of Windſor, and another after that in the church of Durham; being all the while chaplain in ordinary to his majeſty. In 1669 he was created doctor in divinity at Oxford, by virtue of the chancellor's letters. In 1677 he was made dean of Windſor, but did not live long enough to be a biſhop, though he lived ſome years after. All theſe preferments he obtained, partly through his own qualifications, being not only a good ſcholar, but alſo a perfect courtier; and partly through his intereſt with Charles II. to whom he was perſonally known both in Jerſey and France. He publiſhed ſeveral things; and, among the reſt, 1. The Liturgy of the Church of England aſſerted, in a ſermon preached in French at the chapel of the Savoy before the French congregation. Tranſlated into Engliſh by G. B. doctor in phyſic, 1662. 2. A View of the Government and public Worſhip of God in the reformed Churches beyond the Seas: wherein is ſhewed their conformity and agreement with the church of England, as it is eſtabliſhed by the act of uniformity, 1662. Exceptions being made to this book by the Nonconformiſts, he publiſhed, 3. A Vindication of the Church of England againſt the unjuſt and impudent Accuſations of the Schiſmatics, 1669. He died in 1683, and was buried at Windſor.

DUREN, a town of Germany, in the duchy of Juliers, on the river Roer, 12 miles S. of Juliers. Long. 6. 40. E. Lat. 50. 44. N.

DURSLEY, a town in Glouceſterſhire, with a market on Thurſday, and a caſtle, now in ruins. It is inhabited by clothiers, and ſeated near the Severn, 13 miles S. W. of Glouceſter, and 107 W. of London. Long. 2. 23. W. Lat. 51. 40. N.

DURTAL, a town of France, in the department of Mayne and Loire. Its chief trade is tanning. It is 16 miles N.E. of Angers.

DUSKY BAY, a bay of the iſland of New Zealand, in the S. Pacific Ocean. The country here is ſteep, and the hills near the ſea-ſide are covered with intricate and impenetrable foreſts. Long. 166. 18. E. Lat. 45. 47. S.

DUTLINGEN, a town of Suabia, with a bridge over the Danube, and a caſtle, ſeated on a mountain. It belongs to

the Duke of Wirtemberg, and is 33 miles N.W. of Conſtance. Long. 9. 2. E. Lat. 48. 10. N.

DYEING OF WOOD. The methods by which that proceſs is effected are fully ſet forth in the "*Annales des Arts et Manufactures*" by Mr. Nils Nyſtrom, of Norkoping in weden, who alſo has invented a ſuperior mode of preparing a proper varniſh for wood with amber. See AMBER in this SUPPLEMENT.

After deſcribing the proceſs for making the varniſh of amber, he proceeds to direct the method of preparing the iron dye for ſtaining wood.

Iron dye.—Take eight parts of iron filings, and thirty-two of aqua fortis. The nitric acid (or aqua fortis) ſhou d previouſly be diluted with ſixteen parts of water, in a veſſel of ſtone-ware, before we add the iron filings. We ſhould then ſtir this mixture with a wooden ſpatula. This preparation ought to be made under a chimney, on account of the effervefcence and diſengagement of inflammable air (hydrogene gas) which takes place The veſſel which we uſe ought to be twice as large, at leaſt, as the quantity of the mixture would fill, in order that it may be prevented from overflowing during the effervefcence. When the iron has been diſſolved, the mixture has acquired a yellowiſh-brown colour, and as ſoon as it has cooled, let it be put into an open bottle, and placed upon a ſand-bath; and there let it remain for the ſpace of eight-and-forty hours, taking care frequently to ſhake the bottle during that time. When the depoſition has taken place, the ſolution ſhould be poured into flaſks, which ought to be carefully corked: it will then be fit for uſe.

If this preparation has been made with the requiſite care, we ſhall obtain a ſolution of a yellowiſh colour, which is fit for colouring different kinds of wood. If we have added too much water, or if the aqua fortis has been too weak, a deep brown colour is produced; in which caſe, we muſt add a quantity of nitric acid, till the yellow ſhade appears.

This dye may be applied to every kind of wood, except the oak, which, as ſoon as it is applied to it, becomes entirely black; it alſo communicates to other kinds of wood different colours, according as it is applied in a larger or ſmaller quantity. The moſt common ſhades are the yellow-brown, and the deep-brown, with ſtreaks or ſpots of a browniſh red.

The experience of four years has demonſtrated the durability of this kind of dye; it reſiſts the action of the air, of the light, and even of the direct rays of the ſun, without undergoing any alteration. M. Nyſtrom has expoſed ſpecimens of wood, ſtained in this manner, in the moſt diſadvantageous ſituations, without their colours having been perceptibly affected.

Dye of Fernambouc wood.—Take eight parts of Fernambouc wood, four of alum, and four of red ochre pulveriſed. Pour water upon this mixture, and let it infuſe for the ſpace of twenty-four hours; then reduce it to a quarter of the quantity, by boiling, after which, ſtrain it through a piece of fine linen, and put the liquid into bottles, to be uſed as you may have occaſion for it.

When we make uſe of theſe dyes, we may plunge the pieces of wood into them, ſo that they may penetrate into them on all ſides. If we take one part of the iron dye, and dilute it again with three parts of water; if we then pour it upon ſeveral pieces of wood, which are to be kept by force under the fluid; and finally, if we depoſit this preparation in a warm chamber, the wood will in a ſhort time be penetrated by the liquor to the depth of a quarter of an inch, and in ſome parts the liquor will penetrate ſtill deeper.

It is to be obſerved, that the dyeing liquid ſhould be more or leſs diluted with water, according as the natural colour of the wood is more or leſs deep, or charged with gallic acid. The pieces of wood muſt be frequently turned in order that all their ſurfaces may be equally expoſed to the action of the dye, and acquire an uniform tinge. The ſame proceſs may alſo be uſed with the Fernambouc dye. This method, however, is only applicable to pieces of wood of certain dimenſions; for dyeing large pieces a different one muſt be adopted.

In order to dye the white woods with the two compoſitions already deſcribed, the piece of wood ought to be rubbed, five different times, with a ſponge dipped in the iron dye, till it has acquired a mahogany colour. During this application, we muſt remember frequently to ſhake the liquor, as the oxyde of iron always falls to the bottom. It is alſo neceſſary that we ſhould ſuffer the wood to dry, after each application, before we proceed to the next. When the wood has properly dried, it muſt be rubbed once or twice with linſeed oil, always letting it dry after each application. The more the wood is imbued with the linſeed oil, the more mellow are the colours. Another advantage which reſults from this proceſs is, that the wood does not abſorb ſo much of the amber-varniſh, which is expenſive, and which is thus compelled to remain upon the ſurface, to which it gives a gloſs.

The wood being prepared in this manner, it is done over with an uniform coat of amber-varniſh, by paſſing once or twice over it a ſponge dipped in this varniſh, till the ſurface has acquired a very bright gloſs. If the wood has been well imbued with linſeed oil, a ſingle coating of varniſh will be ſufficient; though ſome articles of furniture, ſuch as bedſteads, cheſts of drawers, chairs, &c. which are expoſed to conſtant uſe, and to conſiderable friction, require the application of ſeveral coatings, between each of which the varniſh ſhould be ſuffered to dry.

When the wood has been varniſhed, any inequalities or ruggedneſſes that may remain upon it are removed, after the varniſh has completely dried, by poliſhing it with reeds, after which one more coating of varniſh is applied, to cover the parts that have been laid bare. For applying the varniſh, a ſponge has been found to be by far the beſt inſtrument. It covers the wood in a more uniform manner than the painter's bruſh, which in general forms ſtreaks in the coating, and frequently leaves hairs in it, which afterwards ſeparate themſelves from the ſurface of the wood. The varniſhing-ſponge ought, as ſoon as we have done uſing it, to be put into a bottle, to preſerve it from the contact of the air; for, without this precaution, it would grow hard, and crack, ſo as to become unfit for uſe.

In applying the Fernambouc dye, we may proceed according to the ſame method. When this dye is applied to the wood of the birch, or knotty alder, undulated ſtreaks are formed upon the ſurface, the dye running in the direction of the fibres. The ſame effect takes place with the wood of the pine and red fir: for the reſinous veins do not attract the dye ſo ſtrongly as the reſt of the wood: but this circumſtance, inſtead of being a diſadvantage, frequently adds very much to the beauty of the wood.

Theſe varniſhes have been employed by M. Nyſtrom, after the manner that we have deſcribed, for all kinds of furniture, and with great ſucceſs. They have been uſed for the ſpace of nearly three years, and no change has as yet been obſerved in their appearance. When the varniſh has become dry and hard, it reſiſts the effects of friction and of boiling water; neither is it ſubject to loſe its gloſs by age, provided it be not ſcratched by any hard ſubſtance. If ink, or any other coloured liquid, ſhould drop upon it, it does not penetrate, but may be removed by waſhing the ſurface of the varniſh with warm water. This advantage might alone be ſufficient to recommend the application of this varniſh to mahogany itſelf. It poſſeſſes the property of hardening the ſurface of ſoft woods. Its uſe is not attended with much expence, eight ounces being ſufficient

for varniſhing a common table—a card-table for inſtance. If ſtreaks form in it, the ſpots that have been injured may be repaired with a new coating of varniſh; finally, by varniſhing furniture in this manner every four or five years, we may make it appear perpetually new.

Tables, and other large pieces of furniture, made of ſtained wood, which require a high degree of poliſh, may be finiſhed with pumice-ſtone: thoſe of the moſt even grain and the ſmootheſt ſurface are to be preferred. The white, or ſoft woods, generally puff up when the varniſh is applied, and thus loſe their poliſh; it is therefore very neceſſary that they ſhould previouſly be rubbed with pumice-ſtone.

In treating of amber-varniſh, it might perhaps have been obſerved, that it may be applied to gilding without producing any conſiderable change in its luſtre, particularly if applied in very thin layers, and in an uniform manner. It is eaſy to conceive the advantage of an application, which enables us to clean gilt frames, or other furniture, by waſhing them with ſpirit of wine, or even with ſoap and water, without injury to their brilliancy. It cannot, however, be uſed for covering falſe gilding, as this is attacked and diſcoloured by the varniſh. We ſhall ſtill remark, that it may be uſed for varniſhing all ſorts of oil colours, except the blue, to which it gives a greeniſh tinge. This varniſh poſſeſſes the advantage, that it never cracks, like thoſe which are prepared with gum-lac and ſpirit of wine. A prodigious quantity of amber grows on the coaſts of the Baltic, from whence it might eaſily be obtained.

DYNAMICS, a name applied to that department of phyſico-mathematical ſcience which contains the *abſtract doctrine of moving forces*; that is, whatever neceſſarily reſults from the relations of our idea of motion, and of the immediate cauſes of its production and variations.

E.

EAR

EAOOWE, one of the Friendly Iſlands, in the S Pacific Ocean, diſcovered by Taſman, in 1643, and by him named Middleburg. The land gently riſes to a conſiderable height, preſenting a beautiful proſpect of extenſive meadows, adorned with tufts of trees, and intermixed with plantations. Long. 174. 30. W. Lat. 21. 24. S.

EARLSTON, or EARSILTON, a town in Berwickſhire, ſeated on the river Leader, 35 miles S.E. of Edinburgh. It is the birth-place of the celebrated Thomas the Rhymer, whoſe real name was Thomas Lermont: the ruins of the little tower he poſſeſſed, ſtill remain at the weſt end of the town. A little below Earlſton, on a rocky bank overlooking the Leader, ſtands Cowdenknows, an old building, now ſomewhat modernized; and on the adjacent knolls may be ſeen the remains of its *broom*, ſo renowned in Scottiſh ditty.

EARN, a river, which iſſues from a lake of the ſame name, in Perthſhire. It meanders for above 20 miles, through the valley of Strathearn, and joins the Tay, below Perth.

EARNE, a lake of Ireland, in the county of Fermanagh, 30 miles in length. It is narrow in the middle; and in this part is an iſland on which ſtands Inniſkilling.

EARTH *(Encycl.)*. In that article, from a ſuppoſition that our limits would not admit of the detailed opinions of philoſophers on ſo copious a ſubject, we avoided an account of the different *theories of the Earth*. In this place, however, we think it neceſſary to trace thoſe which are allowed to deſerve the greateſt ſhare of attention.

For a long time, the philoſophy of Ariſtotle prevailed, and the world was thought to be upheld by forms, qualities, and other unintelligible and imaginary beings.—At laſt the French philoſopher, Deſcartes, ſuperſeded the Ariſtotelian, by introducing the atomic, or Democritic, and Epicurean philoſophy. The Carteſian ſyſtem, however, was quickly ſuperſeded by the Newtonian; which ſtill continues, though conſiderably different from what it was left by that great man.—His opinions, indeed, concerning the coſmogony ſeem to have been in a fluctuating ſtate; and hence he delivers himſelf in ſuch a manner, that he hath often incurred the charge of contradicting himſelf.—He maintained, for inſtance, that matter was infinitely diviſible, and the mathematical demonſtrations of this propoſition are well known. Notwithſtanding this, however, when he comes particularly to ſpeak of the original conſtruction of the world, he ſeems to retract this opinion, and adopt the atomic philoſophy. He tells us, that it ſeems probable, that in the beginning God formed matter in *ſolid, maſſy, impenetrable* particles, &c.; and that of theſe particles, endowed with various powers of attraction and repulſion, the preſent ſyſtem of nature is formed. His primary laws of nature are only three in number, and very ſimple. The firſt is, that all matter has a tendency to continue in that ſtate in which it is once placed, whether of reſt or motion. If it is at reſt, for example, it will continue at reſt for ever, without beginning motion of itſelf; but if it is once ſet in motion, by any cauſe whatever, it will for ever continue to move in a right line, until ſomething either ſtops it altogether, or forces it to move in another direction. 2. That the change of motion is always equivalent to the moving force employed to produce it, and in the direction of the right line in which it is impreſſed; that is, if a certain force produces a certain motion, double that force will produce double that motion, &c. 3. Reaction is always contrary and equal to action; or the actions of two bodies upon one another are always equal and contrary to one another.

From theſe three laws, together with the two contrary forces of attraction and repulſion, Sir Iſaac Newton and his followers have attempted to explain all the phenomena of nature. When they come to explain the nature of the attractive and repulſive forces, however, they are exceedingly embarraſſed. Sir Iſaac hath expreſſed himſelf in two different ways concerning them. In his Principia, he pretty poſitively determines them to be owing to a cauſe that is not material: and in his queries, he ſuppoſes they may be effects of ſome ſubtile matter which he calls *ether*. This diſagreement with himſelf hath produced no ſmall diſagreement among his followers. One party, laying hold of his aſſertions in the Principia, determine the world to be upheld by *immaterial* powers; while the other, neglecting the Principia, and taking notice only of the queries at the end of the Optics, ſtrenuouſly maintain, that attraction and repulſion are owing to the action of ſome exceedingly fine and ſubtile ether.—The firſt of theſe ſuppoſitions, it is argued, neceſſarily involves us in one of the following dilemmas. 1. If the attractive and repulſive forces are not material, they muſt either be occaſioned by ſpiritual beings, or they muſt be *qualities* of matter. If they are occaſioned by the action of immaterial beings, theſe beings muſt either be created or uncreated. If they are produced by the action of created beings,

we run into the ſuppoſition of ſome of the ancient heathens, that the world is governed by demons or ſubordinate intelligences; and thus may make an eaſy tranſition to polytheiſm. If attraction and repulſion are the immediate action of the Deity himſelf, we run into the doctrine of making God the ſoul of the world.—This laſt hypotheſis hath been moſt ſtrenuouſly adopted by Mr. Baxter in his treatiſe of the Immateriality of the human Soul. Mr. Boſcovich, Mr. Mitchel, and Dr. Prieſtley, have likewiſe adopted the hypotheſis of immaterial powers to ſuch a degree, that, according to them, the whole world conſiſts of nothing elſe but *attractions* and *repulſions* mixed with *phyſical points*. 2. If we ſuppoſe the attractive and repulſive powers to be only *properties, qualities*, or *laws*, impreſſed on matter by the Deity, we might as well have been contented with the occult qualities of Ariſtotle.—If attraction and repulſion are occaſioned by the action of mere matter, and all the powers in nature are only material, the charge is incurred of making nature direct itſelf in ſuch a manner, that there is no occaſion for the interpoſition, or even the exiſtence, of a Deity at all.

Thus we ſee, the Newtonian coſmogony muſt incline either to the Platonic and Ariſtotelian, or to the Atomic or Epicurean; according to the hypotheſis we lay down concerning the nature of attraction. Des Cartes's ſyſtem was plainly a revival of that of Democritus and Epicurus with ſome corrections and improvements. It was further improved and corrected by Mr. Hutchinſon, who added to it the authority of revelation. The created agents he choſe in his coſmogony were fire, light, and air. Theſe, we ſee, have indeed a very conſiderable ſhare in the operations of nature; but unleſs we explain the manner in which they operate, our knowledge is not at all increaſed, and we might as well have been contented with the Newtonian attraction and repulſion, or even the occult qualities of Ariſtotle. Attempts have indeed been made to ſolve the phenomena of nature, from the action of theſe three agents, both by Hutchinſon himſelf, and many of his followers.—Theſe attempts, however, have always proved unſucceſsful. Some phenomena indeed may be explained pretty plauſibly from the known action of theſe three; but when we come to ſpeak of what may be called the *nicer operations* of nature, ſuch as the growth of plants or animals, we are utterly at a loſs.

The manifeſt deficiency of active principles in all the theories of the earth that have yet been invented, hath occaſioned a conſtant ſearch after others which ſhould be able, by their ſuperior activity, to fill up the blank which neceſſarily remained in the ſyſtem.—Pythagoras, Plato, and Ariſtotle, being unable to account for the formation of the earth from their four elements, called in the aſſiſtance of a *fifth*, which was never yet diſcovered. Epicurus, finding the motions attributed to his atoms by Democritus to be inſufficient, had recourſe to an imaginary, and on his own principles *impoſſible*, declination of the atoms. Deſcartes finding the atoms themſelves inſufficient, aſſerted that they were not atoms, but might be broken into ſmaller parts, and thus conſtitute matter of various degrees of ſubtilty. The Newtonian philoſophers have found Des Cartes's ſyſtem inſufficient; but being greatly diſtreſſed in their attempts to ſolve all the phenomena of nature by mere attraction and repulſion, have been obliged to call in the action of *mind* to their aſſiſtance. The Hutchinſonians were hardly put to it in accounting for every thing by the action of fire, light, and air, when luckily the diſcoveries in electricity came to their aſſiſtance. It muſt be owned, that this fluid does indeed come in like a kind of fifth element, which in many caſes appears to be the animating principle of nature. For ſome time paſt, almoſt all the remarkable phenomena in nature have been explained by electricity, or the action of the electric fluid. But unleſs this action is explained, we are got no further than we were before. To ſay any thing is done by electricity, is not more intelligible than to ſay it was done by attraction. If we explain an effect by a material cauſe, it ought to be done upon mechanical principles. We ought to be ſenſible how one part of matter acts upon another part in ſuch a manner as to produce the effect we deſire to explain. The electrical philoſophers, however, have not yet been able to inveſtigate the manner in which this ſubtile fluid operates; and hence the many diſcoveries in electricity have not contributed to throw that light on the theory of the earth, which perhaps they may do hereafter. With ſome philoſophers, however, the electric fluid itſelf, and indeed all the powers of nature, ſeem in danger of being ſuperſeded by a principle, at preſent very little known, called the *phlogiſton*.—Thus, Mr. Henly tells us (*Phil. Tranſ.* vol. 67), that Mr. Clarke, an ingenious gentleman in Ireland, hath diſcovered all the different kinds of air produced from metals, &c. by Dr. Prieſtley, to be only *phlogiſtic vapours* ariſing from theſe ſubſtances. Dr. Prieſtley himſelf ſuppoſes, that the electric light is a modification of *phlogiſton*; and conſequently thinks it probable, that all light is a modification of the ſame. Fire or flame is thought to be a chemical combination of air with the phlogiſton; and phlogiſton is thought to give the elaſticity to air, and every other elaſtic fluid, &c.—Be this as it will, however, the late diſcoveries in electricity have tended very much to change the form of the Newtonian philoſophy, and to introduce that *materialiſm* into our theories of the natural phenomena which is by ſome people ſo much complained of.

From this general hiſtory of the different agents which philoſophers have choſen to account for the original formation of the earth, and for its preſervation in the preſent form, it appears, that ſcarce any advance in true knowledge hath yet been made. All the agents have been prodigiouſly defective; electricity itſelf, as far as yet known, not excepted. But, before entering into a particular conſideration of thoſe theories which ſeem moſt worthy of notice, it will be neceſſary to point out the principal difficulties which ſtand in the way of one who attempts to give a complete theory of the earth.

1. The earth, although pretty much of a ſpherical figure, is not completely ſo; but protuberates conſiderably about the equatorial parts, and is proportionably flattened at the poles, as is undeniably proved by the obſervations of modern mathematicians. The queſtion here is, Why the natural cauſe which gave the earth ſo much of a ſpherical figure, did not make it a complete and exact ſphere?

2. The terraqueous globe conſiſts of a vaſt quantity of water as well as dry land. In many places, ſuch as the Iſthmus of Darien, a narrow neck of land is interpoſed betwixt two vaſt oceans. Theſe beat upon it on either ſide with vaſt force; yet the iſthmus is never broke down nor diminiſhed. The caſe is the ſame with the iſthmus of Suez which joins Aſia and Africa, and with that which joins the Morea or ancient Peloponneſus to the continent. The difficulty is, By what natural power or law are theſe narrow necks of land preſerved amidſt the waters which threaten them on both ſides with deſtruction?

3. The ſurface of the earth is by no means ſmooth and equal; but in ſome places raiſed into enormous ridges of mountains, and in others ſunk down in ſuch a manner as to form deep valleys. Theſe mountains, though they have been expoſed to all the injuries of the weather for many thouſand years, exhibit no ſigns of decay. They ſtill continue of the ſame ſize as before, though vaſt quantities of earth are frequently waſhed down from them by the rains, which, together with the force of gravity, tending to level and bring them on

an equality with the plains on which they ſtand, we might reaſonably think, ought by this time to have rendered them ſmaller than before. It muſt therefore be enquired into, By what natural cauſe the mountains were originally formed, and how they come to preſerve their ſize without any remarkable diminution?

4. The internal parts of the earth are ſtill more wonderful than the external. The utmoſt induſtry of man, indeed, can penetrate but a little way into it. As far as we can reach, however, it is found to be compoſed of diſſimilar ſtrata lying one upon another, not commonly in a horizontal direction, but inclined to the horizon at different angles. Theſe ſtrata ſeem not to be diſpoſed either according to the laws of gravity or according to their denſity, but as it were by chance. Beſides, in the internal parts of the earth are vaſt chaſms and vacuities. By what means were theſe ſtrata originally depoſited, the fiſſures and chaſms made, &c.?

5. In many places of the earth, both on the ſurface, and at great depths under it, vaſt quantities of marine productions, ſuch as ſhells, &c. are to be met with. Sometimes theſe ſhells are found in the midſt of ſolid rocks of marble and lime-ſtone. In the very heart of the hardeſt ſtones alſo, ſmall vegetable ſubſtances, as leaves, &c. are ſometimes to be found. The queſtion is, By what means were they brought thither?

Theſe are ſome of the moſt ſtriking difficulties which preſent themſelves to one who undertakes to write a natural hiſtory or theory of the earth. The moſt remarkable attempts to produce a theory of this kind are thoſe of Burnet, Woodward, Whiſton, and Buffon.

According to Dr. Burnet, the earth was originally a fluid maſs, or chaos, compoſed of various ſubſtances differing both in denſity and figure. Thoſe which were moſt heavy ſunk to the centre, and formed there a hard ſolid body: thoſe which were ſpecifically lighter remained next above; and the waters, which were lighteſt of all, covered the earth all round. The air, and other ethereal fluids, which are ſtill lighter than water, floated above it, and ſurrounded the globe alſo. Between the waters, however, and the circumambient air, was formed a coat of oily and unctuous matters lighter than water, The air at firſt was very impure, and muſt neceſſarily have carried up with it many of thoſe earthy particles with which it was once blended: however, it ſoon began to purify itſelf, and depoſit thoſe particles upon the oily cruſt above mentioned; which, ſoon uniting together, the earth and oil became the cruſt of vegetable earth, with which the whole globe is now covered. His account of the deſtruction of the primæval world by the flood, by the falling down of the ſhell of earth into the waters of the abyſs, is given under the article DELUGE. It only remains then to give his account of the manner in which he relieves the earth from this univerſal deſtruction; and this he does as follows. Theſe great maſſes of earth, ſays he, falling into the abyſs, drew down with them vaſt quantities alſo of air; and by daſhing againſt each other, and breaking into ſmall parts by the repeated violence of the ſhock, they at length left between them large cavities filled with nothing but air. Theſe cavities naturally offered a bed to receive the influent waters; and in proportion as they filled, the face of the earth became once more viſible. The higher parts of its broken ſurface, now become the tops of mountains, were the firſt that appeared; the plains ſoon after came forward; and at length the whole globe was delivered from the waters, except the places in the loweſt ſituations; ſo that the ocean and ſeas are ſtill a part of the ancient abyſs, that have had no place to which they might return. Iſlands and rocks are fragments of the earth's former cruſt; continents are larger maſſes of its broken ſubſtance; and all the inequalities that are to be found on the ſurface of the preſent earth are effects of the confuſion into which both earth and water were at that time thrown.

Dr. Woodward begins with aſſerting, that all terrene ſubſtances are diſpoſed in beds of various natures, lying horizontally one over the other, ſomewhat like the coats of an onion: that they are replete with ſhells, and other productions of the ſea; theſe ſhells being found in the deepeſt cavities, and on the tops of the higheſt mountains. From theſe obſervations, which are warranted by experience, he proceeds to obſerve, that theſe ſhells, and extraneous foſſils, are not productions of the earth, but are all actual remains of thoſe animals which they are known to reſemble; that all the ſtrata or beds of the earth lie under each other in the order of their ſpecific gravity, and that they are diſpoſed as if they had been left there by ſubſiding waters. All this he very confidently affirms, though daily experience contradicts him in ſome of them; particularly, we often find layers of ſtone over the lighteſt ſoils, and the ſofteſt earth under the hardeſt bodies. However, having taken it for granted, that all the layers of the earth are found in the order of their ſpecific gravity, the lighteſt at top, and the heavieſt next the centre, he conſequently aſſerts, that all the ſubſtances of which the earth is compoſed, were originally in a ſtate of diſſolution. This diſſolution he ſuppoſes to have taken place at the flood: but being aware of an objection, that the ſhells, &c. ſuppoſed to have been depoſited at the flood are not diſſolved, he exempts them from the ſolvent power of the waters, and endeavours to ſhew that they have a ſtronger coheſion than minerals; and that, while even the hardeſt rocks are diſſolved, bones and ſhells may remain entire.

Mr. Whiſton ſuppoſes the earth to have been originally a comet; and conſiders the Moſaic account of the creation as commencing at the time when the Creator placed this comet in a more regular manner, and made it a planet in the ſolar ſyſtem. Before that time, he ſuppoſes it to have been a globe without beauty or proportion; a world in diſorder, ſubject to all the viciſſitudes which comets endure; which, according to the preſent ſyſtem of philoſophy, muſt be alternately expoſed to the extremes of heat and cold. Theſe alternations of heat and cold, continually melting and freezing the ſurface of the earth, he ſuppoſes to have produced, to a certain depth, a chaos reſembling that deſcribed by the poets, ſurrounding the ſolid contents of the earth, which ſtill continued unchanged in the midſt; making a great burning globe of more than 2000 leagues in diameter. This ſurrounding chaos, however, was far from being ſolid: he reſembles it to a denſe, though fluid atmoſphere, compoſed of ſubſtances mingled, agitated, and ſhocked againſt each other; and in this diſorder he ſuppoſes the earth to have been juſt at the eve of the Moſaic creation. But upon its orbit being then changed, when it was more regularly wheeled round the ſun, every thing took its proper place, every part of the ſurrounding fluid then fell into a certain ſituation according as it was light or heavy. The middle, or central part, which always remained unchanged, ſtill continued ſo; retaining a part of that heat which it received in its primæval approaches towards the ſun; which heat he calculates may continue about 6000 years. Next to this fell the heavier parts of the chaotic atmoſphere, which ſerve to ſuſtain the lighter: but as in deſcending they could not entirely be ſeparated from many watery parts, with which they were intimately mixed, they drew down theſe alſo along with them; and theſe could not mount again after the ſurface of the earth was conſolidated: they therefore ſurrounded the heavy firſt-deſcending parts in the ſame manner as theſe ſurrounded the central globe. Thus the entire body of the earth is compoſed next the centre of a great burning globe: next this is placed an heavy terrene ſubſtance that encompaſſes it; round which is

circumfuſed a body of water. Upon this body of waters is placed the cruſt of earth on which we inhabit: ſo that, according to Mr. Whiſton, the globe is compoſed of a number of coats, or ſhells, one within the other, all of different denſities. The body of the earth being thus formed, the air, which is the lighteſt ſubſtance of all, ſurrounded its ſurface, and the beams of the ſun darting through, produced the light, which, we are told by Moſes, firſt obeyed the Divine command.

The whole economy of the creation being thus adjuſted, it only remained to account for the riſings and depreſſions on the ſurface of the earth, with the other ſeeming irregularities of its preſent appearance. The hills and valleys are by him conſidered as formed by their preſſing upon the internal fluid which ſuſtains the external ſhell of the earth, with greater or leſs weight; thoſe parts of the earth which are heavieſt ſink the loweſt into the ſubjacent fluid, and thus become valleys: thoſe that are lighteſt riſe higher upon the earth's ſurface, and are called *mountains*.

Such was the face of nature before the deluge: the earth was then more fertile and populous than it is at preſent; the life of men and animals was extended to ten times its preſent duration; and all theſe advantages aroſe from the ſuperior heat of the central globe, which has ever ſince been cooling. As its heat was then in its full power, the genial principle was alſo much greater than at preſent; vegetation and animal increaſe were carried on with more vigour; and all nature ſeemed teeming with the ſeeds of life. But as theſe advantages were productive only of moral evil, it was found neceſſary to deſtroy all living creatures by a flood; and in what manner this puniſhment was accompliſhed, according to Mr. Whiſton, is taken notice of under the article DELUGE.

Mr. Buffon's theory differs very widely from all the reſt. He begins with attempting to prove, that this world which we inhabit is no more than the ruins of a world. "The ſurface of this immenſe globe (ſays he), exhibits to our obſervation, heights, depths, plains, ſeas, marſhes, rivers, caverns, gulfs, volcanoes; and, on a curſory view, we can diſcover in the diſpoſition of theſe objects neither order nor regularity. If we penetrate into the bowels of the earth, we find metals, minerals, ſtones, bitumens, ſands, earths, waters, and matter of every kind, placed as it were by mere accident, and without any apparent deſign. Upon a nearer and more attentive inſpection, we diſcover ſunk mountains, caverns filled up, ſhattered rocks, whole countries ſwallowed up, new iſlands emerged from the ocean, heavy ſubſtances placed above light ones, hard bodies incloſed within ſoft bodies; in a word, we find matter in every form, dry and humid, warm and cold, ſolid and brittle, blended in a chaos of confuſion, which can be compared to nothing but a heap of rubbiſh, or the ruins of a world."

When taking a particular ſurvey of the external ſurface of the globe, he begins with the ocean, and the motion communicated to it by the influence of the ſun and moon which produces the tides.—"In examining the bottom of the ſea (ſays he), we perceive it to be equally irregular as the ſurface of the dry land. We diſcover hills and valleys, plains and hollows, rocks and earths of every kind; we diſcover likewiſe, that iſlands are nothing but the ſummits of vaſt mountains, whoſe foundations are buried in the ocean. We find other mountains whoſe tops are nearly on a level with the ſurface of the water; and rapid currents which run contrary to the general movement. Theſe currents ſometimes run in the ſame direction; at other times their motion is retrograde; but they never exceed their natural limits, which ſeem to be as immutable as thoſe which bound the efforts of land-rivers. On one hand we meet with tempeſtuous regions, where the winds blow with irreſiſtible fury; where the heavens and the ocean, equally convulſed, are mixed and confounded in the general ſhock; violent inteſtine motions, tumultuous ſwellings, water-ſpouts, and ſtrange agitations, produced by volcanoes, whoſe mouths, though many fathoms below the ſurface, vomit forth torrents of fire; and puſh, even to the clouds, a thick vapour, compoſed of water, ſulphur, and bitumen; and dreadful gulfs or whirlpools, which ſeem to attract veſſels for no other purpoſe than to ſwallow them up. On the other hand we diſcover vaſt regions of an oppoſite nature, always ſmooth and calm, but equally dangerous to the mariner. To conclude, directing our eyes toward the ſouthern or northern extremities of the globe, we diſcover huge maſſes of ice, which, detaching themſelves from the polar regions, advance, like floating mountains, to the temperate climates, where they diſſolve and vaniſh from our view. The bottom of the ocean and the ſhelving ſides of rocks produce plentiful crops of plants of many different ſpecies: its ſoil is compoſed of ſand, gravel, rocks, and ſhells; in ſome places it is a fine clay, in others a compact earth: and in general, the bottom of the ſea has an exact reſemblance to the dry land which we inhabit.

"Let us next take a view of the dry land. Upon an attentive obſervation of this, we ſhall find, that the great chains of mountains lie nearer the equator than the poles; that in the old continent their direction is more from eaſt to weſt than from ſouth to north; and that, on the contrary, in the new continent they extend more from north to ſouth than from eaſt to weſt. But what is ſtill more remarkable, the figure and direction of theſe mountains, which have a moſt irregular appearance, correſpond ſo wonderfully, that the prominent angles of one mountain are conſtantly oppoſite to the concave angles of the neighbouring mountain, and of equal dimenſions, whether they be ſeparated by an extenſive plain or a ſmall valley. I have further remarked, that oppoſite hills are always nearly of the ſame height; and that mountains generally occupy the middle of continents, iſlands, and promontories, dividing them by their greateſt lengths. I have likewiſe traced the courſes of the principal rivers, and find that their direction is nearly perpendicular to the ſea-coaſts into which they empty themſelves; and that, during the greateſt part of their courſes, they follow the direction of the mountains from which they derive their origin. The ſea-coaſts are generally bordered with rocks of marble, and other hard ſtones; or rather with earth and ſand accumulated by the waters of the ſea, or brought down and depoſited by rivers. In oppoſite coaſts, ſeparated only by ſmall arms of the ſea, the different ſtrata or beds of earth are of the ſame materials. I find that volcanoes never exiſt but in very high mountains; that a great number of them are entirely extinguiſhed; that ſome are connected to others by ſubterranean paſſages, and their eruptions not unfrequently happen at the ſame time. There are ſimilar communications between certain lakes and ſeas. Some rivers ſuddenly diſappear, and ſeem to precipitate themſelves into the bowels of the earth. We likewiſe find certain mediterranean or inland ſeas, that conſtantly receive from many and great rivers prodigious quantities of water, without any augmentation of their bounds; probably diſcharging by ſubterraneous paſſages all thoſe extraneous ſupplies. It is likewiſe eaſy to diſtinguiſh lands which have been long inhabited, from thoſe new countries where the earth appears in a rude ſtate, where the rivers are full of cataracts, where the land is nearly overflowed with water or burnt up with drought, and where every place capable of producing trees is totally covered with wood.

"Proceeding in our examination, we diſcover that the upper ſtratum of the earth is univerſally the ſame ſubſtance: that this ſubſtance, from which all animals and vegetables derive their growth and nouriſhment, is nothing but a compoſition of the decayed parts of animal and vegetable bodies;

reduced into ſuch ſmall particles that their former organic ſtate is not diſtinguiſhable. Penetrating a little deeper, we find the real earth, beds of ſand, limeſtone, clay, ſhells, marble, gravel, chalk, &c. Theſe beds are always parallel to each other, and of the ſame thickneſs throughout their whole extent. In neighbouring hills, beds or ſtrata of the ſame materials are uniformly found at the ſame levels, though the hills be ſeparated by large and deep valleys. Strata of every kind, even of the moſt ſolid rocks, are uniformly divided by perpendicular fiſſures. Shells, ſkeletons of fiſhes, marine plants, &c. are often found in the bowels of the earth, and on the tops of mountains, even at the greateſt diſtances from the ſea. Theſe ſhells, fiſhes, and plants, are exactly ſimilar to thoſe which exiſt in the ocean. Petrified ſhells are to be met with almoſt every-where in prodigious quantities: they are not only encloſed in rocks of marble and lime-ſtone, as well as in earths and clays, but are actually incorporated and filled with the very ſubſtances in which they are encloſed. In fine, I am convinced, from repeated obſervation, that marbles, lime-ſtones, chalks, marles, clays, ſand, and almoſt all terreſtrial ſubſtances, wherever ſituated, are full of ſhells and other ſpoils of the ocean."

From theſe poſitions, which he lays down as facts, Mr. Buffon draws the following concluſions:

1. The changes which the earth has undergone within theſe laſt 2000 or 3000 years muſt be inconſiderable, when compared with the great revolutions that took place in thoſe ages immediately ſucceeding the creation. The reaſon he gives for this aſſertion is, that terreſtrial ſubſtances could not acquire ſolidity but by the continued action of gravity: hence, the earth muſt have been originally much ſofter than it is now, and therefore more apt to be changed by cauſes which cannot now affect it.

2. It ſeems an uncontrovertible fact, that the dry land which we now inhabit, and even the ſummits of the higheſt mountains, were formerly covered with the waters of the ſea; for ſhells and other marine bodies are ſtill found upon the very tops of mountains.

3. The waters of the ſea have remained for a long track of time upon the ſurface; becauſe in many places, ſuch immenſe banks of ſhells have been diſcovered, that it is impoſſible ſo great a multitude of animals could exiſt at the ſame time.

4. From this circumſtance it likewiſe appears, that although the materials on the ſurface of the earth were then ſoft, eaſily diſunited, moved, and tranſported by the waters, yet theſe tranſportations could not be ſuddenly effected: they muſt have been gradual and ſucceſſive, as ſea-bodies are ſometimes found more than 1000 feet below the ſurface: and ſuch a thickneſs of earth, or ſtone, could not be accumulated in a ſhort time.

5. It is impoſſible theſe effects could be owing to the univerſal deluge. For, though we ſhould ſuppoſe that all the ſhells in the bottom of the ocean ſhould be depoſited upon the dry land; yet, beſides the difficulty of eſtabliſhing this ſuppoſition, it is plain, that as ſhells are found incorporated in marble, and in the rocks of the higheſt mountains, we muſt ſuppoſe theſe rocks and marbles to have been formed all at the very inſtant when the deluge took place; and that before this grand revolution, there were neither mountains, nor marbles, nor rocks, nor clays, nor matter of any kind ſimilar to what we are now acquainted with; as they all, with few exceptions, contain ſhells, and other productions of the ocean. Beſides, at the time of the univerſal deluge, the earth muſt have acquired a conſiderable degree of ſolidity, by the action of gravity for more than 16 centuries. During the ſhort time the deluge laſted, therefore, it is impoſſible that the waters ſhould have overturned and diſſolved the whole ſurface of the earth to the greateſt depths.

6. It is certain (for what reaſon he does not mention), that the waters of the ſea have, at ſome period or other, remained for a ſucceſſion of ages upon what we now know to be dry land; and conſequently that the vaſt continents of Aſia, Europe, Africa, and America, were then the bottom of an immenſe ocean, replete with every thing which the preſent ocean produces.

7. It is likewiſe certain, that the different ſtrata of the earth are horizontal and parallel to each other. This parallel ſituation muſt therefore be owing to the operation of the waters, which have gradually accumulated the different materials, and given them the ſame poſition which the water itſelf invariably aſſumes.

8. It is certain that theſe ſtrata muſt have been gradually formed, and are not the effect of any ſudden revolution; becauſe nothing is more frequent than ſtrata compoſed of heavy materials placed above light ones; which never could have happened, if, according to ſome authors, the whole had been blended and diſſolved by the deluge, and afterwards precipitated.

9. No other cauſe than the motion and ſediments of water could poſſibly produce the regular poſition of the various ſtrata of which the ſuperficial part of this earth conſiſts. The higheſt mountains are compoſed of parallel ſtrata, as well as the loweſt valleys. Of courſe, the formation of mountains cannot be attributed to the ſhocks of earthquakes, or to the eruptions of volcanoes. Such ſmall eminences as have been raiſed by volcanoes or convulſions of the earth, inſtead of becoming compoſed of parallel ſtrata, are mere maſſes of weighty materials, blended together in the utmoſt confuſion.

Having now, as he thinks, *proved*, that the dry and habitable part of the earth has remained for a long time under the waters of the ſea, and conſequently muſt have undergone the ſame changes that now take place at the bottom of the ſea, he proceeds to enquire what theſe changes are.

10. The ocean, ſince the creation of the world, has been conſtantly agitated by the tides, occaſioned by the action of the ſun and moon; and this agitation is greater in the equatorial than in the other parts of the globe, becauſe the action of the ſun and moon is there ſtrongeſt.

11. The earth performs a rapid motion on its axis; and conſequently its parts have a centrifugal force, which is alſo greateſt at the equator.

12. From the combined action of the two laſt-mentioned cauſes, the tides, and the motion of the earth, it may be fairly concluded, that although this globe had been originally a perfect ſphere, its diurnal motion, and the ebbing and flowing of the tides, muſt neceſſarily, in a ſucceſſion of time, have elevated the equatorial parts, by gradually carrying mud, earth, ſand, ſhells, &c. from other climates, and depoſiting them at the equator.

13. On this ſuppoſition, the greateſt inequalities on the ſurface of the earth ought to be found, and in fact are found, in the neighbourhood of the equator.

14. As the alternate motion of the tides has been conſtant and regular ſince the exiſtence of the world, it is natural to think, that at each tide, the water carries from one place to another a ſmall quantity of matter, which falls to the bottom as a ſediment, and forms theſe horizontal and parallel ſtrata that every-where appear. Here it may indeed be objected, that as the flux is equal to, and regularly ſucceeded by, the reflux, the two contrary motions will balance each other; and whatever is brought in by the flux will be carried back by the reflux. The motion of the ocean, therefore, could

never be the cauſe of the formation even of parallel ſtrata; much leſs of mountains, and all the inequalities to be obſerved in this globe. To this Mr. Buffon replies, that the alternate motion of the waters is by no means equal; for the ſea has a continual motion from eaſt to weſt: the agitations occaſioned by the winds likewiſe produce great inequalities in the tides. It muſt alſo be acknowledged, that, by every motion of the ſea, particles of earth and other matter muſt be carried from one place and depoſited in another: and that theſe collections of matter muſt aſſume the form of parallel and horizontal ſtrata. Laſtly, this objection is obviated by a well-known fact. On all coaſts where the ebbing and flowing of the ſea is diſcernible, numberleſs materials are brought in by the flux, which are not carried back by the reflux. The ſea gradually increaſes on ſome places and recedes from others; narrowing its limits by depoſiting earth, ſand, ſhells, &c. which naturally take a horizontal poſition. Theſe materials when accumulated, and elevated to a certain degree, gradually ſhut out the water, and remain for ever in the form of dry land.

15. The poſſibility of a mountain's being formed at the ſea by the motion and ſediments of the water, will appear from the following conſiderations. On a coaſt which the ſea waſhes with violence during the flow of tide, ſome part of the earth muſt be carried off at every ſtroke of the waves. Even where the ſea is bounded by rock, it is a known fact, that the rock itſelf is greatly waſted by the water; and conſequently that ſmall particles are carried off by the retreat of every wave. Thoſe particles of earth or ſtone are neceſſarily tranſported to ſome diſtance. Whenever the agitation of the water ceaſes, the particles are precipitated in the form of a ſediment, and lay the foundation of a firſt ſtratum, which is either horizontal or inclined, according to the ſituation of the ſurface on which they fall. This ſtratum is ſoon ſucceeded by another, produced by the ſame cauſe; and thus a conſiderable quantity of matter will be amaſſed, and depoſited in parallel beds. In proceſs of time this gradually accumulating maſs will become a mountain in the bottom of the ſea, exactly reſembling both in external and internal ſtructure, thoſe mountains which we ſee on the dry land. If there happened to be ſhells in that part of the bottom of the ſea where we have ſuppoſed the ſediments to be depoſited, they will be covered, filled, and incorporated with the depoſited matter, and form a part of the general maſs. Theſe ſhells will be lodged in different parts of the mountain, correſponding to the times in which they were depoſited: thoſe which lay at the bottom before the firſt ſtratum was formed, will occupy the loweſt ſtation; the others will be found in places more elevated.

16. It has been imagined that the agitation of the ſea produced by the winds and tides is only ſuperficial, and does not affect the bottom, eſpecially where it lies very deep. But it ought to be remembered, that whatever be the depth, the whole maſs is put in motion by the tides at the ſame time; and that, in a fluid globe, this motion would be communicated even to the centre. The attractive power, which occaſions the flux and reflux, is penetrating. It acts equally upon every particle of the maſs; ſo that the quantity of its force at different depths may be determined by calculation. We cannot therefore heſitate in pronouncing, that the tides, the winds, and all other cauſes of motion in the ſea, muſt produce heights and inequalities in its bottom; and that theſe heights muſt uniformly be compoſed of regular ſtrata either horizontal or inclined. The heights thus produced will gradually augment; like the waves which formed them, they will mutually reſpect each other; and if the extent of the baſe be great, in a courſe of years they will form a vaſt chain of mountains.

Whenever eminences are formed, they interrupt the uniform motion of the waters, and produce currents. Between two neighbouring heights in the bottom of the ocean there muſt be a current which will follow their common direction, and, like a river, cut a channel, the angles of which will be alternately oppoſite through the whole extent of its courſe. Theſe heights muſt continually increaſe: for, during the flow, the water will depoſit its ordinary ſediment upon their ridges; and the waters which are impelled by the current will force along, from great diſtances, quantities of matter, which will ſubſide between the hills, and, at the ſame time, ſcoop out a valley with correſponding angles at their foundation. Now, by means of theſe different motions and ſediments, the bottom of the ocean, though formerly ſmooth, muſt ſoon be furrowed and interſperſed with hills and chains of mountains, as we actually find it at preſent. The ſoft materials of which the eminences were originally compoſed, would gradually harden by their own gravity. Such of them as conſiſted of ſandy and cryſtalline particles, would produce thoſe enormous maſſes of rock and flint, in which we find cryſtals and other precious ſtones. Others, compoſed of ſtony particles mixed with ſhells, give riſe to thoſe beds of lime-ſtone and marble in which vaſt quantities of ſea-ſhells are ſtill found incorporated.

18. Theſe cauſes, as before obſerved, act with greater force under the equator than in other climates; for there the tides are higher, and the winds more uniform. The mountains of Africa and Peru are the higheſt in the world; often extending through whole continents, and ſtretching to great diſtances under the waters of the ocean. The mountains of Europe and Aſia, which extend from Spain to China, are not ſo high as thoſe of Africa and South America. According to the relations of voyagers, the mountains of the north are but ſmall hills, when compared with the mountains of the equatorial regions. Thoſe prodigious chains of mountains which run from eaſt to weſt in the old continent, and from north to ſouth in the new, muſt have been formed by the general motion of the tides. But the origin of the leſs conſiderable hills muſt be aſcribed to particular motions occaſioned by the winds, currents, and other irregular agitations of the ſea.

Having thus diſcuſſed ſome very important points reſpecting the theory of the earth, our author now proceeds to anſwer other queſtions which ſeem ſtill more difficult of ſolution.

19. But how has it happened that this earth, which we and our anceſtors have inhabited for ages, which, from time immemorial, has been an immenſe continent, dry, compact, and removed from the reach of water, ſhould, if formerly the bottom of an ocean, be now exalted to ſuch a height above the waters, and ſo completely ſeparated from them? Since the waters remained ſo long upon the earth, why have they now deſerted it? What accident, what cauſe, could introduce a change ſo great? A little reflection, ſays he, will furniſh us with at leaſt plauſible ſolutions to theſe ſeemingly ſo difficult queſtions. We daily obſerve the ſea gaining ground on certain coaſts, and loſing it on others. We know that the ocean has a general and uniform motion from eaſt to weſt; that it makes violent efforts againſt the rocks and low grounds which encircle it; that there are whole provinces which human induſtry can hardly defend againſt the fury of the waves; and that there are inſtances of iſlands which have but lately emerged from the waters, and of regular inundations. Hiſtory informs us of inundations and deluges of a more extenſive nature. Ought not all this to convince us, that the ſurface of the earth has experienced very great revolutions, and that the ſea may have actually given up poſſeſſion of the greateſt part of the ground which it formerly occupied? For example, let us ſuppoſe,

that the old and new worlds were formerly but one continent; and that, by a violent earthquake, the ancient Atlantis of Plato was ſunk. The conſequence of this mighty revolution muſt neceſſarily be, that the ſea would ruſh in from all quarters, and form what is now called the *Atlantic ocean*; and vaſt continents, perhaps thoſe we now inhabit, would of courſe be left dry. This great revolution might be effected by the ſudden failure of ſome immenſe cavern in the interior parts of the globe, and an univerſal deluge would infallibly ſucceed.

20. But, however conjectures of this kind may ſtand, it is certain that ſuch a revolution hath happened; and we may even believe that it hath happened naturally; for if a judgment of the future is to be formed from the paſt, we have only to attend carefully to what paſſes before our eyes. It is a fact eſtabliſhed by the repeated obſervation of voyagers, that the ocean has a conſtant motion from eaſt to weſt. This motion, like the trade-winds, is not only perceived between the tropics, but through the whole temperate climates, and as near the poles as navigators have approached. As a neceſſary conſequence of this motion, the Pacific ocean muſt make continual efforts againſt the coaſts of Tartary, China, and India; the Indian ocean muſt act againſt the eaſt coaſt of Africa; and the Atlantic muſt in a ſimilar manner act againſt all the eaſtern coaſts of America. Hence the ſea muſt have gained, and will always continue to gain, on the eaſt, and to loſe on the weſt. This of itſelf would be ſufficient to prove the poſſibility of the change of the ſea into land, and land into ſea. If ſuch is the natural effect of the ſea's motion from eaſt to weſt, may it not reaſonably be ſuppoſed, that Aſia, and all the eaſtern continent, is the moſt ancient country in the world; and that Europe, and part of Africa, eſpecially the weſt parts of theſe continents, as Britain, France, Spain, &c. are countries of a more recent date?

21. The cauſe of the perpendicular fiſſures with which the earth abounds, is eaſily inveſtigated. As various materials conſtituting the different ſtrata were tranſported by the waters, and depoſited in the form of ſediments, they would at firſt be in a very diluted ſtate, and would gradually harden and part with the ſuperfluous quantity of moiſture they contained. In proceſs of time, drying, they would naturally contract and ſplit at irregular diſtances. Theſe fiſſures neceſſarily aſſumed a perpendicular direction; becauſe in this direction the action of gravity of one particle upon another is equal to nothing: but it acts directly oppoſite to this deſcription, in a horizontal ſituation: the diminution in bulk could have no ſenſible effect but in a vertical line. The contraction of the parts in drying, therefore, and not the contained water forcing an iſſue, as has been alleged by ſome, is the cauſe of perpendicular fiſſures; for it may be often remarked, that the ſides of thoſe fiſſures, through their whole extent, correſpond as exactly as the two ſides of a ſplit piece of wood.

22. Perpendicular fiſſures vary greatly as to the extent of their openings. Some are about half an inch or an inch; others a foot or two feet; ſome extend ſeveral fathoms, and give riſe to thoſe vaſt precipices which ſo frequently occur between oppoſite parts of the ſame rocks, in the Alps and other high mountains. It is plain, that the fiſſures, the openings of which are ſmall, have been occaſioned ſolely by drying. But thoſe which extend ſeveral feet are partly owing to another cauſe; namely, the ſinking of the foundation upon one ſide, while that of the other remains firm. If the baſe ſinks but a line or two, when the height is conſiderable, an opening of ſeveral feet, or even fathoms, will be the conſequence. When rocks are founded on clay or ſand, they ſometimes ſlip a little to one ſide; and the fiſſures are of courſe augmented by this motion.

23. The large openings, however, and prodigious cuts, which are to be met with in rocks and mountains, are to be aſcribed to another cauſe. They could be produced no other way than by the ſinking of immenſe ſubterraneous caverns, that were unable any longer to ſuſtain their incumbent load. But theſe cuts or intervals in mountains are not of the ſame nature with the perpendicular fiſſures: they appear to have been ports opened by the hand of nature for the communication of nations. This ſeems to be the intention of all large openings in chains of mountains, and of thoſe ſtraits by which different parts of the ocean are connected; as the ſtraits of Thermopylæ, of Gibraltar, &c. the gaps or ports in mount Caucaſus, the Cordileras, &c.

24. But the greateſt changes upon the ſurface of the earth are occaſioned by rains, rivers, and torrents from the mountains. Theſe derive their origin from vapours raiſed by the ſun from the ſurface of the ocean, and which are tranſported by the winds through every climate. The progreſs of theſe vapours, which are ſupported by the air, and tranſported at the pleaſure of the winds, is interrupted by the tops of the mountains, where they accumulate into clouds, and fall down in the form of rain, dew, or ſnow. At firſt, theſe waters deſcended into the plains without any fixed courſe; but they gradually hollowed out proper channels for themſelves. By the power of gravity they ran to the bottom of the mountains; and penetrating or diſſolving the lower grounds, they carried along with them ſand and gravel, cut deep furrows in the plains, and thus opened paſſages to the ſea, which always receives as much water by rivers as it loſes by evaporation. The windings in the channels of rivers have uniformly correſponding angles on their oppoſite banks; and as mountains and hills, which may be regarded as the banks of the valleys by which they are ſeparated, have likewiſe ſinuoſities with correſponding angles, this circumſtance ſeems to demonſtrate, that the valleys have been gradually formed by currents of the ocean, in the ſame manner as the channels of rivers have been produced. Rivers produce conſiderable changes on the ſurface of the earth; they carry off the ſoil, wear away the moſt ſolid rocks, and remove every thing that oppoſes their paſſage. The waters of the clouds alſo, which deſcend upon the mountains, by continually waſhing away ſome part of the earth, tend to level them with the plains; and would undoubtedly do ſo, if time enough were allowed for that purpoſe.

25. From what has been advanced, we may conclude, that the flux and reflux of the ocean have produced all the mountains, valleys, and other inequalities on the ſurface of the earth: that currents of the ſea have ſcooped out the valleys, elevated the hills, and beſtowed on them the correſponding directions: that the ſame waters of the ocean, by tranſporting and depoſiting earth, &c. have given riſe to the parallel ſtrata: that the waters from the heavens gradually deſtroy the effects of the ſea, by continually diminiſhing the heights of the mountains, filling up the valleys, and choking up the mouths of rivers; and by reducing every thing to its proper level, they will in time reſtore the earth to the ſea, which by its natural operations will again create new continents interſperſed with mountains and valleys, and every way ſimilar to thoſe which we now inhabit.

Thus far our author preſerves ſome degree of plauſibility in his reaſoning; but in his account of the original formation of the earth, he certainly goes to the utmoſt verge of *probability*, or perhaps of *poſſibility*, in his ſuppoſitions. According to him, all the planets in our ſyſtem were originally parts of the ſun himſelf. They were detached from his body all at once by a mighty ſtroke of a comet. The poſſibility of driving off ſuch a quantity of matter from the ſun by a ſingle ſtroke, he labours hard to prove; but this is far from being the greateſt difficulty in his ſyſtem.—"To this theory," ſays he, "it may

be objected, that if the planets had been driven off from the ſun by a comet, in place of deſcribing circles round him, they muſt, according to the law of projectiles, have returned to the ſame place from whence they had been forced; and therefore, that the projectile force of the planets cannot be attributed to the impulſe of a comet.

"I reply, that the planets iſſued not from the ſun in the form of globes, but in the form of torrents; the motion of whoſe anterior particles behoved to be accelerated by thoſe behind, and the attraction of the anterior particles would alſo accelerate the motion of the poſterior; and that this acceleration, produced by one or both of theſe cauſes, might be ſuch as would neceſſarily change the original motion ariſing from the impulſe of the comet; and that, from this caſe, might reſult a motion ſimilar to what takes place in the planets; eſpecially when it is conſidered, that the ſhock of the comets removes the ſun out of its former ſtation. This reaſoning may be illuſtrated by an example. Suppoſe a muſket-ball diſcharged from the top of a mountain, and that the force of the powder was ſufficient to ſend it beyond a ſemidiameter of the earth: it is certain that this ball would revolve round the earth, and return at every revolution to the place from whence it had been diſcharged. But, inſtead of a muſket-ball, if a rocket were employed, the continued action of the fire would greatly accelerate the original impulſive motion. This rocket would by no means return to the ſame point like the ball; but, *cæteris paribus*, would deſcribe an orbit, the perigee of which would be more or leſs diſtant from the earth in proportion to the greatneſs of the change produced in its direction by the accelerating force of the fire. In the ſame manner, if the original projectile force impreſſed by the comet on the torrent of ſolar matter was accelerated, it is probable, that the planets formed by this torrent acquired their circular or eliptical movements around the ſun."

In like manner, he accounts for the formation and circulation of the ſecondary planets. The revolutions of the primaries on their axes, he accounts for from the obliquity of the original ſtroke impreſſed by the comet. The oblate ſpheroidal figure of the earth is eaſily deduced from its diurnal motion, and the fluidity of the whole at its firſt formation. The flattening at the poles he eſtimates at about one 230th part of the whole. As this computation differs conſiderably from the account given by the mathematicians who were ſent to different parts of the world on purpoſe to determine the figure of the earth, and who made the flatneſs at the poles equal to one 175th part of the whole, he ſuppoſes this difference to have ariſen from changes that have ſince taken place on the ſurface of the earth, occaſioned by the cauſes already mentioned. He then proceeds to account for the formation of all things, in the following manner.—"It is therefore evident, that the earth aſſumed its figure when in a melted ſtate: and, to purſue our theory, it is natural to think, that the earth, when it iſſued from the ſun, had no other form but that of a torrent of melted and inflamed matter: that this torrent, by the mutual attraction of its parts, took on a globular figure, which its diurnal motion changed into a ſpheroid: that when the earth cooled, the vapours, which are expanded like the tail of a comet, gradually condenſed, fell down in the form of water upon the ſurface, depoſiting at the ſame time a ſlimy ſubſtance mixed with ſulphur and ſalts; part of which was carried by the motion of the waters into the perpendicular fiſſures of the ſtrata, and produced metals; and the reſt remained on the ſurface, and gave riſe to the vegetable mold, which abounds in different places, with more or leſs of animal or vegetable particles, the organization of which is not obvious to the ſenſes.

"Thus the interior parts of the globe were originally compoſed of vitrified matter; and, I believe, they are ſo at preſent. Above this vitrified matter were placed thoſe bodies which the fire had reduced to the ſmalleſt particles, as ſands, which are only portions of glaſs; and above theſe, pumice-ſtones, and the ſcoriæ of melted matter, which produced the different clays. The whole was covered with water to the depth of 500 or 600 feet, which originated from the condenſation of the vapours when the earth began to cool. This water depoſited a ſtratum of mud, mixed with all thoſe matters which are capable of being ſublimed or exhaled by fire: and the air was formed of the moſt ſubtile vapours, which, from their levity, roſe above the water.

"Such was the condition of the earth when the tides, the winds, and the heat of the ſun, began to introduce changes on its ſurface. The diurnal motion of the earth, and that of the tides, elevated the waters in the equatorial regions, and neceſſarily tranſported thither great quantities of ſlime, clay, and ſand; and by thus elevating thoſe parts of the earth, they perhaps ſunk thoſe under the poles about two leagues, or a 230th part of the whole, as was formerly remarked: for the waters would eaſily reduce into powder, pumice-ſtones, and other ſpongy parts of the vitrified matter upon the ſurface; and by this means excavate ſome places and elevate others; which, in time, would produce iſlands and continents, and all thoſe inequalities on the ſurface, which are more conſiderable towards the equator than towards the poles. The higheſt mountains lie between the tropics and the middle of the temperate zones, and the loweſt from the polar circles towards the poles. Indeed, both the land and ſea have moſt inequalities between the tropics, as is evident from the incredible number of iſlands peculiar to thoſe regions."

From the preceding extracts, the theories of Drs. Burnet and Woodward, as well as Meſſrs. Whiſton and Buffon, will be eaſily underſtood; but the deficiency of all of them muſt be exceedingly obvious even to the moſt ſuperficial reader. They all aſſume only the powers of attraction and repulſion as agents; without conſidering, that theſe two powers, or indeed any other two with which mankind are acquainted, could only have compoſed matters nearly ſimilar to each other. If the original particles of matter are homogeneous, and endowed with ſimilar powers, all the matters we ſee ought to be homogeneous alſo. But this is far from being the caſe. Some parts of it we ſee are exceedingly hard, others proportionably ſoft. The parts of ſome bodies attract each other violently; thoſe of others have hardly any attraction for each other, but are ſeparable by the ſmalleſt force. And though it ſhould be granted, that the powers of attraction and repulſion were originally different in different parts of matter, we have ſtill to explain by what means the ſimilar parts of matter found out each other in ſuch a chaos as the earth originally was. This ſeems an inſuperable difficulty in the ſyſtems of Drs. Burnet and Woodward; and is equally, though leſs conſpicuouſly ſo, in thoſe of Whiſton and Buffon.

EARTH-NUTS, or GROUND-NUTS (*Encycl.*). The roots of the water-hemlock, a poiſonous plant which bears ſome general reſemblance to that of the arachis, are ſometimes miſtaken for the latter. See an inſtance of this under POISONS in this SUPPLEMENT.

EAR-WAX, or CERUMEN (*Encycl.*). Citizens Fourcroy and Vauquelin have analyſed the ear-wax, and found that it conſiſts of the following ſubſtances. 1. Of an oily matter, more reſembling the fat which is contained in the gall than any other animal fat. 2. Of an albuminous animal ſubſtance. 3. Of a colouring principle, which, by its bitter taſte and its cloſe combination with fat, comes near to the colouring principle of the bile.

EASTBOURN, a town in Suſſex, noted for plenty of the birds called wheatears, and as a place of reſort for bathing. It is ſeated near the Engliſh Channel, 15 miles E.S.E. of Lewes, and 65 S.S.E. of London.

EAST-LOOE, a mean borough in Cornwall; 16 miles W. of Plymouth; 232 from London.

EASTON, a town of Pennſylvania, capital of the county of Northampton, ſeated at the confluence of the Leigh and Delaware, 46 miles N. by W. of Philadelphia. Long. 75. 17. W. Lat. 40. 21. N.

EASTONNESS, the moſt eaſterly cape on the coaſt of Suffolk, and the N. point of Southwold Bay.

EAU-DE-LUCE (*Encycl.*), is prepared in the following manner: ten or twelve grains of white ſoap are diſſolved in four ounces of rectified ſpirit of wine; after which the ſolution is ſtrained. A dram of rectified oil of amber is then added, and the whole filtrated: with this ſolution ſhould be mixed ſuch a proportion of the ſtrongeſt volatile ſpirit of ſal-ammoniac, in a cryſtal glaſs bottle, as will, when ſufficiently ſhaken, produce a beautiful milk-white liquor. If a kind of cream ſhould ſettle on the ſurface, it will be requiſite to add a ſmall quantity of the ſpirituous ſolution of ſoap.—Thoſe who may wiſh to have this liquor perfumed may employ lavender or Hungary water inſtead of the ſpirit of wine.

This compoſition is, however, ſeldom obtained in a genuine ſtate when purchaſed at the ſhops. Its uſe, as an external remedy, is very extenſive; for it has not only been employed for curing the bites of vipers, waſps, bees, gnats, ants, and other inſects, but alſo for burns, and even the bite of a mad dog, though not always with uniform ſucceſs. Beſides, it affords one of the ſafeſt ſtimulants in caſes of ſuffocation from mephitic vapours, and in that ſtate of apoplexy which is termed *ſerous*, as likewiſe after exceſſive intoxication, and in all thoſe paralytic complaints where the veſſels of the ſkin, or the muſcular fibre, require to be excited into action. Nevertheleſs, it ought to be uſed with due precaution.

Mr. Nicholſon, in his Journal, has related the following experiments, made to procure this liquid. He conſiders *maſtic* as a principal ingredient, and the great ſecret by which the *milkineſs* has been communicated to it.

One dram of the rectified oil of amber was diſſolved in four ounces of the ſtrongeſt ardent ſpirit of the ſhops; its ſpecific gravity being .840 at 60 degrees of Fahrenheit. A portion of the clear ſpirit was poured upon a larger quantity of fine powdered maſtic than it was judged could be taken up. This was occaſionally agitated without heat; by which means the gum reſin was for the moſt part gradually diſſolved. One part of the oily ſolution was poured into a phial, and to this was added one part of the ſolution of maſtic. No opacity or other change appeared. Four parts of ſtrong cauſtic volatile alkali were then poured in, and immediately ſhaken. The fluid was of a denſe opake white colour, affording a ſlight ruddy tinge when the light was ſeen through a thin portion of it. In a ſecond mixture, four parts of the alkali were added to one of the ſolution of maſtic; it appeared of a leſs denſe and more yellowiſh white than the former mixture. More of the gum reſinous ſolution was then poured in; but it ſtill appeared leſs opake than that mixture. It was ruddy by tranſmitted light. The laſt experiment was repeated with the oily ſolution inſtead of that of maſtic. The white was much leſs denſe than either of the foregoing compounds, and the requiſite opacity was not given by augmenting the doſe of the oily ſolution. No ruddineſs nor other remarkable appearance was ſeen by tranſmitted light. Theſe mixtures were left at repoſe for two days; no ſeparation appeared in either of the compounds containing maſtic; the compound conſiſting of the oily ſolution and alkali became paler by the ſeparation of a cream at the top.

It appears, therefore, that the firſt of theſe three mixtures, ſubject to variation of the quantity of its ingredients, and the odorant additions which may be made, is a good eau-de-luce.

In a ſubſequent number of the ſame journal, we have the following recipe by one of the author's correſpondents, who had often proved its value by experience. "Digeſt ten or twelve grains of the whiteſt pieces of maſtic, ſelected for this purpoſe, and powdered, in two ounces of alcohol; and, when nearly diſſolved, add twenty grains of elemi (ſee AMYRIS, *Encycl.*). When both the reſins are diſſolved, add ten or fifteen drops of rectified oil of amber, and fifteen or twenty of eſſence of bergamot: ſhake the whole well together, and let the fæces ſubſide. The ſolution will be of a pale amber colour. It is to be added, in very ſmall portions, to the beſt aqua ammoniæ puræ, until it aſſumes a milky whiteneſs, ſhaking the phial well after each addition, as directed by Macquer. The ſtrength and cauſticity of the ammoniac are of moſt eſſential conſequence. If, upon the addition of the firſt drop or two of the tincture, a denſe opake coagulated precipitate is formed, not much unlike that which appears on dropping a ſolution of ſilver into water ſlightly impregnated with common ſalt, it is too ſtrong, and muſt be diluted with alcohol. A conſiderable proportion of the tincture, perhaps one to four, ought to be requiſite to give the liquor the proper degree of opacity."

EAUSE, an ancient town of France, in the department of Gers, 17 miles S.W. of Condon. Long. 0. 10. E. Lat. 43. 51. N.

EBENEZER, a town of the United States, in Georgia, ſituate on the Savannah, 25 miles N.N.W. of Savannah. Long. 81. 22. W. Lat. 32. 28. N.

EBENFURTH, a town of the archduchy of Auſtria, built by the Knights Templars, on the Leyta, 18 miles S. of Vienna.

EBERBACH, a town of Germany, in the palatinate of the Rhine, remarkable for its wine. It is ſeated on the Neckar, 10 miles N.E. of Heidelberg. Long. 8. 56. E. Lat. 49. 26. N.

EBERBERG, a caſtle of Germany, in the palatinate of the Rhine, ſeated at the confluence of the Nahe and Alſen, eight miles S.W. of Creutznach. Long. 7. 52. E. Lat. 49. 38. N.

EBERSTEIN, a diſtrict and caſtle of Suabia, ſubject to the margrave of Baden. The caſtle is the chief place, ſix miles S.E. of Baden. Long. 8. 20. E. Lat. 48. 46. N.

EBERSTEIN, a town of France, in the department of Lower Rhine, eight miles S.W. of Straſburg. Long. 7. 46. E. Lat. 48. 29 N.

EBERVILLE, a town of France, in the department of Puy-de-Dome, with a late rich Benedictine abbey. It is ſeated on the Scioule, eight miles N.E. of Riom. Long. 3. 15. E. Lat. 45. 59. N.

EBULLITION, the ſame with BOILING. The word is alſo uſed in a ſynonymous ſenſe with EFFERVESCENCE.

ECCLEFECHAN, a village in Dumfrieſſhire, noted for its great monthly market for cattle. It is 10 miles S.E. of Dumfries.

ECCLESHAL, a town in Staffordſhire, with a market on Friday. It is ſeated on a branch of the river Sow, and the biſhop of Lichfield and Coventry has a caſtle here. It is ſix miles N.W. of Stafford and 143 of London. Long. 2. 9. W. Lat. 53. 2. N.

ECHTERNACH, a town of Luxemburg, on the river Sout, in a valley ſurrounded by mountains, 18 miles N.E. of Luxemburg. Long. 6 33. E. Lat. 49. 50. N.

ECKEREN, a village of Brabant, five miles N. of Bra-

bant. A battle was fought here in 1703, between the French and the allies.

ECYA, or EXIJA, an epiſcopal town of Spain, in Andaluſia. It contains 20 convents, and about 9,000 inhabitants, whoſe principal trade is in wool and hemp. It is ſeated on the Xenil, 28 miles S.W. of Cordova. Long. 4. 27. W. Lat. 37. 39. N.

EDAM, a town of North Holland, famous for its red-rind cheeſes; ſeated on the Zuider-Zee, 20 miles N. by E. of Amſterdam. Long. 4. 58. E. Lat. 52. 32. N.

EDDYSTONE, the name of ſome rocks in the Engliſh Channel, which cauſe variety of contrary ſets of the tide or current in their vicinity. They are ſituate S.S.W. from the middle of Plymouth Sound, at the diſtance of 14 miles. They are almoſt in the line which joins the Start and the Lizard Points, and their ſituation with regard to the Atlantic is ſuch, that all the heavy ſeas from the S.W. come uncontrolled upon the Eddyſtone rocks, and break over them with the utmoſt fury. On the principal rock (for the reſt are under water) Mr. Winſtanley, in 1696, undertook to build a lighthouſe; and he completed it in 1700. This architect was ſo certain of the ſtability of this ſtructure, that he declared it to be his wiſh to be in it during the moſt tremendous ſtorm. Unfortunately he had his wiſh: it was deſtroyed in the dreadful ſtorm, November 27, 1703, when he periſhed in it. In 1709, another built of wood, but on a different conſtruction, was erected by Mr. Rudyard, which was conſumed by fire in 1755. Another, of ſtone, was begun by Mr. Smeaton, on April 2, 1757, and finiſhed Auguſt 4, 1759. The rock, which ſlopes towards the S.W. is cut into horizontal ſteps, into which are dove-tailed, and united by a ſtrong cement, Portland ſtone, and granite. The whole, to the height of 35 feet from the foundation, is a ſolid of ſtones, engrafted into each other, and united by every means of additional ſtrength. The building has four rooms, one over the other, and at the top a gallery and lantern. The ſtone floors are flat above, but concave beneath, and are kept from preſſing againſt the ſides of the building by a chain let into the walls. It is nearly 80 feet high, and ſince its completion has been aſſaulted by the fury of the elements, without ſuffering the ſmalleſt injury. Its diſtance from the Ram Head, the neareſt point of land, is 12 miles. Long. 4. 24. W. Lat. 50. 8. N.

EDEN, a river which riſes in Weſtmoreland, on the confines of Yorkſhire, and running N. by Appleby and Carliſle, falls into Solway Frith.

EDENTON, a town of North Carolina, on the N. ſide of Albemarle Sound, with an epiſcopal church. It is the capital of the Chowan County, and 78 miles S. by W. of Williamſburgh. Long. 76. 40. W. Lat. 35. 58. N.

EDGHILL, a village in Warwickſhire, where the firſt battle was fought between Charles I. and the parliament, in 1642. It is 14 miles S. of Warwick.

EDGWARE, a town in Middleſex, with a market on Thurſday, eight miles N.W. of London. Long. 0. 14. W. Lat. 51. 37. N.

EDIKOFEN, a town of Germany, in the palatinate of the Rhine, near which a battle was fought between the French and Pruſſians on July 12, 1794; the conteſt was long and bloody, and the victory doubtful; but the battle was renewed the next day, and terminated in favour of the French.

EDINBURGH (*Encycl.*). As many of our readers may feel a ſatisfaction in being acquainted with the manner in which medical education is conducted in a ſeminary ſo much celebrated as that of Edinburgh, we here inſert it, from vol. VI. of the Medical and Phyſical Journal.

The univerſity of Edinburgh was founded by James the VIth of Scotland, about the year 1581, and is denominated in all official writings, *Academia Jacobi Sexti, Regis Scotorum quæ Edinburgi eſt.* It conſiſts of a principal and profeſſors, who have ſmall ſalaries, and all of them, except the regius profeſſors, are appointed by the town-council of Edinburgh, who have likewiſe the power of inſtituting new profeſſorſhips when they ſhall ſee occaſion. The principal, with the whole body of profeſſors, form the Senatus Academicus, which enacts laws for the regulation of the college, and ſettles all matters relating thereto. Degrees are confirmed, at certain periods, by the principal with the conſent and approbation of this body. There is an endowment of a few pounds per annum for a ſmall and limited number of burſars, but there are no fellows.

Moſt of the profeſſors, and the whole number of ſtudents, live in the town; the latter wear no particular dreſs, are ſubject to no college laws, and may attend the lectures at ſuch times only as they pleaſe. There is indeed a ſmall fine for abſence or inattention, at one or two of the junior claſſes, as the Latin and Greek. The college exerciſes, beſides thoſe of conſtruing, tranſlating, or demonſtrating, at the Latin, Greek, or mathematical claſſes, are writing occaſional eſſays on ſubjects connected with their ſtudies; at the logic, the higher Latin and Greek claſſes, the divinity, and of late years at the moral philoſophy. The only claſs, we believe, at which there is any examination on what has been previouſly heard, is the logic. It is rather to be lamented that there are not more frequent opportunities of competition in the various claſſes of this univerſity; and it is a circumſtance which muſt naturally excite conſiderable wonder among thoſe who are informed of it, that there is not a ſingle medal or prize of any kind ever offered for the beſt eſſay on any ſubject, whether literary or philoſophical. When it is conſidered how great is the inducement afforded to induſtry by an honorary reward of this kind, how trifling is the expence attending it, and how very many there are of diſtinguiſhed rank, fortune, and reputation, who have had the elements, if not the whole of their education, at this univerſity, it is extremely ſingular that no endowment of this nature has ever been made. The profeſſors themſelves, who amount to a conſiderable number, and are highly reſpectable for their learning and talents, might, by a very ſmall individual contribution, raiſe a ſufficient ſum annually for defraying the expence of a ſmall number of prize medals.

The profeſſorſhips in the univerſity of Edinburgh are divided into four faculties, viz. the *faculty of theology*, of *law*, of *medicine*, and of *arts*; and the whole number of profeſſors amounts to about twenty-four.

In the *faculty of theology* is compriſed divinity, church hiſtory, Hebrew and oriental languages:

In the *faculty of law*, civil law, law of nature and nations, univerſal hiſtory, and Scot's law:

In the *faculty of medicine*, anatomy and ſurgery, practice of phyſic, chemiſtry, materia medica, theory of phyſic, botany, and midwifery.

In the *faculty of arts*, Latin or humanity (literæ humaniores), Greek, mathematics, logic, moral philoſophy, natural philoſophy, rhetoric and belles-lettres, natural hiſtory, practical aſtronomy, agriculture.

Till near the revolution there were no medical profeſſors at this univerſity, and even till the year 1720 they were merely titular. About that period the late celebrated Profeſſor Monro commenced his anatomical lectures, and from that we may date the formation of the medical ſchool in Edinburgh, which has gradually ariſen to a degree of celebrity unequalled by any other in Europe.

From the above enumeration, it appears that the medical profeſſorſhips are ſeven in number. That of midwifery is not however on the ſame footing with the others, as the pro-

feſſor has no ſhare in the medical examinations, nor is it neceſſary for a ſtudent to attend this claſs before he is eligible to a medical degree.

The lectures commence in the latter end of October, with the exception of midwifery, of which there are three courſes in the year, viz. two in the winter and one in the ſummer, and laſt until the latter end of April or the beginning of May. The botanical lectures are only given in the ſummer ſeaſon, during the months of May, June, and July, at the Botanical Garden, a ſhort diſtance from Edinburgh. The preſent profeſſor of chemiſtry has for ſome time given a ſummer courſe of lectures which laſts three months.

The firſt few lectures in the ſeaſon are always occupied with the hiſtory of the ſcience, by way of introduction: and as the ſacraments of the church of Scotland, which occur twice a-year, give an interruption to them for a week in the beginning of November, the particular buſineſs of the courſe is not entered upon till about the 10th or 11th of that month. The lectures are an hour each in length, except the anatomical, which is an hour and a half at leaſt. They are given on every week-day except Saturday, and on that day ſome of the profeſſors have occaſion to lecture during a part of the ſeaſon, in order to get through the buſineſs of the courſe.

The following are the names of the preſent profeſſors, and the hours at which they lecture:

Dr. Monro Dr. Monro, jun.	anatomy - - - - - -	1 P. M.
Dr. Gregory - -	practice of medicine - - -	9 A. M.
Dr. Hope - -	chemiſtry - - - - -	10 A. M.
Dr. Duncan - -	theory or inſtitutes of med.	11 A. M.
Dr. Home Dr. Home, jun.	materia medica - - -	8 A. M.
Dr. Rutherford -	botany - - - - - - -	8 A. M.
Dr. Hamilton Dr. Hamilton, jun.	midwifery - in winter in ſummer	3 P. M. 10 A. M.

Any perſon who fees a claſs may attend the lectures; it is neceſſary, however, to be afterwards enrolled in the college books at the matriculation, to be able to procure any official document of academical education, and to have acceſs to the valuable collection of books of which the college library conſiſts. This noble library is enriched with a copy of every book which is entered at Stationers' Hall, and is aided by a ſmall ſum paid by each ſtudent at his matriculation. The books may be procured, to a limited number, by ſtudents, on their depoſiting the value with the librarian, who returns it on receiving the book.

The whole number of ſtudents at the univerſity is from 1000 to 1300, of whom between four and five hundred are medical. The profeſſor of anatomy has never fewer than three hundred attending him, and ſometimes many more. The other claſſes, particularly thoſe of the practice of medicine and chemiſtry, are alſo well attended.

To the profeſſor of anatomy belongs a very capital collection of preparations, which may be inſpected by the ſtudents in the lecture-room, or in ſome cloſets adjoining it, in the courſe of the ſeaſon. He is always able to provide a ſufficient number of ſubjects for public demonſtration, but there are no opportunities of private diſſection afforded in the college.

Students who attend the midwifery claſs have the advantage of practice at the lying-in hoſpital. Connected with the medical education of the college is the attendance at the royal infirmary, which is a building capable of containing above two hundred patients, and ſupported principally by voluntary contributions. The medical and ſurgical patients are kept in different wards, and from the medical are ſelected about fifteen males, and as many females, with the moſt intereſting complaints, who are put into ſeparate wards, denominated *clinical*, and are attended by a medical profeſſor of the college, of whom there are generally four who take the duty alternately. The profeſſional buſineſs of the infirmary is performed by two ordinary phyſicians, appointed for a permanence, with ſalaries; two ſurgeons*, a clinical phyſician, two phyſicians' clerks, a houſe ſurgeon, and two clinical phyſicians' clerks. The phyſicians' clerks and houſe ſurgeon are appointed by the managers, and reſide in the hoſpital; the clinical phyſicians' clerks are appointed by the clinical phyſician for the time of his attendance, and do not reſide. The patients are ſeen by the phyſician or ſurgeon having the care of them, every day, except Sunday, at twelve o'clock.

The manner in which the buſineſs of the hoſpital is conducted, reflects much credit on all concerned in it, and is extremely conducive to the improvement of the ſtudent. On the admiſſion of any patient, whether ſurgical or medical, the houſe ſurgeon or phyſicians' clerk, take down an accurate account of the ſymptoms, and hiſtory of the complaint, in a book for the purpoſe, in which are inſerted the daily progreſs and treatment, dictated by the attending ſurgeon or phyſician. Theſe books are, at certain times of the day, left in a particular room for the inſpection of the ſtudent; and as they are liable to the ſeverity of criticiſm, both as to ſtyle and accuracy, it is the intereſt of all parties that they ſhould be correct. The ſurgical caſes of the hoſpital form the baſis of a valuable courſe of lectures, given twice a-week during the winter months, by Mr. Ruſſell.

Patients admitted into the clinical wards are the peculiar objects of attention. An accurate hiſtory of their complaints is taken by one of the clerks on their admiſſion, and a very full report of the ſtate of the patient, with the progreſs and treatment of the diſeaſe, is every day dictated by the clinical phyſician, who alſo gives lectures on theſe caſes at the college every Tueſday and Friday, at five o'clock. There are two clinical phyſicians in winter and one in ſummer, each of them officiating in this ſituation three months.

The fee for the clinical, and each courſe of medical lectures at the college, is three guineas, with a ſmall ſum to the janitor and ſervants. Every part of the hoſpital, whether medical, ſurgical, or clinical, is open to the ſtudent for three guineas annually; and this fee, as well as that for the clinical lectures, is, we believe, leſſened after a certain attendance. The ſtudents are at liberty to viſit any part of the hoſpital, at any time of the day, to make their perſonal obſervations on the ſtate of the patients, and compare the reports dictated by the phyſicians or ſurgeons with the appearances of the diſeaſe.

Before any gentleman can be examined for a medical degree in Edinburgh, he muſt bring forward documents of hav-

---

* The care of the ſurgical patients of the hoſpital formerly belonged to the whole college of ſurgeons, who took the duty by rotation, for two months at a time; the ſucceſſor acting as an aſſiſtant until it became his turn to officiate. Dr. Gregory, while preſident of the college of phyſicians of Edinburgh, publiſhed an addreſs to the managers on the ſubject of the ſurgical attendance of the infirmary, and ſucceeded ſo far as to induce them to make material alterations in it. There are now on the eſtabliſhment ſix hoſpital ſurgeons, who are appointed for a permanence, with ſix aſſiſtant ſurgeons under them. Two of theſe ſurgeons act for two years at a time, and divide the patients. There is alſo a certain number of dreſſers appointed by the ſurgeons.

ing ſtudied medicine three years, at that or ſome other univerſity. The teſtimonial of that part of his education which he received in Edinburgh, is given him from the records of the univerſity by the ſecretary. As it may be acceptable to ſome of our readers to be informed of the regulations with regard to medical degrees in Edinburgh, we ſhall preſent them with nearly a literal tranſlation of the ſtatutes on this ſubject, known by the name of *Statuta Solemnia*.

Statutes of the univerſity of Edinburgh on the ſubject of medical degrees; propoſed by the faculty of medicine, and enacted by the ſenate.

1. No one ſhall be admitted to the degree of doctor of medicine, except on the 24th of June and the 12th of September, or the days immediately ſubſequent.

2. No one ſhall be admitted into the number of candidates unleſs he ſhall have, for the ſpace of three years, ſtudied, in this or ſome other univerſity, medicine and the branches compriſed in it, to wit, *anatomy and ſurgery, chemiſtry, botany, materia medica, and pharmacy,* and the *theory and practice of medicine,* and unleſs he ſhall have attended the clinical lectures given by the profeſſors of medicine, on the caſes in the infirmary.

3. Three months at leaſt before the above-mentioned days, every one deſirous of the honours of medicine, muſt deliver a *medical inaugural diſſertation* to one of the medical profeſſors, who is to read it over, amend it if neceſſary, and annex to it, in writing, his *perlegi*, or certificate of having read it, with the day on which it was received.

4. On or before the 20th of April, or July, he muſt communicate his wiſh to the dean of the faculty of medicine*; and at the ſame time deliver to him his inaugural diſſertation (with the certificate of the profeſſor who has read it annexed), to be ſubjected to the opinion of the faculty of medicine, in order that they may, by this ſpecimen, as well as by a private examination, be acquainted with his progreſs in learning, particularly in the ſcience of medicine, before they admit him into the number of candidates.

5. On the 18th of May, or the 6th of Auguſt, the candidates ſhall be examined by the two medical profeſſors before the faculty of medicine, in the various branches of medical ſcience above enumerated.

6. Should the candidate be approved, an aphoriſm of Hippocrates ſhall be propoſed to him by one of the medical profeſſors, and a medical queſtion by another. The former, explained and illuſtrated by a commentary; the latter, with an anſwer ſupported by proper arguments, he ſhall deliver on the 28th of May, or the 16th of Auguſt, to the profeſſors who propoſed them; and he ſhall defend his commentary and anſwer on the 30th of May or the 18th of Auguſt, before the faculty of medicine.

7. Should the candidate be thus far approved, there ſhall be delivered to him by two profeſſors, two hiſtories of diſeaſes, with queſtions annexed, that he may illuſtrate and anſwer them in writing. The caſes thus illuſtrated, together with the anſwers, he ſhall deliver to the profeſſors propoſing them on the 12th of June or the 1ſt of September, and ſhall defend them before the faculty of medicine on the 15th of June or the 3d of September.

8. If the candidate be approved after the firſt trial on the 18th of May, or the 6th of Auguſt, he is at liberty to print his inaugural diſſertation, and muſt deliver ſix correct copies of it (wanting the page which expreſſes the title and the authority of the univerſity) to the dean of the faculty of medicine, on the 15th of June, or the 3d of September.

9. Should the candidate be a third time approved by the faculty of medicine, the dean of the faculty ſhall report to the ſenate every thing which has been done, and by their authority and approbation, he ſhall be ordered to publiſh and defend it, on the 24th of June or the 12th of September. He ſhall then, if agreeable to the ſenate, receive in the uſual way, the reward of his ſtudies and labour, the degree of doctor of medicine

10. The faculty of medicine ſhall always meet at the college on the above-mentioned days at nine o'clock in the morning.

11. All the aforeſaid examinations and exerciſes ſhall be in the Latin language.

No examinations can be conducted with more candour than thoſe in Edinburgh. Queſtions are never aſked with a view to puzzle or perplex, nor are any ever propoſed which a ſtudent ſhould not be able to anſwer. On the other hand, the examinations are not merely formal, as the profeſſors never heſitate in rejecting a man, whom they do not conceive properly qualified. The principal examination is that mentioned as a private one at No. 4 of the Statuta Solemnia; it is held at the houſe of one of the profeſſors, and is attended by the whole of the faculty of medicine as examinators. The gentleman at whoſe houſe the meeting is held, begins by an examination of the general functions of the body, and then ſelects a particular viſcus, of the ſtructure and uſes of which he requires an explanation. The others confine themſelves to practical and pathological queſtions on the diſeaſes of this organ, in which the prognoſis, diagnoſis, treatment, and nature of the remedies employed in the cure, come under review.

The other examinations are in the college hall. The degree is conferred by the principal, after an oath taken by each graduate to practiſe his profeſſion in a juſt and honourable way. The diplomas are ſigned by the principal and the whole of the members of the Senatus Academicus.

The gradation fees to the college amount to between thirteen and fourteen pounds, and are paid to the proper officer immediately after the examination at No. 5 of the ſtatutes.

A gentleman who has paſſed this examination may, if he pleaſe, defer taking his degree for ſome time, and reſume his exerciſes at the ſtage at which they were left off.

Having given this general account of the mode in which medical education is conducted in the college of Edinburgh, the ſame writer tranſmits the following ſupplementary obſervations on the ſubject. (Med. and Ph. Jour. No. 35.)

The opportunities afforded at this univerſity of proſecuting the ſtudy of medicine are not confined to the college. Private lectures are alſo given in anatomy, ſurgery, phyſiology, and chemiſtry, by men of merit and eminence, which are of conſiderable advantage to the ſtudent, particularly in the ſtudy of anatomy. This ſcience is the only one in which Edinburgh has not arrived at a conſiderable degree of eminence, and it is in a great meaſure owing to the difficulty there has been in procuring a ſufficient number of ſubjects for private diſſection. The exertions of the private teachers have, however, in ſome meaſure, done away this diſadvantage, and the more frequent opportunities of proſecuting practical anatomy which are now enjoyed, muſt neceſſarily be of material ſervice to the univerſity. Anatomy cannot be learnt from lectures alone, for however perſpicuous the demonſtrations may be which accompany them, the ideas which they produce muſt remain in ſome meaſure indiſtinct and imperfect without the aid of diſſection, and the more ſo when they are given to a very large number of ſtudents at one time, as is the caſe in Edinburgh.

* This is generally, if not always, the youngeſt profeſſor of that faculty.

It is of extreme importance in the ſtudy of any ſcience, that the firſt rudiments ſhould be correct and diſtinct. Imperfect ideas are eaſily acquired; but they greatly retard the after-progreſs, and are ſometimes never entirely removed. If there is, therefore, a deſideratum in the medical education of Edinburgh, it is, that more opportunities ſhould be afforded to the ſtudent of proſecuting the ſtudy of anatomy. There are certainly many obſtacles in the way of procuring ſubjects ſufficient to enable the greater number of medical ſtudents to cultivate practical anatomy, and it is not improbable that the popular prejudices againſt diſſection, and the more limited opportunities of obtaining bodies in Edinburgh than in London, will make it always inferior to the latter as an anatomical ſchool. The ſocieties which are inſtituted in Edinburgh for diſcuſſing medicine and medical philoſophy have a conſiderable tendency to encourage the deſirable habits of ſtudy and inveſtigation. It muſt be admitted, however, that they have their diſadvantages; for to young men, who have juſt aſſumed the right of thinking for themſelves, without having obtained that information which is neceſſary as the foundation of their opinions, they frequently hold out a dangerous and ſucceſsful allurement, which diverts them from the more ſubſtantial parts of their ſtudies, renders them diſputatious, and encourages habits of ſelf-complacency and conceit. It is, perhaps, a good deal owing to the effects of ſocieties in general, that the ſtudents of Edinburgh obtained the character from Dr. Franklin of being, with lawyers, particularly fond of diſpute. Upon the whole, however, it appears, that the more reſpectable of the medical ſocieties are conducive to profeſſional improvement, if they are only regarded as ſubſervient to the other parts of education, if they are not attended too early, and if the ſtudent does not, as is too frequently the caſe, take a part in the diſcuſſion beyond his information.

The *royal medical*, and the *royal phyſical*, are two principal ſocieties devoted to ſubjects connected with medicine. The former ſtands higheſt in point of general reſpectability and importance, and has, in the liſt of its members, many of the moſt diſtinguiſhed medical characters in Europe. It was here, as Dr. Gregory remarks in his lectures, that the Boerhaavian doctrines were firſt freely diſcuſſed, and ſuch objections urged againſt their ſolidity, as gradually led to their abandonment. The members aſſume the full right of freedom of diſcuſſion on any opinions, by whatever authorities they may be ſupported, and are extremely jealous of the ſmalleſt endeavour, on the part of the profeſſors, to control them. During the time that the celebrated doctrines of Brown firſt began to be canvaſſed, the warmth of debate was carried on ſo far, as to render it neceſſary to paſs a law (which ſtill exiſts) to enact, that any gentleman who ſhould challenge another, on account of any thing which might take place during debate, ſhould be expelled the ſociety.

The Royal Medical Society was inſtituted in the year 1737, and obtained a charter of corporation in 1778. It is governed by four preſidents, and by committees choſen annually from the members by ballot. The meetings are held once a-week, and laſt from 7 in the evening till 12. An eſſay on a medical caſe, and a diſſertation on ſome ſubject connected with medicine (which are written by the ordinary members in rotation, and are termed a ſet of papers), are diſcuſſed every evening, and not more than two ſets of thoſe papers are expected from any gentleman during the time of his being in the ſociety. They are circulated among the members before diſcuſſion, and are copied into proper books, which are open to their inſpection in the library. Fines are exacted for abſence either during the whole or part of the evening, and theſe are ſo conſiderable as to enforce a pretty punctual attendance. The admiſſion fee is five guineas; one guinea is paid in the beginning of the ſecond year of attendance, and half a guinea in the beginning of the third, after which no further ſum is required. A member, after having written two ſets of papers, and completed two ſeſſions in the ſociety, becomes extraordinary, and is then freed from fines or contributions.

This ſociety is poſſeſſed of a very valuable library and philoſophical apparatus, which are under excellent regulation. Periodical publications and new works lie a certain time upon the library table, for the uſe of the members, before they are put into the body of the library.

There are ſeveral circumſtances which have tended to eſtabliſh the reputation of Edinburgh, and to make it a very general reſort for medical ſtudents. Two or three of thoſe it may not be improper to mention.

The celebrity of its profeſſors, without doubt, brought it firſt into notice, and on this, its eſtimation in the eyes of Europe muſt ſtill depend. The eſtabliſhment of profeſſors in Edinburgh has a powerful tendency to preſerve that zeal and activity in the proſecution of the ſubjects which they teach, ſo neceſſary to the advancement of ſcience and the increaſe of perſonal reputation. The ſalaries are very ſmall, their emoluments muſt therefore principally depend upon the manner in which their lectures are attended, and this again on the eſtimation in which they are held. In Edinburgh, too, the practice of a phyſician is very much limited. Lecturing is not, therefore, as is often the caſe in London, employed as an introduction merely to public notice, but is regarded as a profeſſion to which a man feels it his intereſt to direct all his abilities and attention.

Without having the moſt diſtant intention of making any application on the ſubject, we may be allowed to obſerve, that a more reſpectable phalanx of medical men could ſcarcely be brought together, than filled the profeſſional chairs of this univerſity a few years ago. Any one converſant with its hiſtory, muſt know that we allude to the period at which Dr. Cullen, Dr. Black, Dr. Gregory, Dr. Hope, Dr. Monro, and Dr. Home, were all of them at one time engaged in teaching the different branches of medical ſcience. It is extremely difficult to point out that mode of electing profeſſors, which is moſt likely to enſure their being properly qualified for their office.

The members of a town-council do not appear to be the men beſt adapted for this purpoſe, and yet it is with them that the nomination reſts. Hitherto, there has been little ground of complaint; it may eaſily however be ſeen, that the utmoſt circumſpection is neceſſary to preſerve the reſpectability of the profeſſional chairs in the eyes of Europe and that the ſyſtem which has been adopted of late years, of appointing the ſon as the ſucceſſor or colleague of his father, if carried too far, will be highly injurious to the intereſts of the univerſity.

The habits of life, both of the ſtudents and the inhabitants in general of Edinburgh, are very favourable to the ſteady purſuit of ſcientific knowledge. The ſtudents are not men of fortune, who come to the univerſity for the purpoſe of *lounging away* two or three years for the ſake of form or faſhion, but are ſuch as depend for their ſucceſs on their perſeverance, aſſiduity, and attention in the purſuits to which they are devoted. Enquiry is encouraged by the profeſſors, excited by the eaſy intercourſe which takes place among the ſtudents, and readily gratified by the facility with which books can be procured, whether from the college-library or that of the royal medical ſociety. The deſire of diſtinction among themſelves, and the wiſh to come off with credit on an application for a degree, have alſo a very conſiderable and ſalutary influence upon the ſtudents.

The inhabitants of Edinburgh are, in general, diſtinguiſhed for information and propriety of behaviour, which may be attributed to a variety of cauſes. Learned and literary men, particularly thoſe connected with the college, are held in great eſtimation, and are received with cordiality into the higheſt circles. By far the moſt numerous claſs of the reſpectable inhabitants are in the profeſſions; and commerce, which ſometimes ſuddenly raiſes ignorant and ill-educated men to affluence, has ſcarcely any place in the Scottiſh capital. Theſe circumſtances cannot be without ſome effect upon the minds of young men who go thither for the purpoſe of improvement.

The lectures themſelves are more comprehenſive than thoſe which, as far as we know, are delivered in any other univerſity in Europe; and the infirmary, as mentioned in a former place, is under regulations, which render it productive of much advantage to the ſtudent.

The eſtimation in which Edinburgh is held as a ſchool of medicine, is ſufficiently marked by the general reſort of ſtudents to it from every part of Europe. Few medical men, who can boaſt of a regular courſe of ſtudy, have not enjoyed the advantages of this ſchool; and by much the greater number of the moſt reſpectable phyſicians of this iſland, have graduated in Edinburgh. It may hardly be thought neceſſary to make any obſervations on the reſpectability of Edinburgh degrees, after the detail which we have given, and the general eſtimation in which they are held with the public; we think it proper however to obſerve, that, to the diſgrace of an honourable profeſſion, and of an enlightened nation, which ought, on account of its uſefulneſs, to preſerve its reſpectability, the right of practiſing medicine is at this time to be purchaſed at a Scotch univerſity without ſtudy, attendance, or examination; ſimply by a certificate of fitneſs from two phyſicians, who, it is to be feared, too often ſign it from courteſy, without being adequately informed of the education or acquirements of the perſon whom they recommend. It ought therefore to be recollected by thoſe who, from this circumſtance, depreciate the value of Scotch degrees, that it is unfair and uncandid to claſs the univerſity of St. Andrew's with that of Edinburgh, where the *eligibility to examination for a degree* can only be obtained by three years' regular ſtudy, and where the examination itſelf is well adapted to diſcover how far the ſtudent has availed himſelf of the opportunities he has enjoyed.

It ſeems highly prepoſterous, that a qualification to practiſe a liberal profeſſion, like that of medicine, which has not only its general character for learning to ſupport, but which alſo requires no ſmall ſhare of ſtudy and application to become acquainted with its principles, ſhould be able to be purchaſed by any one who chooſes to be at the expence of it; for though it be admitted, that the certificate of qualification be in ſome meaſure a check upon the introduction of any improper perſons to the honours of medicine, yet is it to be imagined, that medical men cannot occaſionally be found, who will ſo far forget their own honour and the honour of their profeſſion, as to recommend men very ill adapted to ſupport its credit and reſpectability? In the profeſſions of law and divinity, it is required that a man ſhould ſpend a certain time in the ſtudy of his profeſſion before he is admitted to practiſe it; or, at leaſt, that he ſhould be of ſo long a ſtanding as to give him a full opportunity of having turned his attention to it; and even then a certificate of fitneſs is required previous to admiſſion. If ſuch be proper or neceſſary in the profeſſions which we have mentioned, is it not doubly ſo in that of medicine, where the health or the life of individuals depend upon the knowledge and judgment of one man, and where there is often no time for looking into ſources of information, or endeavouring to ſupply a deficient knowledge of the ſubject? The evil is ſerious; and it is the duty of every good man, who wiſhes well to the profeſſion of medicine and to the public, to do his endeavours to remedy it. For though ſome individual inſtances may occur, in which a man may be poſſeſſed of every qualification neceſſary for a phyſician, and would be much inconvenienced by not having a medical degree without the loſs of time incurred by an attendance at an univerſity for the purpoſe of obtaining it, yet the poſſibility of ſuch an occurrence ought not to prevent any meaſure of univerſal public and profeſſional advantage. It would not be thought ſufficient for a perſon in a ſubordinate part of the law, who had been all his life engaged in the practice of his profeſſion, to ſay, that he expected to be once admitted to the bar, becauſe he conceived himſelf qualified to practiſe as a counſel. He would be expected to purſue the ſame courſe, as if he had been juſt entering upon the ſtudy of the law, however inconvenient might be the delay. And it does not appear particularly unreaſonable, that when a profeſſion is either entered upon or changed, a ſacrifice of two or three years ſhould be made, in order to obtain a qualification to practiſe it, though it may occaſionally be attended with ſome perſonal inconvenience.

The Royal College of Phyſicians of London ſeem perfectly convinced of the propriety of requiring a certain academical attendance from every one, previous to examination for the liberty of practiſing in the metropolis; when they make it neceſſary for ſuch as preſent themſelves, to produce documents of having ſtudied two years at the ſame univerſity where they graduated. This by-law appears to be founded upon the moſt judicious principles, and does credit to the judgment of that learned body. The latter part of it is clearly with a view to prevent thoſe from applying for admiſſion as licentiates, who were rejected on their examination for a degree at the univerſity where they were educated, and afterwards procured one by purchaſe.

The Royal College of Phyſicians of Edinburgh have a defect in their charter, which prevents their being able to adopt the ſame ſalutary regulations with that of London, on the mode of admitting licentiates or fellows. By their charter it is enacted, that not only graduates of Edinburgh, but of any other Scotch univerſity, ſhall be admitted by right a licentiate of the college, without examination; and by the conſtitution of the college, a licentiate, after remaining twelve months in that probationary ſtate, is admitted a fellow as a matter of courſe.

That Edinburgh graduates ſhould be admitted without examination into the college of phyſicians, is not improper, becauſe the heads of this college are members of the faculty of medicine of the univerſity, and the perſons who on examination thought him duly qualified to practiſe medicine. But, that any perſon who has purchaſed a St. Andrew's degree, ſhould be able to claim the ſame privilege, completely does away any idea of honour from a connection with that body. The abſurdity of the clauſe above mentioned, more clearly appears from a caſe which is not only poſſible, but may at any time occur. A ſtudent may be thought unqualified for the honour of a degree in Edinburgh, and may be rejected. He may afterwards procure a degree from St. Andrew's, and inſiſt upon admiſſion into the college of phyſicians of Edinburgh, though he will be there aſſociated with the very men who thought him unworthy of a degree from the univerſity. Thus it appears, that the degree of doctor from the univerſity is more honourable than that of fellow of the royal college of phyſicians, a circumſtance far from being generally known, though it may be very fairly inferred from the reſpectable evidence of Dr. Gregory, who made the obſervation to which we alluded above, when actually preſident of the college.

On a compariſon of the advantages afforded by Edinburgh and the Engliſh univerſities, in the ſtudy of medicine, there can be no heſitation in preferring the former. As an argument in favour of Oxford and Cambridge, much ſtreſs has been laid upon the length of time which it is neceſſary to be connected with thoſe univerſities, before the degree of doctor can be obtained. But in this point of view, the balance muſt be on the ſide of Edinburgh, for a great part of the attendance at the Engliſh univerſities is merely nominal, half terms only being ſufficient before taking the degree of bachelor of medicine; and from that time until the period at which the degree of doctor is conferred, no attendance is neceſſary at all. Does the period of abſolute attendance, therefore, which is neceſſary previous to taking a doctor's degree, predominate in Edinburgh, or in the Engliſh univerſities? Much of the advantages derived from a place of education, neceſſarily depends upon the time and punctuality of attendance; and this applies more ſtrongly in medicine, than perhaps any other profeſſion. When we therefore conſider that the period of *actual attendance* in Edinburgh is equal to that which is requiſite at either of the Engliſh univerſities; and when we alſo recollect, that during the whole of that attendance, the time is occupied in the proper buſineſs of the profeſſion, little doubt can exiſt on the comparative merits of thoſe ſeminaries as ſchools of medicine. It is uſual, and indeed neceſſary, that gentlemen educated to phyſic at either of the Engliſh univerſities, ſhould proſecute the ſtudy of their profeſſion elſewhere; but is it not a circumſtance of a moſt ſingular nature, that the only advantage in medicine from thoſe illuſtrious ſeminaries, is the obtaining a degree? and that the previous acquirements which are neceſſary to qualify a man to practiſe with honour to himſelf, or advantage to the world, muſt be made in another place?

Eſtabliſhment for the poor.—There has been opened at Edinburgh, an houſe for the employment and relief of the poor. Notice had been publicly given that mendicity would no longer be permitted in that city; there being both employment and the means of ſubſiſtence in the houſe, for every beggar and deſtitute perſon who was diſpoſed to work. They were alſo informed that they would receive the full amount of their earnings, with ſuch additional gratuitous aſſiſtance, as might, in the whole, be equal to their decent maintenance.

From the 22d of January, 1801, to the 16th of March, ninety perſons of different ages were admitted into the houſe. The number has ſince been conſiderably increaſed. Of theſe, few, comparatively ſpeaking, were of the ordinary claſs of beggars: they, in general, fled upon the alarm; and retired to quieter ſituations, in London, and other municipalities, where ſimilar meaſures of prudential charity have not been adopted. Of thoſe diſtreſſed perſons who have been admitted into the houſe, almoſt all have been received on their own application; many of them widows advanced in life, whom the high price of proviſions, and the want of occupation, had compelled to diſpoſe of the greater part of their furniture and clothes, for immediate ſubſiſtence;—or young women, who, with characters apparently unimpeached, were expoſed to a courſe of pilfering and proſtitution.

It was fixed that they ſhould have *the whole produce of their earnings*; beſides this they receive *gratis*, a cheap dinner, and two pence a-day each in money. The pecuniary allowance has, for the preſent, been rendered expedient by the peculiar circumſtances of the times, the high price of food, and the ſtate of weakneſs and indigence to which the poor are reduced. The continuance of that part of the relief, it is to be hoped, will not be univerſally neceſſary.

Their earnings are ſmall:—but it is not a ſmall object to be obtained, that ſuch a claſs of perſons ſhould be virtuouſly and induſtriouſly employed; that they ſhould be *earning ſomething*, and acquiring the habit and ſkill to earn more. They expreſs very generally, and very ſtrongly, their gratitude for the advantages, which they derive from the charity; and look forward to its continuance with eager and ſolicitous expectation. Only two of them have merited ſerious reprehenſion; and they are now diſmiſſed the houſe, to the advantage and apparent ſatisfaction of the reſt.—Of the ninety perſons admitted, ſeventy-four have been employed in ſpinning flax,—three in ſpinning hemp,—and one in ſpinning wool: all of theſe have been furniſhed by the manufacturer with the raw materials, and are paid by him, according to the uſual rates, for the quantity they reſpectively ſpin.—Beſides theſe, ſix have been employed in making lace, three in knitting ſtockings, two in reeling yarn, and aſſiſting in the houſe, and one (a joiner with five children in great diſtreſs for want of work) in mending the ſpinning-wheels, and in making a variety of little articles for ſale.

To occupation, and the means of ſubſiſtence, the directors of this excellent charity have added medical advice and aid. Of this department, an eminent phyſician, Dr. William Farquharſon, has taken the direction; the inſtitution being put to no other expence, than that of the wholeſale price of the medicines which the poor may require.

The eſtabliſhment is ſupported by voluntary contributions, not only of money, but of clothing and ſpinning-wheels, ſupplied by public bodies at Edinburgh, as well as by individuals. In conſequence of a report made by the Rev. Dr. Baird (*principal of the univerſity* at Edinburgh, and a moſt active conductor of the charity) the ſociety lately eſtabliſhed at Edinburgh, "for encouraging the induſtry and increaſing the comforts of the poor," has taken this charity under its peculiar patronage and adminiſtration; and has added conſiderably to its funds.

EDNAM, a village near Kelſo, in Roxburghſhire, ſeated on the Tweed. It is the birth-place of the poet Thomſon.

EFFINGHAM, a village in Surrey, 12 miles N.E. of Guildford. It was once, according to tradition, a populous town, containing 16 churches. There are, certainly, proofs of its having been a much larger place; for wells and cavities like cellars, have been frequently found in the neighbouring fields and woods; and in the church are ſome ancient ſtalls and monuments.

EGG, a fertile little iſland, one of the Hebrides of Scotland, to the S. of Syke.

EGHAM, a village in Surrey, four miles N.N.W. of Chertſey. Here is a neat almſhouſe for ſix men and ſix women, with a ſchool for the education of 20 boys, founded by Mr. Henry Strode, in 1706; and another almſhouſe, for ſix men and ſix women, founded by Judge Denham, father of the poet of that name. Near this place is the celebrated Runnymead.

EGLINGEN, a town of Suabia, capital of a lordſhip of the ſame name, ſix miles N. of Dillengen.

EGLISAU, an ancient town of Switzerland, in the canton of Zurich, ſeated on the Rhine, 13 miles N. of Zurich. Long. 8. 30. E. Lat. 47. 33. N.

EGMONT BAY, a bay on the S.W. of the Iſland of St. John, in the gulf of St. Lawrence. Long. 64. 0. W. Lat. 46. 30. N.

EGMONT ISLAND, a low woody iſland in the South Pacific Ocean. Long. 138. 30. W. Lat. 19. 20. N.

EGREMONT, a town in Cumberland, with a market on Saturday. It is ſeated near the Iriſh Sea, on the river Eben, over which are two bridges; and on the peak of a hill is a caſtle. It ſent members to parliament in the reign of Ed-

ward I. and is 14 miles S.W. of Cockermouth, and 299 N.W. of London. Long. 3. 35. W. Lat. 54. 32. N.

EGYPTEN, a town of the duchy of Courland, 100 miles S.E. of Mittau. Long. 26. 40. E. Lat. 56. 2. N.

EHIGEN, the name of two ſmall towns of Suabia, the one near the Danube, and the other on the Neckar. They belong to the Houſe of Auſtria. The former is in long. 9. 45. E. lat. 48. 18. N. and the latter in long. 8. 45. E. lat. 48. 25. N.

EHRENBREITSTEIN, a very ancient fortreſs, in the electorate of Treves, on the E. bank of the Rhine, oppoſite Coblentz. It ſtands on the ſummit of a ſtupendous rock, not leſs than 800 feet above the level of the river, and is thought, when ſupported by a competent garriſon, to be impregnable. It has a communication with Coblentz by ſubterraneous paſſages cut out of the ſolid rock; and is plentifully ſupplied with water from a well 280 feet deep. In the centre of a large ſquare in this fortreſs, is placed a cannon, ſuppoſed to be the largeſt in Europe; it was caſt in 1528, weighs 300 quintals, and projects a ball of 180 pounds, upwards of 12 miles. The proſpect from this caſtle is majeſtic, extenſive, and variegated; and the ſtream at its foot is decorated with two ſmall iſlands, on each of which is a convent. In the vale of Ehrenbreitſtein is the old palace of the elector. The fortreſs ſurrendered to the French, after a long ſiege, and a blockade of above a year's continuance, in February 1799.

EHRENFELS, a fortreſs of Bavaria, in the duchy of Neuburg, which gives name to a lordſhip. It is 13 miles N.W. of Ratiſbon.

EJECTION, in Scots law, is the turning out the poſſeſſor of any heritable ſubject by force; and is either *legal* or *illegal*. Legal ejection is where a perſon having no title to poſſeſs, is turned out by the authority of law. Illegal ejection, is one perſon's violently turning another out of poſſeſſion without lawful authority.

EILENBURG, or EULENBURG, a town of Upper Saxony, 12 miles N.E. of Leipſic.

EIMBECK, a town of Germany, in the territory of Grubenhagen, 25 miles S. of Hildeſheim. Long. 10. 0. E. Lat. 51. 46. N.

EIMEO, one of the Society Iſles, in the S. Pacific Ocean, lying near Otaheite. The products of the two iſlands, and the manners of the people, are much the ſame. Eimeo has ſteep rugged hills, running in different directions, leaving large valleys, and gently riſing ground about their ſides. The hills, though rocky, are generally covered with trees almoſt to their tops.

EISLEBEN, a town of Upper Saxony, in the county of Mansfeld, famous as the birth-place of Luther. It is five miles E. of Mansfeld.

EISNACH, a town of Thuringia, capital of a diſtrict of the ſame name, with a celebrated college, 36 miles W. of Erfurt. Long. 10. 25. E. Lat. 50. 59. N

EITHAN, or YTHAN, a river in Aberdeenſhire, which croſſes that county in a S.E. direction, and falls into the Britiſh Ocean at Newburgh.

EKEREFORD, a town of Denmark, in the duchy of Sleſwick, ſeated on the Baltic, 12 miles S.E. of Sleſwick. Long. 10. 30. E. Lat. 54. 56. N.

ELBA, an iſland on the coaſt of Tuſcany, remarkable for mines of iron and loadſtone, and quarries of marble. It is ſubject to the Prince of Piombino, under the protection of the King of Naples, who is in poſſeſſion of Porto-Longone; and the Grand Duke of Tuſcany has Porto-Ferrajo.

ELBASSANO, a town of Turkey in Europe, in Albania, 45 miles S.E. of Durazzo. Long. 20. 9. E. Lat. 41. 34. N.

ELBOGEN, a town of Bohemia, capital of a circle of the ſame name, with a citadel, on the river Eger, 16 miles N E. of Egra. Long. 13. 0. E. Lat. 50. 16. N.

ELBURG, a town of the United Provinces, in Gueldерland, on the E. coaſt of the Zuider-Zee, 10 miles N.E. of Harderwick. Long. 5. 50. E. Lat. 52. 30. N.

ELCATIF, a ſea-port of Arabia Felix, on the W. coaſt of the gulf of Perſia, 300 miles S. of Buſſorah. Long. 53. 5. E. Lat. 26. 0. N.

ELCHE, a town of Spain, in Valencia, 20 miles S.W. of Alicant. Long. 0. 23. W. Lat. 38. 7. N.

ELECTRICITY, GALVANIC. See GALVANISM in this SUPPLEMENT.

ELECTRICAL DOUBLER, an ingenious and uſeful invention of Mr. Bennet, well known to electricians, and much improved by Mr. Cavallo. The original inſtrument would be freed from its principal imperfections, we apprehend, by interpoſing a plate of air between the three plates of the *doubler*. Thus, if we ſtick on one of the plates three very ſmall ſpherules, made from a capillary glaſs tube, or from a thread of ſealing-wax; the other plate, when laid on, will reſt merely on ſo many points; and there will be ſcarcely any friction capable of hindering the proceſs of the experiment. Mr. Nicholſon's contrivance for expediting the effect of the doubler is very ingenious.

ELECTROPHORUS, a machine, repreſented in Plate 26, the phenomena of which are ſomewhat ſingular. It conſiſts of two plates, A and B, uſually of a circular form; though they may be made ſquare, or of the figure of a parallellogram, with more eaſe, and with equal advantage. At firſt the under plate was of glaſs, covered over with ſealing-wax; but there is little occaſion for being particular either with regard to the ſubſtance of the lower plate, or the electric which is put upon it. A metallic plate, however, is perhaps preferable to a wooden one, though the latter will anſwer the purpoſe very well. This plate is to be covered with ſome electric ſubſtance. Pure ſulphur anſwers very near as well as the dearer electrics, ſealing-wax, gum-lac, &c.; but it hath this bad quality, that, by rubbing it, ſome exceeding ſubtle ſteams are produced, which infect the perſon's clothes, and even his whole body, with a very diſagreeable ſmell, and will change ſilver in his pocket to a blackiſh colour. The upper plate of the electrophorus is a braſs plate, or a board or piece of paſteboard covered with tinfoil or gilt paper, nearly of the ſame ſize with the electric plate, though it will not be the worſe that it is ſomewhat larger. It is furniſhed with a glaſs handle (I), which ought to be ſcrewed into the centre. The manner of uſing this machine is as follows.—Firſt, the plate B is excited by rubbing its coated ſide with a piece of new white flannel, or a piece of hare's ſkin. Even a common hard bruſh, having the hair a little greaſed, will excite ſulphur extremely well. When this plate is excited as much as poſſible, it is ſet upon the table with the electric ſide uppermoſt. Secondly, the metal plate is laid upon the excited electric, as repreſented in the figure. Thirdly, the metal plate is touched with the finger or any other conductor, which, on touching the plate, receives a ſpark from it. Laſtly, the metal plate A, being held by the extremity of its glaſs handle (I), is ſeparated from the electric plate; and, after it is elevated above that plate, it will be found ſtrongly electrified with an electricity contrary to that of the electric plate; in which caſe, it will give a very ſtrong ſpark to any conductor brought near it. By ſetting the metal upon the electric plate, touching it with the finger, and ſeparating it ſucceſſively, a great number of ſparks may be obtained apparently of the ſame ſtrength, and that without exciting again the electric plate. If theſe ſparks are repeatedly given to the knob of a coated phial, this will preſently become charged.

"As to the continuance of the virtue of this electric plate, (ſays Mr. Cavallo), when once excited, without repeating the excitation, I think there is not the leaſt foundation for believing it perpetual, as ſome gentlemen have ſuppoſed; it being nothing more than excited electric, it muſt gradually loſe its power by imparting continually ſome of its electricity to the air, or other ſubſtances contiguous to it. Indeed its electricity, although it could never be proved to be perpetual by experiments, laſts a very long time, it having been obſerved to be pretty ſtrong ſeveral days, and even weeks, after excitation. The great duration of the electricity of this plate, I think, depends upon two cauſes: firſt, becauſe it does not loſe any electricity by the operation of putting the metal plate upon it, &c. and, ſecondly, becauſe of its flat figure, which expoſes it to a leſs quantity of air, in compariſon with a ſtick of ſealing-wax, or the like, which, being cylindrical, expoſes its ſurface to a greater quantity of air, that is continually robbing the excited electrics of their virtue.

"The firſt experiments that I made, relative to this machine, were with a view to diſcover which ſubſtance would anſwer beſt for coating the glaſs plate, in order to produce the greateſt effect. I tried ſeveral ſubſtances either ſimple or mixed; and at laſt I obſerved, that the ſtrongeſt in power, as well as the eaſieſt, I could conſtruct, were thoſe made with the ſecond ſort of ſealing-wax, ſpread upon a thick plate of glaſs. A plate that I made after this manner, and no more than ſix inches in diameter, when once excited, could charge a coated phial ſeveral times ſucceſſively, ſo ſtrongly as to pierce a hole through a card with the diſcharge. Sometimes the metal plate, when ſeparated from it, was ſo ſtrongly electrified that it darted ſtrong flaſhes to the table upon which the electric plate was laid, and even into the air, beſides cauſing the ſenſation of the ſpider's web upon the face brought near it, like an electric ſtrongly excited. The power of ſome of my plates is ſo ſtrong, that ſometimes the electric plate adheres to the metal when this is lifted up, nor will they ſeparate even if the metal plate is touched with the finger or other conductor. It is remarkable, that ſometimes they will not act well at firſt, but they may be rendered very good by ſcraping with the edge of a knife the ſhining or gloſſy ſurface of the wax. This ſeems analogous to the well-known property of glaſs, which is, that new cylinders or globes, made for electrical purpoſes, are often very bad electrics at firſt; but that they improve by being worked, *i. e.* by having their ſurface a little worn. Paper alſo has this property.

"If, after having excited the ſealing-wax, I lay the plate with the wax upon the table, and the glaſs uppermoſt, *i. e.* contrary to the common method; then, on making the uſual experiment of putting the metal plate on it, and taking the ſpark, &c. I obſerve it to be attended with the contrary electricity: that is, if I lay the metal plate upon the electric one, and, while in that ſituation, touch it with an inſulated body, that body acquires the poſitive electricity; and the metallic, removed from the electric plate, appears to be negative; whereas it would become poſitive, if laid upon the excited wax. This experiment, I find, anſwers in the ſame manner if an electric plate is uſed which has the ſealing-wax coating on both ſides, or one which has no glaſs plate.

"If the braſs plate, after being ſeparated from, be preſented with the edge toward the wax, lightly touching it, and thus be drawn over its ſurface, I find that the electricity of the metal is abſorbed by the ſealing-wax, and thus the electric plate loſes part of its power; and if this operation is repeated five or ſix times, the electric plate loſes its power entirely, ſo that a new excitation is neceſſary in order to revive it.

"If, inſtead of laying the electric plate upon the table, it is placed upon an electric ſtand, ſo as to be accurately inſulated, then the metal plate ſet on it, acquires ſo little electricity, that it can only be diſcovered with an electrometer; which ſhews, that the electricity of this plate will not be conſpicuous on one ſide of it, if the oppoſite ſide is not at liberty either to part with, or acquire more of the electric fluid. In conſequence of this experiment, and in order to aſcertain how the oppoſite ſides of the electric plate would be affected in different circumſtances, I made the following experiments:

"Upon an electric ſtand E, I placed a circular tin-plate, nearly ſix inches in diameter, which by a ſlender wire H communicated with an electrometer of pith-balls G, which was alſo inſulated upon the electric ſtand F. I then placed the excited electric plate D of ſix inches and a quarter in diameter, upon the tin-plate, with the wax uppermoſt; and on removing my hand from it, the electrometer G, which communicated with the tin-plate, *i. e.* with the under ſide of the electric plate, immediately opened with negative electricity. If, by touching the electrometer, I took that electricity off, the electrometer did not afterwards diverge. But if now, or when the electrometer diverged, I preſented my hand open, or any other uninſulated conductor, at the diſtance of about one or two inches, over the electric plate, without touching it, then the pith-balls diverged; or, if they diverged before, came together, and immediately diverged again with poſitive electricity:—I removed the hand, and the balls came together;—approached the hand, and they diverged: and ſo on.

"If, while the pith-balls diverged with negative electricity, I laid the metal plate, holding it by the extremity K of its glaſs handle, upon the wax, the balls came, for a little time, towards one another, but ſoon opened again with the ſame, *i. e.* negative electricity.

"If, whilſt the metallic reſted upon the electric plate, I touched the former, the electrometer immediately diverged with poſitive electricity; which if, by touching the electrometer, I took off, the electrometer continued without divergence.—I touched the metal plate again, and the electrometer opened again; and ſo on for a conſiderable number of times, until the metal plate had acquired its full charge. On taking now the metal plate up, the electrometer G inſtantly diverged with ſtrong negative electricity.

"I repeated the above-deſcribed experiments, with this only difference in the diſpoſition of the apparatus, *i. e.* I laid the electric plate D with the excited ſealing-wax upon the circular tin-plate, and the glaſs uppermoſt; and the difference in their reſult was, that where the electricity had been poſitive in the former diſpoſition of the apparatus, it now became negative, and *vice verſa*; except that, when I firſt laid the electric plate upon the tin, the electrometer G diverged with negative electricity, as well in this as in the other diſpoſition of the apparatus. I repeated all the above experiments with an electric plate, which, beſides the ſealing-wax coating on one ſide, had a ſtrong coat of varniſh on the other ſide, and their reſult was ſimilar to that of thoſe made with the above-deſcribed plate."

This is Mr. Cavallo's account of the electrophorus; but there is one part of it in which he muſt certainly be miſtaken. He tells us, that "inſtead of laying the electric plate upon the table, it is ſet upon an electric ſtand, ſo as to be accurately inſulated, then the metal plate ſet on it acquires ſo little electricity, that it can only be diſcovered by an electrometer." In what manner this gentleman came to miſtake a plain fact ſo egregiouſly, is not eaſy to determine; but it is certain, that an electrophorus, inſtead of having its virtue impaired by being inſulated, has it greatly increaſed, at leaſt the ſphere of its activity is greatly enlarged. When lying on the table,

if the upper plate is put upon it without being touched with the finger, it will not ſhew much ſign of electricity. But as ſoon as it is put on the electric ſtand, both the upper and under ſide appear ſtrongly negative. A thread will be attracted at the diſtance of eight or ten inches. If both the upper and under ſide are touched at the ſame time, a ſtrong ſpark will be obtained from both, but always of the ſame kind of electricity, namely, the negative kind. If the upper plate is now lifted up, a ſtrong ſpark of poſitive electricity will be obtained from it; and on putting it down again, two ſparks of negative electricity will be produced.

The ſingularity of this experiment is, that it produces always double the quantity of negative electricity that it doth of the poſitive kind; which cannot be done by any other method yet known. Another very ſurpriſing circumſtance is, that when the electrophorus remains in its inſulated ſituation, you need not always touch the upper and under ſide of the plates at once, in order to procure poſitive electricity from the upper plate: it is ſufficient to touch both ſides only once. On lifting up the upper plate, a ſpark of poſitive electricity is obtained as already mentioned. On putting it down again, a ſpark of the negative kind is obtained from the upper plate, even though you do not touch the lower one. On lifting up the upper plate, a ſpark of poſitive electricity is obtained, but weaker than it would have been had both ſides been touched at once. Putting down the upper plate again without touching both, a ſtill weaker ſpark firſt of negative and then of poſitive electricity will be obtained from the upper one. Thus, the ſparks will go on continually diminiſhing, to the number perhaps of two or three hundred. But at laſt, when the electricity of the whole machine ſeems to be totally loſt, if both ſides are touched at once, it will inſtantly be reſtored to its full ſtrength, and the double ſpark of negative, with the ſingle one of poſitive electricity, will be obtained without intermiſſion as before.

To account for all theſe phenomena very particularly, is perhaps impoſſible, without a greater degree of knowledge concerning the internal fabric of bodies than we have acceſs to attain. In general, however, it is evident, that the phenomena of the electrophorus ariſe from the diſpoſition that the electric matter hath to keep up an equilibrium within itſelf throughout every part of the univerſe. In conſequence of this, no motion of the electric matter can be produced upon the one ſide of a body, but it muſt immediately be balanced by a correſponding one on the oppoſite ſide; and in proportion to the ſtrength of the one, ſo will the ſtrength of the other be. When the under plate of the electrophorus is excited, the negative electricity, or vibratory action of the electric matter towards the excited ſide, is produced; and the moment that ſuch an action is produced on one ſide, it is reſiſted by a ſimilar one on the oppoſite ſide, and thus the electrophorus becomes negatively electrified on both ſides. As long as the under part of the machine communicates with the earth, the vibratory motion is impeded by the progreſſive one towards the earth. This makes the reſiſtance on the under ſide leſs, and therefore the vibratory motion on the upper part extends but a ſmall way. When the plate is inſulated, the electric matter has not an opportunity of eſcaping to the earth as before, becauſe it is ſtrongly reſiſted by the air; a vibration therefore takes place on both ſides, and extends to a great diſtance from the plate. When the upper plate is ſet upon the electrophorus, the ſame kind of electricity, *viz.* the negative kind, is communicated to it. When both ſides are touched, with the finger, or with any other conducting ſubſtance, both electricities are ſuddenly taken off, becauſe the electric matter running along the conducting ſubſtance on both ſides, puts an end to the vibratory motion in the air, which conſtitutes the very eſſence of what we call *electricity*. There is now a quiet and equal balance of the electric matter on both ſides, and therefore no ſigns of electricity are ſhewn. But as ſoon as the upper plate is taken off, this balance is deſtroyed. The fluid in the metal plate had not been able to penetrate the electric ſubſtance in ſuch a manner as to put a ſtop to the vibrations of what was within it. As ſoon then as the plate is taken off, the electricity, or vibratory motion towards the electric, breaks out at that ſide. But this motion *inwards* to the electric, which conſtitutes negative electricity, neceſſarily becomes *outward* from the plate; and as no motion of the fluid can be produced on one ſide of a body, but what is immediately communicated to the other, the upper plate becomes electrified poſitively, and the under one negatively on both ſides.

ELEVATOR, a mechanical contrivance for raiſing any thing to an height from the ſurface of the earth.—The following deſcription of a machine called a *ſpeedy elevator*, invented by Dr. Collin, appears in the Tranſactions of the American Philoſophical Society, and the doctor was honoured with the Magellanian gold medal for this invention.

The main body of the baſe is a rectangular ſolid floor. (See F. W. Plate 27). To its corners are jointed four horizontal legs, of equal thickneſs with it, but half the length, having their nether ſides even with its bottom. When the machine is uſed, theſe are diſplayed ſo that their ends form a rectangle, the diagonals of which may be on thoſe of the main body, or vary from them in a poſition moſt promotive of ſtability.

The pillars A A ſtand vertical on the long diameter of the baſe, equally diſtant from its ends. Their feet enter into it, and are by ſtrong faſtenings incorporated with its body. Theſe pillars are pairs. Their form is a rectangular parallelopiped. Their inner ſides have grooves from top to bottom, which terminate by offsets in cylindric ſegments. Near the tops are central embrazures, whoſe ſides are fortified with iron plates that reach within the ſolid parts above and below. The pulleys are of metal, with ſteel axes and braſs naves for eaſy turning, and deep channels for ſecuring the cords.

The pillars are joined by three pairs of ribs. Theſe are rectangular; and wide, but comparatively thin; placed horizontally, between the tops and embrazures, about the middles, and near the feet. Their ends are cloſely fitted within the pillars, and well faſtened.

The piers B B are more ſlender than A A; with ſhorter heads; but the length of their bodies is equal to the whole of theſe. They have ſimilar grooves, embrazures, pulleys, and joining ribs. Their faces are parallel rectangles. The backs of their bodies have tongues along the middles that fit the grooves of A A. Theſe are vertical rectangular ridges, and parts of the very pieces, formed by cutting down both ſides to a proper level. Theſe lower ſurfaces, being even and ſmooth, will thus move cloſe along the correſponding plain parts of A A while the tongues glide in contact with the ſides of the grooves.

The cords *a a* are well paired in length and texture. They ply over the pulleys of A A in the ſaid hollows behind the grooves; having their ends fixed under the feet of B B, and on the boxes of the windlaſs. This is well ſecured in the baſe, cloſe to and right beneath the pillars.

The cords *b b* are faſtened by one end on the heads of A A. They paſs over the pulleys of B B, and reach as far below them as *a a* reach below the pulleys of A A, which is the diſtance of theſe pulleys from the baſe. Their other ends are tacked a little above the bottoms of the piers C C.

Theſe piers are with their apparatus framed like B B; have leſs bulk and ſhorter heads. Their pulleys clear the tops of B B when the machine is down.

The cords *c c* have the ſame length with *b b*, below the

pulleys of C C; plying over theſe; faſtened on the heads of B B, and ſomewhat above the bottom of the pier D.

This is a ſingle piece. It has two backs to fit the grooves of C C, formed like the backs of the other pieces.

A frame is accurately fixed and poiſed on the top of D. In this the load L is placed, ſo that its centre of gravity is exactly or very nearly over the centre of the frame.

When the power begins to wind the cords *a a*, theſe raiſe the piers B B. As they riſe, their pulleys recede from the tops of A A, and by ſtretching the cords *b b* lift the piers C C. Theſe recede at the ſame time from the tops of B B, and lift the pier D. Thus while B B are wound up from the baſe to the height of the pulleys of A A, D riſes treble that height; and, however great may be the number of moving pieces, it multiplies the celerity and acquired elevation of the uppermoſt by that of the firſt.

As the duration and celerity of all the movements is the ſame, the lengths of all the cords below the reſpective pulleys muſt be equal.

As the whole acquired elevation is by thoſe parts of the piers which are drawn out of their folds, theſe ought to have a very great proportion. Therefore B B reach the baſe when down; and the heads of A A are but long enough to keep them ſafe in their grooves, when drawn up. Again, as the ends of the cords *b b* will be above the baſe according to the length of the heads of A A, the heads of B B are ſhortened, and the bodies of C C are prolonged below thoſe ends, in order to ſave room, and yet afford theſe piers a ſecure depth in the grooves of B B, when drawn up. On the ſame principle the heads of C C are ſhortened, and a part of D left under the ends of *c c*. As theſe additions of ſaid pairs cannot increaſe the elevation, the cords ought to be fixed above them in order to ſhorten the bearings, and ſo far make the bodies firmer. In a longer ſeries of piers this ſhortening of the heads can only be continued to the limit of depth neceſſary to ſupport the ſtrains.

The pier D preſſes the cords *c c* by its own weight, and the load L. This preſſure cauſes an equal pulling and conſequential reſiſtance in the tops of the piers B B. The pulleys of the piers C C muſt bear this double preſſure $= 2\,L + 2\,D$. Theſe therefore preſs the cords *b b* with ſaid weight and their own $= 2\,L + 2\,D + C\,C$. This doubled $= 4\,L + 4\,D + 2\,C\,C$ is the preſſure on the pulleys of B B: but their heads are pulled up by $L + D$: the difference of theſe forces added to their own weight is the preſſure of theſe piers on the cords *a a*, $= 3\,L + 3\,D + 2\,CC + B\,B$. The power on the windlaſs muſt be equal to this.

In any ſeries the power muſt lift a weight equal to the firſt piers, double the ſecond, and ſo forth, till the laſt pier and its load multiplied by the number of moving pieces.

The pulleys, cords, and ribs, have ſome weight, and are to be counted as parts of their reſpective piers. A competent allowance is likewiſe required for the friction of the pulleys, which impedes the aſcent, though the deſcent is advantageouſly retarded by it.

The preſſure on the pulleys of the pillars A A is double the power. The ſtrain in their tops is half of the weight on the pulleys of B B. The difference of theſe forces, $= 4\,L + 4\,D + 3\,CC + 2\,BB$, added to their own weight, is the preſſure on the baſe,

The ſtrain in the tops of any piers in a ſeries is equal to what the power would be, if the pair next above was the laſt. The weight on the pulleys of the ſame pair is double the ſtrain in the tops of the pair next below. The ſtrain on their feet is equal to the ſtrain in the tops of the pier two ranks below.

It is very neceſſary to compute the ſtrains and preſſures in order to ſecure all the parts, and to ſave needleſs bulk, which would be a great diſadvantage in the piers by the additional expence of power. The preſſure of vertical pieces by their own weight muſt be counted, though not as equal to the ſame quantity of external burthen laid upon them: its operation is viſible in high maſſive beams, which bend without any load; but in ſhort though ſlender pieces it is not ſufficient to break the internal coheſion of the parts. The effect of external weight is according to its quantity, and to the height and ſlimneſs of the piers; but not in uniform proportions. Divers kinds of wood have alſo different degrees of weight, and of vertical firmneſs: ſome are both ſtiff and light to an admirable degree: piers made of theſe can under ſlender forms bear weights many times greater than their own. Theſe qualities are in their blended effects of different value in this machinery: the pillars are the moſt preſſed, but they cauſe no weight to the power, and therefore their bulk is the leſs detriment. B B being the heavieſt laden piers are the moſt ſolid, but they have only a ſimple moment: C C bearing leſs are lighter, but their moment is double: D has a treble moment, but the lighteſt burthen, and thus the leaſt weight of its own. Theſe continually growing increments of ſolidity are neceſſary conſequences of the conſtant double bearings; but ought to be ſmall in compariſon to the preſſures thus produced, which become very great, when the load to be lifted and the elevation are conſiderable. Lightneſs is then moſt beneficial in the upper ranks, and firmneſs in the lower, at *theſe muſt lift but thoſe be lifted* many times: accordingly different ſorts of wood may be choſen by their degrees of lightneſs and firmneſs; they being otherwiſe proper, eſpecially for cloſe and ſmooth folding.

On account of the grooves and tongues, the pieces cannot have thoſe regular forms that give the greateſt ſolidity; nor can the pulleys be placed exactly over the line of central ſtrength. In practice, theſe defects muſt not exceed neceſſary limits. Moreover, when the preſſures and ſtrains on the ſeveral parts of the pieces are eſtimated, hollows may be contrived in places that can bear it.—Theſe niceties cannot be marked in a model.

When the load, the elevation, and quality of the wood, are given; the lighteſt ſeries of piers is found by computing the reſults from different numbers. A greater number muſt effect a greater proportion of the whole elevation than a ſmaller, becauſe the pillars, by becoming ſhorter, contribute leſs; this addition is a new expence of power. The weight of the load is eſſential, as it muſt be multiplied by the whole number of piers; imparts the ſame moment to its own pier of competent bulk; and in conjunction with it thickens with continual increaſe all the others. On the other hand the firmneſs of piers increaſes greatly with the decreaſe of their height within certain limits. Some ſpecies of wood have alſo correſponding degrees of ſtrength. The co-operation of theſe advantages may therefore render a conſiderable number of ſhort piers light, and proportionally ſo in their reſpective multiple moments. The more numerous the piers are, the ſooner is the machine wound up, and let down, which is an advantage, ſo far as men can make greater exertions for a ſhort time.

The form of the windlaſs determines, in combination with the preceding, the ſpeed of operation, and the degree of power. It admits various modes: for example, one might be placed on either ſide of the pillars, with long handles on the winches; by which eight men can work together. This model is intended to ſhew conſiderable effects from an eaſy apparatus: accordingly two men lift another, and three tiers of piers: they are aided by a ſufficient projection of the winches beyond the ſemidiameter of the boxes: this has ſuch proportion to the height of the pulleys in the pillars, and the equal

length of the cords *a a* below them, that the whole winding is done by a few turns. The dimenſions of the piers are not ſpecified, as my experiments are not ſufficient; but I eſtimate them ſo, that the elevation is at leaſt fifty feet. The power increaſes, though the velocity decreaſes, by leſſening the width of the boxes; and this can be done while their length can ſo correſpond, that the rounds of the cords *a a* have ſufficient room, when the machine is wound up.

Oblique preſſures cannot ariſe from the principles of conſtruction; but happen from inevitable imperfection of materials and workmanſhip in a ſmall degree, which is not an object of exact calculation, but ſhould have full allowance for its effects on the machine. The obliquity will be the greater as the folding is ſhallow, and the fitting is looſe. The effect reſults jointly from the angle of declination, the length of the pier, and its moment of weight. The oblique bearings on the ends of the tongues, when the machine is wound up, will be dangerous, if theſe have not a competent ſolidity. All the piers with their moments of weight bear on the pillars; and the preſſure on their pulleys is the difference between double the power and the ſtrain of their heads, which balance is very great. This preſſure remains there when the machine is wound up, in every ſtage of the elevation, however great. The common centre of gravity of the pulleys thus preſſed, the pillars themſelves, and the baſe, is below the pulleys. Thus the machine has a great ſtability, and the baſe is accordingly not extenſive.

This machine combines theſe advantages: ready approach to heights otherwiſe not acceſſible without great trouble: ſpeedy aſcent and deſcent: convenient folding for keeping under cover, and for eaſy conveyance. It can be applied to ſeveral uſeful purpoſes:—Quick hoiſting and lowering of things on many occaſions; particularly ſaving of goods from upper ſtories in caſes of conflagration: high elevation and ſpeedy exchange of ſignals; theſe being light may be raiſed three hundred feet, and above interjacent hills: elevation of a perſon for taking views, and quick deſcent when required; as on reconnoitring an enemy within ſhot: a machine calculated for lifting him at leaſt one hundred feet by eight men can be light enough for carrying on a waggon by two horſes.

ELEUTHES, a kingdom of Tartary, lying to the N.W. of Chineſe Tartary. It was conquered, in 1759, by the Emperor of China. See KALMUCKS.

ELIAS, the prophet, memorable for having eſcaped the common cataſtrophe of mankind; being taken up alive into heaven, in a fiery chariot, about 895 B. C. See *the Bible*.

ELICHMAN (John), a native of Sileſia in the 17th century, who practiſed phyſic at Leyden, and was remarkable for underſtanding 16 languages. He ſupported an opinion, that the German and Perſian languages were derived from the ſame origin. His Latin tranſlation of the *Tablet of Cebes*, with the Arabic verſion and the Greek, was printed at Leyden in 1640, under the care of Salmaſius, who prefixed thereto a very ample preface.

ELISHA, the prophet, famous for the miracles he performed, died about 830 B. C. See *the Bible*.

ELIZABETH, queen of England, daughter of Henry VIII. and Anna Boleyn, was born at Greenwich, September 7th, 1533. According to the humour of the times, ſhe was early inſtructed in the learned languages, firſt by Grindal, who died when ſhe was about 17, and afterwards by the celebrated Roger Aſcham. She acquired likewiſe conſiderable knowledge of the Italian, Spaniſh, and French languages. Dr. Grindal was alſo her preceptor in divinity, which ſhe is ſaid to have ſtudied with uncommon application and induſtry. That Elizabeth became a proteſtant, and her ſiſter Mary a papiſt, was the effect of that cauſe which determines the religion of all mankind; namely, the opinion of thoſe by whom they were educated: and this difference of opinion in their tutors, is not at all ſurpriſing, when we recollect, that their father Harry was of both religions, or of neither.

But the ſtudies of our illuſtrious princeſs were not confined merely to languages and theology: ſhe was alſo inſtructed in the political hiſtory of the ancients; and was ſo well ſkilled in muſic, as to ſing and play "artfully and ſweetly."

After the ſhort reign of her brother Edward, our heroine being then about 20 years of age, her ſiſter *firebrand* acceding to the crown, Elizabeth experienced a conſiderable degree of perſecution, ſo as to be not a little apprehenſive of a violent death. She was accuſed of nobody knows what; impriſoned; and, we are told, inhumanly treated. At laſt, by the interceſſion of King Philip of Spain, ſhe was ſet at liberty; which ſhe continued to enjoy, till, on the death of her *pious* ſiſter, ſhe, on the 17th of November, 1558, aſcended the throne of England. Her political hiſtory, as a queen, is univerſally known and admired: but her attention to the government of her kingdom did not totally ſuſpend her purſuit of learning. Aſcham, in his *School-maſter*, tells us, that, about the year 1563, five years after her acceſſion, ſhe being then at Windſor, beſides her perfect readineſs in Latin, Italian, French, and Spaniſh, ſhe read more Greek in one day, than ſome prebendaries of that church did read Latin in a whole week (p. 21).—She employed Sir John Forteſcue to read to her, Thucydides, Xenophon, Polybius, Euripides, Æſchines, and Sophocles. (*Ballard*, p. 219.)—That the Latin language was familiar to her, is evident from her ſpeech to the univerſity of Oxford, when ſhe was near ſixty; alſo from her ſpirited anſwer to the Poliſh ambaſſador in the year 1598. And that ſhe was alſo ſkilled in the art of poetry appears, not only from the ſeveral ſcraps which have been preſerved, but likewiſe from the teſtimony of a cotemporary writer, Puttenham, in his *Art of Engl. Poetry* (a very ſcarce book). Theſe are his words:—"But, laſt in recital, and firſt in degree, is the queen, whoſe learned, delicate, noble muſe, eaſily ſurmounteth all the reſt, for ſenſe, ſwectneſs, or ſubtilty, be it in ode, elegy, epigram, or any other kind of poem," &c. In this author are to be found only a ſpecimen of 16 verſes of her Engliſh poetry. "But," ſays Mr. Walpole, "a greater inſtance of her genius, and that too in Latin, was her extempore reply to an inſolent prohibition delivered to her from Philip II. by his ambaſſador, in this tetraſtic:

Te veto ne pergas bello defendere Belgas:
Quæ Dracus eripuit, nunc reſtituantur oportet:
Quas pater evertit, jubeo te condere cellas:
Religio papæ fac reſtituatur ad unguem.

"She inſtantly anſwered him, with as much ſpirit as ſhe uſed to return his invaſions,

Ad Græcas, bone rex, fient mandata calendas."

Being earneſtly preſſed by a Romiſh prieſt, during his perſecution, to declare her opinion concerning the real preſence of Chriſt's body in the wafer, ſhe anſwered,

Chriſt was the word that ſpake it;
He took the bread, and brake it;
And what that word did make it,
That I believe, and take it.

Fuller's Holy State.

She gave the characters of four knights of Nottinghamſhire in the following diſtich:

Gervaſe the gentle, Stanhope the ſtout.
Markham the lion, and Sutton the lout.

Walp. Cat.

Coming into a grammar-ſchool, ſhe characteriſed three claſſic authors in this hexameter :

Perſius a crab-ſtaff; bawdy Martial; Ovid a fine wag;
Full. Worth. of Warw. 126.

Sir Walter Raleigh having wrote on a window,

Fain would I climb, yet fear I to fall;

She immediately wrote under it,

If thy heart fail thee, climb not at all.
Worth. of Devonſh. 261.

Doubtleſs, ſhe was a woman of ſingular capacity, and extraordinary acquirements; and, if we could forget the ſtory of the Scottiſh Mary, and of her favourite Eſſex, together with the burning a few Anabaptiſts, we might pronounce her the moſt illuſtrious of illuſtrious women. She died in her palace at Richmond, the 24th of March, 1602, aged 70, having reigned 44 years; and was interred in the chapel of Henry VII. in Weſtminſter Abbey. Her ſucceſſor James erected a magnificent monument to her memory.—She wrote, 1. *The mirrour, or glaſs of the ſinful ſoul.* This was tranſlated out of French verſe into Engliſh proſe, when ſhe was eleven years old. It was dedicated to Queen Catharine Parr. Probably it was never printed; but the dedication and preface are preſerved in the *Sylloge epiſtolarum*, in Hearne's edition of *Livii Foro Julienſis*, p. 161. 2. *Prayers and meditations*, &c. Dedicated to her father, dated at Hatfield, 1545. Manuſcript, in the royal library. 3. *A dialogue out of Xenophon, in Greek, between Hiero a king, yet ſome time a private perſon, and Simonides a poet, as touching the life of the prince and private man.* Firſt printed, from a manuſcript in her Majeſty's own handwriting, in the Gentleman's Magazine for 1743. 4. Two orations of Iſocrates, tranſlated into Latin. 5. Latin oration at Cambridge. Preſerved in the king's library: alſo in Hollinſhed's Chron. p. 1206; and in Fuller's Hiſt. of Cambr. p. 138. 6. Latin oration at Oxford. See Wood's Hiſt. and Antiq. of Oxf. lib. 1. p. 289. alſo in Dr. Jebb's Append. to his life of Mary queen of Scots. 7. A comment on Plato. 8. *Boethius de conſolatione philoſophiæ*, tranſlated into Engliſh anno 1593. 9. *Salluſt de bello Jugurthino*, tranſlated into Engliſh anno 1590. 10. A play of Euripides tranſlated into Latin, *Cat. of Royal Auth.* 11. A prayer for the uſe of her fleet in the great expedition in 1596. 12. Part of Horace's art of poetry, tranſlated into Engliſh, anno 1598. 13. *Plutarch de curioſitate*, tranſlated into Engliſh. 15. Letters on various occaſions to different perſons; ſeveral ſpeeches to her parliament; and a number of other pieces.

ELIZABETH PETROWNA (daughter of Peter the Great), empreſs of Ruſſia, diſtinguiſhed herſelf by her ſignal clemency. She made a vow, that no perſon ſhould be put to death in her reign, and ſhe ſtrictly obſerved it. The example was followed, and confirmed by law, under the late Sovereign of Ruſſia, Catharine II. Elizabeth died in 1762, in the 21ſt year of her reign and 52d of her age.

ELIZABETH'S ISLAND, an iſland on the coaſt of Maſſachuſet's Bay, having Cape Cod to the N. and the iſland of Nantucket to the E. The natives are chiefly employed in the fiſheries. Long. 69. 3. W. Lat. 42. 0. N.

ELIZABETH TOWN, one of the oldeſt towns of the ſtate of New Jerſey; purchaſed of the Indians in 1664, and ſettled ſoon after. It has a handſome preſbyterian church, an epiſcopal church, and an academy. It is 15 miles S.W. of New York.

ELKHOLM, a ſea-port of Sweden, in Blekingen, ſeated on the Baltic, 24 miles W. of Carleſcroon. Long. 14. 50. E. Lat. 56. 20. N.

ELLERENA, an epiſcopal town of Spain, in Eſtremadura, 54 miles N. of Seville. Long. 5. 20. W. Lat. 38. 26. N.

ELLESMERE, a town in Shropſhire, with a market on Tueſday. It is ſeated on a large mere, in a ſmall but fertile diſtrict of the ſame name, 16 miles N.N.W. of Shrewſbury, and 176 N.W. of London. Long. 2. 53. W. Lat. 53. 53. N.

ELLICHPOUR, a town of Hindooſtan, in Berar, capital of a Circar of the ſame name, ſubject to the nizam of the Deccan. It was formerly the capital of Berar, and is 144 miles N.E. of Aurungabad. Long. 78. 5. E. Lat. 21. 12. N.

ELLORE, the capital of one of the Northern Circars, in the peninſula of Hindooſtan, 32 miles N. of Maſulipatam. Long. 81. 15. E. Lat. 16. 43. N.

ELM (*Encycl.*). Cit. Boucher, in a memoir read before *la Société d'Emulation* at *Abbeville*, has given ſome obſervations on elm-trees. Theſe trees are frequently attacked by ulcers, from which, at length, a great number of them periſh. *Du Hamel* had already endeavoured to find out the cauſe of this diſeaſe, and aſcribed it to a plethora of the ſap, an opinion which Cit. Boucher has confirmed by numerous experiments. He propoſed at the ſame time a remedy, which he ſucceſsfully applied to it. He obſerved that the local ulcer never attacked the trees on their north ſide, but always on the ſouth ſide. It acts principally on trees planted in a boggy ſoil, and along the ſides of rivers. Its ſeat is generally not far from the ground. This ulcer, owing to a ſuperabundant ſap, differs from a ſimilar one, deſcribed in *Journal d'Hiſtoire Naturelle*, *No.* 5, 1789, as in this the liquor expoſed to the air, ſoon takes the conſiſtency of a gum, and has the flavour of ſugar. —The remedy conſiſts in boring every tree attacked by the diſeaſe, at the ulcer itſelf; and in applying a tube in the hole, occaſioned by the borer, penetrating about nine lines in depth. The ſound trees, which are alſo bored, afford no liquor, whereas thoſe that are ulcerated yield it in great abundance, increaſing particularly in fine weather, and when the wound is expoſed to the ſouth. Stormy weather and great winds ſtop the infuſion. In this manner, he remarks that the ulcers dry and heal in 48 hours. It is probable, that ſuch a terebration, tried on other vegetables, and particularly on fruit trees, will produce the ſame effects. Pliny, Columella, and Palladius, have already mentioned this expedient being employed by the ancients, which, however, has not been practiſed for many years. Cit. Boucher concludes by remarking, that this tree is a native of Europe, and has not been lately introduced into France, as is commonly ſuppoſed; but the writings of the ancients prove, that it exiſted there long ago.—The chemical analyſis which he made of the ſap, ſhewed that it contained a conſiderable quantity of acetite of potaſh, a little acetite of lime, a certain quantity of vegetable or muco-ſaccharine matter, and a conſiderable proportion of muriate of lime; ſlight traces of ſulphate and muriate of potaſh were likewiſe perceived.

ELMADIA, or MAHADIA, a town of the kingdom of Tunis, ſeated on the gulf of Capes. It is ſurrounded by the ſea, is well fortified, and has a good harbour. It was taken by Emperor Charles V. but retaken ſoon after. Long. 8. 47. W. Lat. 35. 4. N.

ELME, ST. a caſtle of the iſle of Malta, ſeated on a rock near the city of Waletta, at the mouth of a very fine harbour.

ELMO, FORT, ST. a fortreſs of France, in the department of the Eaſtern Pyrennées, ſeated on the river Tet, five miles N. of Colioure. It was taken by the Spaniards, in 1793, but retaken the next year.

ELPHIN, a town of Ireland in the county of Roſcommon, and the ſee of a biſhop, eight miles N. of Boyle, and 16 N. of Roſcommon.

ELRICH, a town of Upper Saxony, formerly the capital of the county of Klettenburg. Here are ſome conſiderable manufactures. It is 6 miles N.W. of Nordhauſen.

ELSFLETH, a town of Weſtphalia, ſeated at the conflux of the Hunte and Weſer, 17 miles N.E. of Oldenburg.

ELTEMAN, a town of Franconia in the biſhopric of Wurtzburg, on the river Maine. Long. 10. 52. E. Lat. 50. 8. N.

ELTENBERG, a lofty and extenſive mountain in the duchy of Cleves. On it is an ancient fortreſs. It ſtands at the extreme point of a promontory, ſix miles E. of Cleves; and is the termination of a large chain of hills that runs parallel to the E. ſhore of the Rhine, at the diſtance of ten miles from its borders.

ELTHAM, a town in Kent, with a market on Monday, eight miles S. of London. Here are the remains of a palace, in which Edward II. often reſided, and his ſon, John of Eltham, was born. Its ſtately hall, ſtill entire, is converted into a barn.

ELTZ, a town of Germany, in the biſhopric of Hildeſheim, ſeated on the Leina, ten miles S.W. of Hildeſheim. Long. 10. 5. E. Lat. 52. 5. N.

ELWANGEN, a town of Suabia, with a chapter, whoſe provoſt is a prince of the Empire, and lord of the town. It is ſeated on the Jaxt, 17 miles S.E. of Halle, and 25 S.W. of Anſpach. Long. 10. 28. E. Lat. 49. 2. N.

EMBALMING, (*Encycl.*). On the ſubject of embalming, the following directions are given in the EDINBURGH PRACTICE OF PHYSIC AND SURGERY, &c. lately publiſhed.

"After eviſceration, as has been directed in opening a dead body, and continuing the inciſion further upwards, even into the mouth, and, if poſſible, without cutting the ſkin of the neck, all the cavities are to be well cleanſed, and the humidity ſucked up with ſponges, then waſhed with *tinct. myrrhæ*, and filled with ſpices compounded of fragrant herbs, aromatic drugs, and gums reduced to powder not very fine, firſt reſtoring the heart to its former reſidence, after having opened its ventricles, cleanſed and waſhed them with the tincture, ſtuffed them with the ſpices, and ſewed them up; and then the cavities are to be ſtitched very cloſe with the glovers' or ſpiral future. Large and deep inciſions are alſo to be made in all the moſt fleſhy parts, cleaning and waſhing them with the tincture in the ſame manner, filling them with the antiſeptic ſpices, and ſtitching them up. Then the head, trunk, and limbs, are to be perfectly well covered with cerecloth; putting a piece under the chin, to be ſecured by ſewing on the top of the head, after having well adjuſted the cap of the ſkull, ſewed the ſcalp together, and cleaned the mouth, as has been directed for the other parts, and putting in ſome of the ſpices. The cerecloth is to be prepared, according to art, with a compoſition made of wax, roſin, ſtorax, and painters' drying oil. After the application of the cerecloth, with great care and exactneſs, cut into ſuitable pieces according to the reſpective parts, and cloſing them well every-where, the face being cloſe ſhaved, is to be covered with ſome of the above compoſition melted, and laid on with a bruſh of a proper degree of heat, and of a moderate thickneſs; which may have a faint fleſh-colour given it with vermilion; and when it is grown cold and ſtiff upon this part, it may be lightly covered with hard varniſh; or this varniſh, applied thick, may here ſerve the purpoſe alone. A cap is to be well adapted to the head, falling down upon the neck, and to be ſewed under the chin, making a few circular turns about the neck with a roller of a proper breadth. All the reſt of the corpſe is to be incloſed in a ſheet, to be artfully cut, and ſewed on very cloſe and ſmooth, with the fineſt tape, and the *flat ſeam* mentioned in the preceding chapter; over which an appropriate dreſs is to be put, as the relations or friends think fit to direct and appoint, and then laid into the coffin, which ſhould be in readineſs: but when it is ſome great perſonage, who is to lie in ſtate for public view before the funeral rites are ſolemnized, the dreſs muſt be appropriated to his dignity and character. The brain and other viſcera are to be put with ſome of the ſpices into a leaden box. Sometimes the heart, prepared as has been directed, to preſerve it from putrefaction, is depoſited in an urn by itſelf.

EMANATION, the act of flowing or proceeding from ſome ſource or origin; or the thing that proceeds from that action.

EMBANKMENT, a raiſed mound or body of earth, thrown up to preſerve land from inundation, and thus render it fit for agricultural purpoſes. This is a very important branch of rural economy, and has been much encouraged in this country.

The following account of an embankment againſt the ſea, by Mr. Anthony Tatlow, is taken from the communications to the Hon. Board of Agriculture.

"The embankment againſt the ſea," ſays Mr. Tatlow, "that I mentioned when laſt at the Muſeum, is upon the eſtate of the earl of Aſhburnham, at Pembrey, in the county of Carmarthen, whither his lordſhip ſent me upon his coal and other buſineſs, and with directions to ſee if I could deviſe any method of preventing the ſea from making further incroachment upon his property, which it had been doing for many years; and particularly in October 1795, had broke in and covered many hundred acres, damaged the houſes, buildings, ſtack-yards, and gardens; and it was the general opinion, that a regular embankment muſt be formed, which would coſt ſome thouſand pounds, he having ſeveral miles of coaſt. The view that I firſt took was upon a very windy day, and the ſhore an entire ſand, which extended at low water many miles. In riding along, I perceived that any piece of wood, or accidental impediment to the courſe of the ſand, raiſed a hill: it immediately occurred to me, that by making a hedge at the weak and low places, with wings to catch the ſand as the wind blew it in different directions, I ſhould obtain the deſired effect. I therefore directed ſtakes nine feet long to be cut, and driven one foot and a half into the ſand, at two feet and a half diſtance from each other; betwixt which I had furze interwove, ſo as to form a regular furze hedge ſeven feet and a half high. Of this, ſince laſt June, I have done eleven hundred and thirty-ſeven yards; and in October laſt when I was there, a great deal of the hedge was covered, and ſince that time I am informed by letter, that a great deal more of it is ſo; and that the neighbouring inhabitants draw great comfort to themſelves, from the ſecurity my furze embankment gives them, as its preſent appearance plainly evinces, that at a trifling expence I can ſecure Lord Aſhburnham's eſtate from being inundated; for, whenever the firſt hedge is not high enough to prevent the ſea overflowing, another may be built upon the ſand formed by that hedge, and ſo on in ſucceſſion, till it is perfectly ſafe."

EMBO, a village near Brora, on the E. coaſt of Sutherlandſhire. Here a perſon was burnt, in 1727, for the imaginary crime of witchcraft; the laſt inſtance of theſe fanatic executions in Scotland.

EMBOLY, a town of Macedonia, with a Greek archbiſhop's ſee. It is the ancient Amphipolis; and is ſometimes called Chriſtopolis. It is ſeated on the Stromona, 40 miles N.E. of Salonichi. Long. 23. 55. E. Lat. 40. 59. N.

EMBS, a river of Weſtphalia, which riſes in the county of Lippe, and falls, at Embden, into the Dollart, a bay of the German Ocean.

EMBS, or EMS, a town of Suabia, capital of a county of the ſame name. Near it are ſome baths impregnated with ſulphur. It is 10 miles S. of Bregentz.

EMERALD (*Encycl.*). Cit. Vauquelin has lately diſcovered *chrôme and a new earth in the emerald*, and aſſerts that he formerly found theſe ſubſtances in the beryl. He alſo ſtates the analyſis of the pulverulent chlorite, which contains 26 parts of ſilex, 18 $\frac{50}{100}$ of alumine, 8 of magneſia, 43 of oxyd of iron, 2 of muriate of ſoda, or potaſs, and 2 of water; a reſult which is different from all that have hitherto been given in the analyſis of chlorites. He attributes this difference, rather to the nature of this apparently mixed earth than to the inaccuracy of chemical operations.

EMESSA, a town of Syria, in the government of Damaſcus. There are ſtill noble ruins, that ſhew it was anciently a magnificent city.

EMPOLI, a town of Tuſcany, with a biſhop's ſee, ſeated on the Arno, 17 miles S.W. of Florence. Long. 11. 6. E. Lat. 43. 42. N.

ENCKHUYSEN, a ſea-port of N. Holland, on the Zuider-Zee. It was once a flouriſhing place; but its harbour being now obſtructed by ſand, it has loſt its former conſequence. It is 25 miles N.E. of Amſterdam. Long. 5. 4. E. Lat. 52. 45. N.

ENDEAVOUR, STRAIT, a ſtrait of the S. Pacific Ocean, which ſeparates New Guinea from New Holland. It received its name from Captain Cook, who explored it in 1770. Its length is 10 leagues, and its breadth about five, except at the N.E. entrance, where it is contracted to leſs than two miles, by the iſlands called Prince of Wales' Iſlands.

ENDINGEN, a town of Suabia, in Auſtrian Briſgaw, formerly free and imperial. It is ſeated near the Rhine, 10 miles below Briſach.

ENFIELD, a town in Middleſex, with a market on Saturday. It was once famous for an extenſive royal chace, diſforeſted in 1779. Here was a royal palace, whence Edward VI. went in proceſſion to the Tower, on his acceſſion to the throne. After the death of Queen Elizabeth, it was alienated from the crown; and only a ſmall part of it is left ſtanding, the whole of the front having been taken down, in 1792, and its ſite occupied by ſome houſes. It is 10 miles N. of London. Long. 0. 2. E. Lat 51. 41. N.

ENGADINA, a country of the Griſons, in the mountains of the Alps. It is divided into Upper and Lower, extending along the banks of the river Inn, from its ſource to the Tyroleſe. Upper Engadina is a beautiful valley; yet, on account of its elevation, produces nothing but rye and barley. The winter ſets in early, and ends late here, during which time ſledges are the common vehicles. Even in ſummer, the air is cold and piercing, and the corn occaſionally much damaged by the hoar froſt.

ENGELBERG, a valley of Switzerland, 10 miles long, entirely ſurrounded by very lofty and barren mountains, and bounded by the cantons of Bern, Uri, and Underwalden. It is ſubject to the abbot of a Benedictine monaſtery of the ſame name, who is under the protection of the cantons of Lucern, Uri, Schweitz, and Underwalden; but in ſpiritual concerns he ſubmits to the juriſdiction of the Biſhop of Conſtance. His revenues are very conſiderable, and ariſe principally from his commerce in cheeſes. The naturaliſt will find this a very intereſting country. Glaciers, of a very great extent, and extremely diverſified, are found on the ſides of very fertile mountains, and exhibit ſingular points of view. There is abundance of fine black marble, white veined; a vitriolic earth, ſlate impregnated with vitriol; ſmall cryſtals, called Swiſs diamonds; ſilver, and vitriol. The abbey is 12 miles S.W. of Altdorf. See TITLISBERG.

ENGERS, a town of Germany in the electorate of Treves, capital of a county of the ſame name. It is ſeated on the Rhine, 10 miles N. of Coblentz. Long. 7. 32. E. Lat. 50. 55. N.

ENGHEIN, a town of Auſtrian Haiſault, near which was fought the famous battle of Steenkirk. It is 15 miles S.W. of Bruſſels. Long. 4. 5. E Lat. 50. 42. N.

ENGIA, or ENGINA, an iſland of Turkey in Europe, in a gulf of the ſame name, between Livadia and the Morea. There is a town upon it of the ſame name, 22 miles S. of Athens. Long. 23. 59. E. Lat. 37. 45. N.

ENGROSSING, the writing a deed over fair, and in proper legible characters. Among lawyers it more particularly means the copying fair upon parchment, or ſtamped paper, any writing or legal inſtrument or conveyance. Engroſſing is the buſineſs of the law-ſtationer.

ENKIOPING, a town of Sweden, in Upland, on the N. ſide of Lake Maeler, 21 miles S.W. of Upſal.

ENNIS, a borough of Ireland, in the county of Clare. It is large and populous, and ſituate on the Fergus, which is navigable for large boats from the Shannon, and adds greatly to the trade of the town. It is 17 miles N.W. of Limerick. Long. 8. 54. W. Lat. 52. 49. N.

ENNISCORTHY, a borough of Ireland, in the county of Wexford, where is a manufacture of coarſe woollen cloth, and ſome conſiderable iron works. It is ſituate on the Slaney, cloſe under Vinegar-hill, where the Iriſh rebels were entirely defeated on June 21, 1798. It is 10 miles N. of Wexford, and 27 N.E. of Waterford.

ENO, or ENOS, a town of Romania, near the gulf of Eno, with a Greek archbiſhop's ſee, 125 miles W of Conſtantinople. Long. 26. 15. E. Lat. 40. 46. N.

ENOCH (the Prophecy of); an apocryphal book, of which there remains but a few fragments.

Enoch was certainly one of the moſt illuſtrious prophets of the firſt world, ſince Moſes ſays of him, that *he walked with God*. This prophet is famed in the church for two things: The firſt is, his being taken up into heaven, without ſeeing death (Heb. xi. 5.): the ſecond is, his prophecy; a paſſage of which St. Jude has cited in his epiſtle, ver. 14. The ancients greatly eſteemed the prophecy of Enoch. Tertullian, on the authority of this book, deduces the original of idolatry, aſtrology, and unlawful arts, from the revolted angels, who married with the daughters of men. And it is on the teſtimony of this book, that the fathers of the 2d and 3d centuries, as Irenæus, Cyprian, and Lactantius, received for true this fable of the marriage of the angels with the daughters of men. St. Auguſtin, who was leſs credulous, allows, indeed, that Enoch wrote ſomething divine, becauſe he is cited by St. Jude; but inſinuates, that the authority of this book is doubtful, and that it cannot be proved that it was really written by Enoch. Indeed, the account it gives of giants engendered by angels, and not by men, has manifeſtly the air of a fable; and the moſt judicious critics believe, it ought not to be aſcribed to Enoch.

ENSENE, a town of Egypt, on the E. ſide of the Nile, 120 miles S. of Cairo. Long. 30. 54. E. Lat. 28. 5. N.

ENSKIRKEN, a town of Germany, in the duchy of Juliers, 15 miles S.W. of Cologne. Long. 6. 19 E. Lat. 51. 0. N.

ENSTORF, a town of the upper palatinate of Bavaria, 22 miles N. of Ratiſbon.

ENT (Sir George), an eminent Engliſh phyſician, born at Sandwich in Kent in 1604. He was educated at Sidney College, Cambridge; and, afterwards travelling into foreign countries, received the degree of doctor of phyſic at Padua. After his return he obtained great practice, was made preſident of the College of Phyſicians in London, and at length received the honour of knighthood from King Charles II. He was extremely intimate with Doctor Harvey; whom he learnedly defended in a piece entitled, Apologia pro Circulatione Sanguinis, contra Æmilium Pariſanum, Animadverſiones in Malachiæ

Thruſtoni; and ſome obſervations in the Philoſophical Tranſactions. Glanville, ſpeaking of his Plus Ultra of the modern improvements in anatomy, numbers Sir George Ent, Doctor Gliſſon, and Doctor Wallis, with the moſt celebrated diſcoverers in that ſcience. The two former were among the firſt members of the Royal Society. Sir George Ent died in October 1689.

ENTRE-DOUERO-E-MINHO, a province of Portugal, 45 miles in length, and 35 in breadth. Braga is the capital.

ENTRY *of an Heir*, in Scots law, that form of law by which an heir veſts in himſelf a proper title to his predeceſſor's eſtate.

EPERIES, a town of Upper Hungary, capital of the county of Saros, remarkable for its mines of ſalt. It is ſeated on the Tatza, 20 miles N. of Caſſovia. Long. 21. 13. E. Lat. 49. 8. N.

EPERNAY, an ancient town of France, in the department of Marne. It was taken by Henry IV. in 1592, when Marſhal Biron was killed, while that monarch had his hand on his ſhoulder. The wines produced in its neighbourhood are very exquiſite. It is 17 miles N.W. of Chalons. Long. 4. 0. E. Lat. 49 5. N.

EPINAL, a town of France, in the department of the Voſges, and famous for its paper mills. It was taken by Marſhal Crequi, in 1670, when its fortifications were diſmantled. It is ſeated on the Moſelle, near the mountains of the Voſges, 35 miles S.E. of Nanci. Long. 6. 0. E. Lat. 48. 4. N.

EPIPHANIUS (St.), an ancient father of the church, born at Beſanducan, a village in Paleſtine, about the year 332. He founded a monaſtery near the place of his birth, and preſided over it. He was afterwards elected biſhop of Salamis; when he ſided with Paulinus againſt Meletius, and ordained in Paleſtine, Paulinian, the brother of St. Jerom; on which a conteſt aroſe between him and John biſhop of Jeruſalem. He afterwards called a council in the iſland of Cyprus, in which he procured a prohibition of the reading of Origen's writings; and made uſe of all his endeavours to prevail on Theophilus biſhop of Alexandria to engage St. Chryſoſtom to declare in favour of that decree: but not meeting with ſucceſs, he went himſelf to Conſtantinople, where he would not have any converſation with St. Chryſoſtom; and formed the deſign of entering the church of the apoſtles, to publiſh his condemnation of Origen: but being informed of the danger to which he would be expoſed, he reſolved to return to Cyprus; but died at ſea, in the year 403. His works were printed in Greek, at Baſil, 1544, in folio; and were afterwards tranſlated into Latin, in which language they have been often reprinted. Petavius reviſed and corrected the Greek text by two manuſcripts, and publiſhed it together with a new tranſlation at Paris in 1622. This edition was reprinted at Cologne in 1682.

EPIRUS *(Encycl.)*. This country, according to Joſephus, was firſt peopled by Donanim, the ſon of Javan and grandſon of Japhet. The people were very warlike: but they continued in their ſavage ſtate long after their neighbours were civilized; whence the Iſlanders uſed to threaten their offenders with tranſportation to Epirus. Their horſes were in great requeſt among the ancients, as well as the dogs produced in one of the diviſions called *Moloſſus*; and hence theſe dogs were called by the Romans *Moloſſi*.

The hiſtory of Epirus commences with the reign of Pyrrhus, the ſon of Achilles by Deidamia the daughter of Lycomedes king of Scyros. He is ſaid to have behaved with great bravery at the ſiege of Troy; but it would appear that he behaved with no leſs barbarity. After the city was taken, he is ſaid to have killed old King Priam with his own hand; to have thrown Aſtyanax the ſon of Hector and Andromache headlong from an high tower; and ſacrificed Polyxena the daughter of Priam on the tomb of her father. He carried Andromache with him into Epirus, where he ſettled by the advice of the famous ſoothſayer Helenus, one of Priam's ſons, who had ſerved during the Trojan war both under his father and himſelf. The only remarkable period of the hiſtory of Epirus is the reign of Pyrrhus II. who made war upon the Romans. He was invited into Italy by the Tarentines; and embarked about 280 B. C. After having eſcaped many dangers by ſea, he landed in that country, and with great difficulty gained a victory over the Romans; but he was afterwards utterly defeated by them, and obliged to return into his own country. To retrieve his honour, he then undertook an expedition againſt Macedon; where he overthrew Antigonus, and at laſt made himſelf maſter of the whole kingdom. He then formed a deſign of ſubduing all the other Grecian ſtates; but met with ſuch an obſtinate reſiſtance at Lacedæmon, that he was obliged to drop the enterprize; and was ſoon after killed at the ſiege of Argos, by a woman, who from the wall threw a tile upon his head. Deidamia, the grand-daughter of Pyrrhus, was the laſt that ſat on the throne of Epirus. She is ſaid to have been murdered after a ſhort reign; upon which the Epirots formed themſelves into a republic.

Under the new form of government Epirus never made any conſiderable figure, but ſeems rather to have been dependent on the kingdom of Macedon. The Romans having conquered Philip king of that country, reſtored the Epirots to their ancient liberty; but they, forgetful of this favour, ſoon after took up arms in favour of Perſeus. As a puniſhment for this ingratitude, the Romans gave orders to Paulus Emilius, after the reduction of Macedon, to plunder the cities of Epirus, and level them with the ground. This was punctually executed throughout the whole country on the ſame day, and at the ſame hour. The booty was ſold, and each foot-ſoldier had 200 denarii, that is, ſix pounds nine ſhillings and two pence, and each of the horſe the double of this ſum. An hundred and fifty thouſand men were made ſlaves, and ſold to the beſt bidder for the benefit of the republic. Nor did the vengeance of Rome ſtop here; all the cities of Epirus, to the number of 70, were diſmantled, and the chief men of the country carried to Rome, where they were tried, and moſt of them condemned to perpetual impriſonment. After this terrible blow, Epirus never recovered its ancient ſplendor. Upon the diſſolution of the Achæan league, it was made part of the province of Macedon; but when Macedon became a dioceſe, Epirus was made a province of itſelf, called the province of *Old Epirus*, to diſtinguiſh it from *New Epirus*, another province lying to the eaſt of it. On the diviſion of the empire, it fell to the emperors of the Eaſt, and continued under them till the taking of Conſtantinople by the Latins, when Michael Angelus, a prince nearly related to the Greek emperor, ſeized on Etolia and Epirus, of which he declared himſelf deſpote or prince; and was ſucceeded by his brother Theodorus, who took ſeveral towns from the Latins, and ſo far enlarged his dominions, that, diſdaining the title of *deſpote*, he aſſumed that of *emperor*, and was crowned by Demetrius archbiſhop of Bulgaria. Charles, the laſt prince of this family, dying without lawful iſſue, bequeathed Epirus and Acarnania to his natural ſons, who were driven out by Amurath the Second. Great part of Epirus was afterwards held by the noble family of the Caſtriots; who, though they were maſters of all Albania, yet ſtyled themſelves princes of Epirus. Upon the death of the famous George Caſtriot, ſurnamed *Scanderberg*, Epirus fell to the Venetians, who were ſoon diſpoſſeſſed of it by the Turks; in whoſe hands it ſtill continues, being now known by the name of *Albania*, which comprehends the Albania of the ancients, all Epirus, and that part of Dalmatia which is ſubject to the Turks.

EPISCOPIUS (Simon), one of the moſt learned men of the 17th century, and the chief ſupporter of the Arminian ſect, was born at Amſterdam in 1583. In 1612 he was choſen divinity profeſſor at Leyden, in the room of Gomarus, who reſigned; and the functions of his office, with his private ſtudies, were light burthens to him, compared with the difficulties he ſuſtained on account of the Arminian controverſy: which, though it began in the univerſities, ſoon flew to the pulpits, from whence it ſpread and inflamed the people. The ſtates of Holland having invited Epiſcopius to take his place at the ſynod of Dort, he went thither accompanied by ſome remonſtrant miniſters; but the ſynod would not allow them to ſit as judges, nor to appear in any other capacity than as perſons ſummoned before them: they ſubmitted, were depoſed from their functions, and baniſhed the territories of the commonwealth. Epiſcopius and his perſecuted brethren retired to Antwerp; but the times growing more favourable, he returned to Holland in 1626, and was made miniſter of the church of the Remonſtrants at Rotterdam: in 1634, he was choſen rector of the college founded by his ſect at Amſterdam, where he ſpent the remainder of his days. He died in 1643, of the ſame diſorder which had killed his wife before, a retention of urine; having loſt his ſight ſome weeks previous to his end. The learned have beſtowed great eulogiums on Epiſcopius; but he did not always write with that moderation which might have been wiſhed. His works make two volumes in folio, of which the ſecond conſiſts of poſthumous publications.

EPPING, a town in Eſſex, with a market on Friday. The butter made in this neighbourhood, and called Epping butter, is highly eſteemed in London. Epping is ſeated at the N. end of a foreſt of the ſame name, 17 miles N.N.E. of London. Long. 0. 9. E. Lat. 51. 46. N.

EPPING-FOREST, a fine foreſt in the S.W. of Eſſex, formerly a much more extenſive diſtrict, that contained a great part of the county. It then went by the name of the Foreſt of Eſſex; and afterwards, when its boundaries had been conſiderably contracted, it had the name of Waltham Foreſt, from its vicinity to Waltham Abbey.

EPPINGEN, a town in Germany, in the palatinate of the Rhine, with a caſtle, ſeated on the Elfats, 20 miles N.E. of Philipſburg. Long. 9. 0. E. Lat. 49. 24. N.

EPULONES, in Roman antiquity, miniſters who aſſiſted at the ſacrifices, and had the care of the ſacred banquet committed to them.

EPWORTH, a village of the Iſle of Axholm, in Lincolnſhire, nine miles N. of Gainſborough. It is the birth place of John Weſley, one of the founders of the ſect of the methodiſts.

ERBACH, a town of Franconia, capital of a county of the ſame name, 16 miles N.N.E. of Heidelberg, and 20 N.E. of Manheim.

ERIBOL, LOCH, an arm of the ſea, on the N. coaſt of Sutherlandſhire, capable of affording a ſafe retreat to the largeſt veſſels. It receives ſeveral ſtreams; particularly that which flows from a lake called Loch Hope.

ERICHT, LOCH, a lake in the diſtrict of Athol, Perthſhire. It extends ſeveral miles into Inverneſsſhire. Near this place wandered the fugitive Pretender, in 1746, lurking in caves, and among rocks. The waters of this lake deſcend into another, called Loch Rannoch.

ERISSO, a town of Macedonia, with a biſhop's ſee, at the bottom of the gulf of Monte Sancto.

ERITH, a village in Huntingdonſhire, on the Ouſe, five miles E.N.E. of St. Ives. Near this place is a piece of antiquity called Belfar's Hill, an artificial mount, generally ſuppoſed to be the place where the people took up arms againſt William the Norman, in 1066, after he defeated Harold at the battle of Haſtings.

ERIVAN, a city and the capital of Perſian Armenia, in a province of the ſame name, with an Armenian patriarch. It is defended by a fortreſs, in which is the governor's palace, and by a caſtle, on the river Zuengui, near a lake of its own name, which is very deep, and 60 miles in circumference. The Meidan is an open ſquare, 400 paces over, wherein are very fine trees. The baths and caravanſaries have their beauties, but the churches of the Chriſtians are ſmall, and half under ground. It is 105 miles N.W. of Aſtrabad. Long. 44. 10. E. Lat. 40. 20. N.

ERKELENS, a town of Weſtphalia, in the duchy of Juliers, with a caſtle, ſeated on the Roer, 10 miles N.W. of Juliers. Long. 6. 35. E. Lat. 51. 4. N.

ERLANG, a town of Franconia, in the marquiſate of Culembach, ſeated on the Regnitz, 12 miles N.W. of Nuremburg. Long. 11. 5. E. Lat. 49. 35. N.

ERMELAND, a country ſurrounded by Pruſſia, formerly ſubject only to the biſhop and chapter, and called the biſhopric of Ermeland, but now become a province of Pruſſia.

ERNEE, a town of France, in the department of Mayenne, ſituate on the Mayenne, 15 miles N.N.W. of Laval. Long. 0. 48. W. Lat. 48. 19. N.

ERPACH, a town of Franconia, capital of a county of the ſame name, with a caſtle, 30 miles S.E. of Francfort. Long. 9. 10. E. Lat. 40. 32. N.

ERQUIKO, a ſea-port of the Red Sea, on the coaſt of Abex, ſubject to Turkey. It is 320 miles S.W. of Mecca. Long. 39. 5. E. Lat. 17. 30. N.

ERROMANGO, one of the New Hebrides, in the South Pacific Ocean. Long. 169. 19. E. Lat. 18. 47. S.

ERZERUM, a city of Turkiſh Armenia, with Armenian and Greek epiſcopal ſees. It is ſituate between the two ſources of the Euphrates, in a beautiful plain, at the foot of a chain of mountains, fruitful in all ſorts of corn. It is ſurrounded by double walls, defended by ſquare towers. The Turks, who are all janiſſaries, are about 12,000 in number; but moſt of them are tradeſmen, and receive no pay. The Armenians have two churches, the Greeks but one: the latter are moſtly braziers, and live in the ſuburbs. A great trade is carried on here in furs, Perſian ſilks, cottons, calicoes, and drugs. This town is a thoroughfare, and a reſting-place for the caravans to the Eaſt Indies. It is 104 miles S. by E. of Trebiſond. Long. 40. 35. E. Lat. 39. 56. N.

ESCALONA, a town of Spain, in Old Caſtile, 14 miles N.N.E. of Sagovia.

ESCALONA, a town of Spain, in New Caſtile, ſurrounded with walls. It is ſituate on an eminence, in a fertile country, near the Albreche, 20 miles N.W. of Toledo, and 32 S.W. of Madrid.

ESCAPE, or FIRE-ESCAPE, a contrivance for removing perſons and their property ſafely from the upper windows of a houſe on fire. Several methods of doing this have been ſuggeſted by different perſons. The following deſcription of a machine for ſaving perſons from the upper ſtories of a houſe on fire, by Dr. Collin, appears in the Tranſactions of the American Philoſophical Society, who rewarded the inventor with their gold medal.

A B C C (Plate 27) is a trunk with a ſocket from top to bottom, and two pulleys *a*, *a*, in the ſides C, C. In this cylindrical ſhaft D E moves, ſupported on the pulleys by two ropes. Theſe are by one end tacked to the foot of the ſhaft, and by the other to the axes of the windlaſſes I, I, which ſtand below. The cranks, winding the ropes round the axes, lift the foot of the ſhaft to the pulleys, and by unwinding let it down to the bottom.

F E G is a lever, turning on its fulcrum, which is fixed on the top of the ſhaft, by the iron tire *d*. The long arm is preſſed by the frame at its end: the ſhort one is held in balance by the rope G H, which is faſtened on the baſe of the machine. As the lever deſcends with the ſhaft, the rope ſlackens on the ſhort arm; then the other, no longer balanced, deſcends round the fulcrum, and by this motion turns the ſhort one upwards tight againſt the rope. Their angular contrary movements continue thus, until the ſhaft reaches the bottom of the ſocket; and the baſket at the ſame time comes to the ground.

The baſe is a rectangular plank floor with a compact frame underneath. The trunk is fixed in it, by ſeveral braces *c*, and other uſual faſtenings, both above and below, ſtanding ſomewhat from the centre towards the rope G H, in order to counteract its raiſing that end.

The windlaſſes are firmly ſet in the floor, near the trunk, directly under the pulleys.

The wheels are low and ſtrong, placed near the corner of the baſe. They have locks, to be uſed when the machine is loading.

The baſket is breaſt-high, and wide enough for four perſons. The three iron rods keep it more ſteady than cords would; and their openings admit one perſon at a time. It hangs free from the end of the lever.

The principles of this conſtruction ariſe from the requiſite properties of this machine: it muſt be ſpeedily brought; readily fitted; practicable in confined places; want no ſupport from the wall; reach a conſiderable height, and alſo project over obſtacles on or above the ground; take down ſeveral perſons at once, and without any exertion of theirs. The two vertical pieces folded, with the lever oblique, can both be houſed and eaſily carried: when put in action, they expand gradually; and the lever is high when at full length. The baſe may be convenient, becauſe its own weight, with the trunk and the four men at the windlaſſes keep the centre of gravity pretty low; and all the preſſures bear perpendicular on the longer face. Beſides, people may ſit down on the ſides, or hold it by handſpikes, which may be kept on it, and when wanted, put into holes near the margins, ſo as to project outwards. A level poſition being very neceſſary, a plumb rule ſhould alſo be hung on the trunk.

The cylindrical form of the ſhaft and ſocket procures an eaſy gliding motion, that leſſens the occaſional ſideway bearings. It is alſo leſs alterable by wear, and change of weather; it makes the ſhaft more ſolid, and thus requires leſs bulk in both pieces. The two quarters of the trunk which are ſlit for a communication of the ropes with the ſhaft, will yet be ſtrong enough by the ſolid piers that bear the pulleys. The other two have ſufficient firmneſs againſt oblique preſſures, ariſing from the action of the machine, or from the caſual inclination of the baſe. The part from the brim to the pulleys inclusively is fortified by the iron-band B B, to ſecure the ſhaft when drawn up. The height of that piece, its own weight, the preſſure on its head, and the obliquity of the ſame at the time, together with probable external accidents, will determine the width; it need perhaps not exceed a fifth of the part below.

The trunk and ſhaft require ſtiff and hard materials. The lever being made of tough wood, may be further ſtrengthened by iron plates. The ſolidity and ſhape of the fulcrum and arms muſt be carefully proportioned to their reſpective weights.

The ſhaft, when down, reaches beyond the trunk ſo much as to clear the lever of the piers. This added to the diſtance of the brim from the pulleys, is the difference between the ſhaft and their height *a a*. The altitude *a* E is therefore *a a* doubled and that ſurplus. If the ſhaft bore a greater proportion in effecting this altitude, it muſt be longer; conſequently it would, when ſtanding, hold the arm further from the ground, and render that piece, with itſelf, leſs portable; and, when up, increaſe the weight on the fulcrum, and the preſſure againſt the ſocket.

The arm E F riſes from *a* E on an angle about fifty degrees with the horizon, thus making a good projection, and a conſiderable increaſe of altitude. Its proportion to the ſhaft and angle with it when down, are ſuch as to ſet the baſket on the ground.

Theſe angles, the ſhaft, and the ſpace *a a* (its elevation), accord in adjuſting the proportion of E G, and the poſition of the rope. When the lever deſcends, the arm E G opens and throws out the rope, keeping it ſtretched all the while. This makes it deſcribe a circular arch. The lever having come to a horizontal poſition, the arm by the continued rotation returns towards the line *a* E, and makes the rope retrace the arch until the ſhaft is down. If the reverſed angle of the arm is then equal to *a* E G, the rope comes to the point G, from whence it went, if leſs it goes beyond. In the firſt caſe E G is the ſide of a triangle which has *a a* for its baſe and two angles equal to *a* E G; in the ſecond it is leſs than this ſide. As the elevation of E F is not above 50, its complement *a* E G (40) is greater than the angle of E F with the ſhaft, which with that ſpan would hold the arm too high from the ground. It conſequently exceeds the reverſed angle, which (being oppoſite) is equal with this. Therefore the ſhort arm is leſs than the ſaid ſide, but the difference is not great.—The ſituation of the ſhaft being moſt critical in the higheſt elevation, the rope ſhould then allow the lever very moderate rotation, and thus leſſen the kicking of the weight againſt the fulcrum. Its poſition will therefore be nearly perpendicular, when the deſcent begins, that the arch, immediately falling, or riſing very little, may keep down the end of E G. This poſition requires a moderate elevation of E F; for if the angle D E G is too contracted, E G will project far beyond the foot of the rope, in and about its horizontal paſſage, and thus produce a detrimental obliquity. It alſo limits the fall of E F, by regulating the reverſed angle; for the nearer the point G returns to the ſhaft, the further it goes from the rope, and the more oblique is the outward draught.

The obliquity of draught admitted in this machine, appears eaſy on the model: trials may prove a greater elevation of the lever practicable. The proportion of the ſhort arm is ſufficient while the whole weight to be wound up does not exceed that of twelve perſons: for ſo much, at leaſt, four hands at the windlaſſes are competent. If the rope is drawn by hands, this arm muſt ſtill, for the ſake of convenient carriage, be much ſhorter than the other; and accidents of miſmanagement might happen, which the fixed rope prevents: it is prudent to adjuſt the machine with all the powers it can exerciſe; eſpecially as it muſt be uſed on the diſmal occaſion of nocturnal conflagrations.

In conſiderable towns the houſes differ ſo much in height, that machines of two ſizes are neceſſary. The larger ſhould be competent for the third or fourth ſtories in the higheſt buildings, according to their dimenſions, and the practicable ſize of the three pieces; and the ſmaller for thoſe in the loweſt. As both have ſeveral degrees of elevation, they will alſo ſuit inferior ſtories reſpectively, and thus take in all the different heights. The baſket muſt aſcend ſo near beneath the window, that the perſons may, without fear, get in, and deſcend ſo low that they may get out. For the laſt arm cannot be long enough, when great altitudes demand very high ſhafts; then a rope ladder may be fixed on the baſket, and let down when the machine ſtops, ten feet from the ground,

if neceſſary. As the dimenſions of the lever and ſhaft of large machines demand great ſolidity, their weight will bear a conſiderable proportion of the whole that is wound up. One or two perſons more in the baſket would proportionably leſs increaſe the whole. Their baſes will alſo be wide enough for two men at each of the four cranks. The ſmaller machines muſt ſupport the weight of four full-grown perſons, as the fire may prevent a ſecond going up. Their baſes are to be fitted for narrow alleys, and crowded places.

Much property might be ſaved from the fire by machines of a ſimilar conſtruction with this, having a capacious baſket, and capſtans inſtead of windlaſſes. The combination of perpendicular and lateral movements may alſo be applied to many other valuable purpoſes.

Perpendicular lines being dropped from the point G to the baſe, the ſquares of theſe, and the ſquares of the diſtances of their ends from the foot of the rope, are jointly equal to the ſquare of the rope. The ſquare of E G is likewiſe equal to thoſe of its ſines. When the ſhaft is drawn up, the perpendicular height of the rope differs from the joint heights of the ſhaft and pulleys by the coſine of D E G; and when the ſhaft is down, it is equal to the height of this piece, joined to the coſine of the reverſed angle. The ſines of theſe angles are equal to the diſtances between the ends of the ſaid perpendiculars and the centre of the trunk's bottom. Taking the value of the rope in the two caſes, gives this equation:

$a\,a^2 + 2$ ſhaft. $\times\, a\,a =$
$2\,a\,E \times$ cos. D E
$+\ 2\,f\,h \times$ eos. rev. ang.
$+\ 2\,a\,H \times$ Sin. D E G—Sin. rev. a. } E G.

This will guide the choice of angles, proportion of E G, and poſition of the rope.

ESCAPEMENT (*Encycl.*), a part of the machinery of a watch. See WATCH. The following deſcription of a new eſcapement for watches appears in the Tranſactions of the Society for the Encouragement of Arts, Manufactures, and Commerce; and thirty guineas were voted to Mr. De Laſons for this invention.

"Having conſidered the perfection of chronometers," ſays the author, "to conſiſt more in giving an equal impulſe to the balance than to any other general cauſe, I preſent to the ſociety the model of a new eſcapement, which has not only the property of correcting the errors of the main-ſpring, train of wheels, &c. and giving an equal power to the balance, but likewiſe the wheels are locked, without ſpring-work, perfectly ſafe from getting out of order, and are unlocked with leſs power than in any eſcapement I know, as the wheels do not bear againſt the locking with more than a tenth part of the whole preſſure from the main-ſpring; a circumſtance I believe to be perfectly new.

"Although the giving an equal impulſe to the balance has been already moſt ingeniouſly done by Mr. Mudge and Mr. Haley (from whoſe great merit I would not wiſh to detract), yet the extreme difficulty and expence attending the firſt, and the very compound locking of the ſecond, render them far from completing the deſired object.

"The perfections and advantages ariſing from my improvements on the remontoire detached eſcapement for chronometers, which gives a perfectly equal impulſe to the balance, and not only entirely removes whatever irregularities ariſe from the different ſtates of fluidity in the oil, from the train of wheels, or from the main-ſpring, but does it in a ſimpler way than any with which I am acquainted. I truſt it will not be thought improper in me to anſwer ſome objections made at the examinations before the committee, as I am fully perſuaded the more mathematically and critically the improvements are inveſtigated, the more perfect they will prove to be.

"It was firſt obſerved, that my method did not ſo completely detach the train of wheels from the balance as another eſcapement then referred to. I beg leave to remark, that the train of wheels in mine is prevented from preſſing againſt the locking, by the whole power of the remontoire-ſpring; ſo that the balance has only to remove the ſmall remaining preſſure, which does away that objection, and alſo that of the diſadvantage of detents, as this locking may be compared to a light balance turning on five pivots, without a pendulum-ſpring; and has not only the advantage of banking ſafe at two turns of the balance, and of being firmer, and leſs liable to be out of repair than any locking where ſpring-work is uſed, but likewiſe of unlocking with much leſs power.—It was then obſerved, it required more power to make it go than uſual. Permit me to ſay, it requires no more power than any other remontoire eſcapement, as the power is applied in the moſt mechanical manner poſſible.—And, laſtly, it was ſaid, that it ſet or required the balance to vibrate an unuſually large arch before the piece would go. This depends on the accuracy of the execution, the proportionate diameter and weight of the balance, the ſtrength of the remontoire-ſpring, and the length of the pallets. If theſe circumſtances are well attended to, it will ſet but little more than the moſt generally detached eſcapements."

In plate 26, A. ſhews the eſcape wheel.

B. the level pallet, on an arbor with fine pivots, having at the lower end

C. The remontoire or ſpiral ſpring fixed with a collar and ſtud, as pendulum-ſprings are.

D. The pallet of the verge, having a roller turning in ſmall pivots for the lever pallet to act againſt.

E. Pallets to diſcharge the locking, with a roller between, as in fig. 4.

F. The arm of the locking pallet continued at the other end to make it poiſe, having ſtuds and ſcrews to adjuſt and bank the quantity of motion.

a and *b*. The locking pallets, being portions of circles, faſtened on an arbor turning on fine pivots.

G. The triple fork, at the end of the arm of the locking pallets.

The centre of the lever-pallet in the draft, is in a right line between the centre of the ſcape-wheel and the centre of the verge, though in the model it is not: but may be made ſo or not, as beſt ſuits the ealliper, &c.

The ſcape-wheel A, with the tooth 1, is acting on the lever pallet B, and has wound up the ſpring C; the verge-pallet D (turning the way repreſented by the arrow) the moment it comes within the reach of the level pallet, the diſcharging pallet E, taking hold of one prong of the fork, removes the arm F, and relieves the tooth 3 from the convex part of the lock *a*. The wheel goes forward a little, juſt ſufficient to permit the lever-pallet to paſs, while the other end gives the impulſe to the balance: the tooth 4 of the wheel is then locked on the concave ſide of the lock *b*, and the lever-pallet is ſtopped againſt the tooth 5, as in fig. 3. So far the operation of giving the impulſe, in order again to wind the remontoire-ſpring (the other pallet at E, in the return, removing the arm F the contrary direction), relieves the tooth 3 from the lock *b*. The wheel again goes forward, almoſt the whole ſpace, from tooth to tooth, winds the ſpiral-ſpring again, and comes into the ſituation of fig. 1, and thus the whole performanee is completed. The end of the lower pallet B reſting on the point of the tooth 1, prevents the wheel exerting its full force on the lock *a*, as in fig. 1. The ſame effect is produced by the pallet laying on the tooth 5, by preventing the wheel from preſſing on *b*; and thus the locking beeomes the tighteſt poſſible. This eſcapement may be much ſimplified by putting a ſpring with a pallet made in it, as in fig. 5, inſtead of the lever-pal-

let, and ſpiral-ſpring. The operation will be in other reſpects exactly the ſame, avoiding the friction of the pivots of the lever-pallet. This method I prefer for a piece to be in a ſtate of reſt, as a clock; but the diſadvantage, from the weight of the ſpring in different poſitions, is obvious.

The locking may be on any two teeth of the wheel, as may be found moſt convenient.

ESCHELLES, a town of Savoy, on the frontiers of Dauphiny, 10 miles S.W. of Chamberry. Long. 5. 45. E. Lat. 45. 30. N.

ESCHWEGEN, a town of Germany, in the Landgrave of Heſſe-Caſſel, ſeated on the Werra, 22 miles S.E. of Heſſe-Caſſel. Long. 10. 6. E. Lat. 51. 9. N.

ESCHWEILER, a town of Weſtphalia, in the duchy of Juliers, ſix miles S. of Juliers.

ESENS, a town of Weſtphalia, in Eaſt Frieſland, on the German Ocean, 20 miles N. of Embden. Long. 7. 14. E. Lat. 53. 47. N.

ESFARAIN, a town of Perſia, in Koraſan, famous for the great number of writers it has produced. It is 90 miles E. of Aſtrabad. Long. 41. 23. E. Lat. 36. 48. N.

ESGUEYRA, or ESGUERIA, a town of Portugal, in Beira, eight miles S. of Aveiro.

ESHER, a village in Surrey, on the river Mole, five miles S.W. of Kingſton. It is diſtinguiſhed by a noble Gothic manſion, the two towers of which are as they were originally built by Cardinal Wolſey.

ESKDALE, the moſt eaſterly diviſion of Dumfrieſſhire, ſo named from the river Eſk, which flows through it, in a courſe of 20 miles, to the town of Langholm.

ESKISHEHR, a town of Natolia, on the river Sakaria, 116 miles S.E. of Conſtantinople. Long. 30. 58. E. Lat. 39. 48. N.

ESLINGEN, a large Imperial city of Suabia, in the duchy of Wirtemburg. Here are ſeveral convents, but the inhabitants are chiefly Proteſtants. It is ſeated on the Neckar, eight miles S.E. of Stutgard. Long. 9. 20. E. Lat. 48. 47. N.

ESOPUS, a town of the ſtate of New York, on a river of the ſame name, 76 miles N. of New York.

ESPALION, a town of France, in the department of Aveiron, 14 miles N.N.E. of Rhodez. Long. 2. 40. E. Lat. 44. 32. N.

ESPERIE, a town of Hungary, near which are ſome famous ſalt mines. It is 22 miles N. of Caſchaw. Long. 21. 38. E. Lat. 49. 5. N.

ESPERNON, a town of France in the department of Eure and Loire, ſeated on the Gueſle, 12 miles N.E. of Chartres. Long. 1. 44. E. Lat. 48. 36. N.

ESPIERS, a town of Auſtrian Flanders, where a river of the ſame name falls into the Schelt, eight miles N. of Tournay. Long. 3. 25. E. Lat. 50. 53. N.

ESPOSENDA, a ſea-port of Portugal, in Entre-Duero-e-Minho, at the mouth of the Cavado, 22 miles N. of Oporto. Long. 8. 21. W. Lat. 41. 32. E.

ESSECK, a trading town of Sclavonia, with a ſtrong caſtle. It has a bridge over the marſhes, 8865 geometrical paces in length and 15 in breadth, with towers at a quarter of a mile diſtant from each other, and handſomely railed on each ſide. It is a difficult paſs, and there have been ſeveral battles fought here between the Turks and Germans. There are trees in all the ſtreets of the town, which was taken from the Turks in 1687, ſince which time it has continued in the hands of the houſe of Auſtria. It is ſeated on the river Drave, 80 miles W. by N. of Belgrade, and 175 S. by E. of Vienna. Long. 19. 58. E. Lat. 45. 40. N.

ESSEN, a town of Weſtphalia in the duchy of Cleves, formerly Imperial, but now ſubject to the abbeſs of Eſſen. It is eight miles E. of Duiſburg. Long. 7. 4. E. Lat. 51. 22. N.

ESTAPO, a ſtrong town of New Spain, ſeated at the mouth of the river Tlaluc, 230 miles S.W. of Mexico. Long. 103. 5. W. Lat. 17. 30. N.

ESTAVAYER, a town and bailiwic of Swiſſerland, in the canton of Friburg, on the borders of the lake of Neuchatel, with a fine caſtle. In the 15th century it belonged to the duke of Savoy, who, taking part againſt the Swiſs, they beſieged and ſacked the town in 1473. It is 13 miles W. of Friburg. Long. 6. 56. E. Lat. 46. 55. N.

ESTE, a town of Italy, in the Paduan, 15 miles S.W. of Padua. Long. 12. 44. E. Lat. 45. 55. N.

ESTELLA, an epiſcopal town of Spain, in Navarre, capital of the territory of the ſame name; ſeated on the Ega, 15 miles W. of Pampeluna. Long. 2. 0. W. Lat. 42. 40. N.

ESTEPA, a town of Spain, in Andaluſia, with an ancient caſtle, on a mountain, 62 miles N. by W. of Malaga. Long. 4. 19. W. Lat. 37. 16. N.

ESTEPONA, a town of Spain, in Granada, near the coaſt, 20 miles W.S.W. of Marbella.

ESTHWAITE-WATER, a lake in Lancaſhire, between Hawkſhead and Windermere Water. It is two miles and a half long, and half a mile broad, interſected by a peninſula from each ſide, jutting far into the lake. On the banks are villages and ſcattered houſes, pleaſantly ſituated under woods, and hanging grounds, clothed with verdure; all heightened by the deep ſhade of the woods, and the ſtrong back-ground of rocky mountains. At the head of a gentle ſlope, a handſome modern houſe, called Belmont, commands a delightful view of the lake and its environs. The fiſh are pike, perch, eel, and trout; but no char is found in this lake, though it is connected with Windermere-water.

ESTREMOS, a town of Portugal, in Alentejo, divided into the upper town and the lower. The upper is commanded by a citadel, on the top of a hill, ſtrongly fortified, and ſurrounded by a large ditch. The houſes are white, and the principal are adorned with fine marble pillars: there is alſo a tower of marble, finely poliſhed. The lower town is the neweſt, and has a large ſquare, in the middle of which is a baſin. An earthen-ware is made here, greatly eſteemed for its beauty and fine ſmell. The Portugueſe gained a complete victory over Don John of Auſtria near this place, 1763. It is ſeated on the river Terra, which falls into the Tajo, 15 miles W. of Badajoz, and 75 E. of Liſbon. Long. 7. 16. W. Lat. 38. 44. N.

ESWECEN, a town of Germany, in the landgrave of Heſſe Caſſel, 25 miles S.E. of Caſſel. Long. 10. 9. E. Lat. 51. 11. N.

ETAIN, a town of France, in the department of Meuſe, 15 miles N.E. of Verdun. Long. 5 35. E. Lat. 49 15. N.

ETAMPES, a town of France, in the department of Seine and Oiſe, ſeated on the river Olet or Etampes, which abounds with craw-fiſh. It is 15 miles E. of Chartres. Long. 2. 10. E. Lat. 48. 30. N.

ETAPLES, a ſea-port of France, in the department of the Straits of Calais, ſituate near the mouth of the Canche, 13 miles S. of Boulogne. Long. 1. 56. E. Lat. 50. 46. N.

ETAYA, a town of Hindooſtan Proper, in the province of Agra, ſituate on a high bank of the Jumna. Many parts of the bank are 60 feet high, the ſides of which conſiſt of what in India is called concha, which is orginally ſand; but the conſtant action of the ſun, in the dry ſeaſon, forms it almoſt into a vitrification. On the top, near the river, are the remains of a fort. The town is large, but very wretched, having but two tolerable houſes. It is 62 miles S.E. of Agra. Long. 79. 25. E. Lat. 26. 43. N.

ETHIOPIA, a name by which a vaſt region of Africa has been diſtinguiſhed by ſome geographers, who have divided it into Upper and Lower Ethiopia. The firſt includes Abyſſinia and Nubia; the ſecond all the countries of the equinoctial line; as far as Lower Guinea, Monomugi, Monomotapa, &c.

ETIENNE (St.), a city of France, in the department of Rhone and Loire, remarkable for its manufactures in iron and ſteel, for the tempering of which the water of the brook Furens, on which it is ſeated, is extremely good. Beſide the manufacture of arms, hardware, and cutlery (the moſt conſiderable in France), the weaving of ribands forms a conſiderable article of its commerce. Coal is found in its neighbourhood, and alſo a ſoft ſtone fit for grind-ſtones. Its merchandiſe is conveyed to Paris, Nantes, and Dunkirk, by the Loire, which begins to be navigable for ſmall barges at St. Lambero. St. Etienne is 22 miles S.E. of Fuers, and 260 S. by E. of Paris. Long. 4. 30. E. Lat. 45. 22. N.

ETLINGEN, an ancient town of Suabia, in the margravate of Baden-Dourlach, ſeated at the confluence of the Wirim and Entz, three miles S. of Dourlach. Long. 9. 30. E. Lat. 48. 59. N.

ETOLIA (*Encycl.*). The Etolians were a reſtleſs and turbulent people; ſeldom at peace among themſelves, and ever at war with their neighbours; utter ſtrangers to all ſenſe of friendſhip, or principles of honour; ready to betray their friends upon the leaſt proſpect of reaping any advantage from their treachery: in ſhort, they were looked upon by the other ſtates of Greece no otherwiſe than as outlaws and public robbers. On the other hand, they were bold and enterpriſing in war; inured to labour and hardſhips; undaunted in the greateſt dangers; jealous defenders of their liberties, for which they were on all occaſions willing to venture their lives, and ſacrifice all that was moſt dear to them. They diſtinguiſhed themſelves above all the other nations of Greece, in oppoſing the ambitious deſigns of the Macedonian princes; who, after having reduced moſt of the other ſtates, were forced to grant them a peace upon very honourable terms. The conſtitution of the Etolian republic was copied from that of the Achæans, and with a view to form, as it were, a counter alliance; for the Etolians bore an irreconcileable hatred to the Achæans, and had conceived no ſmall jealouſy at the growing power of that ſtate. The Cleomenic war, and that of the allies, called the *ſocial war*, were kindled by the Etolians in the heart of Peloponneſus, with no other view but to humble their antagoniſts the Achæans. In the latter, they held out, with the aſſiſtance only of the Eleans and Lacedæmonians, for the ſpace of three years, againſt the united forces of Achaia and Macedon; but were obliged at laſt to purchaſe a peace, by yielding up to Philip all Acarnania. As they parted with this province much againſt their will, they watched all opportunities of wreſting it again out of the Macedonian's hands; for which reaſon they entered into an alliance with Rome againſt him, and proved of great ſervice to the Romans in their war with him: but growing inſolent upon account of their ſervices, they made war upon the Romans themſelves. By that warlike nation they were overcome, and granted a peace on the following ſevere terms: 1. The majeſty of the Roman people ſhall be revered in all Etolia. 2. Etolia ſhall not ſuffer the armies of ſuch as are at war with Rome to paſs through her territories, and the enemies of Rome ſhall be likewiſe the enemies of Etolia. 3. She ſhall, in the ſpace of 100 days, put into the hands of the magiſtrates of Corcyra all the priſoners and deſerters ſhe has, whether of the Romans or their allies, except ſuch as have been taken twice, or during her alliance with Rome. 4. The Etolians ſhall pay down in ready money, to the Roman general in Etolia, 200 Euboic talents, of the ſame value as the Athenian talents, and engage to pay 50 talents more within the ſix years following. 5. They ſhall put into the hands of the conſul 40 ſuch hoſtages as he ſhall chooſe; none of whom ſhall be under 12, or above 40, years of age: the pretor, the general of the horſe, and ſuch as have been already hoſtages at Rome, are excepted out of this number. 6. Etolia ſhall renounce all pretenſions to the cities and territories which the Romans have conquered, though thoſe cities and territories had formerly belonged to the Etolians. 7. The city of Oenis, and its diſtrict, ſhall be ſubject to the Acarnanians.

After the conqueſt of Macedon by Paulus Æmilius, they were reduced to a much worſe condition; for not only thoſe among them, who had openly declared for Perſeus, but ſuch as were only ſuſpected to have favoured him in their hearts, were ſent to Rome, in order to clear themſelves before the ſenate. There they were detained, and never afterwards ſuffered to return to their native country. Five hundred and fifty of the chief men of the nation were barbarouſly aſſaſſinated by the partiſans of Rome, for no other crime but that of being ſuſpected to wiſh well to Perſeus. The Etolians appeared before Paulus Æmilius in mourning habits, and made loud complaints of ſuch inhuman treatment; but could obtain no redreſs: nay, ten commiſſioners, who had been ſent by the ſenate to ſettle the affairs of Greece, enacted a decree, declaring, that thoſe who were killed had ſuffered juſtly, ſince it appeared to them that they had favoured the Macedonian party. From this time thoſe only were raiſed to the chief honours and employments in the Etolian republic, who were known to prefer the intereſt of Rome to that of their country; and as theſe alone were countenanced at Rome, all the magiſtrates of Etolia were the creatures and mere tools of the Roman ſenate. In this ſtate of ſervile ſubjection they continued till the deſtruction of Corinth, and the diſſolution of the Achæan league; when Etolia, with the other free ſtates of Greece, was reduced to a Roman province, commonly called the *province of Achaia*. Nevertheleſs, each ſtate and city was governed by its own laws, under the ſuperintendency of the pretor, whom Rome ſent annually into Achaia. The whole nation paid a certain tribute, and the rich were forbidden to poſſeſs lands any-where but in their own country.

In this ſtate, with little alteration, Etolia continued under the emperors, till the reign of Conſtantine the Great, who, in his new partition of the provinces of the empire, divided the weſtern parts of Greece from the reſt, calling them *New Epirus*, and ſubjecting the whole country to the *præfectus prætorii* for Illyricum. Under the ſucceſſors of Conſtantine, Greece was parcelled out into ſeveral principalities, eſpecially after the taking of Conſtantinople by the weſtern princes. At that time, Theodorus Angelus, a noble Grecian, of the imperial family, ſeized on Etolia and Epirus. The former he left to Michael his ſon; who maintained it againſt Michael Palæologus, the firſt emperor of the Greeks, after the expulſion of the Latins. Charles, the laſt prince of this family, dying in 1430, without lawful iſſue, bequeathed Etolia to his brother's ſon, named alſo Charles; and Acarnania to his natural ſons, Memmon, Turnus, and Hercules. But, great diſputes ariſing about this diviſion, Amurath II after the reduction of Theſſalonica, laid hold of ſo favourable an opportunity, and drove them all out in 1432. The Mahometans were afterwards diſpoſſeſſed of this country by the famous prince of Epirus, George Caſtriot, commonly called *Scanderbeg*; who, with a ſmall army, oppoſed the whole power of the Ottoman empire, and defeated thoſe barbarians in 22 pitched battles. This hero, at his death, left great part of Etolia to the Venetians; but they not being able to make head againſt ſuch a mighty power, the whole country was

ſoon reduced by Mohammed II. whoſe ſucceſſors hold it to this day.

ETTENHEIM, a town of Germany, in the biſhopric of Straſburg, 15 miles N. of Friburg, and 19 S.S.E. of Straſburg. Long. 7. 26. E. Lat. 48. 25. N.

ETTLINGEN, or ETTINGEN, a town of Suabia, on the Albe, ſix miles S.S.W. of Dourlach.. Long. 9. 26. E. Lat. 48. 58. N.

ETTRICK, a river in Selkirkſhire, which riſes from the mountainous region in the S.W and having formed a junction with the Yarrow, their united ſtreams meet the Tweed, where that river enters Roxburgſhire. From the woods, formerly on the banks of this river, the county obtained the name of Ettrick Foreſt. Ettrick Banks are the ſubject of a paſtoral Scotch ditty.

EU, a ſea-port of France, in the department of Lower Seine, with a ſtrong caſtle, and a handſome ſquare. The principal trade is in ſerges and lace. It is ſeated in a valley, on the river Brele, 15 miles N.E. of Dieppe. Long. 1. 30. E. Lat. 50. 3. N.

EVAPORATION *(Encycl.)*. In addition to what has been ſaid on this ſubject, we purpoſe to give the experiments on evaporation made by Dr. Wiſtar, an account of which appears in the Tranſactions of the American Philoſophical Society.

" In an eſſay publiſhed in the laſt volume of the Tranſactions of the Society," ſays the doctor, " I deſcribed a ſpecies of evaporation which was excited by ſuſpending ice, at the melting point, in air reduced to the temperature of 0 of Fahrenheit's ſcale; and conſidered as the effect of a general law of nature, in conſequence of which an inelaſtic vapour (which commonly is viſible) ariſes from water, and from wet ſubſtances, whenever they are warmer than the atmoſphere which ſurrounds them.

" From facts ſtated in the ſame paper it was inferred, that this inelaſtic vapour does not depend upon any poſitive quantity or degree of ſenſible heat in the evaporating body, but upon a relative degree, exceeding that of the atmoſphere to which it is expoſed; and that it is produced by the paſſage of heat from the moiſt body into the contiguous air.—If this theory be true, it follows that a ſlow diſtillation may be performed, with the common apparatus, by applying cold to the receiver or refrigeratory, without increaſing the heat of the retort or ſubſtance to be diſtilled, as there will be a continual paſſage of heat from the body to be evaporated or diſtilled, into the air of the receiver.

" Although, for the reaſons there given, I had no doubt of the truth of the doctrine advanced in my former paper, I was deſirous of ſubmitting it to the teſt of this experiment, becauſe it has been ſuggeſted that the vapour which appeared to ariſe from ice might have riſen from the mixture of different proportions of air of different temperatures: whereas by diſtilling or evaporating in a luted retort and receiver, there can be no mixture of warm and cold air; and by uſing a ſubſtance which is not contained in the atmoſphere, we ſhall avoid all ſuſpicion that the vapour which ariſes from it may have originated from the air in the veſſels.

" With theſe views I poured an ounce and half of vitriolic æther into a retort, and luted it to a receiver with a long neck, which was placed in a mixture of ſalt and ſnow, while the retort was ſurrounded by air of the temperature of 50° of Fahrenheit. The frigorific mixture, from the impurity of the ſalt, was ſeldom below 10°, ſo that the difference between the æther in the retort and the air in the receiver did not exceed 40°.

" When the apparatus had been thirty hours in this ſituation the frigorific mixture was removed, and one-third of the æther was found diſtilled into the receiver.

" I believe no cauſe can be aſſigned for this diſtillation but the paſſage of heat through the æther into the cold air of the receiver; and to be certain that the application of cold to the receiver *really produced it*, I prepared a ſimilar diſtilling apparatus, in the ſame manner preciſely, and placed the retort in contact with that of the other apparatus, while the receiver, inſtead of being chilled by the cold mixture, ſtood in air of the ſame temperature with the retorts, *viz.* 5° ; but no diſtillation took place during thirty hours.

" To vary the experiment, I placed ſome camphor in another apparatus prepared as above, and fixed the receiver in the frigorific mixture, while the retort ſtood in air of the temperature of 50°; at the expiration of thirty hours ſome of the camphor was found ſublimed, and the ſublimate had thoſe arboreſcent appearances which uſually attend it when produced by heat."

EVAUX, a town of France, in the department of Creuſe, 20 miles from Mount Laçon. Long. 2. 35. E. Lat. 46. 12. N.

EUDIOMETER (*Encycl.*). When it was diſcovered that common atmoſpherical air contained about 21 parts of vital air, or oxygen, and 79 of azote, or nitrogen, in 100 by meaſure; it was haſtily concluded by phyſiologiſts, that we had acquired a power of aſcertaining the comparative ſalubrity of atmoſpherical air, during different winds, and in different places. For it was believed that the ſalubrity was proportional to the quantity of oxygen, and that this quantity admitted of conſiderable variation in different ſituations. It was however ſoon found, by the experiments of Dr. Prieſtley and Mr. Cavendiſh, and ſince confirmed by many others, that the air of open ſeas, or the tops of high mountains, does not differ conſiderably, in the proportion of thoſe conſtituents, from that of the ſtreets of London. But when we ſay the ſtreets of London, we do not mean to include the rooms, theatres, exhibitions, &c. where either reſpiration or combuſtion, or both, are going on. This ſource of contaminated air is, however, by no means confined to the metropolis; for wherever well-jointed ſaſhes, double doors, double windows, or any other means of excluding freſh ſupplies of air from inhabited rooms, are employed, there a deterioration of it muſt take place. The means of analyzing and correcting the water we uſe, are generally known; but the beſt means of aſcertaining the proportion of oxygen contained in the air we breathe, is known only to a few chemiſts. We ſhall, therefore, preſent our readers with Mr. Davy's new Eudiometer, an account of which appears in the Journals of the Royal Inſtitution:

" The dependence (he ſays) of the health and exiſtence of animals upon a peculiar ſtate of the atmoſphere, and the relations of this ſtate to proceſſes connected with the moſt eſſential wants of life, have given intereſt and importance to enquiries concerning the compoſition and properties of atmoſpheric air.

" This elaſtic fluid has been long known to conſiſt chiefly of oxygen and nitrogen, mingled together, or in a ſtate of looſe combination, and holding in ſolution water.

" A variety of proceſſes have been inſtituted, with the view of determining the relative proportion of the two gaſes, but moſt of them have involved ſources of inaccuracy; and lately all, except two (the ſlow combuſtion of phoſphorus, and the action of liquid ſulphurets), have been generally abandoned.

" Both phoſphorus and ſolution of ſulphuret of potaſh abſorb the whole of the oxygen of atmoſpheric air at common temperatures, and they do not materially alter the volume, or the properties of the reſidual nitrogen; but their operation is extremely ſlow; and in many caſes it is difficult to aſcertain the period at which the experiment is completed.

" I have lately employed as an eudiometrical ſubſtance the ſolution of green muriat, or ſulphat, of iron, impregnated with nitrous gas; and I have found that it is in ſome reſpects ſuperior to many of the bodies heretofore uſed, as it rapidly condenſes oxygen without acting upon nitrogen, and requires for its application only a very ſimple and a very portable apparatus.

" This fluid is made by tranſmitting nitrous gas through green muriat, or ſulphat, of iron, diſſolved to ſaturation in water. As the gas is abſorbed, the ſolution becomes of a deep olive brown, and when the impregnation is completed it appears opaque and almoſt black. The proceſs is apparently owing to a ſimple elective attraction; in no caſe is the gas decompoſed; and under the exhauſted receiver it aſſumes its elaſtic form, leaving the fluid with which it was combined unaltered in its properties.

" The inſtruments neceſſary for aſcertaining the compoſition of the atmoſphere, by means of impregnated ſolutions, conſiſt ſimply of a ſmall graduated tube, having its capacity divided into one hundred parts, and greateſt at the open end; and of a veſſel for containing the fluid.

" The tube, after being filled with the air to be examined, is introduced into the ſolution; and, that the action may be more rapid, gently moved from a perpendicular towards a horizontal poſition. Under theſe circumſtances the air is rapidly diminiſhed; and, in conſequence of the dark colour of the fluid, it is eaſy to diſcover the quantity of abſorption. In a few minutes the experiment is completed, and the whole of the oxygen condenſed by the nitrous gas in the ſolution in the form of nitrous acid.

" In all eudiometrical proceſſes with impregnated ſolutions, the period at which the diminution is at a ſtand muſt be accurately obſerved; for, ſhortly after this period, the volume of the reſidual gas begins to be a little increaſed, and, after ſome hours, it will often fill a ſpace greater by ſeveral of the hundred parts on the ſcale of the tube, than that which it occupied at the maximum of abſorption.

" This circumſtance depends upon the ſlow decompoſition of the nitrous acid (formed during the experiment), by the green oxide of iron, and the conſequent production of a ſmall quantity of aëriform fluid (chiefly nitrous gas) *; which, having no affinity for the red muriate, or ſulphate, of iron produced, is gradually evolved, and mingled with the reſidual nitrogen,

" The impregnated ſolution with green muriate is more rapid in its operation than the ſolution with green ſulphate. In caſes when theſe ſalts cannot be contained in a ſtate of abſolute purity, the common or mixed ſulphate of iron may be employed. One cubic inch of moderately ſtrong impregnated ſolution is capable of abſorbing five or ſix cubic inches of oxygen, in common proceſſes: but the ſame quantity muſt never be employed for more than one experiment.

" A number of comparative experiments, made on the conſtitution of the atmoſphere at the Hotwells, Briſtol, in July, Auguſt, and September, 1800, with phoſphorus, ſulphurets of alkalies, and impregnated ſolution, demonſtrated the accuracy of the proceſſes in which the laſt ſubſtance was properly employed. The diminutions given by the ſulphurets were indeed always greater by a minute quantity than thoſe produced by phoſphorus and impregnated ſolutions: but the reaſon of this will be obvious to thoſe who have ſtudied the ſubject of Eudiometry. In no inſtance was it found that 100 parts in a volume of air contained more than 21 of oxygen: *and the variations connected with different winds, and different ſtates of temperature, moiſture, &c. were too ſmall, and too often related to accidental circumſtances, to be accurately noticed.*

In analyſing the atmoſphere in different places, by means of impregnated ſolutions, I have never been able to aſcertain any notable difference in the proportions of its conſtituent parts. Air, collected on the ſea at the mouth of the Severn, on October the 3d, 1800, which muſt have paſſed over much of the Atlantic, as the wind was blowing ſtrong from the weſt, was found to contain 21 per cent of oxygen in volume; and this was nearly the proportion in air ſent from the coaſt of Guinea to Dr. Beddoes, by two ſurgeons of Liverpool.

" If we compare theſe reſults with the reſults gained more than twenty years ago by Mr. Cavendiſh, from experiments on the compoſition of atmoſpherical air, made at London and Kenſington; conſidering, at the ſame time, the reſearches of Berthollet in Egypt, and at Paris, and thoſe of Marti in Spain; we ſhall find ſtrong reaſons for concluding, that the atmoſphere, in all places expoſed to the influence of the winds, contains very nearly the ſame proportions of oxygen and nitrogen: a circumſtance of great importance; for, by teaching us that the different degrees of ſalubrity of air do not depend upon differences in the quantities of its principal conſtituent parts, it ought to induce us to inſtitute reſearches concerning the different ſubſtances capable of being diſſolved or ſuſpended in air, which are noxious to the human conſtitution; particularly as an accurate knowledge of their nature and properties would probably enables us, in a great meaſure, to guard againſt, or deſtroy, their baneful effects.

" The moſt obvious impregnation of the atmoſphere is that with diſtilled water; and many people have taken up an opinion, that, independent of *miaſmata*, the only noxious qualities of the atmoſphere depend on its moiſture, or the quantity of water diffuſed through it, when the thermometer is near 32°, or, as they expreſs it, " when cold and moiſture are combined; but we ſhall endeavour to ſhew, on ſome future occaſion, that this opinion is not well founded."

Cit. Berthollet has made ſeveral obſervations relating to Eudiometry, in a memoir preſented to the National Inſtitute of France. The celebrated Mr. Humboldt having examined and compared the different ſubſtances employed for knowing the quantity of oxygen contained in a given quantity of atmoſpherical air, gave the preference to the nitrous gas, which has been propoſed by Fontana, as abſorbing the oxygen better than other ſubſtances employed for the ſame purpoſe. It contains, however, ſometimes a greater or leſs quantity of azote, which renders its effect not ſo ſure; a circumſtance which may be remedied, after the repeated experiments of Mr. Humboldt, by waſhing the gas intended for uſe with a ſolu-

* The decompoſition of nitrous acid, by ſolutions containing oxide of iron, at its minimum of oxidation, is a very complex proceſs. The green oxide, during its converſion into red oxide, not only decompoſes the acid, but likewiſe acts upon the water of the ſolution; and ammoniac is ſometimes formed, and ſmall portions of nitrous oxide and nitrogen evolved with the nitrous gas.

tion of ſulphat of iron, which abſorbs all the nitrous gas, but not the azote that is mixed with it. It is this action of the ſulphat of iron that Cit. Berthollet has examined; and he has found, that in this caſe, the nitrous gas is not only abſorbed, but decompoſed, and by being deprived of a part of its azote, it is changed into nitrous acid. He thinks, on the whole, that the nitrous gas may differ in the proportions of its two principles, the oxygen and the azote, but that it never contains the azote in ſimple mixture.

The following experiments with the Eudiometer, made at Martinique, by Dr. Davidſon, were communicated to Dr. Mitchell, in a letter dated Fort Royal, April 7th, 1798.

"There is," ſays he, "a large proportion of oxygen, contained in the atmoſpheric air within the tropics. With equal meaſures of nitrous air, obtained from braſs wire and atmoſpheric air, there was an abſorption of 67.100; but with two meaſures of atmoſpheric air, there was ſomewhat leſs, from 52.100, to 58.100, that is to ſay, from three meaſures, or three hundred parts, there were left two and 42,100, to 48.100. I have alſo tried a mixture of ſulphur and iron-filings, in a cylindrical glaſs tube, and found above four-tenths of the air diminiſhed. As thoſe experiments were made in the preſence of a number of medical gentlemen, who have certified the fact, as they have obſerved it themſelves, I can therefore with confidence ſpeak to the reſult of our experiments.

"We ſhall now be more eaſily able to account for the ſpeedy ruſting of metals, without having recourſe to the action of ſuppoſed muriatic ſoda diſſolved in the air. The rancidity of oils, and the ſpeedy fermentation of vinous liquors, may, perhaps, be alſo owing to the greater heat of the climate; but metals would be leſs apt to contract ruſt from the greater heat, if the air contained only the proportion of oxygen, which it contains in Europe. Conſumptions here are alſo more quickly fatal than they are in Europe. On ſome of the Weſt-India iſlands, ſuch as Barbadoes and Antigua, where leſs rain falls, and where the heat of the air is kept at a ſteady temperature by their ſmallneſs, and the trade-winds blowing over the whole iſland, without being diverted by high or woody land, conſumptions are not leſs fatal than in the larger and moiſter iſlands. This is a fact, of which all writers upon diſeaſes of the Weſt Indies take notice; and which we would principally endeavour to account for, from the air being more highly charged with oxygen, than it is in Europe. If people labouring under pulmonary conſumption, are ſometimes benefited by ſea voyages within the tropics, we are to look for the temporary relief afforded, in the ſea-ſickneſs; the irritable ſtate of the ſtomach, by ſympathy preventing the lungs acting in decompounding and abſorbing oxygen; and in the determination to the ſurface carrying off the redundancy by the ſkin. Their coſtive habit, whilſt at ſea, proves that there is more than uſual determination to the ſurface—hence relief to the lungs."

Certificates of theſe facts are ſubjoined, with the ſignatures of Dr. Chiſholme, and other reſpectable perſons.

Among the articles contained in the extracts lately publiſhed from the Memoirs of the School of Medicine at Paris, we find an ingenious eſſay by Citizen Jurine, with obſervations by Citizen Seguin, on the following important queſtion:

"What advantages can medicine derive from the modern diſcoveries in the art of aſcertaining the purity of the air, by the different eudiometers?

Citizen Jurine's memoir, which gained the prize in 1787, is divided into four parts: 1. The firſt relates to the modification of atmoſpherical air by reſpiration. 2. The ſecond treats of the air which is exhaled by the ſkin, and of the nature of ambient air in different diſeaſes. 3. The third explains the difference of atmoſpherical air, the air of hoſpitals and ſick rooms. We ſhall examine each of theſe ſections of Cit. Jurine's works ſucceſſively, taking notice at the ſame time of the principal obſervations made by Seguin.

In the firſt place, Jurine remarks on the opinions, the views, and the ſeveral diſcoveries of Prieſtley, the Abbe Fontana, Scheele, Bergmann, and Morozzo, and the ſolid and luminous theory of Lavoiſer and La Place. He next explains the extent and capacity of the lungs, after Hales and Jurine. Afterwards he analyzes the air exſpired in different circumſtances of life and health. The means of analyzation were lime water, nitrous gas, and the flame of a wax candle.

Experiments were in the firſt place made to aſcertain the difference relative to age, ſex, the ſtate of faſting, and the effect of digeſtion. The air produced by the moſt complete exſpiration was then divided into four parts, and ſucceſſively ſubmitted to a comparative analyſis. The other experiments were intended to aſcertain the changes produced in the air exſpired in fever, the laſt ſtage of conſumption, blood-letting, reſpiration in pure oxygen, or in air rendered leſs reſpirable from previous reſpiration. Citizen Halle having already publiſhed a part of the reſults of theſe experiments, under the article *Air* in the *Dictionnaire de Médec, de l'Encycl. Meth.* it is unneceſſary to repeat them. To this firſt part of Citizen Jurine's memoir, Citizen Segun directs his principal objections, which directly attack the accuracy of the eudiometers, the lime water, and nitrous gas, employed.

In the ſecond part, Citizen Jurin explains ſeveral experiments made upon himſelf, the reſults of which were, that he diſengaged a certain quantity of carbonic gas by the ſkin. Citizen Seguin thinks, on the contrary, that the carbonic gas does not iſſue through the ſkin, but is only that formed by the act of reſpiration, which, deſcending by its ſpecific weight, in the bath where the Geneveſe phyſiologiſt made his experiments, had diſplaced the atmoſpheric air from the veſſels he employed.

Citizen Hallé has again offered the principal facts deduced from the experiments contained in the third part. The objection of Citizen Seguin againſt their reſult in general, that there is uniformly produced a kind of *mephites* in the inteſtinal canal, is, that, on the contrary, the predominance of azote in the large inteſtines, according to the experiments of Jurine, ought not to be attributed to the atmoſpheric air contained in the ſtomach and inteſtines loſing a portion of oxygen, and the azotic gas becoming by that means more abundant.

The fourth part of this work exhibits a ſhort view of the improvements medicine has received from pneumatic chemiſtry, which, in the report, is brought down to the preſent period.

The memoir of M. Gattoni, like the preceding, is intended to give a ſolution of the phyſiological problem propoſed by the Medical Society, and contains the particulars of a variety of reſearches and experiments. The author, after relating the hiſtory of the nitro-aërial eudiometer, and ſhewing the incorrectneſs of that inſtrument, and its general inſufficiency to aſcertain the change of the air by the different kinds of miaſmata, adopts the eudiometer of Volta, which he deſcribes. The experiments made with this latter inſtrument, like thoſe made with all the others, have only elucidated the different proportions of azote, oxygen, and carbonic acid gas variouſly modified, by different airs, or by the ſtate of the patient on whom the experiments were tried, or by the different cauſes of diſeaſe.

EVE, the mother of all mankind; who, being deluded by the ſerpent, occaſioned the fall, and all its diſmal conſequences. See ADAM.

EVERDING, a town of Upper Auſtria, ſeated on the

Danube, 12 miles W. of Lintz. Long. 13. 46. E. Lat. 48. 19. N.

EVERFIELD, a town of Weſtphalia in the duchy of Berg, ſeated near the Wipper, 18 miles E. of Duſſeldorf.

EVERSHOT, a town in Dorſetſhire, with a market on Friday, 12 miles N.W. of Dorcheſter, and 129 W. by S. of London. Long. 2. 55. W. Lat. 50. 52. N.

EWELL, a town in Surrey, with a market on Thurſday, ſeated on a rivulet which empties itſelf into the Thames, at Kingſton. It is 10 miles N.N.E. of Darking, and 13 S.S.E. of London. Long. 0. 15. W. Lat. 51. 26. N.

EXCHANGE, BILLS OF *(Encycl.)*. On promiſſory notes, drafts, or orders, by 31 Geo. III. c. 25; 37 Geo. III. c. 90; and 41 Geo. III. c. 10. the following duties are payable, viz.

On bills and notes payable on demand.] For every piece of vellum, parchment, or paper, upon which any bill of exchange, draft, or order for the payment of money on demand, ſhall be written, &c. where the ſum amounts to 40s. and does not exceed 5l. 5s. by 31 Geo. 3, c. 25, three-pence; 37 Geo. 3, one penny; 41 Geo. 3, c. 10, two-pence.—Total 6d.

Above 5l. 5s. and not exceeding 30l. by 31 Geo. 3, c. 25, ſix-pence; 37 Geo. 3, c. 90, two-pence; 41 Geo. 3, c. 10, four-pence.—Total 1s.

Above 30l. and not exceeding 50l. by 31 Geo. 3, c. 25, nine-pence; 37 Geo. 3. c. 90, three-pence; 41 Geo. 3, c. 10, ſix-pence.—Total 1s. 6d.

Above 50l. and not exceeding 100l. by 31 Geo. 3, c. 25, one ſhilling; 37 Geo. 3, c. 90, four-pence; 41 Geo. 3, c. 10, eight-pence.—Total 2s.

Above 100l. and not exceeding 200l. by 31 Geo. 3, c. 25, one ſhilling and ſix-pence; 37 Geo. 3, c. 90, ſix-pence; 41 Geo. 3, c. 10, one ſhilling.—Total 3s.

For every promiſſory, or other note, for payment of money to the bearer on demand, which may be re-iſſuable, after payment, at the place where the ſame was firſt iſſued, where the ſum amounts to 40s. and does not exceed 5l. 5s. by 31 Geo. 3, c. 25, three-pence; 37 Geo. 3, c. 90, one penny; 41 Geo. 3, c. 10, two-pence.—Total 6d.

Above 5l. 5s. and not exceeding 30l. by 31 Geo. 3, c. 25, ſix-pence; 37 Geo. 3, c. 90, two-pence; 41 Geo. 3, c. 10, four-pence.—Total 1s.

Above 30l. and not exceeding 50l. by 31 Geo. 3, c. 25, nine-pence; 37 Geo. 3, c. 90, three-pence; 41 Geo. 3, c. 10, ſix-pence.—Total 1s. 6d.

Above 50l. and not exceeding 100l. 31 Geo. 3, c. 25, one ſhilling; 37 Geo. 3, c. 90, four-pence; 41 Geo. 3, c. 10, eight-pence.—Total 2s.

Above 100l. and not exceeding 200l. by 31 Geo. 3, c. 25, one ſhilling and ſix-pence; 37 Geo. 3, c. 90, ſix-pence; 41 Geo. 3, c. 10, one ſhilling.—Total 3s.

When theſe promiſſory notes ſhall be paid by the perſon by whom the ſame ſhall have been made or ſigned, and firſt iſſued, and at the place where the ſame were firſt iſſued, the perſon ſo paying the ſame, notwithſtanding ſuch payment may at any time afterwards, and ſo often as there ſhall be occaſion after every ſuch payment thereof, but not otherwiſe, again iſſue and negotiate ſuch notes; and every ſuch note is declared to be after payment, but not otherwiſe, iſſuable and negotiable. But if ſuch notes ſhall be paid by any other than the perſon making or ſigning the ſame, or at any place other than the place of iſſuing, ſuch note ſhall be conſtrued to be vacated and ſatisfied, and ſhall be no longer negotiable but cancelled; and if any perſon ſhall again iſſue any ſuch note after payment by any perſon other than the perſon making the ſame, or at any place other than the place of iſſuing, or if any perſon named in ſuch note for payment thereof, ſhall after payment neglect or refuſe to cancel the ſame, ſuch perſon ſhall forfeit 20l. And if ſuch note ſhall not be cancelled, then, and as often as it ſhall be again iſſued, there ſhall be due, anſwered, and paid the like duty as was firſt charged on ſuch note, to be payable by and charged on the perſon who ſhall again iſſue and negotiate ſuch note, ſ. 7.

For any promiſſory or other note, payable to the bearer on demand, which may be re-iſſued, after payment at the ſame, or any other place than where firſt iſſued, where the ſum ſhall amount to 40s. and not exceed 5l. 5s. by 31 Geo. 3, c. 25, ſix-pence; 37 Geo. 3, c. 90, two-pence; 41 Geo. 3, c. 10, four-pence.—Total 1s.

Above 5l. 5s. and not exceeding 30l. by 31 Geo. 3, c. 25, one ſhilling; 37 Geo. 3, c. 90, four-pence; 41 Geo 3, c. 10, eight-pence.—Total 2s.

[It is declared that theſe notes may, as often as occaſion ſhall require, be again iſſued by the perſon making the ſame, notwithſtanding ſuch notes have been paid by the perſon making the ſame, or any other perſon in purſuance of any appointment for the payment thereof.]

Bills and notes payable after date.] For every bill of exchange, draft, or order, payable otherwiſe than on demand, or any promiſſory or other note payable otherwiſe than to the bearer on demand, where the ſum ſhall amount to 40s. and not exceed 30l. by 31 Geo. 3, c. 25, ſix-pence; 37 Geo. 3, c. 90, two-pence; 41 Geo. 3, c. 10, four-pence.—Total 1s.

Above 30l. and not exceeding 50l. by 31 Geo. 3, c. 25, nine-pence; 37 Geo. 3, c. 90, three-pence; 41 Geo. 3, c. 10, ſix-pence.—Total 1s. 6d.

Above 50l. and not exceeding 100l. by 31 Geo. 3, c. 25,

one ſhilling; 37 Geo. 3, c. 90, four-pence; 41 Geo. 3, c. 10, eight pence.—Total 2s.

Above 100l. and not exceeding 200l. by 31 Geo. 3, c. 25, one ſhilling and ſix-pence; 37 Geo. 3, c. 90, ſix-pence; 41 Geo. 3, c. 10, one ſhilling.—Total 3s.

Bills and notes exceeding 200l. *value.*] And for every bill of exchange, promiſſory, or other note, draft, or order, payable on demand or otherwiſe, where the ſum ſhall exceed 200l. there ſhall be charged by 31 Geo. 3, c. 25, two ſhillings; 37 Geo. 3, c. 90, eight-pence; 41 Geo. 3, c. 10, one ſhilling and four-pence—Total 4s.

Which duties ſhall be paid by the perſon making or ſigning ſuch bills, &c.

Foreign bills of exchange.] Drawn in ſets, according to the cuſtom of merchants, where the ſum ſhall not exceed 100l. ſhall be charged by 31 Geo. 3, c. 25, ſix-pence; by 37 Geo. 3, c. 90, three-pence; 41 Geo. 3, c. 10, four-pence—Total 1s. 1d. ——Exceeding 100l. and not 200l. 31 Geo. 3, c. 25, nine-pence; 37 Geo. 3, c. 90, three-pence; 41 Geo. 3, c. 10, ſix-pence.—Total 1s. 6d.——And exceeding 200l. by 31 Geo. 3, c. 25, one ſhilling; 37 Geo. 3, c. 90, four-pence; 41 Geo. 3, c. 10, eight-pence.—Total 2s.——And every bill of each ſet ſo drawn is ſaid to be chargeable with the duty.

N. B. The time limited in the act 41 Geo. 3, for the commencement of the new duties, is from and after April 5, 1801.

The exemptions from the foregoing duties, are theſe:

1. Drafts or orders, payable to bearer on demand, bearing date on or before the day on which the ſame ſhall be iſſued, and at the place from which the ſame ſhall be drawn and iſſued, and drawn upon any banker, or perſon acting as a banker and reſiding and tranſacting buſineſs as a banker, within ten miles of the place where ſuch draft or order ſhall be actually drawn and iſſued.

2. All notes and bills whatever iſſued by the bank of England, upon condition of their paying into the exchequer the annual ſum of 12,000l. half yearly, on Oct. 10 and April 5.

New regulations in 31 Geo. 3. c. 25.

If any bill, &c. ſhall be written on paper not ſtamped, or ſtamped with a ſtamp of lower value than directed; then there ſhall be due and paid the full duty hereby chargeable; which ſhall be payable by and charged upon all perſons who ſhall draw or make, and utter and negotiate ſuch bill, &c. ſ. 6. And all perſons who ſhall write or ſign, or cauſe to be written or ſigned, or who ſhall accept or pay, or cauſe to be accepted or paid, any bill, &c. without being firſt ſtamped with a proper ſtamp, or upon which there ſhall not be ſome ſtamp reſembling the ſame, ſhall forfeit 20l. ſ. 10.

Every promiſſory or other note, payable to the bearer on demand, which ſhall be iſſued after payment under this act, ſhall notwithſtanding be payable to the perſon holding the ſame; and ſuch perſon may maintain an action thereupon. ſ. 9.

The 19th ſection declares, that no bill, &c. ſhall be available in law or equity, unleſs ſtamped with the lawful ſtamp; and that it ſhall not be lawful for the commiſſioners to ſtamp any paper, &c. after any bill, &c. ſhall be written thereon, under any pretence whatever.

But it ſhall be lawful for any perſon who ſhall be the holder of any bill, note, draft, or order, made after July 20, 1797, which ſhall be ſtamped with a ſtamp of a different denomination than required, if the ſame ſhall be of equal or ſuperior value to the ſtamp required, to produce the ſame within the times herein-after mentioned, to the head office or ſuch officer as the commiſſioners ſhall appoint; and the commiſſioners may direct the proper officer, upon payment of the duty, and ſuch penalty as is after mentioned, over and above the duty, to ſtamp ſuch bill, note, draft, or order, with the proper ſtamp, and to give a receipt for the duty and penalty, ſo paid, on the back of ſuch bill, note, draft, or order.

If any ſuch bill, note, draft, or order, ſhall be produced before the ſame ſhall be payable, the ſame ſhall be ſtamped on payment of the ſaid duty, and the penalty of 40s.; but if the ſame ſhall be payable before the production thereof to the commiſſioners, then the ſame ſhall not be ſtamped, unleſs on payment of the duty and 10l. for the penalty.

The method of recovering the penalties is the ſame as under the receipt tax—which ſee under the head RECEIPTS in this SUPPLEMENT.

Note alſo, that by 41 Geo. 3, c. 10, no note re-iſſuable on March 24, 1801, ſhall be ſo after June 5, 1801, until properly ſtamped with the new duty.

EXCOECARIA (*Encycl.*). Of the Excoecaria Agallocha, Profeſſor Wildenow, of Berlin, has given the following account in a late publication.

The agallochum, which is known by the name of aloe-wood, or the aromatic aloe, is one of the moſt valuable ſpices imported from the Eaſt, and has been in high eſtimation, even in the earlieſt ages. According to the different ſpecies of the plant, it is called *lignum aloes, agallochi veri, aquilæ*, and *calambac*, all of which differ remarkably in their ſenſible properties. It is, however, very difficult to aſcertain the botanical character of theſe various ſpecies.

The aromatic wood of aloe is properly a reſin, which has pervaded the pores of the tree. The genuine ſort of this reſinous wood is as precious as gold, and is uſed only by the great and affluent in the Eaſt Indies, China, and Japan, as an agreeable perfume, with which they fumigate houſes: hence it is but rarely imported into Europe. It is black, and variegated with grey veins, ſwims on water, and if ſtrongly rubbed on glaſs, leaves behind reſinous particles, which neither water, ſaliva, expreſſed oils, nor an alkaline lye, but ſpirit of wine only will diſſolve and remove. Its odour is very grateful.

This ſubſtance has, in former times, been much uſed as a medicine, not only in biliary complaints, diſeaſes of the liver and ſtomach, and dyſentery, but likewiſe as a remedy for the maw-worm; but at preſent it is entirely neglected—a revolution to which ſeveral of the ancient remedies have been ſubject, and which is likely to take place with many of the modern.

Father DE LOUREIRO aſſures us, that he diſcovered, in the province of Cochin-China, the tree which affords the true aloe. This aromatic wood is found in reſinous maſſes, only in old, half-decayed, hollow trees. According to this writer, the tree belongs, in the ſyſtem of LINNÆUS, to the firſt diviſion of the tenth claſs, the Decandria Monogynia: he called it *Aloexylum Agallochum.* It grows on the higheſt mountains of Cochin-China, on the banks of the river Lav, which flows through the whole of that province. Loureiro had no opportunity of ſeeing the bloſſoms on the tree; he could only once obtain them dried, and tranſmitted by a friend, ſo that the parts of fructification were much bruiſed and lacerated on a long journey, and he could with difficulty give the following deſcription:—

ALOEXYLUM AGALLOCHUM. Differ. ſpec. Aloe. *foliis* lanceolatis, alternis: *pedunculis* polyfloris, terminalibus.

Hab. *Arbor* magna: *trunco* et *ramis* erectis, altiſſimis: *cortice* cannabino, fuſco, glabro, nec craſſo.

Folia lanceolata, octo polyces longa, integerrima, plana, glabra, ſubcoriacea, alterna, petiolata. *Flos* terminalis, pedunculis polyfloris.

Uſus. Ligni hujus ſuffimenta inter omnia maximè æſtimantur apud nationes Orientales. Ex arboris cortice fit vulgaris charta, in quâ Conchin-chinenſes ſcribunt, ſicut in Japonia fit ex cortice Mori.

Virtus medica. Excitans, corroborans, cephalica, cardiaca.

Suffitus valet contra vertiginem et paralyſim. Pulvis cohibet vomitum et fluxus ventris, præcipuè Lientricos, quod non propriè aſtringendo, ſed corroborando agit.

This tree is not of a poiſonous nature, and yields no milky ſap when perforated. With reſpect to the *genuine* wood of aloe, Loureiro maintains that the various ſpecies differ remarkably, both in colour and flavour. By ſome botaniſts, this aromatic wood has been confounded with the *Lignum Aquilæ*, which is likewiſe eſteemed for its agreeable odour, and like the Agallochum verum, Calambac, and Garo de Malacca, affords different ſpecies of perfume. KAEMPFER and LAMARCK have given a particular deſcription of the genuine aromatic aloe. CAVANILLES, an eminent botanical writer, calls the plant that produces this valuable drug Aquilaria ovata.

In Plate 26 we have given a repreſentation of this plant: *a* is a branch of the natural ſize, with the catkins juſt opened: *b* a catkin in full bloſſom.

EXCULPATION LETTERS OF, in Scots law, a writ or ſummons iſſued by authority of the court of juſticiary, at the inſtance of a pannel, for citing witneſſes to prove his defences, or his objections to any of the jury or witneſſes cited againſt him.

EXECUTOR, in Scots law, ſignifies either the perſon entitled to ſucceed to the moveable eſtate of one deceaſed, or who by law or ſpecial appointment is entruſted with the adminiſtration of it.

EXECUTRY, in Scots law, is the moveable eſtate falling to the executor. Under executry, or moveables, is comprehended every thing that moves itſelf, or can be moved; ſuch as corn, cattle, furniture, ready money, &c.

EXERCITOR, in Scots law, he who employs a ſhip in trade, whether he be owner, or only freights her from the owner.

EXETER, a town of N. Carolina, on the N.E. branch of Cape Fear River, 30 miles N. of Wilmington.

EXETER, a town of New Hampſhire, on Exeter River, with a good harbour, 15 miles S.W. of Portſmouth.

EXIDEUIL, a town of France, in the department of Dordogne, 20 miles N.E. of Perigueux, and 32 S. of Limoges. Long. 0. 54. E. Lat. 45. 24. N.

EXILLES, a ſtrong fort of France, in the department of the Upper Alps. It was taken by the Duke of Savoy in 1708, but reſtored by the treaty of Utrecht. It is an important paſſage, ſix miles W. of Suza, and 40 N.E. of Embrun.

EXMOOR, a foreſt in Somerſetſhire, in the N.W. corner of that county, extending thence into Devonſhire.

EXMOUTH, a village in Devonſhire, on the E. ſide of the bay which forms the mouth of the river Ex, 10 miles S. by E. of Exeter. It is much frequented for the benefit of ſea-bathing.

EXPANSION (*Encycl.*). The following paper on the expanſion of wood by heat, by Dr. Rittenhouſe, appears in the Tranſactions of the American Philoſophical Society.

"In the preſent ſtate of experimental philoſophy," ſays the doctor, "it is well known that bodies in general enlarge their dimenſions, or expand, on being heated, and contract in cooling. From ſome experiments heretofore made, wood has been thought to make an exception to the general rule, and this opinion has ſo prevailed that many curious perſons have applied wooden pendulum rods to their time-pieces, to prevent the variation in their rate of going, ariſing from the expanſion and contracting of a metal rod. From my own obſervations, however, as well as thoſe of ſome of my friends, the wooden pendulum rod does not appear to anſwer the expectations formed on it. I had in my poſſeſſion for ſeveral years an excellent time-piece, made for this ſociety by an ingenious workman and worthy member of the ſociety. The reſult of my conſtant attention to this clock was, that though its regular variations with heat and cold were probably much leſs than thoſe of metal pendulums, it nevertheleſs went always faſter in winter than in ſummer, and was liable to very ſudden and conſiderable variations; ariſing, no doubt, from the combined effects of heat and cold, moiſture and dryneſs. This determined me to make ſome careful experiments with a pyrometer capable of receiving a piece of wood of the length of a ſecond pendulum. Several years ago, I made ſome experiments of this kind, perfectly correſponding with thoſe I have lately made, and which I now communicate to the ſociety.

"I took a ſtraight-grained piece of white hiccory, green, for I could not procure any ſeaſoned, its length 39 inches, and about $\frac{1}{8}$ of an inch ſquare. This I placed in my pyrometer, and kept it fully extended by a weight faſtened to a ſtring, going over a pulley. To the pyrometer I applied the tube and glaſſes of a good compounded microſcope, and a micrometer, the value of the ſmaller diviſions whereof I found to be nearly .00053 parts of an inch, each.

"The rod of wood being placed in the pyrometer, I poured ſand all around it, heated to about 250 of Fahrenheit, which degree of heat I found the wood would bear without ſcorching. On pouring in the hot ſand, the rod expanded very much, but ſoon began to contract, even before the ſand was ſenſibly cooled, which I ſuppoſe aroſe from the hot ſand extracting the moiſture of the wood. It continued to contract as the whole grew cool, ſo that when the rod had acquired its firſt temperature it was near 30 of the above diviſions ſhorter than at firſt. I repeated the operation a ſecond and third time, and had then reaſon to conclude that the wood was nearly as dry as it would become by lying long in a dry air. I now let it cool to the temperature of the atmoſphere, which was 75° and heating the ſand to 200 only, I poured it around the rod. In a few minutes it expanded 16 diviſions. In half an hour the ſand had cooled to 125, and the rod had contracted 11 diviſions. In an hour more the ſand was 80, and the rod ſhortened full 4 diviſions more, being nearly equal to its length when the ſand was firſt applied. On the whole I conclude that very dry wood expands with heat pretty regularly, though certainly in a much leſs degree than any of the metals or even glaſs.

"The rod above mentioned having been kept in a dry place for twelve months, I again tried it with the pyrometer, having fixed near one end of it a ſmall graduated ſcale of ivory, 360 diviſions whereof were equal to one inch. This ſcale was viewed with the microſcope, furniſhed with a croſs hair, and I thought this method preferable to the ſcrew micrometer uſed before.

"The rod was placed in the pyrometer when the temperature of the air was about 60°. On pouring ſand around it, heated a little higher than boiling water perhaps, it immediately expanded $\frac{1}{2}$ a diviſion, but in leſs than a minute it began to contract, and continued to do ſo for an hour, when I drew off the ſand. It was now full 10 diviſions ſhorter than at firſt, ſo that it had imbibed a great deal of moiſture from the air, which it again parted with to the heated ſand. Three hours afterwards, when the rod was cool, I again poured the ſand on it, heated as before. It now continued to expand for about three minutes, when its length was increaſed $3\frac{1}{4}$ diviſions, it then began to contract, and became full 3 diviſions ſhorter than when the ſand was poured on it. I cauſed the ſand to run off once more, and let the rod cool. Then heating the ſand 250° by a thermometer, I poured it on the rod, and in a few minutes it expanded $3\frac{3}{4}$ diviſions, it then began to contract ſlowly, and in 15 minutes it became $\frac{2}{3}$ of a diviſion ſhorter than at firſt. On the whole, I conclude that the expanſion of wood, in its length, will be irregular, correſponding partly to the warmth, and partly to the moiſture of the atmoſphere."

EYE, a river, which rifes in the N. W. part of Berwickfhire, and falls into the Britifh Ocean, at Eyemouth.

EYESDALE, a fmall ifland on the coaft of Argyleſhire, to the S. E. of Mull. It is noted for its ſlate quarries.

EYMOUTIERS, a town of France, in the department of Upper Vienne, containing about 2000 inhabitants, with a conſiderable trade in ſkins, leather, and rags. It is ſeated on the Vienne, 20 miles N. of Limoges. Long. 1. 10. E. Lat. 46. 10. N.

Eymoutiers, a town of France, in the department of Dordogne, 15 miles S. of Perigueux.

EYNDHOVEN, a town of Dutch Brabant, in the diſtrict of Bois-le-Duc, at the confluence of the Eynds and Dommel, 13 miles S. E. of Bois-le-Duc. Long. 5. 26. E. Lat. 51. 31. N.

F.

F A C

FAABORG, a ſea-port of Denmark, on the ſouth coaſt of the iſland of Funen, 17 miles S. of Odenſee. Long. 10. 16. E. Lat. 55. 12. N.

FABRIANO, a town of Italy, in the marquiſate of Ancona, famous for its excellent paper. It is 25 miles N. E. of Foligni. Long. 12. 32. E. Lat. 43. 10. N.

FACE-ACH, a name popularly given to any ſlight rheumatic affection of the face. The term, however, more properly belongs to a moſt formidable chronic diſorder of that part, which, not being underſtood by phyſicians, has hitherto gone by the quaint and untechnical appellation of Dolor Faciei.

This dreadful diſeaſe, which is commonly ſtyled the *Dolor Faciei* of Fothergill *, on account of its being ſuppoſed to have been firſt mentioned by that practitioner, was before known, in the year 1756, to Mr. Andre, ſurgeon at Paris, who accurately deſcribed it under the name of *tic*, and explained it with ſeveral obſervations. Mr. Siebold, however, traced the hiſtory of this diſorder further back, finding that, in 1724, it had been treated by John Hartmann Degener, practitioner at Nimmegen, whoſe excellent obſervation and deſcription of that affection is communicated in the firſt volume of *Acta Naturæ Curioſor. (de dolore quodam perrara acerboque maxillæ ſiniſtræ partes occupante et per paroxyſmos recurrente,* p. 347). This practitioner even ſuppoſes, that Lawrence Bauſch, phyſician at Schweinfurth in Franconia, preſident and founder of the Societas Naturæ Curioſorum, died of this diſorder in the year 1665, according to the annals of that ſociety. The patient felt for four years a very excruciating pain in the right maxilla, ſometimes growing leſs, and then ceaſing; but, at laſt, it increaſed to ſuch a degree, that he became unable to ſpeak or to ſwallow, and, notwithſtanding all poſſible remedies, died emaciated, and with a palſy on the left ſide. There exiſted alſo, Obſervations on this diſeaſe by Dr. Daniel Ludwig, in the year 1673.—Miſc. Nat. Cur. Dec. I. Ann. III. Obſerv. 252, de dolore ſuperciliari acerbiſſimo.

The Dolor Faciei may be called analogically (otalgy, odontalgy, &c.) *proſopalgy*, as it undoubtedly belongs to the topical pains without fever; and this name ſeems, beſides, to be congruous with reſpect to the ſeat as well as to the origin and kind of pain. The ſeat of the diſeaſe has been thought to originate in the teeth, but even drawing of them proved to be of no effect. It is obſerved by Dr. Fothergill, that the diſeaſe generally appears about the fortieth or fiftieth year of age, a period in which people are not much ſubject to tooth-ach; and though ſeveral patients ſuffered tooth-ach at the ſame time, yet others were quite exempt. The *antrum Highmorianum* is equally aſſigned as the ſeat of the diſeaſe, but without any probability, as it ſeems impoſſible a pain ſo ſevere, and laſting for ſo long a time, ſhould take place there, without producing ſome change, inflammation, and ſuppuration, which never was the caſe in all the inſtances of that painful affection, according to what we find recorded in the annals of medicine: teeth were drawn out, and an opening made into the *antrum*, without ever perceiving any matter to iſſue thence. The pain generally extends itſelf to the jaws, a circumſtance which is to be aſcribed to the diſtribution of nerves. The diſeaſe, luckily, occurs ſo ſeldom, that even phyſicians of the moſt extenſive practice never had an opportunity of obſerving it: we find it, however, mentioned by practitioners of all nations, except the Italians. Dr. Fothergill met with ſixteen inſtances of it; Dr. Thilenius, a German phyſician, ſaw it but twice during a moſt extenſive practice of twenty years; Dr. Aepli, a Swiſs phyſician, only once in twenty-ſeven years. The following exhibits the literature of different nations on the above diſeaſe.

Fothergill obſerved, that this diſorder moſtly attacks women; but Degener and others ſaw it in men. Mr. Siebold met with three inſtances in the female ſex, and one in a man; it ſeems, however, to occur more frequently in women than in men, and the proportion is about five to four. It is remarkable, that the ſubjects of the diſeaſe in England were moſtly women, in the proportion of 1 to 14; and in Germany moſtly men, in the proportion of 21 to 13. On reviewing the caſes mentioned by different authors, we obſerve that they were for the moſt part confined to the period of age between the thirtieth and eightieth year; and inſtances of the diſorder being met with at an earlier period of life have but rarely occurred. The German tranſlator of Dr. Fothergill's works relates a caſe of a young lady, nineteen years of age; and alſo Dr. Leidenfroſt a ſimilar inſtance (*Diſſert. ſupra citat.*). Dr. Rahn, Prof. Weidmann of Mentz, and Prof. Siebold of Wurzbourg, are the only perſons who have obſerved this diſorder in pregnant women. The patient of Prof. Weidmann was attacked by the pain a month before her delivery: evacuants were fruitleſsly employed; but ſhe was cured by opium and bark. Dr. Seibold's caſe is very remarkable, on account of the pain ceaſing entirely during pregnancy, a circumſtance that ſeems to prove the great power which the body enjoys in this ſtate, of reſiſting ſeveral diſeaſes, a remark already made by Hippocrates (*de internis affectionibus*, cap. 53, ed. chart. t. viii.

* Dolcris Faciei, morbi rarioris atque atrocis obſervationibus illuſtrati, adumbratio Diatribe I. qua exercitationes clinicas in noſocomio juliæo habendas indicit G. Ch. Siebold, Dr. Med. Prof. Wirceburgi, 1795, pp. 22, in 4to.—Diatribe II. qua pro capeſſendo in illuſtri inclyta et ornatiſſima facultate medica loco et dignitate ad orationem die xxix Jul. 1797, publice celebrandam invitat. pp. 23, in 4to. Tranſlated in the Med. and Phyſ. Journ. No. XXX.

p. 677), who tells us that a dolor ischiadicus disappeared during the period of pregnancy, which, however, recurred twenty days after the delivery. Dr. Sauter saw this painful affection disappear during a putrid fever, and Dr. Selle in an intermittent fever; in both which cases it returned after the fevers were cured. It seems not improbable, but that this disorder may be endemical, and even epidemical; at least the disease has not been more frequently observed than at Clausthal, the capital of the Hercynian mountains; and in the mountainous country of Salzbourg, it is not at all rare. Mr. Andre remarks, that in a very short time he met with eight or ten cases of this disorder, whereas he had not a single one afterwards during a period of twenty-seven years.

This affection seems not to be peculiar to a particular temper and habit of body, but attacks people of very different constitutions suddenly and unexpectedly: its duration is extremely long, as it may last for many years without doing any evident harm to the whole constitution, or without terminating fatally in an immediate manner. A woman suffered this painful affection from her nineteenth year to her eightieth, and got rid of it but shortly before she died. In other cases, however, the disorder emaciates and destroys the body, particularly for want of rest: the diseased side of the face is frequently disfigured, and persons subject to this affection receive, as it were, a double profile, of which Prof. Baldinger relates a curious instance in his Medical Journal, volume ii. No. 7.

Although many symptoms of this disorder are of the spasmodic kind, yet we have more reason to think it to belong to the class of convulsive disorders, and it is therefore erroneously called *trismus dolorificus*, after Sauvages and Pugol, because the vehement contortions do not occur in every patient, and may, moreover, be rather considered as *conamina naturæ medicatricis*, and efforts by which the patients endeavour to relieve themselves from pain, for which purpose they likewise rub the part with much vehemence. A difficulty of speech and of swallowing are observed in some cases, probably from the distortions of the muscular fibres that are subservient to this purpose. A considerable salivation came on in another instance, where the patient became almost hectic; but Mr. Siebold attended a patient whose salival excretion was entirely suppressed; another subject of that disorder had a very much swollen *glandula Warthoni*, from which a fœtid and purulent matter issued. The eyes remain sometimes dry, and it is not always that the pain forces out tears; sometimes they become red and humid. In some patients a redness and heat of the affected part precedes the paroxysm of pain, of which phenomenon a curious instance is related by Dr. Rahn, where the heat was so intense that it could be felt at some distance. Other symptoms frequently to be remarked in patients of this kind are, an intumescence of the belly, a torpor of the intestinal canal, and an obstinate costiveness, which are probably owing to a spasm of the *nervus sympatheticus magnus*, that is intimately connected by anastomosis with the fifth pair; an opinion which agrees also somewhat with analogy, as we do not rarely observe, that if the cheeks, or the cheek-bones, are any way affected, the liver is also diseased: those symptoms ought, therefore, to be rather considered as merely secondary, and arising *per consensum*, than as the causa primaria of the disease. It has been observed in one case by Dr. Lentin, that when the belly began to swell, the pain soon after disappeared; and in another case it was greatly diminished by it, which symptom seems to prove that the morbid matter is deposited on the intestines: it deserves, however, to be ascertained by further observations. It is remarkable, that in a case of Dr. Siebold, the patient had a particular relish for sweet things, which that gentleman is inclined to ascribe to a depravation of taste, occasioned by the affection of the neighbouring nerves, or to an obstruction of the liver, in which this symptom sometimes occurs. The pulse was often full, slow, and soft, during the paroxysm, and at other times it decreased ten beats at every return of the pain.

The seat of the pain has been observed,

1. *In some single part of the face*, viz. at the inner *canthus* of the eye, Fothergill; in the *orbita, the same*; at the *supercilia* of the right eye, Pugol; in the jaw-bone, Fothergill; in the joint of the jaws, Selle, Pugol; in the *maxilla inferior*, at the passage of the *nervus inframaxillaris*, Lentin; in the *ossa temporum*, Fothergill; in the *nervus infraorbitalis*, Albinus and Van Wy; in the *ala nasi*, Vogler, Thouret, at the margin of the tongue, Lentin.

2. *In one half of the face*, Fothergill.

3. *In both cheeks*, Pugol.

4. *In both sides of the maxilla inferior, at the exit of the nerve.*

5. *In the whole head and face*, Lentin.

6. *In one foot*, Lentin. (See Med. and Phys. Journal, vol. iii. 575.)

The head and face are particularly exposed to this painful affection, on account of the quantity of nervous fibres that every-where spread over the surface of the head. The pain essentially differs from any other that occurs in the various parts of the human body, though it may, in some measure, be compared with the *dolor ischiadicus* of Cotunni. Dr. Lentin derives its origin from the *medulla oblongata*; and Prof. Siebold likewise thinks it may originate in a part remote from the affected place, in the *ganglion Gasseri*; others have derived it from the bones; but we still want anatomical observations for ascertaining the proper source of the pain.

Remote causes.] The *causæ prædisponentes* of the disorder appear to be, 1. Violent blows and contusions of the above parts, Andre. 2. Cicatrices, Lentin. 3. Preceding toothach. 4. Too great tenderness of the skin; but the disorder occurred in persons whose skin was by no means to be called tender or soft. 5. Congestions towards the head.

Internal causes.] 1. Cancerous acrimony. Dr. Fothergill first proposed this opinion, whence it has been called by some authors, the *cancerous rheumatism*. The cancerous nature of the disease seems to be confirmed by the following arguments: 1. There is no other cause to be discovered, but that it is owing to a cancerous poison. 2. It most frequently occurs in women, who are particularly disposed to cancers. It generally appeared at the period of the ceasing menstruation, or when they were past the time of menstruation, where a particular tendency to cancer takes place. 4. The kind is exceeding similar to that occasioned by a cancer. 5. Both disorders have much analogy in their preceding symptoms. 6. Four women suffering this affection, had the *scirrhus mammarum* previously. 7. The effect of hemlock in this disease, which is likewise much praised in cancers.

Adverse arguments.] 1. The disease is not at all uncommon in men, where cancerous acrimony could not be traced, as well as in many women. 2. Menstruation did not always cease in some patients, but they became even pregnant during the disease. 3. The cancerous poison easily attacks glandular parts, but we seldom find them altered, indurated, or painful in the neighbourhood of the pain. 4. There is no instance of the Dolor Faciei having terminated in a cancer of the lips or of the cheek. If it did, however, arise from a cancerous acrimony, it should be more frequently observed in men than women, because the *cancer labiorum* is oftener observed in the male sex. 5. The parts disposed to cancer have been frequently irritated by the persons who had the Dolor Faciei, without ever producing such an affection. 6. It is

not probable that the cancerous acrimony ſhould remain ſo long at a place ſo ſenſible, without manifeſting itſelf in a general way.

Theſe arguments are indeed of ſome weight, to make us believe that a cancerous poiſon is by no means the only cauſe of that affection, nay, that it is not even to be conſidered as a chief cauſe of it.

Arthritic matter. Almoſt all the authors who have treated on this ſubject, agree in aſſigning this as the proximate cauſe of that diſorder, but particularly Dr. Leidenfroſt. Dr. Degener is likewiſe of this opinion, having obſerved at the affected place a tumor ſimilar to that in the joints of gouty people. Dr. Seibold ſaw, in a patient ſuffering the moſt violent pains at the *ſupercilia*, a node perfectly like that of arthritic limbs; and Dr. Ludwig fairly tells us, that the patients ſuffering this diſorder became gouty ſoon after. The diſeaſe ſeems to have an arthritic origin in the caſes related by Dr. Boehmer and Lavagan, who found the pain diſappear when the uſual arthritic paroxyſms returned.

3. *Exanthematous acrimony.* Exanthemata have been obſerved in this diſeaſe, either in the face itſelf or in ſome other part of the body. Mr. Andre obſerved miliary eruptions in the face, upon the diſappearance of which the pain began to ceaſe; but when they broke out again, the pain recurred with the former violence. Bonnard and Legavan relate inſtances of herpetic eruptions on the arm having preceded the diſorder; and the German tranſlator of Dr. Fothergill's works ſaw it appear after a retrograde itch: the pain diſcontinued when the itch broke out again, but as ſoon as it was removed by proper remedies, the pain immediately returned; and the diſeaſe laſted in this way from the nineteenth year of age to the twenty-ſeventh.

4. *Scrophulous acrimony.* Menouret and Selle (loc. cit.) aſſign this as a cauſe of the diſeaſe in two inſtances.

5. *Cartarrhous acrimony.* Vogler and Pujol, loc. cit.

6. *Rheumatic matter.* It is not improbable that this is a moſt frequent cauſe of that painful affection, which we find likewiſe confirmed by the authority of experience and obſervation.

7. *Venereal poiſon.* M. Seibold is not inclined to admit this as a cauſe of the above diſeaſe, becauſe the venereal pain is always ſeverer in the night than in the day, without intermiſſions, and ſeems to be more ſeated in the bones than in the muſcular and nervous parts. We have, beſides, no obſervation of the venereal poiſon being aſſigned as the cauſe of that pain, if we except Mr. Watſon. (*Journal de Médecine*, 1793, month of March.) It has been, however, obſerved, that the diſeaſe was ſucceſsfully treated with mercurials; but this can by no means ſerve as an argument for the venereal nature of the diſorder.

8. *Preceding ſerous profluvia ſuppreſſed.* Dr. Lentin relates a caſe in which a purulent ſalivation preceded the pain, by the appearance of which, the paroxyſm of the pain became leſs vehement and ſhorter: in another caſe the pain ſucceeded a running of the ears: and Dr. Thilenius ſaw a patient who had a kind of gonorrhœa previous to the pain, which began to run again as ſoon as the pain had ceaſed.

Van Swieten (*Commentar. in Aphoriſm. Boerhaav.* §. 757) and Davidſon (*loc. citat.*) have obſerved a pain in the face, ſimilar to an ague, which, however, eſſentially differs, according to Dr. Fothergill, from the diſorder we are ſpeaking of. The patient of Van Swieten had a very ſevere hemicrania, laſting every day for eight hours, which, after this time, abated by degrees. At the firſt attack the pain appeared in the place where the branch of the fifth pair iſſues from the foramen ſupraorbitale: in another caſe a topical febrile pulſe was remarked at the affected place: the diſeaſe was cured by the bark. The typic character of this pain, and the termination of its paroxyſm, with a ſtrong perſpiration, ſufficiently diſtinguiſh it from the true Dolor Faciei.

Four caſes of this inexplicable malady are related in vol. ii. of the Edinburgh Practice of Phyſic, Surgery, and Midwifery.

FAHLUN, a town of Sweden, capital of Dalecarlia, ſituate in the midſt of rocks and hills, between the lakes of Run and Warpen. It contains two churches, and (including the miners) 7000 inhabitants. The copper-mine, which gives exiſtence and celebrity to the town, is on its eaſt ſide. It is 30 miles N.W. of Hedemora. Long. 16. 42. E. Lat. 60. 34. N.

FAIRFIELD, a town of Connecticut, ſeated near the ſea, 100 miles S.W. of Boſton. Long. 73. 30. W. Lat. 41. 12. N.

FAIR ISLE, an iſland of the Northern Ocean, between Shetland and Orkney, from both which its high towering rocks are viſible. On the E. ſide the Duke of Medina Sidonia, admiral of the Spaniſh armada, was wrecked in 1588.

FAISANS, an iſland in the river Bidaſſoa, which ſeparates France from Spain. It is alſo called the Iſland of Conference, becauſe Lewis XIV. and Philip IV. here ſwore to obſerve the peace of the Pyrenées, in 1660, after 24 conferences between their miniſters. Here alſo the hoſtages of France and Spain are received and delivered, it being conſidered as a neutral place. It is ſituate between Andaye and Fontarabia. Long. 1. 46. W. Lat. 43. 20. N.

FAKENHAM, a town in Norfolk, with a market on Thurſday; ſituate on a hill, 20 miles N.W. of Norwich, and 110 N.N.E. of London. Long. 0. 58. E. Lat. 52. 53. N.

FALAISE, a town of France, in the department of Calvados, with a caſtle, and one of the fineſt towers in France. It is remarkable for being the birth-place of William the Conqueror. It has a good trade in ſerges, linen, and lace; and its fair, which begins on Auguſt 16, is the moſt famous in France, next to that of Beaucaire. It is ſeated on the river Anté, 20 miles S.E. of Caen, and 115 W. of Paris. Long. 0. 2. W. Lat. 48. 53. N.

FALKENAU, a town of Bohemia, which has manufactures of alum, ſulphur, and vitriol; ſeated on the Eger, 12 miles N. of Egra, and 66 W. of Prague. Long. 12. 38. E. Lat. 50. 21. N.

FALKENBERG, a ſea-port of Sweden, on the Baltic, 17 miles N.W. of Helmſtadt. Long. 12. 50. E. Lat. 56. 52 N.

FALKENBURG, a ſtrong town of Germany, in the new marche of Brandenburg, ſeated on the Traje, 60 miles E. of Stetin. Long. 15. 58. E. Lat. 53. 35. N.

FALKINGHAM, a town in Lincolnſhire, with a market on Thurſday, 18 miles W. by S. of Boſton, and 104 N. of London. Long. 0. 20. W. Lat. 52. 48. N.

FALMOUTH, a town of Virginia, on the river Rappahannoc. Long. 77. 32. W. Lat. 38. 21. N.

FALMOUTH, a ſea-port in the ſtate of Maſſachuſets, 50 miles S.S.E. of Boſton. Long. 70. 32. W. Lat. 41. 31. N.

FALMOUTH, a town of the Iſland of Jamaica, on the N. coaſt. Long. 77. 33. W. Lat. 18. 31. N.

FALSTER, a little iſland of Denmark, near the entrance of the Baltic, between the iſlands of Zealand, Laland, and Mona. Nikoping is the capital.

FALSTERBO, a ſea-port of Sweden, in Schonen, chiefly known for a lighthouſe and its herring fiſhery, 22 miles S.S.W. of Lund. Long. 12. 48. E. Lat. 55. 22. N.

FAMAGUSTA, a town in the iſland of Cyprus, with a Greek biſhop's ſee, and a harbour, defended by two forts. It was taken by the Turks, in 1570, after a ſiege of ſix months, when they flayed the Venetian governor alive, and murdered the inhabitants, though they ſurrendered on honourable terms.

It is 62 miles N. of Nicoſia. Long. 35. 55. E. Lat. 35. 10. N.

FAMARS, a town of France, in the department of the North, near which the French were defeated by the allies, April 23, 1793. It is three miles S. of Valenciennes.

FAMINE, Port, a fortreſs, on the N.E. coaſt of the ſtraits of Magellan. Here a Spaniſh garriſon periſhed for want; ſince which it has been neglected. Long. 70. 20. W. Lat. 55. 44. S.

FANANO, a town of Italy, in the Modeneſe, 25 miles S. of Modena. Long. 11. 18. E. Lat. 44. 10. N.

FANJEAUX, a town of France, in the department of Aude, 14 miles W. of Carcaſſone. Long. 1. 57. E. Lat. 43. 11. N.

FANO, a town of Italy, in the duchy of Urbino, with a biſhop's ſee. Here are an ancient triumphal arch, handſome churches, and fine palaces: It is ſeated on the gulf of Venice, eight miles S.E. of Peſaro. Long. 13. 5. E. Lat. 43. 46. N.

FANTIN, a kingdom on the Gold Coaſt of Guinea, where the Engliſh and Dutch have forts. Its palm-wine is much better and ſtronger than that in other parts of the coaſt. The principal village has the ſame name.

FAREHAM, a town in Hampſhire, with a market on Wedneſday, 12 miles E. of Southampton, and 74 W. by S. of London. Long. 1. 6. W. Lat. 50. 53. N.

FAREWELL, Cape, a promontory of the iſland of New Zealand. Long. 172. 41. E. Lat. 40. 37. S.

FARGEAU, St. an ancient town of France, in the department of Yonne, with a caſtle, 10 miles S.E. of Briare, and 82. S. of Paris. Long. 3. 8. E. Lat. 47. 40. N.

FARIM, a country of Africa, to the S. of the river Gambia. It has a town of the ſame name. Long. 13. 50. W. Lat. 14. 10. N.

FARM (*Encycl.*). At the concluſion of that article we pointed out as an inſtance of what an *ornamental farm* ſhould be, that belonging to Mrs. Southcote, near Weybridge in Surrey, called Woburn Farm. It may not be amiſs to deſcribe this place, which contains 150 acres. Of theſe near 35 are adorned to the higheſt degree; of the reſt, about two-thirds are in paſture, and the remainder is in tillage. The decorations are, however, communicated to every part: for they are diſpoſed along the ſides of a walk, which, with its appendages, forms a broad belt round the grazing-grounds; and is continued, though on a more contracted ſcale, through the arable. This walk is properly garden; all within it is farm; the whole lies on two ſides of a hill, and on a flat at the foot of it: the flat is divided into corn-fields; the paſtures occupy the hill; they are ſurrounded by the walk, and croſſed by a communication carried along the brow, which is alſo richly dreſſed, and which divides them into two lawns, each completely encompaſſed with garden.

Theſe are in themſelves delightful; the ground in both lies beautifully; they are diverſified with clumps and ſingle trees; and the buildings in the walk ſeem to belong to them. On the top of the hill is a large octagon ſtructure; and, not far from it, the ruin of a chapel. To one of the lawns the ruin appears, on the brow of a gentle aſcent, backed and grouped with wood; from the other is ſeen the octagon, upon the edge of a ſteep fall, and by the ſide of a pretty grove, which hangs down the declivity. This lawn is further embelliſhed by a neat Gothic building; the former by the houſe, and the lodge at the entrance; and in both, other objects of leſs conſequence, little ſeats, alcoves, and bridges, continually occur.

The buildings are not, however, the only ornaments of the walk; it is ſhut out from the country, for a conſiderable length of the way, by a thick and lofty hedge-row, which is enriched with woodbine, jeſſamine, and every odoriferous plant whoſe tendrils will entwine with the thicket. A path, generally of ſand or gravel, is conducted in a waving line, ſometimes cloſe under the hedge, ſometimes at a little diſtance from it; and the turf on either hand is diverſified with little groupes of ſhrubs, of firs, or the ſmalleſt trees, and often with beds of flowers: theſe are rather too profuſely ſtrewed, and hurt the eye by their littleneſſes; but then they repleniſh the air with their perfumes, and every gale is full of fragrancy. In ſome parts, however, the decoration is more chaſte; and the walk is carried between larger clumps of evergreens, thickets of deciduous ſhrubs, or ſtill more conſiderably open plantations. In one place it is entirely ſimple, without any appendages, any gravel, or any ſunk fence to ſeparate it from the lawn; and is diſtinguiſhed only by the richneſs of its verdure, and the nicety of its preſervation. In the arable part it is alſo of green ſward, following the direction of the hedges about the ſeveral incloſures: theſe hedges are ſometimes thickened with flowering ſhrubs; and in every corner or vacant ſpace, is a roſary, a cloſe or an open clump, or a bed of flowers: but if the parterre has been rifled for the embelliſhment of the fields, the country has on the other hand been ſearched for plants new in a garden; and the ſhrubs and the flowers which uſed to be deemed peculiar to the one, have been liberally transferred to the other; while their number ſeems multiplied by their arrangement in ſo many and ſuch different diſpoſitions. A more moderate uſe of them would, however, have been better; and the variety more pleaſing, had it been leſs licentious.

But the exceſs is only in the borders of the walk; the ſcenes through which it leads are truly elegant, every-where rich, and always agreeable. A peculiar cheerfulneſs overſpreads both the lawns, ariſing from the number and the ſplendor of the objects with which they abound, the lightneſs of the buildings, the inequalities of the ground, and the varieties of the plantations. The clumps and the groves, though ſeparately ſmall, are often maſſed by the perſpective, and gathered into conſiderable groupes, which are beautiful in their forms, their tints, and their poſitions. The brow of the hill commands two lovely proſpects: the one gay and extenſive, over a fertile plain, watered by the Thames, and broken by St. Anne's Hill and Windſor Caſtle; a large mead, of the moſt luxuriant verdure, lies juſt below the eye, ſpreading to the banks of the river; and beyond it the country is full of farms, villas, and villages, and every mark of opulence and cultivation. The other view is more wooded: the ſteeple of a church, or the turrets of a ſeat, ſometimes riſe above the trees; and the bold arch of Walton Bridge is there a conſpicuous object, equally ſingular and noble. The incloſures on the flat are more retired and quiet; each is confined within itſelf; and all together they form an agreeable contraſt to the open expoſure above them.

With the beauties which enliven a garden are every-where intermixed many properties of a farm: both the lawns are paſtured; and the lowings of the herds, the bleating of the ſheep, and the tinklings of the bell-wether, reſound through all the plantations: even the clucking of poultry is not omitted; for a menagerie of a very ſimple deſign is placed near the Gothic building: a ſmall ſerpentine river is provided for the water-fowl; while the others ſtray among the flowering ſhrubs on the banks, or ſtraggle about the neighbouring lawn: and the corn-fields are the ſubjects of every rural employment, which arable land from ſeed-time to harveſt can furniſh. But though ſo many of the circumſtances occur, the ſimplicity of a farm is wanting; that idea is loſt in ſuch a profuſion of ornament; a ruſticity of character cannot be preſerved amidſt all the elegant decorations which may be laviſhed on a garden.

Experimental Farm, a new eſtabliſhment propoſed by Sir John Sinclair, bart. on a very extenſive plan, for the purpoſe of improving agriculture by proper experiments.

This new inſtitution is to be called "THE PLOUGH, or JOINT STOCK FARMING SOCIETY, for the Purpoſe of aſcertaining the Principles of Agricultural Improvement." There is every reaſon to hope that this project will meet the moſt ample ſucceſs; for, independently of the advantage which the public may expect to derive from the employment of a large capital in experimental farms, conducted and ſuperviſed by the moſt eminent and enlightened agriculturiſts, thoſe who ſhall be induced to ſubſcribe to the plan have a fair and reaſonable proſpect of ſeeing themſelves not only reimburſed their original depoſit, but of being rewarded by a handſome accumulation. Among the moſt diſtinguiſhed promoters of the plan are, the Dukes of Argyle, Bedford, and Somerſet; the Earls of Egremont and Wemyſs; Lords Macdonald and Rancliffe; the Biſhop of Llandaff, the Lord Mayor of London, Sir John Call, Sir James Colquhoun, Sir James Norcliff Innes, Sir John Macpherſon, and Sir Charles Middleton; and ſeveral gentlemen of large property and great knowledge.

The outlines of this plan, which, by the permiſſion of Sir John Sinclair, were preſented to the public in the Britiſh Magazine, are as follow:

I. *The propoſed capital.*

1,600 ſhares at 50l. each - - - £. 80,000.

It is alſo intended to admit half ſhares at 25l. each; but the perſons holding them, though they will have a right to partake in the pecuniary advantages of the inſtitution, will not be entitled to vote in the choice of directors. The number of ſhares which each perſon may hold not to be reſtricted. The directors to be annually choſen in London, and to meet there. The books of the ſociety to be always open to the inſpection of ſubſcribers.

II. *Propoſed Expenditure.*

1. To eſtabliſhing eight experimental, arable, and grazing farms, in the neighbourhood of London, and in different parts of the kingdom, at 4,000l. each	£. 32,000
2. To ditto two upland farms, for improving mountain ſheep, at 1,500l. each - - - -	3,000
3. To purchaſing 5,000 acres, incloſing and planting them, with larch, fir, and other trees, and other expences attending the ſame - - - - -	35,000
4. To a contingent fund, for incidental and unforeſeen expences - - - - - - -	10,000
	£. 80,000

III. *Ultimate Return.*

1. Sale of ſtock, crop, and implements, on the experimental farms, at the concluſion of 21 or 30 years, or any other period fixed by the ſociety * -	£. 35,000
2. Value of 5,000 acres of land, the buildings erected thereon, and of 1,250,000 larches, fir, and other trees, at the concluſion of 30 years - -	218,000
3. Principal of a contingent fund, on the ſuppoſition that the intereſt will defray all expences of management, &c. - - - - - - -	10,000
Total - - -	£ 263,000

Which is above thrice the original capital. In addition to the ultimate return, the ſubſcribers will, in the interim, enjoy the following advantages, namely:

1. An account of the proceedings of the ſociety annually tranſmitted to them:

2. The privilege of viſiting the experimental farms, either in their own neighbourhood, or wherever eſtabliſhed by the ſociety:

3. The right of nominating perſons to be inſtructed at the different agricultural academies propoſed to be erected at each experimental farm: and,

4. A diviſion of the annual profit that may ariſe from the experimental farms.

It is alſo intended to keep up ſuch a connection with the Board of Agriculture, and the various ſocieties formed for agricultural purpoſes in the kingdom, as cannot fail to be attended with the moſt important advantages, both to the ſociety itſelf, and to the farming intereſt in general.

Conditions of the Subſcription.

1. No ſubſcriber ſhall be compellable to pay his ſubſcription, or ſhall incur any expence whatever, unleſs the purpoſes of the inſtitution are actually carried into effect:

2. The capital of 80,000l. ſhall not be increaſed, without the conſent of a majority of ſubſcribers:

3. The ſociety ſhall be eſtabliſhed by charter, or by act of parliament, or by deed enrolled, ſo as to prevent the poſſibility of any demand beyond the ſum ſubſcribed:

4. The ſhares ſhall be transferable from the time the ſociety is eſtabliſhed, and the ſums ſubſcribed payable by inſtalments, to be determined on at a general ſpecial meeting of the ſubſcribers, and iſſued ſolely under the authority of directors or truſtees, appointed by the ſociety for that ſpecial purpoſe.

In recommendation of his propoſal, the worthy baronet has deſcanted with great force and ingenuity on the advantages of experimental farms. He eſtabliſhes as a principle, that the art of agriculture can never be brought to any high degree of perfection, unleſs by experiments, accurately tried, and perſevered in for ſome time. In ſupport of this opinion, he refers to the writings of Arthur Young, Marſhall, and Dr. Francis Home. From the increaſing population of London, and of other large towns in the kingdom, Sir John obſerves, it is impoſſible they can be ſupplied with proviſions at a reaſonable rate, unleſs agriculture is brought to a high degree of perfection. At preſent the nation depends on foreign induſtry and cultivation for a part of its ſubſiſtence, and we are periodically viſited with a ſcarcity of food, which increaſes the expence of living to every family in the kingdom, and loads the rich with heavy additional burthens to maintain the poor, and to preſerve them from the miſeries of famine. A ſmall portion of that ſum, the exaction of which thus becomes ſo frequently neceſſary, were it properly applied to the improvement of agriculture, would ſoon enable this country to feed itſelf, and, indeed, would put it in the power of the farmer to ſupply the public with proviſions at a reaſonable rate. Hence it is evident, that every man who pays 15d. inſtead of 9d. for a loaf of bread, or 10s. in the pound inſtead of 2s. for poor-rates, ought to conſider himſelf eſſentially intereſted in promoting agricultural improvements, and ought, for his own intereſt, to ſupport any meaſure calculated for that purpoſe, as far as his circumſtances will permit.

There is ſcarcely any part of the kingdom where greater quantities of waſte and unproductive land are to be found than in the neighbourhood of London, or ground, in many inſtances, more capable of improvement. It is to be hoped that the general bill of incloſure will ſoon paſs, in conſequence of which thoſe waſtes will be divided. But that will be of little avail, unleſs the means of improving them are aſcertained. When Enfield Chaſe was divided, many perſons, from ignorance, ſuffered conſiderable loſſes in attempting to improve

* The experimental farms might be given up at the end of 21 years, and that part of the property divided. The plantations, probably, had better be retained for nine or ten years longer.

portions of the waſte; whereas had the principles of improvement been accurately aſcertained by means of experimental farms, the purchaſers would have improved the land greatly to their own, and to the public benefit.

Sir John further recommends his plan by ſtating the numerous advantages, in point of knowledge and rational recreation, which will reſult from it to men of buſineſs who have acquired fortunes by the purſuit of their profeſſions in cities, and to thoſe who make temporary excurſions into the country, but return diſguſted for want of ſome intereſting avocation or laudable purſuit.

In explanation of the manner in which the plan is to be carried into execution, it is ſaid, that although a capital of 80,000l. would be neceſſary, yet from 10,000l. to 20,000l. will be ſufficient to give it a fair beginning, either with an experimental farm, or an extenſive plantation, or with both, in the neighbourhood of the metropolis. With ſuch a ſum the project will proceed; for however deſirable it might be to carry a great ſcheme into execution, becauſe it commands the attention of thoſe who take a ſhare in the management of it, yet the important object is, to lay a ſolid foundation, which may, according to circumſtances, be afterwards extended. And it is ſuggeſted, that when once a capital is embarked, and a farm eſtabliſhed ſufficient to ſecure ſhare-holders from eventual loſs, there is abundant room to hope, that the example of the metropolis will be followed, and a correſpondence eſtabliſhed in all parts of the kingdom.

With the honeſt zeal reſulting from conviction, Sir John proceeds to remove the preſumeable objections to his plan: firſt, *that no experimental farm is neceſſary*. In anſwer to this he obſerves, that the value of new inventions cannot be correctly eſtimated without ſuch eſtabliſhments, nor will it be poſſible to aſcertain what practices ought to be avoided, and what ought to be purſued. The former is as important to be known as the latter, yet ſeldom communicated to the public, becauſe the farmer is, in general, aſhamed of acknowledging his want of ſucceſs; and, indeed, where his experiments anſwer, they are frequently concealed, leſt others ſhould avail themſelves of ſuch diſcoveries. The object of an experimental farm, however, is to aſcertain facts, and to publiſh them; and as much credit would be acquired by an intelligent and public-ſpirited ſociety for their exertions in detecting errors, as in proving facts likely to be uſeful.

Second, *that there are many experimental farms now carried on by individuals, which will anſwer the ſame purpoſe*. Theſe are more properly to be accounted *pattern farms*, for the advantage of their own immediate neighbourhood, than experimental ones, in the ſtrict ſenſe of that word. In order to render indeed experimental farms generally uſeful, the farms muſt be open to the inſpection of the public; the account of each experiment muſt be regularly publiſhed, and every experiment, likely to affect the cultivation of any part of the kingdom, tried with the utmoſt preciſion. It cannot be expected that perſons whoſe attention is neceſſarily directed to other objects can renounce every other purſuit, and devote themſelves excluſively to the conducting of experiments; whereas, when an experimental farm is once eſtabliſhed, it will ſoon be proved by the evidence of facts, 1ſt, What is the beſt mode of rendering arable land productive, and the proper rotation of crops in all ſoils and ſituations. 2d, What is the beſt ſyſtem for the management of graſs lands. 3d, What are the moſt uſeful implements of huſbandry. 4th, What are the moſt profitable breeds of animals, and the beſt and cheapeſt modes of rearing, feeding, and fattening them. 5th, What is the beſt plan for rendering waſte or barren land productive. Theſe are points of infinite conſequence, which never have yet, and indeed never can be aſcertained, unleſs by means of farms appropriated for that ſpecial purpoſe: it will require, it is true, the unceaſing attention of an intelligent manager; and the experiments, in order to be relied on, muſt be made with almoſt mathematical accuracy and ſtrictneſs. The expence alſo muſt be conſiderable; but the ultimate advantage to the public muſt be ſo great, as amply to compenſate for any trouble, or coſt, which may attend the execution *.

Third, *that it would be difficult to find managers*. This objection, not referring ſo much to the principle of the undertaking, as to a contingent fact, conſtituting a difficulty, is anſwered by the perſonal aſſertion of Sir John, that he knows ſome who would carry on the undertaking with zeal and energy, and take ſhares as a ſecurity for their good behaviour, and a pledge of their being intereſted in its ſucceſs. After deſcanting on the benefits which will accrue, both to the public and the manager, and which will operate as a ſtimulus on his activity and integrity, while every poſſibility of fraud is cautiouſly precluded, the following remark is made:—In regard to the particular plan of experiments to be purſued, the following meaſures may be adopted: as ſoon as a farm is taken, an accurate plan of it ſhould be obtained, diſtinguiſhing the different ſoils, and every other circumſtance connected with it. Every aſſiſtance will then be procured from the beſt practical farmers in the kingdom, to draw up a regular courſe of experiments, and a rotation of crops beſt calculated for the different fields; and ſuch a plan muſt be rigidly adhered to by the manager, unleſs the committee of management give directions to the contrary. Thus the manager will only be accountable for the ſtrict execution of the orders he receives; and as thoſe orders will be given in conſequence of the moſt mature conſideration, hence the whole ſyſtem, it is to be hoped, will be carried on with the utmoſt regularity and correctneſs: then would there not be a ſingle principle in agriculture that might not be thus aſcertained in the ſpace of a few years; and farmers, in future, would have an invariable ſtandard to go by, which they might rely on with certainty.

The fourth and laſt objection to which an anſwer is given is, that the profits of the propoſed plantation are over-rated. To obviate this ſuppoſition, Sir John Sinclair ſtates the great probability that, in thirty years, the value of timber will be greatly inhanced; but, taking it at its preſent value, there is every reaſon to conſider it greatly under-rated. In proof of this he cites the valuation of the foreſt of Culroſs, near Edinburgh, which conſiſts of Scotch firs forty-three years old, and is valued at 93l. 15s. an acre. Now as larch at thirty years old is as valuable as fir at forty-five, there is every reaſon to expect that the 5000 acres propoſed to be planted will be worth at leaſt 90l. an acre, and conſequently, inſtead of 218,000l. the ſum firſt ſtated, will produce 450,000l.

This is the ſubſtance of a moſt benevolent, patriotic, and practicable plan, in which individuals, without forgetting for

* For inſtance, if the queſtion is, What is the beſt breed of cattle? Their food muſt be accurately weighed, and a regular account preſerved of the whole quantity they eat during the whole courſe of the experiment. If the queſtion is to aſcertain, Whether large or ſmall animals pay beſt for the food they eat; the experiment muſt be begun from their birth, and continued till they are ſlaughtered. In ſhort, almoſt every experiment of great conſequence requires a degree of attention and perſeverance, and a duration, in point of time, which can only be expected from a public inſtitution devoted excluſively to that purpoſe.

a moment the dictates of prudence, may render a moſt important ſervice to their country, and become patrons of an inſtitution which future ages ſhall revere as the ſource of innumerable and inexhauſtible bleſſings.

We have copied from Sir John's publication the annexed engravings (Pl. 28.), which repreſent the diſtribution of an experimental farm of 400 acres, and a circular cottage, which is recommended as being peculiarly warm and convenient, and, if built of good materials, capable of laſting for ages, with hardly any repair. An additional recommendation of ſuch a building is its cheapneſs, as it will not, in the northern parts of Scotland, coſt more than 30l.

FARNABIE (Thomas), ſon of a carpenter at London, born in 1575, ſtaid a ſhort while at Oxford; where being enticed to abandon his religion, he went to Spain, and was there educated in a college belonging to the Jeſuits. Being weary of their ſevere diſcipline, he went with Sir John Hawkins and Sir Francis Drake in their laſt voyage in 1595. He was afterwards a ſoldier in the Low-countries; but being reduced to great want, returned to England, where wandering about for ſome time under the name of *Thomas Bainrafe*, the anagram of his name, he ſettled at Mattock in Somerſetſhire, and taught a grammar-ſchool with good reputation. He removed to London, and opened a ſchool with large accommodations for young gentlemen. While he taught this ſchool he was made maſter of arts at Cambridge, and incorporated into the univerſity of Oxford. Thence he removed, in 1636, to Seven-oaks in Kent; and taught the ſons of ſeveral noblemen and gentlemen, who boarded with him, with great ſucceſs, and grew rich. His works gained him reputation. Upon the breaking out of the civil commotions in 1641, he was caſt into priſon. It was debated in the houſe of commons, whether he ſhould be ſent to America; but this motion being rejected, he was removed to Ely-houſe in Holborn, and there he died in 1647. Mr. Farnabie was a very eminent grammarian; and many writers have ſpoken with great approbation of his labours. M. Bayle in particular ſays, "His notes upon moſt of the ancient Latin poets have been of very great uſe to young beginners; being ſhort, learned, and deſigned chiefly to clear up the text."

FARO, an iſland of Sweden, near the iſland of Gothland, about 30 miles in circumference, populous and fertile. The principal town has the ſame name, and is ſituate on the S.E. coaſt. Long. 19. 7. E. Lat. 57. 50. N.

Faro, a ſea-port of Portugal, in Algarva, on the gulf of Cadiz, with a biſhop's ſee. It has ſome trade in almonds, figs, oranges, and wine, and is 20 miles S.W. of Tavira. Long. 7. 48. W. Lat. 36. 54. N.

Faro, Farro, or Feroe Islands, a cluſter of ſmall iſlands in the Northern Ocean, between 5 and 8° W. long. and 61 and 63° N. lat. They are ſubject to Denmark. Seventeen are habitable, each of which is a lofty mountain, divided from the others by deep and rapid currents. Some of them are deeply indented with ſecure harbours, all of them ſteep, and moſt of them faced with tremendous precipices. The ſurface conſiſts of a ſhallow ſoil of remarkable fertility; producing plenty of barley, and fine graſs for ſheep. No trees above the ſize of a juniper, or ſtunted willow, will grow here; nor are any quadrupeds to be ſeen except ſheep, and rats and mice, originally eſcaped from ſhips. Vaſt quantities of ſea-fowls frequent the rocks, and the taking of them furniſhes a perilous employment for the inhabitants. The exports are ſalted mutton, tallow, gooſe-quills, feathers, eider-down, knit woollen waiſtcoats, caps and ſtockings. To the S. of theſe iſlands is a conſiderable whirpool. See Bird-*Catching*.

Faro or Messina, the ſtrait between Italy and Sicily, remarkable for having the tide ebb and flow every ſix hours, with great rapidity, though it is but ſeven miles over. It is ſo named, from the faro, or lighthouſe, on Cape Faro, and its vicinity to Meſſina.

FARRIERY (*Encycl.*). This once vulgar art has deſervedly been reſcued from the hands of ignorance by the labours of the Veterinary College, and its ingenious profeſſor Mr. Coleman. (See College, *Supp.*) The improved ſtate of Veterinary literature is alſo a ſubject of high congratulation to the country; who are now poſſeſſed of valuable works on the ſubject from the pens of the late and preſent profeſſors of the college; and from Meſſrs. White, Riding, John Lawrence, Richard Lawrence, and Boardman; to the latter of whom the public is indebted for a Veterinary Dictionary, which comprehends all that is known on the ſubject of the diſeaſes of horſes and cattle, illuſtrated with excellent engravings of the anatomy of the horſe, &c. See Frog in this Supplement.

FARRINGDON, a town in Berks, with a market on Tueſday, ſeated on an eminence, near the Thames, 18 miles W. of Oxford, and 50 W. by N. of London. Long. 1. 27. W. Lat. 51. 44. N.

FARSISTAN, a province of Perſia, bounded on the E. by Kerman, on the N. by Irac-Agemi, on the W. by Kuſiſtan, and on the S. by the gulf of Perſia. It is very fertile, and famous for its excellent wines, called the Wines of Schiras, the capital of this province. Here are the ruins of Perſepolis, perhaps the moſt magnificent in the world.

FARTACK, a town of Arabia Felix, at the foot of a cape of the ſame name. Long. 51. 25. E. Lat. 15. 55. N.

FAT (*Encycl.*). A patent has been granted to Mr. Wilſon Fitzgerald, of the Inner Temple, for a mode of producing fat or tallow. The proceſs conſiſts in pouring upon animal fleſh, of any kind, a ſufficient quantity of ſtrong nitrous acid, which decompoſes the fleſh, and produces the tallow. Or, inſtead of the nitrous acid, a compoſition may be employed, conſiſting of two thirds ſulphuric acid, and one third nitrous—or of two thirds nitrous, and one third muriatic or oxymuriatic acid. Or, inſtead of theſe, a compound may be uſed, conſiſting of lime, ſulphate of pot-aſh, alum, and pyrites.

FATTIPOUR, a town of Hindooſtan Proper, in the province of Agra, where the emperors of Hindooſtan, when in the zenith of their power, had a palace. It is 25 miles W. of Agra. Long. 77. 43. E. Lat. 27. 22. N.

FAVIGNANA, a ſmall iſland, 15 miles in compaſs, on the W. ſide of Sicily, with a fort. Long. 12. 25. E. Lat. 38. 16. N.

FAYAL, one of the Azores, or Weſtern Iſlands, which ſuffered greatly by an earthquake, in 1764. Its capital is Villa do Horta.

FAYENCE, a town of France in the department of Var, celebrated for its manufacture of earthen ware. It ſtands near the river Biaſon, 10 miles W. of Graſſe. Long. 6. 44. E. Lat. 43. 38. N.

FAYETTE, a county of Kentucky, bounded on the N. by the Ohio, on the E. by Bourbon county, and on the S.W. by the river Kentucky. Lexington is the capital.

Fayette, a county of Pennſylvania, 37 miles long, and 33 broad. In 1790, it contained 13,325 inhabitants. Union is the capital.

FAYETTEVILLE, a town of N. Carolina, on the N.W. branch of Cape Fear River, 90 miles N.W. of Wilmington, to which that river is navigable for boats.

FAYOUM, a town of Egypt, capital of a province of the ſame name, 49 miles S.S.W. of Cairo. Long. 30. 39. E. Lat. 29. 27. N.

FE, SANTA, a rich and regularly built city, the capital of New Mexico, and the ſee of a biſhop. It is ſituate near the ſource of the Rio del Norte. Long. 108. 48. W. Lat. 36. 50. N.

Fe, Santa, a town of Paraguay, ſituate at the confluence of the Salade with the Plata, 450 miles S.W. of Aſſumption. Long. 60. 40. W. Lat. 30. 45. S.

FEAR, Cape, a cape of N. Carolina, remarkable for a dangerous ſhoal, called, from its form, the Frying-pan. This ſhoal lies at the entrance of Cape Fear River, which is formed by two branches, called the N.W. and N.E. branches. Theſe unite above Wilmington, and fall into the Atlantic, below Brunſwick. Long. 77. 45. W. Lat. 33. 40. N.

FECAMP, an ancient ſea-port of France, in the department of Lower Seine. It had lately a Benedictine abbey, remarkable for its opulence and great privileges. The church is one of the largeſt in France. Fecamp is 24 miles N.E. of Havre-de-Grace. Long. 0. 23. E. Lat. 49. 37. N.

FELDKIRCHE, a trading town of Germany, capital of a county of the ſame name, in Tirol. It is ſeated on the river Ill, near its entrance into the Rhine, 15 miles E. of Appenzel. Long. 9. 49. E. Lat. 47. 10. N.

FELICUDA, one of the Lipari Iſlands, in the Mediterranean, 28 miles W. of Lipari. The inhabitants preſerve rain-water in ciſterns, there being no ſpring in the iſland.

FELIX, St. an iſland in the S. Pacific Ocean, N.N.W. of Juan Fernandes. Long 86°. W. Lat. 26°. S.

FELLETIN, a town of France, in the department of Creuſe, noted for its manufacture of tapeſtry. It is 20 miles S.S.W. of Evaux, and 21 S.S.E. of Gueret. Long. 2. 6. W. Lat. 45. 53. N.

FELLEN, a town in the Ruſſian government of Riga, ſeated on a river of the ſame name, 62 miles S.E. of Revel. Long. 24. 5. E. Lat. 58. 22. N.

FELSBERG, a town of Germany, in the principality of Heſſe Caſſel, with an ancient caſtle on a rock, 12 miles S. of Caſſel.

FELTRI, an epiſcopal town of Italy, in the Treviſano, capital of a diſtrict of the ſame name. It is ſeated on the Aſona, 40 miles N. of Padua. Long. 11. 55. E. Lat. 46. 3. N.

FELTRIA (anc. geog.), a town on the borders of Rhætia towards Italy. Now *Feltri*, in the territory of Venice, on the Piava. Long. 12. 16. E. Lat. 46°. N.

FEMEREN, a fertile iſland of Denmark, in the Baltic, three miles from the coaſt of Holſtein.

FENESTRELLE, a town and fort of Piedmont, in the valley of the Vaudois. It was taken by the Duke of Savoy, from the French, in 1708, and ceded to him by the treaty of Utrecht. It is 18 miles W. of Turin. Long. 7. 21. E. Lat. 45. 10. N.

FERABAD, a town of Perſia, capital of the province of Mazanderan, ſeated among the mountains which bound the Caſpian Sea to the S. and 12 miles from it. Shah-Abbas often ſpent his winters here. It is 130 miles W. of Aſtrabad. Long. 53. 21. E. Lat. 37. 14. N.

Ferabad, a town of Perſia, two miles from Iſpahan, and extending almoſt three miles along the banks of the Zenderoad. It was built by Shah-Abbas, who brought the Armenians here from the preceding town, after they had revolted from the Turks.

FERCULA, or Forcula, a town of Biledulgerid, and the principal place of a diſtrict. It is 50 miles W. of Sugulmeſſa. Long. 4. 30. W. Lat. 31. 40. N.

FERDINAND V. king of Spain, called *the Catholic*, which title was continued to his ſucceſſors. He married Iſabella of Caſtile, by which that kingdom was united to the Spaniſh crown. This illuſtrious couple laid the foundation of the future glory and power of Spain. The conqueſt of Grenada, and the diſcoveries of Chriſtopher Columbus, make this reign a celebrated æra in the hiſtory of Spain. He died in 1516, aged 63.

FERE, a town of France, in the department of Aiſne, famous for its powder-mill, and ſchool of artillery. Near this town is the caſtle of St. Gobin, famous for its manufacture of fine plate-glaſs. Fere is ſeated at the confluence of the Sere and Oiſe, 20 miles N. of Soiſſons, and 75 N.E. of Paris. Long. 3. 25. E. Lat. 49. 29. N.

FERENTINO, or Fiorento, an epiſcopal town of Italy, in Campagna di Roma, ſeated on a mountain, 44 miles S.E. of Rome. Long. 13. 27. E. Lat. 41. 46. N.

FERENTINUM (anc. geog.), a town of the Hernici in Latium, which the Romans, after ſubduing that nation, allowed to be governed by its own laws. Now *Ferentino*, an epiſcopal city in the Campania of Rome. Long. 14. 5. E. Lat. 41. 45. N.

FERENTUM, or Forentum (anc. geog.), a town of Apulia in Italy. Now *Forenza*, in the Baſilicata of Naples.

FERMO, an ancient town of Italy in the marquiſate of Ancona, with an archbiſhop's ſee. It is ſeated near the gulf of Venice, 17 miles S.E. of Macerata. Long. 13. 50. E. Lat. 43. 7. N.

FERNANDO NORONHA, an iſland near the coaſt of Braſil, ſubject to the Portugueſe. Long. 32. 33. W. Lat. 3. 56. S.

Fernando Po, an iſland of Africa, 25 miles W. of the coaſt of Benin. It is 30 miles long, and 20 broad. Long. 3. 3. E. Lat. 3. 6. N.

FERNELIUS (John), phyſician to Henry II. king of France, was born in Picardy, in the latter end of the 15th or the beginning of the 16th century. Being ſent to Paris to ſtudy rhetoric and philoſophy, he applied himſelf in a moſt intenſe manner. All other pleaſure was inſipid to him. He cared neither for play nor for walking, nor for entertainments, nor even for converſation. He read Cicero, Plato, and Ariſtotle. The reading of Cicero procured him this advantage, that the lectures he read on philoſophical ſubjects were as eloquent, as thoſe of the other maſters were barbarous at that time. He alſo applied himſelf very earneſtly to the mathematics.

This continual ſtudy drew upon him a long fit of ſickneſs, which obliged him to leave Paris. On his recovery, he returned thither with a deſign to ſtudy phyſic; but before he applied himſelf entirely to it, he taught philoſophy in the college of St. Barbara. After this he ſpent four years in the ſtudy of phyſic; and, taking a doctor's degree, confined himſelf to his cloſet, in order to read the beſt authors, and to improve himſelf in the mathematics; that is, as far as the buſineſs of his profeſſion would ſuffer him. Never was a man more diligent than Fernel. He uſed to riſe at four o'clock in the morning, and ſtudied till it was time either to read lectures or to viſit patients. He then examined the urine that was brought him; for this was the method of thoſe times, with regard to the poor people, who did not ſend for the phyſician. Coming home to dine, he ſhut himſelf up among his books, till they called him down to table. Riſing from table, he returned to his ſtudy, which he did not leave without neceſſary occaſions. Coming home at night, he did juſt as at noon: he ſtaid among his books, till they called him to ſupper; returned to them the moment he had ſupped; and did not leave them till eleven o'clock, when he went to bed.

In the courſe of theſe ſtudies, he contrived mathematical inſtruments, and was at great charges in making them. But his wife murmuring at the expence, he diſmiſſed his inſtrument-makers, and applied himſelf in good earneſt to practiſe phyſic. But as viſiting patients did not employ his whole time, he read public lectures upon Hippocrates and Galen. This ſoon gained him a great reputation through France and in foreign countries. His buſineſs increaſing, he left off read-

ing lectures; but as nothing could make him ceaſe to ſtudy in private, he ſpent all the hours he could ſpare in compoſing a work of phyſic, *Phyſiologia*, which was ſoon after publiſhed. He was prevailed with to read lectures upon this new work, which he did for three years: and undertaking another work, which he publiſhed, *De venæſectione*, he laid himſelf under a neceſſity of reading lectures ſome years longer, in order to explain this new book to pupils.

While he was thus employed, he was ſent for to court, in order to try whether he could cure a lady, whoſe recovery was deſpaired of. He was ſo happy as to cure her; which was the firſt cauſe of that eſteem which Henry II. who was then but dauphin, and was in love with that lady, conceived for him. This prince offered him, even then, the place of firſt phyſician to him; but Fernel, who infinitely preferred his ſtudies to the hurry of a court, would not accept the employment. When Henry came to the throne, he renewed his intreaties: but Fernel repreſented, that the honour which was offered to him was due, for ſeveral reaſons, and as an hereditary right, to the late king's phyſician; and that, as for himſelf, he wanted ſome time to make experiments concerning ſeveral diſcoveries he had made relating to phyſic. The king admitted this: but as ſoon as Francis I.'s phyſician died, Fernel was obliged to go and fill his place at Henry II.'s court. And here juſt the contrary to what he dreaded came to paſs: for he enjoyed more reſt and more leiſure at court, than he had done at Paris; and he might have conſidered the court as an agreeable retirement, had it not been for the journeys which the new civil war obliged the king to take. He died in 1558, leaving behind him a great many works, beſides what have been mentioned; as, *De abditis rerum cauſis*, ſeven books of Pathology, a book on remedies, &c. They have been printed ſeveral times; with his life prefixed, written by William Plantius his diſciple.

FEROE ISLANDS. See FARO.

FERRENDINA, a town of Naples, in Baſilicata, near the river Baſianto, 25 miles S.W. of Matera. Long. 16. 34. E. Lat. 40. 40. N.

FERTE-ALAIS, a town of France, in the department of Seine and Oiſe, 18 miles S. of Paris. Long. 2. 27. E. Lat. 48. 30. N.

FERTE-BERNARD, a town of France, in the department of Sarte, ſeated on the Huiſne, 20 miles N.E. of Mans. Long. 0 39. E. Lat. 48 8. N.

FESTENBERG, a town of Sileſia, in the principality of Oels, 14 miles N.W. of Wartenburg.

FETHARD, a borough of Ireland, in the county of Tipperary, eight miles S.E. of Caſhel, and 86 S.S.W. of Dublin.

FETHARD, a town of Ireland, in the county of Wexford, on the coaſt, 81 miles S. of Dublin. Long. 7. 3. W. Lat. 52. 10. N.

FEVER (*Encycl.*). It is well known not only to medical men but to others who have experienced the direful effects of contagious fevers, that in ſmall, cloſe, and dirty rooms they infect a very great proportion of mankind; not leſs than 26 out of 27, or a ſtill higher proportion. In a large airy, clean apartment, however, even putrid fevers are ſeldom or never infectious. When this poiſonous vapour is much diluted with freſh air, it is not noxious.—From a large collection, and an attentive conſideration, of facts relative to this diſtemper, have been formed the following rules, which cannot be too generally known.

1. As ſafety from dangers entirely depends on cleanlineſs and freſh air, the room door of a patient ill of an infectious fever, eſpecially in the habitations of the poor, ſhould never be ſhut; a window in it, during the day, ought to be frequently opened. Such regulations would be highly uſeful, both to the patient and nurſes; but are particularly important previous to the arrival of any viſitor.

2. The bed-curtains ſhould never be cloſe drawn round the patient; but only on the ſide next the light, ſo as to ſhade the face.

3. Dirty clothes, utenſils, &c. ſhould be frequently changed, immediately immerſed in cold water, and waſhed clean when taken out of it.

4. All diſcharges from the patient ſhould be inſtantly removed. The floor near the patient's bed ſhould be rubbed clean every day with a wet mop, or cloth.

5. The air in a ſick-room has, at the ſame time, a more infectious quality in ſome parts of it than in others. Viſitors and attendants ſhould avoid the current of the patient's breath, —the air which aſcends from his body, eſpecially if the bed-curtains be cloſed,—and the vapour ariſing from all evacuations. When medical or other duties require a viſitor to be placed in theſe ſituations of danger, infection may be frequently prevented by a temporary ſuſpenſion of reſpiration.

6. Viſitors ſhould not go into an infectious chamber with an empty ſtomach; and in doubtful circumſtances, on coming out, they ſhould blow from the noſe, and ſpit from the mouth, any infectious poiſon, which may have been drawn in by the breath, and may adhere to thoſe paſſages.

The Society for bettering the Condition of the Poor have publiſhed the preceding rules, which were extracted from a manuſcript of Dr. Haygarth's, with his permiſſion. They are intended to enable medical and clerical viſitors of the ſick to perform their important duties with ſafety to themſelves, and are printed upon a ſeparate ſheet, by the Society, with a view to their being diſtributed, ſo that a printed copy may be put up in every houſe where there is an infectious fever.

Houſes of recovery for the reception of poor perſons affected with typhus fever were firſt opened in Mancheſter; and the example has lately been followed in London and many other places. See HOUSE OF RECOVERY, in this Supplement.

FEURS, an ancient town of France, in the department of Rhone and Loire, ſeated on the Loire, 23 miles S.W. of Lyons.

FEZ, a kingdom of Barbary, 125 miles in length and breadth; bounded on the W. by the Atlantic Ocean, on the N. by the Mediterranean Sea, on the E. by Algiers, and on the S. by Morocco and Tafilet. The air is temperate and wholeſome, and the country full of mountains, particularly to the W. and S. where Mount Atlas lies; but it is populous and fertile, producing citrons, lemons, oranges, dates, almonds, olives, figs, raiſins, ſugar, honey, flax, cotton, pitch, and corn in abundance. The inhabitants breed camels, beeves, ſheep, and the fineſt horſes in Barbary.

FIANO, a town of Italy, in the patrimony of St. Peter, ſeated on the Tiber, 15 miles N. of Rome.

FIANONA, a town of Venetian Iſtria, ſeated on the gulf of Carnero, 17 miles N. of Pola.

FICHERULOLO, a fortified town of Italy, in the Ferrareſe, ſeated on the Po, 12 miles W. of Ferrara. Long. 11, 31. E. Lat. 45. 6. N.

FICHTELBERG, a mountain in Bohemia, which extends from near Bareuth to Eger, about 16 miles. It is one of the higheſt mountains in Germany.

FICTION (*Encycl.*). An ingenious writer in the Britiſh Magazine for 1800 makes the following curious remarks on the ſources of poetic and romantic fiction.

"I accord," ſays he, "with Mr. Franklin's obſervation, that the tale of Camarupa and Camatata bears internal evidence of an Indian origin, yet two or three paſſages would induce one to ſuppoſe that it is not of very great antiquity, or rather, that it has received ſome alteration from its Perſian tranſlator. The race of men with leathern feet, the perſecu-

tors of Camarupa and others, Mr. Franklin ſays, are even now ſuppoſed to inhabit the northern parts of Indoſtan: nor am I diſpoſed to queſtion their exiſtence. The ſtory in which they appear (p. 74) is evidently founded upon, or borrowed from, that in the Arabian Nights, where, like Camarupa, Sindbad with a ſtone daſhes out the brains of his unmerciful rider, 'the old man of the ſea.' The OURAN-OUTANGS, as Mr. Hole conjectures in his Remarks on the Arabian Nights, are undoubtedly the ſpecies alluded to; their feeding on fruit only in either tale is a ſtriking characteriſtic. The αγριοι ανθρωποι (or γοριλλαι) in Hanno's remarkable voyage, words of the ſame import as *ouran-outang*, *homines ſylveſtres*, are evidently of the ſame ſpecies. Our early voyagers to the ſame coaſt which Hanno viſited, called this animal *pongo*, or the *giant-ape*; and it was ſometimes literally repreſented as of gigantic ſtature. Purchas, in his Pilgrimes, mentions his having been informed that their 'height was like a man's, but their bigneſſe twice as great.' We have ſeen in ſome old romance, but forget where, the PONGO introduced as a ſavage giant, overthrowing the ranks of battle with his knotty club. The account given of it by Battell, who viſited the coaſt of Africa in 1603, is curious and juſt, though ſomewhat exaggerated. (See Purchas' *Pilgrimes*, vol. ii. 982.) They are deſcribed in Hanno's voyage as covered with hair, flying to precipices, and defending themſelves with ſtones. A circumſtance recorded of their leſſer brethren, by Strabo (Geog. xv. p. 710, Paris ed.) And which is noticed likewiſe in Churchill's Voyages (vol. iii. 143).

"Sir John Mandeville's 'ſkynned folk with roughe heir as a roughe beſt, ſaf only the face and the pawme of the hond,' which he meets with in one of the iſles of Ynde, are of the ſame family. And thoſe with ſhort dog-tails, mentioned by Marco Paulo as inhabiting a diſtrict called *Lambri*, belong to the ſame race. Inveniuntur etiam in hoc regno qui caudas habent ut canes, longitudinis unius, palmi, et hi in civitatibus non habitant, ſed in montibus. (L. iii. c. 18.) By Lambri, Sumatra is probably intended, often called Java Minor by early European travellers. *Lambri* is one of its Indian appellations, and Mandeville ſeems to allude to it by the name of *Lamaray*. His account indeed often wonderfully coincides with that of the Venetian traveller, and perhaps he borrowed from him. However that may be, this *paſtoral race*, which very wiſely ſhunned 'towering cities and the buſy hum of men,' were, we may ſafely conclude, the anceſtors of the *orang cooboo* and *orang googoo* mentioned by Mr. Marſden as inhabiting the interior parts of Sumatra. The natives of the iſland, he tells us, ſuppoſe the latter to be endued with the gift of ſpeech. After having allowed them to belong to the human ſpecies, 'their having a language peculiar to themſelves (I think theſe are Mr. Marſden's words) appears a natural conſequence.' Whoever wiſhes to ſee their claims to humanity ſtated and enforced, is referred to their learned advocate, Lord Kaims' Origin of Languages, vol. i. b. 2.

"Camarupa's aërial excurſion to the mountain of *Caf* (Caucaſus), and the incidents there, reſemble the marvellous narrative of Aboulfouaris: and ſo do Mitra Chandra's adventures among the Genii, 'who delight in blood.' A country inhabited by women, called *Tirea Rai*, occurs likewiſe in the Perſian tales; and it is obſervable, that Marco Paulo teſtifies to the exiſtence of two iſlands in the Indian ocean, one inhabited by men, the other by *women only** (l. iii. c. 37). Again, the enormous whale in Camarupa is not unlike that in Sindbad; and the daughter of the Fairy Queen, who, in 'taking her accuſtomed tour through the air to view the different parts of the earth,' beholds the prince whilſt aſleep, and is ſtruck with admiration at his beauty (p. 61), extremely reſembles a ſiſter fairy, who makes her aërial tour at the opening of Camaralzaman's ſtory in the Arabian Nights. In either tale, a child is granted to the ardent deſires of the royal parent, through the interceſſion and prayers of religious perſons. This circumſtance is to be found in more than one ſtory of the latter collection; and I believe in various oriental tales. But does it not rather militate againſt the predeſtinarian ſyſtem, ſo univerſally adopted in the Eaſt? For had not thoſe religious perſons been *prevailed upon* to offer up their prayers in behalf of their then childleſs ſovereigns, we are to conclude that no child in future would have been born to them: therefore they counteracted deſtiny! Probably, however, a genuine predeſtinarian will hold in contempt ſuch ſceptical objections, and inſiſt that the monarch's requeſts, the derviſe's interceſſions, and birth of the children, were links of the ſame chain, all equally pre-ordained, and reſulting from inevitable neceſſity.

"The mode by which Camaralzaman and the Princeſs Badoura become mutually enamoured of each other, has not only a counterpart in the Indian tale, but alſo in the OBERON of Wieland. The interview in the Arabian Nights, by means of which the hero and heroine contract a mutual affection, is indeed real, but that of Camarupa and Camalata, and that of Sir Huon and Rezia, is viſionary. (See OBERON, cant. iii. ſt. 6. cant. iv. ſt. 49.) In each inſtance, however, it is effected by ſupernatural means: *fairies* intervene, and the reſult is the ſame. Whether this incident in Wieland is taken from the old romance of Sir-Huon of Bourdeaux, we know not, but think it highly probable. From Spenſer's mentioning the night and fairy in conjunction, we may reaſonably infer, that they are introduced together in that or ſome other ancient tale of chivalry. *Guyon*, he tells us,

> —Knight-hood took of good Sir Huon's hand,
> When with King Oberon he came to fairy land.
> B. II. c. 1. ſt. 6.

"The ſtory of January and May is narrated by Wieland in the 6th canto, in exactly the ſame manner as by Chaucer and Pope; yet we cannot help ſuſpecting that it is to be found likewiſe in the old romance, and from thence copied by Chaucer. The idea is ſtrengthened by the following note of Mr. Stevens, towards the concluſion of The Midſummer Night's Dream: 'I have been informed that the originals of Shakſpeare's OBERON and TITANIA are to be *fought* (we truſt he means *found*) in the ancient French romance of *Huon de Bourdeaux*.'

"Pluto and Proſerpine are in Chaucer 'the king and quene of faerie:' and the former, like Oberon in Wieland (canto vi. ſt. 87), appears well acquainted with the Bible, and quotes Solomon's ſarcaſtic obſervations on the fair ſex in a ſimilar manner. (See Tyrwhit's ed. of Chaucer, vol. ii. l. 10163.) Proſerpine (not yet converted from paganiſm it may be preſumed) 'ſweres by her modre Ceres' ſoul,' and egregiouſly abuſes the ſapient king as a 'lechour and an idolaſtre;' and declares, that

> She ſete nat of all the vilunie
> That he of women wrote, a *boterflie!*

"But let us return from the ſtrange mixture of abſurdity, keen wit, and ſtrong ſenſe, which ſo frequently chequers the pages of our primitive bard. If the preceding conjecture be right, that we are to look for the origin of Chaucer's January and May, of his Pluto and Proſerpine, of Shakſpeare's Oberon and Titania, in the old French romance of Sir Huon of Bourdeaux, a pertinent quotation from it would be extremely grate-

* See alſo the Two Mahomedans' Account of India in the 9th Century, publiſhed by Renaudot, p. 1.

ful, not only to your correſpondent Caſſius, but to many an antiquary who does not look with contempt on romantic lore. In that caſe, however, though I apprehend the French legend is ſuppoſed to have been written in the 13th or 14th century, I ſhould not readily allow *that* part of the ſtory to be of European manufactory. It may, as Mr. Hole in his Remarks on the Arabian Nights ſuppoſes of ſome ſimilar eccentric fictions, have been imported by our adventurous cruſaders; or, perhaps at a much earlier era, may have been introduced by ſome colony from the eaſtern world into European diſtricts. Sir William Jones ſays, 'I confidently affirm, that the *Goths* and *Hindus* had originally the ſame language, gave the ſame appellations to the ſtars and planets, adored the ſame falſe deities, performed the ſame bloody ſacrifices, and profeſſed the ſame notions of rewards and puniſhments after death.' Aſ. Diſſ. vol. iii. 15. Among the Gothic nations, long before the commencement of the croiſades, beings of a ſimilar nature to fairies in our popular mythology had an exiſtence. In the northern Sagas they are ſtyled *duergar*, or *dwarfs*, and perform actions ſurpaſſing human nature. They were, probably, of eaſtern origin, and brought to England by our Saxon anceſtors.

"Mr. Hole obſerves, that Chaucer's January and May (and he might have added the ninth novel in Boccaccio's ſeventh Decameron) is to be traced in the tales of Inatulla; and he is ſuppoſed to have *derived it from the Bramins*. The *tales* to which he refers were merely paraphraſed by Dow; but ſince that time have been tranſlated by Mr. Scott, and entitled the Bahar-Danuſh of Einaiut-Oollah (Inatulla). In them, however, the ſimilitude will be found equally obvious, if you conſult leſſon 4. vol. ii. p. 64: and in the ſubſequent leſſon another tale occurs concerning the ſuppoſed miraculous reſtoration of a noſe, reſembling an incident in Maſſenger's Guardian, and traced by Mr. Hole to the *Hectopades*, ſtyled by Sir William Jones 'the moſt beautiful if not moſt *ancient* collection of apologues in the world.'

"That Sir Huon of Bourdeaux and other ancient legendary tales were commonly derived, through ſome medium or other, from an Aſiatic, perhaps an Indian, origin, I have little doubt. The primary notice of Oberon in our language (and ſeemingly from Sir Huon of Bourdeaux) we find in Spenſer: and among the firſt who mention Titania as copartner in his royalty, is Shakeſpeare in the Midſummer Night's Dream. He inveſts Mab, however, with regal honours in his Romeo and Juliet; and Mab in Drayton's Nymphidia, a performance which exhibits much ſprightly humour and original fancy (and in other poems of that age), ſhares imperial dignity with Oberon. Where we are to look for their firſt introduction into ideal exiſtence, or the derivation of either name, is, I believe, not eaſily to be aſcertained. The exiſtence, however, of a fairy queen in the days of Elizabeth was the popular creed, and had continued ſo probably from an age long preceding that of Chaucer; who, in order to ridicule ſuch idle fancies, repreſents Sir Thopas as fully determined that

'An elf queen ſhould his Lemman be.'

"And we find that not only Prince Arthur in Spenſer's beautiful legend, but the aſpiring Abel Drugger in Jonſon's Alchemiſt, had ſome pretenſions to her majeſty.

"It is rather ſtrange, however, that during this period the elf queen ſhould not have acquired a decided appellation. Oberon, after Spenſer's time, poſſeſſed, we apprehend, his regal prerogative without a competitor. But Richard Johnſon, the contemporary of Shakſpeare, and Drayton in his Honourable Hiſtory of the Seven Champions of Chriſtendom, diveſts Titania of her ſovereignty, converts the Fancy's midwife into a fairy midwife (a circumſtance however not diſſonant to ancient ſuperſtition), whom he denominates Proſerpine, and reinſtates in her ſhadowy domains.

"Though the exiſtence of ſuch imaginary beings, as the elfine queen and her tiny ſubjects,

'Theſe antique fables and thoſe fairy toys,'

no longer obtains credence among the leaſt enlightened minds, yet the extenſive influence of that idea in former ages affords a ſubject not unintereſting to ſpeculative minds, who wiſh to inveſtigate the progreſs of traditionary fiction and human credulity. Johnſon evidently compiled from old metrical romances; and the paſſage to which we allude in reſpect to Proſerpine is, her attendance on Sabra in the hour of her delivery; which remarkably coincides with the *accouchement* of Rezia in Oberon, where Titania is preſent on the ſame occaſion. We can with as little reaſon ſuppoſe that Wieland ever conſulted the *Seven Champions of Chriſtendom*, as that Johnſon in a decided compilation, invented one of the moſt ſingular incidents recorded in it. The correſponding paſſage is managed with much delicacy by Wieland in his Oberon, and we are convinced our readers would not be diſpleaſed at our making ſome extracts from it, did not the peculiarity of the circumſtance warrant the tranſcription. We ſhould be pleaſed indeed to ſee another *Epic Romance*, of a ſimilar complexion and ſuperior order, undertaken by its tranſlator. The eccentric ſpirit of the *Orlando Furioſo*, its wild tranſitions from humour to ſublimity, and their not unfrequent mixture in the ſame paſſage, would, we truſt, receive ample juſtice from the lively pen of Mr. Sotheby. Huggin's faithful but tame tranſlation, would prove of ſervice to any one not familiar with the Italian langüage. According to Cervantes' happy image, it exhibits indeed the wrong ſide of the tapeſtry, but not a thread is miſplaced or loſt. To proceed to the compariſon, we were going to ſay contraſt, but notwithſtanding the wildneſs of Johnſon's tale, and bombaſt of his language, ſome rude graces, a luxuriance and vigour of fancy, gratify the imagination at the expence of judgment.—'St. George and Sabra are repreſented as wandering in a mighty wilderneſs, overgrown with lofty pines and cedar-trees, and many huge and mighty oaks, the ſpreading branches whereof ſeemed to withhold the light of heaven from their untrodden paſſages, and tops, for exceeding height, to reach into the element. The inhabitants were ſylvans, ſatyrs, fairies, and other wood nymphs, which by day ſported up and down the foreſt, and by night tended the pleaſure of Proſerpine, the fairy queen. The muſic of ſilver-ſounding birds ſo cheerfully reſounded through the woods, and the whiſtling wind made ſuch melody amongſt the leaves of trees, that it raviſhed their ſenſes like harmony of angels, and made them think they had entered the ſhades of gladſome Elyſium: one while they wondered at the beauty of the woods, which nature adorned with a ſummer's livery; another while at the green and fragrant graſs drawn out in round circles by fairys' dances.' Here, 'till thrice three times the ſilver moon had renewed her borrowed light,' wandered the diſconſolate Sabra and afflicted champion. 'Before the painful hour of her delivery approached, he had provided her a bower of vine branches, which he erected between two pleaſant hills: where, inſtead of a princely cabinet, behung with arras and rich tapeſtry, ſhe was conſtrained to ſuffice herſelf with a ſimple lodging covered with roſes and other fragrant flowers. Her bed was made of green moſs and thiſtle-down, beſet curiouſly round about with olive branches and the ſprigs of an orange-tree, which made it ſeem more beautiful than Flora's pavilion or Diana's manſion.' Sabra, however delighted ſhe might be with the elegant bower conſtructed by the knight, requeſts his abſence; for the time approached when, as no other *accouchcuſe* was to be expected, ſhe imagined that ſome

friendly fairy might witneſs her diſtreſs, and lend her aſſiſtance. According to her wiſh, Proſerpine attends *in propria perſonâ*, and three lovely boys are introduced into the world: but let Sabra tell her own ſtory: 'The winds carried my groans to every corner of this wilderneſs, whereby both trees and herbs aſſiſted my complaints; beaſts, birds, and feathered fowls, ſeemed to pity my moans: but in the midſt of my torments, when my ſoul was ready to forſake this worldly habitation, there appeared to me a queen crowned with a golden diadem, in ſtate and geſture like imperious Juno, and in beauty to divine Diana: her garments for bravery ſeemed to ſtain the rainbow in her brighteſt hue, and for diverſity of colours, to ſurpaſs the flowers in the fields: on her attended many beautiful nymphs, ſome clad in garments in colour like the cryſtal ocean, ſome in attire as gallant as the pleaſant roſe, and ſome more glorious than the azured firmament. Her wiſdom might compare with Apollo's, her judgment with Pallas', and her ſkill with Lucina's.'—In ſhort, at the appearance of the benevolent elfine queen and her beautiful attendants, the pains of Sabra vaniſh, her children are born, and the fairy viſion diſappears. (See the firſt Part, l. 14.)

"Though the imagery and claſſical references in Johnſon ſeem to ſhew that he copied them from ſome poetical compoſition; yet the latter could ſcarcely occur in a *very old* metrical romance. Perhaps he introduced them to ſhew his own claſſical learning, a faſhionable accompliſhment in his age.—Be that as it may, the following imagery in Wieland, who, we believe, never refers to the Roman poets, reſembles the firſt quotation, though we do not venture to aſſert that it proceeds from a common origin.

No more the foreſt bows before the blaſt,
A naked wreck—but where the pillars ſtand
Of arch'd embow'ring roofs that ſhade the land,
Where nature's temple towers ſublime in air,
The pomp of foliage thickens full and fair,
And cluſtering leaves on leaves religious gloom expand.
The earth is deck'd anew with flow'ry bloom,
Fair budding ſmile the garden, grove, and plain,
Charm'd echo thrills the birds' melodious ſtrain,
And rocks are wreath'd with plants that breathe perfume.
From bubbling rills the purling currents ſtray
Down the green moſs, and wind their ſilver way:
And through the night, from time to time renew'd,
The lonely bird amid the thick'ning wood
Trills to the ſilent moon her melancholy lay.

Canto viii. ſt. 50. 51.

"However accidental the preceding reſemblance might be, we can ſcarcely entertain a doubt but that the ſubſequent paſſages in Wieland were derived from the ſame ſource as thoſe in Johnſon. The figures belong to the ſame piece of tapeſtry, but thoſe of the German poet are unqueſtionably on the right ſide. Sir Huon and Rezia (or Amanda) are wrecked on a lonely iſland inhabited only by an aged hermit. After ſome time ſhe finds herſelf in the ſame ſituation as Sabra, and experiences the ſame diſtreſs.

The hour was come: oppreſs'd with ſilent woe,
Amanda, lingering, near the cottage ſtrays
'Mid fragrant ſhrubs that ſhade her ſecret ways,
Where op'ning flowers around profuſely blow,
And breathe freſh incenſe on the gale of morn.
Down a ſmall path ſhe wanders on forlorn;
Then ſtops before a grot, where ivy weaves
The rich luxuriance of her cluſt'ring leaves,
While day's reſplendent beams their gloſſy tint adorn.

Canto viii. ſt. 68.

"This grotto, like the wilderneſs in *The Seven Champions*, is a favourite haunt of the Fairy Queen, till now impervious to mankind; but Amanda

——— with gentle hand
Removes the ivy web, and enters in alone.

At once, a ſecret ſhudder gently ſteals
Along her frame, upon a yielding ſeat
She ſinks, where moſs and blooming roſes meet.
Now only feels, through bone and marrow feels,
Thrill upon thrill ſwift-pierting anguiſh dart—
'Tis paſt—ſweet languor ſteals upon the ſmart.
It ſeems that o'er her eyes pale moon-beams glide,
Gradual in deep and deeper ſhadow dy'd,
Till, ſoftly huſh'd to ſleep, oblivion ſtills her heart.
And from within her a confuſion gleams
Of lovely ſhapes; ſome o'er her ſweep, ſome roll'd,
Each in the other floating, fold on fold;
Mixture of wond'rous mood!—And now it ſeems
Before her knees three lovely angels ſtand:
Clear to her gaze their myſtic rites expand:
And lo! a woman veil'd in roſeate ray,
Holds to her lips, as dies her breath away,
A wreath of roſes freſh that bud beneath her hand.
For the laſt time her higher-beating heart
Thrills with a ſhort and ſoftly-ſilenc'd pain.
The forms are fled away—ſhe ſwoons again:
And now, without remembrance of a ſmart,
Wakes to ſoft notes, and ſeems afar to hear
Their low-lull'd echoes dying from the ear.
The ſiſter forms are vaniſh'd from her view;
Alone before her, robed in roſeate hue,
The gracious *elfine queen* ſoft-ſmiling deigns appear.
Within her arms repos'd a new-born child:
She gives it to Amanda—then, as blown
At diſtance, in a * *wink* away is flown;
Sweet odours breathe where late the fairy ſmil'd—
The dreamer opes her diſenchanted eyes.

Canto viii. ſt. 61.

"It is ſufficient, without proceeding further, to have pointed out the moſt ſtriking inſtance in which authors of ſo heterogeneous a nature, at leaſt in reſpect to talents, as Johnſon and Wieland, coincide. The reader, whoſe curioſity may lead him to compare the opening of the 14th chapter of the *Seven Champions*, with the latter part of the eighth canto in Oberon, will find ſome other reſemblances, though of a leſs obvious nature.

"Poetical alchemy converts the baſeſt ore into the richeſt metal; and had the fantaſtic creed of their ſuperſtitious anceſtors been unknown to Shakſpeare and Milton, we ſhould have loſt many of their moſt pleaſing images. To diſcover the original mine, as in the caſe of Dubartas and Milton, which led us into this ſubject, gratifies our curioſity: and even to trace literary petty larceny in writers of an inferior claſs is not deſtitute of amuſement. The few inſtances we have adduced,

* This word is often introduced and not happily. Almanzor *winks* his ſlaves to approach, and Almanſaris *winks* Sir Huon away, &c. &c.

and innumerable ones might be given, are perhaps ſufficient to ſhew, that thoſe of the Eaſt were as little ſcrupulous in availing themſelves of their predeceſſors' labours as our own countrymen.—'The Loves of Camarupa and Camalata,' though we ſuſpect ſome paſſages interpolated by the Perſian tranſlator, is in all probability the foundation of the fictions we have already noticed in the Arabian Nights and Perſian Tales. The rude and inartificial manner in which it is conſtructed, induces us to ſuppoſe it no modern fabrication.

"Thoſe incidents alſo in Oberon, which coincide with Chaucer's January and May, ſeem to have come originally from the banks of the Ganges: and Einaiut Oollah is much rather to be ſuſpected of having borrowed from his countrymen than from the old bards of Europe.—We forgot to mention that Sir Huon, like Mitra Chandra, is ſuſpected of being purſued by divine vengeance, and thrown overboard to appeaſe the fury of the tempeſt. His undertaking, however, to deprive Haroun Alraſhid, the hero of the Arabian Nights, of his ſilver beard and four grinders, is moſt decidedly an accidental fiction; invented, we may conceive, by a fanciful crazy minſtrel, or merry *Jongleur*, to divert ſome *Mahound-hating* chieftain and his martial followers when the croiſade mania infected Europe.——But we are loſing ourſelves in the labyrinth of conjecture, without any friendly clue, any worm-eaten publication, or black-letter manuſcript, to guide and direct us. We here think it adviſable, therefore, to relinquiſh the ſubject".

FIELD-GARDENING, a kind of *gardening-huſbandry*; the advantages of which are ſet forth in the following extract of a letter from Sir Henry Navaſour, bart. to Lord Carrington This communication publiſhed by the Board of Agriculture as an appendix to Sir John Sinclair's Obſervations, ſtrongly confirms the practicability of a cottager being enabled to keep a cow by the produce of arable land only. (See COTTAGER, *Supp.*)

"The advantages that appeared to me (ſays Sir Henry), in cultivating land in the *Flemiſh* manner, or what is now called, about Fulham and that neighbourhood, the *field gardening* huſbandry, are conſiderable. I have for ſome years encouraged my cottagers in Yorkſhire in this mode of managing their ſmall garths or gardens, which are in general from one to three acres; and I have now an opportunity of ſtating the huſbandry of a poor induſtrious cottager's garth. As the man can neither read nor write, theſe particulars have been tranſmitted to me from his own mouth; and, as I ſaw his land almoſt every day during the laſt harveſt, I can vouch that this account is not far from the truth.

Produce.	Value.	A. R. P.
240 Buſhels of potatoes -	£. 24 0 0	0 2 0
60 Ditto of carrots - -	6 0 0	0 1 0

Produce before ſtated.

£. 23 2 0 £. 54 0 0
23 2 0

Profit £. 30 18 0 if ſold at market, excluſive of butter.

"His ſtock was two cows and two pigs: one of his cows had a ſummer's gait for twenty weeks with his landlord. The land was partly ploughed and partly dug with the ſpade, cultivated (the ploughing excepted) by the man, his wife, and a girl about twelve years of age, in their *ſpare* hours from their daily *hired* work, ſeldom a whole day off, except in harveſt; made the rent in butter, beſides a little uſed in the family. The man relates that he thinks he clears, one year with another, from the three acres, about £. 30. The daily wages his family earns, about keep them. It is very evident that this man clears from his three acres more than a farmer can poſſibly lay by from more than eighty acres of land in the common huſbandry of the country, paying for horſes, ſervants, &c.; and it muſt be obvious to every one how great the advantages muſt be to ſociety by cultivating land in this manner It would have taken more than half the quantity of his three acres in paſture for one cow at graſs during half the year; whereas (excepting the ſummer's gait for one of his cows, as mentioned before) his ſtock of two cows and two pigs is kept and carried on the whole year. The family lives well, and a handſome ſum has been yearly ſaved to place out two ſons, and ſupply them with clothes, waſhing, &c."

FILTRATION, a method of clarifying turbid liquors by mechanical ſtraining. The term is generally applied to the paſſing of ſuch liquors through filtering paper, flannel, &c. by which the fæculent matter they contain is left behind. It is one of the modes of CLARIFICATION or DEFECATION. See the latter article in this Supplement.

Among the various contrivances, few appear to poſſeſs the advantage of ſimplicity, combined with that of affording an ample ſupply of a fluid ſo eſſentially neceſſary to the preſervation of health, as pure water.—A patent has lately been granted to Mr. JAMES PEACOCK, of Finſbury-ſquare, for a filtering machine, which is ſtated to be ſuperior to any hitherto invented. It completely accompliſhes the purpoſe of filtration, by cauſing the turbid fluid to aſcend through a medium of fine gravel, of progreſſive degrees of fineneſs, by which means the fouleſt water or other fluid becomes perfectly freed from all (mixed) impurities, without any noxious mineral quality, which pumice or other common filtering ſtones are ſuſpected to communicate. Should, from continual uſe, its operation become in any degree impeded, it may be completely cleanſed with the greateſt facility in the ſhort ſpace of one minute; an advantage poſſeſſed by none of the common machines that operate by *deſcent*. Beſide theſe uſeful properties, Mr. PEACOCK's filtering machine does not occupy more room than a large drip-ſtone with its apparatus, and yields a conſtant and pure ſtream of more than 300 gallons in 24 hours.—A ſpecimen of this machine is depoſited for inſpection at Guildhall, London.

The editor of the Domeſtic Encyclopedia, recommends a very ſimple and effectual apparatus, by which the pureſt water may be eaſily procured. This contrivance is calculated on the plan of the celebrated filtering machine erected at Paris, in the vicinity of the *Samaritaine*, and by means of which the foul water of the river Seine is ſo completely purified, as to be diveſted of its laxative properties. Beſides, this machinery, if conſtructed on a large ſcale, is well adapted to ſupply the largeſt breweries, or dyeing works, with any quantity of *pure* water at a trifling expence, and is attended with very little additional trouble.

When we reflect on the method which Nature purſues in the filtration of water, we find that ſuch waters as deſcend from hills, though paſſing through ſand and rocks, are ſeldom perfectly pure; but that thoſe are the moſt limpid, which, by aſcending, ooze out near the foot of a mountain. The cauſe of this difference appears to be owing to the circumſtance, that if the water only *deſcends* through ſand, the fineſt and moſt weighty foreign particles gradually penetrate through the ſandy ſtrata; on the contrary, when it is forced to *riſe* through ſand, all ſuch ponderous ingredients ſettle at the bottom; becauſe, from their greater ſpecific gravity, they cannot aſcend to the top. The lighter particles of fluids, conſequently, in both caſes remain in the upper ſtrata of the earth or ſand.

From theſe conſiderations, Profeſſor *Parrot*, jun. of Paris, was induced to give his filtering machine the form repreſented in pl. 29. fig. 1.

The principal part of the machinery conſiſts of a ſquare veſſel, bent in the form of an inverted ſyphon. The curve may be circular, elliptic, or in any other direction. This veſſel is filled with fine, pure ſand, till nearly the height of the dotted line *x*, *y*, which denotes the aſcent of the water to D, whence it flows into the receiver. The part marked A, B, ſhould always project above this line, according to the ſize of the filtering machine. To A, B, there is attached a woollen bag, which is open at the top, and the lower part of which touches the ſand. It ſerves the purpoſe of collecting the coarſeſt impurities, and thus preſerves the ſand for a longer time from becoming foul. The bag, therefore, may occaſionally be removed, and rinſed in clean water.—It is evident, that the water flows at A, through the bag into the filtre, and riſes at the place marked D, which is conſiderably lower than the former. It affords a very agreeable ſight to obſerve the moſt limpid fluid penetrating the uppermoſt ſtratum of ſand, perfectly ſimilar to that oozing from the pureſt natural ſpring.

Prof. *Parrot* remarks, that he procured a filtering machine made of block-tin, for aſcertaining, by experiments, the purity and quality of water that may thus be obtained in a given time. It conſiſted of the following dimenſions: the ſmall diameter B, E, was eight Paris inches; the large of the whole machine, eleven inches; conſequently the thickneſs of the veſſel A, B, was one inch and a half;—the breadth of it, two inches and ſeven-eighths. The perpendicular height of the lower ſide, from C, its baſis, to the rim D, whence the water iſſues, was four inches and one-twelfth; the oppoſite height of the mouth A, B, eight inches and three-fourths; and the height of the ſand on the ſide marked D, was three inches and one-ſixth.

Although, in experiments of this nature, much depends on the relative ſize and purity of the ſand, which neceſſarily afford different reſults, yet Prof. *Parrot* has, after repeated trials, deduced the following concluſions, which appear to be well founded.

1. That the difference of the *niveau*, or water-level, has an eſſential influence on the quantity of the purified water thus obtained; 2. That a prolongation of the ſtratum of ſand does not conſiderably diminiſh the product of the filtre, but remarkably contributes to the purity of the fluid. 3. That if the water be forced to paſs through the ſand with increaſed velocity, it will be leſs pure than by allowing it a proper time for its paſſage; and, 4. That a machine of the dimenſions above deſcribed, will furniſh about three quarts of water in an hour, or eighteen gallons in twenty-four hours. This quantity, however, being too large in proportion to the ſize of the machine, it is adviſable, either to leſſen the difference of the water-fall; or, which is ſtill better, to prolong the ſtratum of ſand, in order to reduce the filtration of the water to half the quantity above ſtated, and to obtain it in greater purity. Thus, a filtering apparatus eighteen inches long from A to D, two inches thick, and four broad, would afford every hour ſix pints of very pure water. If, therefore, ſo ſmall a machine, containing a very moderate ſtratum of ſand, and requiring only a difference of two or three inches in the height of the water, furniſhes a clear and pure fluid, it follows that an apparatus on a larger ſcale, provided with a bed of ſand from five to ſix feet long, and admitting of a difference from twelve to eighteen inches in the fall of the water, might be uſefully employed in public wells, hydraulic machines, and even in camps, for the ſupply of an army.

In the conſtruction of large filtering machines, Prof. *Parrot* juſtly obſerves, that they ſhould not be extended in the direction A, C, D, to a greater length than is abſolutely neceſſary; as, in this caſe, they will not require any conſiderable difference in the fall and riſe of the water: on the other hand, their breadth and thickneſs may be accordingly increaſed.—Thus, the diameter of ſuch a machine would ſtill more reſemble that of a ſyphon, as is repreſented in the plate, at fig. 2.

This form might alſo be adopted for ſmaller machines,

eſpecially ſuch as are deſigned for *travellers*, two of whom might be amply provided with pure water, and in a very ſhort time, by a veſſel of the following dimenſions: from P, to Q, eight inches long; from P, to R, twelve inches high; and the whole four inches in breadth.

If the form laſt delineated be employed on an extenſive ſcale, there ſhould be a trap-door in the lowermoſt part marked R, ſo conſtructed that it may fit exactly, and admit no paſſage to the water: this aperture would ſerve only for the removal of the ſand, when it is rendered foul by long uſe. In the ſmaller machines, intended for travelling, ſuch a door is unneceſſary, as they may be eaſily emptied of their contents through either of the orifices P, or Q. Inſtead of this addition to the latter, the upper room (which in the firſt of the figures is circumſcribed with the letters B, F, E) might ſerve as a reſervoir of pure water, that could either be decanted, or drawn off by means of a cock applied to the centre of the machine, marked F. We think, however, this latter arrangement, which is propoſed by M. Parrot, in many reſpects objectionable, and therefore adviſe the reader to make uſe of the more ſimplified conſtruction. Hence we ſhall only add, that every filtering machine ought to be provided with a cloth cover, to prevent the duſt from riſing with the water, without impeding its filtration.

It is needleſs to expatiate on the great advantages of filtering machines in the different proceſſes of dyeing, baking, brewing, diſtilling, and all the domeſtic arts. As no particle of real nutriment can be aſſimilated to the human fluids, without being previouſly macerated and reduced by *water* (whether this fluid be introduced into the ſtomach, in the form of beer, wine, ſpirits, tea, &c.), it will be eaſily underſtood that *impure* water cannot fail to produce, however ſlowly, many dangerous, and often incurable, diſeaſes—the ſource of which is ſeldom ſuſpected.

FINALE, a town of Italy, on the coaſt of Genoa, with a ſtrong citadel, two forts, and a caſtle. It was ſold to the Genoeſe, by the emperor Charles VI. in 1713; and is 30 miles S.W. of Genoa. Long. 8. 0. E. Lat. 44. 14. N.

FINALE, a town of Italy, in the Modeneſe. It has been often taken and retaken; and is ſeated on an iſland formed by the river Panaro, 22 miles N.E. of Modena. Long. 11. 25. E. Lat. 44. 46. N.

FINCASTLE, the chief town of Botetourt County, in Virginia, 36 miles E. of Lexington.

FINDHORN, a fiſhing-town in Murrayſhire, at the mouth of a bay of the ſame name, with a tolerable harbour, 17 miles W. by N. of Elgin. Long 3. 40. W. Lat. 57. 45. N.

FINDHORN, a river of Scotland, which riſes in Inverneſsſhire, and croſſing Nairneſhire and the N.W. corner of Murrayſhire, forms a bay, to which it gives name, and which opens into the frith of Murray, at the town of Findhorn.

FINMARK, a part of Daniſh Lapland, in the government of Wardhuys.

FIONDA, an ancient town of Natolia, on the gulf of Satalia, with a biſhop's ſee, 25 miles S.W. of Satalia. Long. 31. 57. E. Lat. 36. 45. N.

FIORENZO, ST. a ſea-port of Corſica, on a gulf of the ſame name, ſeven miles W. of Baſtia. It was taken by the Engliſh and Corſicans, from the French, in 1794. Long. 9. 20. E. Lat. 42. 35. N.

FIRE. See COMBUSTION.

FIRE-ESCAPE; a contrivance for the purpoſe of reſcuing perſons in imminent danger from fire. See ESCAPE in this Supplement.

In the Annual Regiſter for 1775, an account is given of a machine for ſaving perſons and effects from the flames. It conſiſts, 1. Of a pole of fir, which may be of any convenient length, being about five inches in diameter at the bottom, and at the top or ſmalleſt end, about three inches. At the diſtance of three feet from the top, is a mortice through the pole, to which a pulley is fixed, that is nearly of the ſame diameter as that part of the pole. A rope about three-fourths of an inch in diameter, and twice the length of the pole, at one end of which is a ſpring-hook, to paſs through the handle of the baſket, when uſed; it is put through the mortice over the pulley, and drawn tight on each ſide, nearly to the bottom of the pole, where it is ſecured till wanted. 3. A baſket, which ought to be of ſtrong wicker-work, three and a half feet long, two and a half feet wide, rounded off at the corners; and four feet deep, rounding every way at the bottom. To the top of the baſket is fixed a ſtrong iron curve, or handle, with an eye or ring in the middle: a ſmall cord about the length of the pole, is likewiſe faſtened to one ſide of the baſket, near the top.—Theſe being the principal parts, there are alſo ſeveral ſtraps, &c. for ſecuring the poles from ſliding; of which the reader will find a minute account in the volume before quoted. This contrivance can be raiſed, and two or more perſons may be taken out of the upper windows of a houſe, and let down ſafely in the ſtreet, within the ſpace of thirty-five ſeconds, or little more than half a minute.

FIRE-ENGINE (*Encycl.*). Under the articles FIRE and HYDROSTATICS, various uſeful inventions are deſcribed for the purpoſe of extinguiſhing accidental conflagrations. In the year 1785, the ſilver medal and twenty guineas were conferred by the Society for the Encouragement of Arts, &c. on Mr. Furſt, as a reward for his contrivance to increaſe the effect of engines in extinguiſhing fires; of which the following is a ſhort deſcription: From a platform riſes an upright pole or maſt, of ſuch height as may be judged neceſſary; a gaft ſlides upon it in an aſcending direction, and along both is conveyed the leather hoſe from the engine. The branch, or noſe-pipe of the engine projects at the extremity of the gaft; towards which an iron frame is fixed, whence two chains are ſuſpended: and from theſe hang ropes, which ſerve to give an horizontal direction to the branch; while other ropes that run through proper pulleys, and are thus conveyed down the maſt, ſerve likewiſe to communicate a vertical motion to it. By theſe means, the branch or noſe-pipe of the engine is conducted into the window of any room where the fire more immediately rages; and the effect of the water diſcharged is applied in the moſt efficacious manner to the extinguiſhing of the flames.

A patent was granted in January 1790, to Mr. Joſeph Bramah, of Piccadilly, and to Mr. Thomas Dickenſon, of Bedworth Cloſe, in the county of Warwick, for a new improved engine on a rotative principle. The merits of this machine depend on its having two wheels or cylinders of braſs, or any other metal; one of which is of a greater, and the other of a ſmaller diameter, in any proportion required; both are nearly of equal length, but may be increaſed or decreaſed, according to the purpoſe to which the machine is applied. As ſoon as the larger wheel is fixed, the ſmaller one is placed within it, and is faſtened on an axis, ſo as to turn in a rotative direction round its centre; the ſmaller wheel being thus ſtationed, may be occaſionally fixed, and the larger one moved in the ſame direction round the ſmaller one: the former of theſe, however, is preferable in all caſes. At each end of the larger wheel there is a *ſtanch*, to which are ſcrewed two plates, or caps incloſing its ends, and into which the extremities of the ſmaller wheel are inſerted, ſo as to render the junction *watertight*: through theſe caps paſſes the axis of the inner cylinder, in order to communicate motion from without.—Or the inner wheel may be applied ſo as to give motion, by its external end or ends, to any other engine or machine connected with it.—

Theſe are the component parts of Meſſrs. Bramah's and Dickenſon's patent engines; for a more particular account of which, we refer the reader to the 2d vol. of the Repertory of Arts and Manufactures, where he will find a minute account of the machinery, and the effects it is calculated to produce.

A patent was likewiſe granted in December 1792, to Mr. Charles Simpkin, of Oxford-ſtreet, engine maker; for his improvements in all kinds of machines for extinguiſhing fire.—This invention conſiſts in exploding or removing the valves both from that part of the cylinder where the vacuum is made by the piſton or fly, and from beneath the air-veſſel; and in making uſe of valves, by the application of certain filtering chambers, with partitions or diviſions, to preſerve the effect of the valves, during the uſe of any improper fluid. Theſe filtering chambers are to be placed between the drawing valves, and the ſtrainer in common uſe, on the ſuction-pipe. The partitions in the chambers may be of fine wire-work, or of any other ſubſtitute, that will act as a firſt and ſecond filtration in the chamber.

The deſign of this invention is, to render the valves more free of acceſs, and to prevent the neceſſity of opening any other parts of the engine, except the chambers containing the valves; by which means the effect of the machine is increaſed, and conſequently the fire may be more eaſily extinguiſhed.

To theſe different contrivances we ſhall add the American fire-engine, of which we have given an accurate engraving. It was invented by Mr. Benjamin Dearborn, who communicated to the American Academy of Arts and Sciences, from whoſe Memoirs for 1794 we extract the following particulars:

Fig. 1. Plate 30, A B, and C D, are the edges of two planks, confined together by four bolts.—*a b*, and *c d*, are two cylindrical barrels, in each of which a piſton, with a valve, is faſtened to the ſpear *e*, and is moved up and down alternately by the motion of the arms E E. Beneath each barrel a hole is made through the plank A B, which is covered with a valve. The arms E E, are ſuſpended on the common centre *f*: there are alſo arms parallel to theſe on the oppoſite ſide: *g g* are the ends of handles which are faſtened acroſs the ends of the arms. At *h*, a bolt goes acroſs, from arm to arm, to which the piece *i*, *k*, is affixed, and on which it plays; the lower end of this piece is faſtened to the top of the ſpear *e*.—G, *l*, *f*, is a ſtandard for the purpoſe of ſupporting the arms, to which there is a correſpondent one on the oppoſite ſide; both are notched into the edges of the planks, where they are ſecured by a bolt, which paſſes through them at *l*, and has a nut or fore-lock on the oppoſite ſide. H I, H I, are ſquare braces, anſwering the purpoſe of ducts, through which the water aſcends from the barrels, paſſing through the plank at *m*.—K L, K L, are irons in the form of a ſtaple, in order to confine the braces: the lower ends of theſe irons meet, and are ſecured by a bolt, paſſing through them, and M N, *n o*, which is a piece that goes up through a mortice in the centre of the planks. This piece is ſquare from the lower end, till it reaches the top of the braces; whence they become cylindrical to the top, the upper end being perforated ſufficiently low down, in order to communicate with the braces. O, P, is an iron ring, that ſurrounds the tube, and has two ſhanks which aſcend through the head, which ſcrews on the top at *p*, *q*:—*r*, *s*, is a ferule nailed round the tube.

Fig. 2. is the ſame engine; the arms and ſtandards being taken off, in order to delineate more clearly the mode of ſecuring the braces; an object which is completely effected by a wedge driven into the mortice *a*: beneath the upper plank *b*, is a hole for admitting a paſſage to the bolt, which ſecures the ſtandards. In this figure, a ſide view of the head is given, with the pipe in a perpendicular direction.

The machine is confined within a box, ſet on wheels, as in the common fire-engines. The whole is made of wood, excepting the ſpears of the pumps, and a few bolts, &c. The advantages of this machine are, that it can be made in any place where common pumps are manufactured; the interior work will not exceed *one-fourth* of the price of thoſe which are conſtructed on the uſual plan; and that they are incomparably more eaſy to work than the common ones; circumſtances which ſtrongly recommend the American fire-engine to the attention of the public.

On the breaking out of a fire, all conſtables are enjoined, by ſeveral acts of parliament, to repair to the place; to uſe every exertion for extinguiſhing the flames; and to cauſe people to work, &c.—By the 10 Ann, c. 14, no action ſhall be commenced againſt any perſon in whoſe houſe or chamber a fire ſhall break out accidentally: but, if ſuch fire happen through the negligence of any ſervant, the latter incurs a penalty of 100l. to be diſtributed among the ſufferers; and, in default of payment, he is to be impriſoned for 18 months, during which time he is to be kept to hard labour.

FIRMIN (Thomas), an eminent citizen of London, born in 1632, who diſtinguiſhed himſelf by his public benefactions and extenſive charities, as alſo by ſome opinions contrary to the received doctrine of the Trinity. The plague in 1665, the great conflagration in 1666, with the arrival of the French Proteſtants in 1680 and 1681, all furniſhed him with great opportunities of exerting his benevolent diſpoſition. He died in 1697; and was buried in the cloiſters of Chriſt's hoſpital, where his virtues are recorded in a monumental inſcription.

FISH (*Encycl.*). For a patent method of curing fiſh, ſee the article CURING in this Supplement.

FISH RIVER, GREAT, a conſiderable river of Africa, which riſes in the unknown interior regions, divides Caffraria from the country of the Hottentots, and falls into the Indian Ocean, in lat. 30. 30. S. The deepeſt parts of this river are inhabited by the Hippopotamus, and the adjacent woods by elephants, rhinoceroſes, and buffaloes.

FISHER-ROW, a town near Edinburgh, on the W. ſide of the mouth of the Eſk, which contains many handſome houſes, and has ſome excellent villas in its vicinity.

FISHKILL, a town of the ſtate of New York, 66 miles N. of New York. Long. 73. 48. W. Lat. 41. 31. N.

FISSATO, a ſea-port of Barbary, in the province of Tripoli, 90 miles N.W. of Tripoli. Long. 12. 10. E. Lat. 33. 50. N.

FISTELLA, a fortified town of Morocco. The inhabitants carry on a great trade in fine garments. It is 125 miles N.E. of Morocco. Long. 5. 25. W. Lat. 32. 27. N.

FIVE CHURCHES, an epiſcopal town of Hungary, 85 miles S. of Buda. Long. 18. 13. E. Lat. 46. 5. N.

FIUME, or ST. VEIT, a ſea-port of Auſtrian Iſtria, with a caſtle. It is very populous; noted for wine, good figs, and other fruits; and the cathedral is worth obſervation. The harbour is formed by the river Finmara, which enters the bay of Carnero, in the gulf of Venice. It is 37 miles E. of Capo d'Iſtria. Long. 14. 46. E. Lat. 45. 40. N.

FIXLMILLNER (Placidus), a celebrated German aſtronomer, was born on the 28th of May, 1721, at Achleiten, a village in hither Auſtria, not far from Kremſmunſter. He received the rudiments of his education in the convent of Kremſmunſter, which was indebted to his uncle the abbot, Alexander Fixlmillner, for an excellent ſchool and an obſervatory. Placidus conceived an early attachment to the mathematics, and took ſo much pleaſure in delineating mathematical figures, that his mother, out of deriſion, called him the almanack-maker. After ſome ſtay at the above ſeminary, he removed to Salzburg, where he completed his courſe of philoſophy, and obtained in that faculty the degree of doctor. His taſte for the mathematics, however,

became ſtill ſtronger. His father having aſked him one day, what preſent he ſhould give him, he requeſted Wolf's Epitome of the Mathematics; which he ſtudied with the greateſt pleaſure and ſatisfaction, during ſuch hours as he could ſpare from his other avocations: but, having deſtined himſelf for the convent, he was admitted a noviciate at Kremſmunſter, in 1737, and next year he publicly took the vows before his uncle, the abbot Alexander.

After a ſtay of two years in the convent, his *oheim* ſent him again to Salzburg to complete his ſtudies in juriſprudence and theology; but, at the ſame time, he applied with great aſſiduity to the mathematics, languages, hiſtory, and antiquities. He learned alſo to play on the harpſichord and organ; and made ſo much progreſs in muſic, that he compoſed ſeveral pieces both in the ſacred and theatrical ſtyle. He diſputed in ſome theological theſes, obtained the degree of doctor in theology; and in 1745 returned to his convent, where he was conſecrated to the prieſthood.

About this time the *Ritterſchule* having been eſtabliſhed at Kremſmunſter, Placidus was appointed profeſſor of canon law; a department in which he had acquired great reputation at the univerſity. This office he held for forty years, and reſigned it only a ſhort time before his death. Almoſt about the ſame period he was appointed dean of the higher ſchool, and ſoon after principal regent over the young nobility; which places he retained alſo till his death. He poſſeſſed great knowledge of the canon laws, and on that account was often employed in proceſſes and other affairs relating to the convent: he was likewiſe inſcribed *Notarius apoſtolicus in curia Romana.*

In the year 1760 he publiſhed a theological work, under the title of *Reipublicæ Sacræ Origines Divinæ*; but he acquired far more celebrity by his aſtronomical labours, both as an obſerver and a writer. The abbot Alexander Fixlmillner, a great friend of the ſciences, and particularly of the mathematics, having reſolved, in the year 1747, to form an eſtabliſhment in his convent for promoting the latter, firſt ſet apart a ſpacious apartment for the purpoſe of containing mathematical and philoſophical inſtruments. This paved the way for ſomething further; and he determined, for the improvement of his conventuals in aſtronomy, to erect an obſervatory. Among thoſe convents which for a long time have devoted their leiſure and riches to the advancement of ſcience and the good of mankind, none has diſtinguiſhed itſelf more than that of Kremſmunſter. This very old abbey is not the ſeat of infidelity and indolence, but a patron of the nobleſt branches of ſcience. The obſervatory, founded in 1748, was completed in 1758, and the ſuperintendence of it was intruſted to Eugenius Dobler, a brother of the order.

Alexander's ſucceſſor, the abbot Bertohld Vogel, who long reſided at Salzburg, as profeſſor of canon law and rector of the univerſity, being well acquainted with Fixlmillner's great knowledge, particularly in the mathematics, appointed him, in 1762, to be aſtronomer at Kremſmunſter, with leave to retain his office as profeſſor of canon law. He now applied with great zeal to render himſelf more fit for his new occupation, as he had not yet attended much to practical aſtronomy, and was even but little acquainted with thoſe books from which he could obtain information on the ſubject. His great attachment, however, to this ſcience, fine genius, and a deſire of being uſeful to the inſtitution in which he reſided, and to the world, made him overcome every difficulty. The firſt book that fell into his hands was Lalande's *Expoſition du Calcul Aſtronomique*, with which alone, without any oral inſtruction, he began to ſtudy and to make obſervations. This work, together with Vlacq's logarithmetic tables, were for a long time his only ſources and guides, till he at length obtained Lalande's large work on aſtronomy. Fortunately, a carpenter, named John Illinger, born in a village belonging to the abbey, though he could neither read nor write, was able, under the direction of Fixlmillner, to conſtruct for him very neat mural quadrants, zenith ſectors, tranſit inſtruments, and pendulum clocks. Other inſtruments were made for him by Brander of Augſburgh, and he procured achromatic teleſcopes from Dollond; ſo that by his activity the obſervatory at Kremſmunſter ſoon became one of the moſt celebrated, and beſt ſupplied with apparatuſes, in Germany. His principal aſſiſtants were Theod. Derfflinger, who afterwards became his ſucceſſor, and Father B. Waller.

Fixlmillner now acquired a conſiderable rank among aſtronomical writers. In 1765 he publiſhed his *Meridianus Speculæ Aſtron. Cremifanenſis*, in which he eſtabliſhed the firſt elements of his obſervatory, and determined its longitude and latitude. In 1776 he publiſhed his ſecond aſtronomical work, called *Decennium Aſtronomicum*, which contained the obſervations made by him at Kremſmunſter from 1765 to 1775, and which is replete with important and uſeful information. His third work, on which he was employed towards the cloſe of his life, and which was printed after his death, appeared in 1791. It contains a valuable collection of obſervations made between the years 1776 and 1791, together with a great many calculations and treatiſes, which ſtill add to his celebrity in this department. Beſides theſe, many important articles written by him are to be found in the *Journal des Savans*; Bernoulli's Epiſtolary Correſpondence; the French *Ephemerides des Move*; the Aſtronomical Almanac of Berlin; the Aſtronomical Ephemerides of Vienna; and the Memoirs of the Royal Academy of Sciences at Paris.

The important ſervice rendered to the ſcience of aſtronomy by Fixlmillner is well known to all aſtronomers. The great number of his obſervations of Mercury, at a time when they were rare, and difficult to be made, enabled Lalande to complete his accurate tables of that planet, for which the French aſtronomer publicly returned him thanks. Fixlmillner was one of the firſt aſtronomers who obſerved the orbit of the newly-diſcovered planet Uranus. He was alſo the firſt who ſupported Bode's conjecture, that the ſtar 34 in the Bull, obſerved by Flamſtead in the year 1690, and which afterwards diſappeared, was the new planet. Fixlmillner was a man of ſo great application and activity, that he not only made obſervations, but calculated them all himſelf, and deduced from them the neceſſary reſults. All his obſervations, of whatever kind, he calculated on the ſpot; and to avoid errors he always calculated them a ſecond time. To uncommon induſtry he united great penetration and deep reflection, as is proved by the great many excellent remarks and diſcoveries to be found in his works. It muſt here be added, that this able aſtronomer lived in a remote part of the country, at a diſtance from all literary helps, and from others who purſued the ſame ſtudies; that is to ſay, from all thoſe things which could animate his zeal; and yet he continued, till the laſt day of his life, a ſingular inſtance of perſeverance and attachment to his favourite ſtudy. But few men were ſo little ſubject to the imperious power of the paſſions. Simple in his manners, he poſſeſſed great equanimity and firmneſs, like the immutable laws of nature which he ſtudied. His wide-extended celebrity did not render him proud: whatever was written or ſaid in his praiſe, he endeavoured rather to conceal than to publiſh. His cloſe application at length impaired his health, and brought on obſtinate obſtructions, which ended in a diarrhœa. He died on the 27th of Auguſt, 1791, in the 71ſt year of his age, the 53d of his reſidence in the convent, and the 46th after his entering into the prieſthood.

FLADSTRAND, a ſea-port of Denmark, in N. Jutland,

with a harbour defended by three forts. It is 30 miles N.N.E. of Alburg. Long. 10. 19. E. Lat. 57. 33. N.

FLADUNGEN, a town of Franconia, 40 miles N. of Wurtzburg, and 44 N.W. of Bamberg. Long. 9. 57. E. Lat. 50. 22. N.

FLAG (*Encycl.*). The happy event of the union of Great Britain and Ireland has neceſſarily occaſioned an alteration in the national flag. See the repreſentation of the preſent FLAG in plate 30. In it are combined the ſaltiers of St. Andrew and St. Patrick, ſurmounted by the Croſs of St. George. For the armorial enſigns diſplayed in the Royal Standard, ſee UNION in this Supplement.

FLATTERY, CAPE, on the W. coaſt of N. America, diſcovered by Captain Cook in 1778; and ſo named becauſe he was diſappointed at not finding a harbour. Long. 124. 57. W. Lat. 48. 25. N.

FLAVIGINI, a town of France, in the department of Côte d'Or, with a late celebrated Benedictine abbey. It is ſeated on a mountain, 12 miles E. of Semur, and 140 E. of Paris. Long. 4. 37. E. Lat. 47. 26. N.

FLECHE, a town of France, in the department of Sarte. Here is the nobleſt college in France, built in 1603, by Henry IV.; and in the chapel are depoſited his heart and that of his queen in gold boxes. It is ſeated on the river Loire, 22 miles N. of Angers. Long. 0. 3. W. Lat. 47. 39. N.

FLEECY-HOSIERY, a very uſeful kind of manufacture, in which fine fleeces of wool are interwoven into a cotton piece of the common ſtocking texture. The following is the ſpecification of the Patent granted to Mr. Holland, of Broad-ſtreet, Bloomſbury, in the county of Middleſex, for a method of making ſtockings, ſocks, waiſtcoats, and other clothing, for perſons afflicted with complaints requiring warmth, and for common uſe in cold climates, and for making falſe or downy calves in ſtockings. It is dated September 22, 1788.

He deſcribes the nature of his invention in theſe words: "Having in the common ſtocking-frame, twiſted ſilk, cotton yarn, flaxen or hempen thread, worſted or woollen yarn, or any ſuch-like twiſted or ſpun materials, begin the work in the common manner of manufacturing hoſiery, and having worked one or more courſe or courſes in the common way, begin to add a coating, thus: draw the frame over the arch, and then hang wool or Jerſey, raw or unſpun, upon the beards of the needles, and ſlide the ſame off their beards upon their ſtems, till it comes exactly under the nibs of the ſinkers; then ſink the jacks and ſinkers, and bring forward the frame, till the wool or Jerſey is drawn under the beards of the needles, and, having done this, draw the frame over the arch, and place a thread of ſpun materials upon the needles (under the nibs of the ſinkers), and proceed in finiſhing the courſe in the uſual way of manufacturing hoſiery with ſpun materials. Any thing manufactured in this way has, on the one ſide, the appearance of common hoſiery, and on the other ſide the appearance of raw wool. The raw or unſpun materials may be worked in with every courſe, or with every ſecond, third, or other courſe or courſes, in quantity proportioned to the warmth and thickneſs required. The above-mentioned raw or unſpun materials may be fixed alſo thus: having drawn the frame over the arch, hang them upon the beards of the needles, ſlide them off the beards upon their ſtems, and without ſinking the jacks and ſinkers, draw the frame off the arch, and bring the raw or unſpun materials forward under the beards of the needles; then draw the frame over the arch, and proceed in finiſhing the courſe, as before directed. The ſaid raw or unſpun materials may be fixed likewiſe thus: hang them upon the beards of the needles, without having the frame over the arch, and ſlide them off their beards upon their ſtems; then bring forward the frame till the raw or unſpun materials are drawn under the beards of the needles, and, having done this, draw the frame over the arch, and proceed in finiſhing the courſe as before directed. Hoſiery may be coated by any of theſe methods, not only with wool and Jerſey, but alſo with ſilk, cotton, flax, hemp, hair, or other things of the like nature, raw or unſpun, but the method firſt deſcribed fixes them moſt firmly. The common ſtocking-frame is mentioned above, but any other frame, upon a ſimilar principle, may anſwer the purpoſe. The method of making the falſe or downy calves in ſtockings, is by working raw or unſpun wool, or Jerſey, or any other raw or unſpun materials, into the calves of ſtockings, in the different methods before deſcribed, and to any required form or thickneſs." The latter uſe to which this invention is applied, we may be allowed to ſay, is ſomewhat ludicrous.

FLEET, a river in Kircudbrightſhire, which winds through a beautiful valley, and enters Wigton Bay, at Gatehouſe. On the W. ſide of the river are the veſtiges of a camp, a druidical circle, and a vitrified fort.

FLENDSBURG, a town of Denmark, capital of Sleſwick, with a ſtrong citadel. It has a harbour in the Baltic Sea, and is a place of conſiderable commerce, 15 miles N.W. of Sleſwick. Long. 9. 47. E. Lat. 54. 50. N.

FLEURANCE, a town of France, in the department of Gers, 13 miles N. of Auch. Long. 0. 36. E. Lat. 43. 51. N.

FLEURUS, a village of the Netherlands, in the province of Namur, remarkable for a victory gained by the French, over the allies, in 1690; and here, in June 1794, the Auſtrians were defeated in a general attack of the French poſts. It is ſix miles N.E. of Charleroy.

FLEURY, a town of France, in the department of Saone and Loire, 30 miles N. of Chalons. Long. 4. 50. E. Lat. 47. 13. N.

FLEXIBLE STONES. In the Philoſophical Magazine we find a communication from Profeſſor M. A. Pictet, of Geneva, on Flexible Stones, addreſſed to the editor, Mr. Tulloch. Alluding to another writer's deſcription of the *elaſtic quartz*, or *flexible ſand-ſtone*, from Brazil, he wonders that the author did not mention a ſimilar phænomenon which has been obſerved in another ſtony ſubſtance, commonly as inflexible as any ſiliceous aggregate, but thoroughly different in point of chemical compoſition—"I mean" ſays he, "the table of *elaſtic marble*, which is ſhewn at Rome as a great curioſity. A friend of mine, M. Fleuriau de Bellevue, from La Rochelle, who had ſeen it, gueſſed at the cauſe of its flexibility, and went ſo far as to render, by a particular proceſs, any given ſpecimen of Carrara marble as evidently flexible as the table in queſtion. He purſued at Geneva the ſeries of experiments which led him to that diſcovery, and read to our Society of Phyſics and Natural Hiſtory an account of the whole, which has been ſince publiſhed in La Metherie's *Journal de Phyſique*. The following are the leading facts:

"That ſpecies of marble conſiſts, as you well know, in a confuſed aggregation of ſmall irregular cryſtals interwoven in all poſſible directions, and adhering to one another by a certain degree of coheſive force. He thought that if he could, by any proceſs, deſtroy that adherence, without altering much the ſolidity of the cryſtals themſelves, he might thus obtain a looſe, but entire, ſtony aggregate, which would become flexible on account of the relative mobility of the integrant cryſtals, but keep its ſolidity and preſerve its form in conſequence of their being deeply implicated and interwoven among themſelves.

"According to that theory, he undertook a ſeries of experiments by expoſing ſlips of marble to the action of fire in ſand-baths of regularly graduated and well aſcertained temperatures: he thus found a point where the adheſion of the cryſtals was looſened, without any material alteration in their hard-

neſs. He gave to his friends ſome ſpecimens of Carrara marble thus rendered flexible. I have one of them in my poſſeſſion here in London, which may be ſeen by any perſon who ſhould yet entertain any doubts as to the poſſibility of the fact.

"Now, a volcanic fire may have acted on a large maſs of marble nearly as my friend's furnace has done on his ſmall ſpecimens; and this explanation of the natural phænomenon I conſider as being as near to truth as moſt of our conjectures on ſimilar ſubjects can be."

FLIE, or VLIELAND, an iſland on the coaſt of Holland, at the middle of the entrance of the Zuyder-Zee.

FLIX, a town of Spain, in Catalonia, ſtrong both by art and nature. It is built on a peninſula, in the river Ebro, where it makes an elbow, which ſerves the town inſtead of a ditch, and may be conducted quite round it. The ſide where the river does not paſs, is covered by mountains, and defended by a caſtle on an eminence; and near it is a waterfall. It is 20 miles S. of Lerida. Long. 0. 26. E. Lat. 41. 15. N.

FLOATING BATHS. As the erection of public baths has, from the remoteſt ages, been conſidered an object worthy of national attention, and private ſolicitude, we have ſelected the following article from the Domeſtic Encyclopedia: The floating baths at Hamburgh are an eſtabliſhment which owes its origin to the enlightened members of the "Society for the encouragement of Arts and Uſeful Trades," founded in that city, in the year 1765. Theſe baths were projected by Dr. Moldenhawer, phyſician at Hamburgh, and erected by public ſubſcription, on a ſmall lake of freſh water, called the *Alſter*. M. Arens, an eminent architect of the ſame city, delineated the plan of the building, which, we are informed, is an improvement on ſimilar baths eſtabliſhed in the principal towns of the French republic.

Although we have not had an opportunity of comparing the *internal* conſtruction of the Hamburgh baths, with thoſe floating on the river Thames, near Weſtminſter-bridge, yet we have reaſon to believe that they are eſſentially different from any other exiſting in this country. Induced by this conſideration, and convinced of the intrinſic advantages which the former poſſeſs, independent of their beautiful external appearance, we have cauſed accurate repreſentations to be given in Plate 29, of which the following is an explanation:

Fig. 1, *A, The elevation of the longitudinal front of the Floating Bath*, with its ornamental entrance; of the ſurrounding gallery, and the tents expanded over the bathing machines, and covered with ſail-cloth, which had been four times varniſhed. The wooden roof is alſo covered with ſtrong ſail-cloth, which had been repeatedly coated with tar. The whole veſſel is 80 feet in length, and 40 in breadth.

B, Elevation of the tranſverſe ſide of the Floating Bath, with its glaſs doors and windows, through the former of which the corridor, and through the latter the cabins on each ſide receive their light.

C, Section of the Building: namely, *a, b*, of the *Bathing Machines*, and *c, c*, of the chambers for undreſſing and dreſſing. On each longitudinal ſide of the veſſel, there are (as appears on inſpecting Plate 29) ſix of theſe *chambers*, which may be eaſily opened from within; and on each tranſverſe ſide are two *lateral cabins*, partly furniſhed, and partly deſigned for ſtore-rooms, to hold various implements.

The corridor, extending from one ſide-door to the other, within the centre of the building (ſee fig. 2, *B, f*), is ſeven feet and a half wide; and on each ſide are the bathing machines and chambers.

Theſe *chambers* for undreſſing and dreſſing, which are provided with ſky-lights, and marked *c*, are ſeven feet and a half in length, and four feet wide. They are anti-chambers to the bathing machines *a, b*, and each of the former contains the moſt neceſſary articles of furniture, ſuch as a table, chair, looking-glaſs, cork-couch (for ſupporting the feet till they are dried, after coming from the bath), pegs for ſuſpending clothes, a boot-jack, &c.

The bathing machines *a, b*, below the ſurface of the water, conſiſt of four ſides, made of laths two inches thick, through which it flows, and they are provided with a ſolid wooden floor, ſecured by iron ſtaples. Theſe machines are ſix feet broad and ſeven long, ſo that the whole body may move in them without conſtraint.

Their conſtruction renders them moveable, ſo that they may be raiſed or lowered at pleaſure and with little trouble, as appears from the machine *b*; while the impurities ſettled at the bottom may be eaſily removed. At the ſide of the ſteps (ſee fig. 2, *h*), which extend to the bottom of the bathing machine, the latter is provided with a balluſter (fig. 2, *i*), adjacent to which is placed a table and chair. The bathing machines are adapted to different depths of water, ſo that every individual may regulate them at $2\frac{1}{2}$, 3, $3\frac{1}{2}$, or 4 feet in depth, and theſe proportions are marked within the chamber. Above each machine are ſuſpended two ſtrings, one of which is connected with a bell fixed in the corridor, for calling the waiter: by means of the other, the bathing perſon may exclude the current of air circulating between the bottom of the floating veſſel and the ſurface of the water, as there is a wooden board which ſlides down for that purpoſe.

Fig. 2, *A*, Repreſents the conſtruction of the floating veſſel, which ſerves for the foundation of the building. It conſiſts of ſtrong double fir-beams, connected with each other by iron bolts and ſtaples.

B, Repreſents the *ground-plan* of one half of the floating veſſel; *a*, the entrance; *b*, a room on the oppoſite ſide for the waiter, who is appointed to receive and deliver the admiſſion tickets, &c.; *c*, the lateral cabins; *d*, the undreſſing chambers; *e*, the bathing machines; *f*, the corridor; *g*, the ſurrounding gallery; *h*, the ſtaircaſes leading into the water; *i*, the balluſters at the bathing machines: all theſe parts have already been deſcribed.

In his *View of the Ruſſian Empire*, the Rev. W. TOOKE, who reſided many years in that country, ſays, "It is not to be doubted that the Ruſſians owe their longevity, their robuſt ſtate of health, their little diſpoſition to certain mortal diſeaſes, and their happy and cheerful temper, moſtly to theſe baths; though climate, aliment, and habits of living, likewiſe contribute their ſhare.—The great Lord-chancellor Bacon, and other ſagacious obſervers of nature and of mankind, have lamented, and certainly not without cauſe, that this bathing has fallen into diſuſe among the modern nations of Europe, and juſtly wiſh the practice back again in all our towns and villages. In fact, when we conſider that the old phyſicians ſo early introduced into their practice this remedy of Nature's own invention, and employed it with ſuch great ſucceſs; when we recollect that Rome, for five hundred years together, had no phyſicians, but only baths, and that to this day a multitude of nations cure almoſt all their maladies merely by baths; we cannot avoid regarding the diſmiſſion of them as the epocha of a grand revolution which has been wrought in the phyſical ſtate of the human race, in our quarter of the world.

"The natural perſpiration, the moſt important of all excretions, muſt naturally go on better in a body conſtantly kept ſoft by bathing. A great number of impurities which privily lay in us, the train to tedious and dangerous diſtempers, are timely removed, ere they poiſon the blood and the juices.—All exanthematic diſeaſes are abated by bathing, conſequently

then the ſmall-pox; and if this dreadful diſorder be actually leſs fatal in Ruſſia than in other countries, this phenomenon need not be attributed to any other cauſe than the vapour-baths."

FLODDON, a village in Northumberland, five miles N. of Wooler. Near this place a bloody battle was fought between the Engliſh and Scots in 1513, in which James IV of Scotland was killed, with the principal of his nobility, and 10,000 men.

FLORAC, a town of France, in the department of Lozere, 13 miles S. of Mende, and 23 N.W. of Alais. Long. 3. 30. E. Lat. 44. 18. N.

FLORENT (St.), a town of France, in the department of Maine and Loire, with a late rich Benedictine abbey; ſeated on the Loire, 20 miles W.S.W. of Angers. Long. 0. 56. W. Lat. 47. 24. N.

FLORENTIN (St.), a town of France, in the department of Yonne, at the confluence of the Armance and Armançon, 15 miles N.E. of Auxerre, and 80 S.E. of Paris. Long. 3. 55. E. Lat. 48. 1. N.

FLORENTINO, one of the three provinces of Tuſcany; bounded on the W. by the republic of Lucca and the Modeneſe, on the N. by the Apennines, on the E. by the duchy of Urbino, and on the S. by the Sienneſe. It is well watered, and very fertile. Florence is the capital.

FLORES, a fertile iſland, one of the Azores, ſo called from the abundance of flowers found upon it. Long. 31. 0. W. Lat. 39 34. N.

FLOTZ, a town of Upper Saxony, in the principality of Anhalt Zerbſt, ſix miles N.W. of Zerbſt.

Flotz, a town of Walachia, ſeated on the Geniſſa, near its influx into the Danube.

FLOUR (St.), an epiſcopal town of France, in the department of Cantal. Good knives are made here, and its fairs are famous for the ſales of mules and rye. It is ſeated on a mountain, 45 miles S. of Clermont and 250 of Paris. Long. 3. 11. E. Lat. 45. 2. N.

Flour (*Encycl.*). In 1795, when the extreme dearneſs of bread made all perſons anxiouſly attend to every circumſtance which contributed to enhance its price, a *Friendly Society* at Rothley, in Leiceſterſhire, determined to employ 50*l.* of their capital in purchaſing corn, and to diſpoſe of the flour obtained from it at a low price. Their chief object was to ſupply the members of the ſociety with flour at prime coſt. They purpoſed alſo to ſell it to their neighbours at a price, which, though conſiderably lower than that at which the article was retailed by the neighbouring millers and huckſters, might give them legal intereſt for their 50*l.* and indemnify them for contingent expences and loſſes. In a ſhort time, however, this diſtinction between members and other perſons was thought invidious; and flour was ſold by the ſtone to all who applied, on ſuch terms as would barely reimburſe the price of the corn and the expences, and afford intereſt for the 50l.

It was their reſolution to ſell for ready money only; and they fixed on a part of every Monday, when two of their members were to attend at their club-room, and ſupply ſuch purchaſers as ſhould apply there. They bought a quantity of corn with the aſſiſtance of a reſpectable farmer; and found that they could ſell the flour for at leaſt ſixpence a ſtone (of 14lb.) leſs than was charged for flour, apparently of the ſame quality, by the neighbouring dealers. The ſaving to the purchaſers was about 20*l.* per cent. Flour continued to be ſold to the amount of 10*l.* or 12*l.* every week, until after ſome months had elapſed, when the millers lowered the prices, and the ſales decreaſed. From that time to the preſent, from 4*l.* to 7*l.* has been the amount of the weekly ſum received at the ſales.

When the plan of the ſociety was firſt ſet on foot, they ſold much more barley flour than wheat flour; but, as corn became cheaper, the poor returned by degrees to the uſe of wheat, to which moſt of them had been accuſtomed; and now the quantity of wheat flour diſpoſed of is three-fourths or four-fifths of the whole quantity ſold. The wheat is ground into a ſort of flour called "thirds," without any of the finer part of the flour being taken from it; and thus all the nutritious qualities of the grain are preſerved. The bread made of this flour is very wholeſome and palatable, and not ſo brown as that which is frequently eaten in farmers' houſes. There is a very ready ſale for the bran, which, in order to make the flour of the requiſite quality, is ſeparated at the mill from the groſs produce of the wheat. The miller is not paid for grinding by an allowance of toll, but in money; which is found to be by far the moſt eligible method of ſatisfying his demands. For ſome time flour has been ſold on two days of the week, for the better accommodation of the poor.

The foregoing plan has effectually anſwered the purpoſe of keeping the price of flour as low as that of corn would admit; and, in ſome degree, of improving the quality of the flour ſold in the neighbourhood, by affording the poor a certainty of buying it, in its pureſt ſtate, of the friendly ſociety.

Every thing that contributes to ſupply the poor with genuine flour, at a fair price, is of very great importance; otherwiſe the greater part of the poor will be compelled to apply to the mealman, the huckſter, or the baker, for the chief article of their food; and, in general, to pay from 15*l.* to 25*l.* per cent., probably upon an average 20*l.* per cent. more than the original coſt of the flour. The mode adopted at Rothley, is ſuch as would be imitable in almoſt every part of the kingdom; and it has the merit of putting into the hands of the ſuffering individuals, their own remedy againſt the monopoly of the millers.—It is to be obſerved, that the power of purchaſing corn is by no means ſo clear and deciſive a benefit to the poor, as that of purchaſing flour at prime coſt.

The benefit of the plan adopted at Rothley is ſo evident, the mode of proceſs ſo ſimple, and the amount of expence ſo eaſily aſcertained, that arguments in its favour are unneceſſary. It may however be of uſe to ſuggeſt ſome cautions, grounded on circumſtances which have happened at Rothley, as to the mode of executing ſuch a plan.—1ſt. It is material that the price ſhould be ſuch as will allow at leaſt in ſome degree for the riſk of the ſpeculation. An unexpected loſs has happened at Rothley by a ſudden fall in the price of wheat, and by the deſtruction of ſome corn in a windmill.—2dly. The ſociety ſhould be prepared for the effects of a competition, on the part of the neighbouring millers. A reduction in their price of flour, bringing it nearly if not quite to a level with the price of the ſociety, will aſſuredly take place. This, though in fact one of the very beneficial conſequences of ſuch a meaſure, will leſſen the cuſtom of the ſociety for a time, while it affords incontrovertible evidence of the utility of the plan, and of the ſervice which it has done the neighbourhood.—3dly. The accounts, in this and in all other matters of buying and ſelling, ſhould be very correctly kept. If this is not done, every ſuch undertaking will in the end be a loſing trade.—4thly. It is eſſential, that the reſolution of ſelling for ready money only, ſhould be punctiliouſly adhered to: otherwiſe the ſociety will hold out a moſt pernicious temptation to the poor to run in debt, and will involve itſelf in the riſk of being induced to give them ſtill more credit, in order to obtain payment of their exiſting debts. Beſides, where a ſociety is numerous, and conſiſts of manufacturers, artizans, and day-labourers, there is no poſſibility of aſcertaining the line to be

adhered to, when the rule has been once broken. Each individual will vote that his neighbour ſhould have the ſame, or a greater indulgence than the perſon who preceded him. Thus all the diſtinctions, uſually made by private ſhopkeepers in giving credit, will be diſregarded, and ruin muſt enſue. In caſes of private trade, credit is given for the purpoſe of obtaining cuſtom: but when public benefit is the ſole object of a ſociety, they may diſregard the little arts of the ſhopkeeper; and proceed inflexibly upon that plan, which is moſt beneficial to the individual, and to the public.

Similar modes of procuring a regular ſupply of flour, at a moderate price, have been adopted at Quorndon, Sileby, Mountforrell, and ſome other places in Leiceſterſhire; recommended by the ſame benefits, as thoſe attending the execution of the plan at Rothley.

An account of a mode adopted in the pariſh of Hadham, in the county of Hertford, for ſupplying the poor with flour of the beſt quality, and at a reaſonable rate, is given by the Rev. Dr. Hamilton, in the Reports of the Society for bettering the Condition of the Poor.

"During the whole of the autumn of 1797," ſays Dr. Hamilton, "complaints were made, throughout the pariſh and neighbourhood of Hadham, of the great difference in the proportional price of wheat at the markets, and of flour as ſold at the mill, or in the ſhops. I was very ſenſible of the grounds for diſcontent, both in the ſellers of wheat, and the purchaſers of flour; and, as a remedy for the grievance, I determined to procure, from time to time, a ſufficient quantity of good wheat from the market (having prevailed on a very reſpectable miller in the neighbourhood, to undertake to grind for me as much as I ſhould require), by which means I might be able to ſupply the poor of the whole pariſh with good flour, and at a reaſonable price. This has been done for theſe laſt three months, and is ſtill in practice, giving very great ſatisfaction to the poor, who are the purchaſers.—My firſt purchaſe was as follows:

	£.	s.	d.
110 buſhels of wheat - - -	30	4	0
Grinding, dreſſing, and bringing home -	1	12	3
Total	31	16	3

PRODUCE.

340 pecks and 3 lb. of flour, at 1s. 9d. per peck	30	2	5
18 ſtrikes of pollard, at 1s. 6d. per ſtrike -	1	7	0
2 quarters and 4 buſhels of bran, at 8s. per quarter	1	0	0
	32	9	5
Prime coſt	31	16	3
Profit	0	13	2

"This accommodation to the poor has been effected without any expence, except the advance of 40l. and with very little trouble. At the pariſh work-houſe there is a large vacant room, where the ſacks of flour are depoſited, as they come from the mill; and, twice in the week, a ſervant attends two hours, with the maſter of the work-houſe, in the flour chamber; and the poor are, with great convenience, thus ſerved with the beſt wheat flour, and with full meaſure."

Dr. Hamilton's agent ſold, during the fortnight, about 40 ſacks, at 1s. a buſhel under the ſhop price; the ſaving upon which, to the poor who are purchaſers, amounts to 5l. per week: he is not at preſent able to tell exactly what the profit or loſs is; but he believes it is not much either way. Wheat too has been riſing almoſt every week for ſome time; and probably he muſt raiſe his price one penny in the peck. His calculation, as to the load of wheat which he has juſt bought, is as follows:

	£.	s.	d.
Price of the load - - -	12	0	0
Grinding, ditto - - -	0	8	0
Carriage from the mill - -	0	3	9
	12	11	9

PRODUCE.

124 pecks of flour, at 1s. 10d. -	11	7	4
8 ſtrikes of pollard, at 1s. 6d. -	0	12	0
1 quarter of bran, at 8s. - -	0	8	0
	12	7	4
Loſs -	0	4	5
	12	11	9

OBSERVATIONS.

By theſe means the poor are enabled to purchaſe their flour, with a ſaving of at leaſt 4d. in every peck, excluſive of the benefit of having it of the beſt ſort, and full meaſure*; which, at 5l. per week (the gain on twenty ſacks), amounts to 260l. per ann.; being two-thirds of the whole poor's-rate of the pariſh of Hadham. This plan gives ſuch general ſatisfaction, that it will probably be ſoon adopted in the adjoining pariſhes; the poor of which have been, in ſome inſtances, ſupplied from the ſtock. It is alſo beneficial to the other claſſes of life, as well as to the poor: the miller, upon this flour being ſold, at firſt reduced his price from 8s. 8d. to 8s. 4d.; and he has not raiſed it for the laſt two months, though the price of wheat conſiderably advanced during that period.

Every thing that can be done, to enable the poor to procure the neceſſaries of life, at a moderate rate, of full meaſure, and of good quality, is of the utmoſt importance. It has been the misfortune of this country, that, in every article of food, the profits of the ſpeculator interfere between the growth and the conſumption; and, in ſome inſtances, increaſe the price to nearly double. If the farmer would ſupply his labourer with flour, potatoes, bacon, and cheeſe, † at prime coſt, he would enable him to maintain his family much better, and at leſs ex-

* It is ſaid in confirmation of Dr. Hamilton's obſervation, that in the ſouth diviſion of Eaſington ward, in the county of Durham, on a ſtrict inſpection of weights and ſcales by order of the magiſtrates, the deficiency diſcovered in the ſmaller ſhops was ſuch (as appears by the ſtatement of the chief conſtable who made the examination) as had occaſioned a loſs to the poor of that diſtrict, though ſmall and by no means populous, amounting to not leſs than 500l. a-year.

† It would be a very deſirable thing that the poor ſhould be able to ſupply themſelves with beer of their own brewing, without being obliged always to recur to the alehouſe. We are aware of the diſadvantage in brewing ſmall quantities; but that might be compenſated for by great advantages, and by the ſuperior flavour of beer *brewed and drank at home*.—The following receipt is according to the proportions uſed in the Houſe of Induſtry, at Shrewſbury. Take half a buſhel of malt, and four pounds of treacle, and three quarters of a pound of hops; this will make twenty-five gallons of beer; the coſt of which (ſuppoſing the

pence, and thereby prevent the increaſe of the poor's-rate: he would attach him to his ſervice, and put an end to the old complaint of the "*rambling and unſettled diſpoſition of the poor*:" he would alſo keep down the price of labour; which is neceſſarily increaſed on account of the diſadvantageous ſituation in which the labourer is placed as to the purchaſe of every neceſſary of life. In ſhort, the farmer would do his labourer much good, and himſelf more.

FLOWERS (*Encycl.*). Though no parts of plants are more generally known than their flowers, yet the definitions given by different authors of this word are very various, and neceſſary to be explained in order to the underſtanding of their works. Jungius defines it to be the moſt tender part of a plant, remarkable for its colour or form, or for both, and cohering with the fruit. But this author himſelf acknowledges his definition to be too limited, as there are ſeveral plants whoſe flowers are produced remote from their fruit. Mr. Ray ſays, the flowers cohere for the moſt part with the rudiments of the fruit: which is likewiſe a phraſeology too inaccurate to be admitted in definitions. Tournefort defines the flower to be a part of a plant very often remarkable for its peculiar colours, for the moſt part adhering to the young fruit, to which it ſeems to afford the firſt nouriſhment, in order to explicate its moſt tender parts: but this is ſtill a more indeterminate definition than the former. Pontedera defines a flower to be a part of a plant, unlike the reſt in form and nature. If the flower has a tube, it adheres to, or is fixed very near, the embryo, to the uſe of which it is ſubſervient; but if the flower has no tube, then its baſe does not adhere to the embryo. This definition is ſcarce intelligible, except to expert botaniſts. Juſſieu defines a flower to be compoſed of chives and a piſtillum, and to be of uſe in the generation of the plant: but this definition is too imperfect, as there are many plants in which the piſtillum is found at a great diſtance from the chives, many flowers which have no piſtillum, and many which have no chives. Vaillant has been happier in his definition. He ſays, that flowers are the organs which conſtitute the ſexes of plants, which are ſometimes found naked, and without any covering; and that the petals which moſt of them have are no way eſſential to their uſe, but ſerve, and are intended, merely as covers for them: but yet, as theſe coats or coverings are the moſt conſpicuous and moſt beautiful parts of the flowers, theſe are to be called *flowers*, be they of whatever form or ſtructure or colour; and whether they contain the organs of both ſexes in each individual, or only of one, or even but of ſome part of one, provided they are not of the ſame figure and colour with the leaves of the plant. The ſhorteſt and moſt expreſs definition, however, ſeems to be that of Martin; which is, that flowers are the organs of generation of both ſexes, adhering to a common placenta, together with their common covering; or of either ſex ſeparately, with its proper coverings if it have any.

The parts of flowers have been already deſcribed under BOTANY, p. 33, yet we apprehend the following general remarks made by eminent botaniſts, on *growth*, *enlargement*, *colours*, and *duplication of flowers*, particularly thoſe of Dr. Darwin, will be very acceptable.

I. It is an eſtabliſhed fact, that flowers as well as fruits grow larger in the ſhade, and ripen and decay ſooneſt when expoſed to the ſun. Hence, likewiſe, the foliage or buds of plants requires more moiſture for its vigorous growth than their flowers, or organs of fructification. Further, obſerves Dr. DARWIN, the frequent rains of our climate, are apt not only to waſh off the farina from the burſting anthers, and thus to prevent the impregnation of the piſtil, but alſo to delay the ripening of the fruit or ſeeds, from the want of a due evaporation of their perſpirable matter, as well as from the deficiency of ſolar light in the cloudy ſeaſons. In another place of his admirable *Phytologia*, this philoſopher remarks that, as a ſuperfluous ſupply of water is more friendly to the growth of leaf-buds, than to the generation of flower-buds, the production of ſeeds may be forwarded by ſupplying their roots with leſs water than uſual. But when the bloſſoms appear, an addition of water promotes their growth, by affording nouriſhment, which ſhould again be leſſened, when the fruit has acquired its full ſize, both to promote its maturity and improve its flavour; as the ſaccharine matter and eſſential oil will thus be in a leſs diluted ſtate.—Although the fruit may become ſweeter and larger, when the green as well as the floral leaves continue on the tree, yet the corols, with the ſtamens, ſtigmas, and nectaries (the ſucceeding fruit not conſidered), ſuffer, in the opinion of Dr. DARWIN, no injury when both kinds of leaves are removed, as by the depredations of inſects. Nay, ſome floriſts aſſert, that the flowers thus become ſtronger, producing no bulbs, as is the caſe with tulips and hyacinths.

2. The variegated *colours* of the petals of flowers are ſo beautiful, and afford ſuch delight to the eye of the contemplative naturaliſt, as to deſerve ſome inveſtigation. It is probable that *varieties* in the colours of ſingle flowers raiſed from ſeeds, may be generally obtained by ſowing thoſe which already poſſeſs different ſhades, contiguous to others of the ſame ſpecies; or, by bending the flowers of one colour, and ſhaking the anther-duſt over thoſe of another. Thus Dr. DARWIN ſuppoſes the beds of the corn blue-bottle, *centaurea cyanus*, acquire thoſe beautiful ſhades of blue, purple, and white. As ſome animals change their natural colours, when tranſplanted in different ſituations of ſoil, a ſimilar effect may be produced by ſowing flowers in factitious compoſts, which conſiderably differ from each other with reſpect to vegetable nutriment, and perhaps alſo in their colour. Experiments on this ſubject, as well as on the variegation of the leaves of ſhrubs and trees, are however wanting to confirm this conjecture; though the latter probably originates from ſoil or ſituation, and may be communicated by ingrafting.—The origin of *new* colours in flowers, and of variegated foliage, is imagined to ariſe from the want of nouriſhment of the ſoil on which they grow, compared to that aſſigned to them by Nature; or from a defect of moiſture and of heat; a ſuppoſition countenanced by the dwarfiſh ſize of ſuch plants, in general, and eſpecially by the reduced ſtature of tulips, when their petals acquire various colours.

The immediate cauſe of the various colours preſented by ſome flowers, ſuch as poppies, has not hitherto been diſtinctly aſcertained; but Dr. DARWIN conjectures that, as they are not variable by the obliquity with which they are ſeen, like thoſe of mother-pearl, card-fiſh, &c. they do not depend on the thinneſs of their pellicle, and may, therefore, ariſe from the greater facility which ſome parts of vegetables, more than others, poſſeſs in parting with their *oxygen* (which ſee) when expoſed to the ſun's light; for all flowers are more or leſs blanched before they firſt open.

3. The origin of *double flowers* is believed to reſult from the luxuriant growth of the plant, in conſequence of exceſſive nou-

---

value of the grains to be only equal to the expence of fuel) would be 2d. a gallon, where the materials were purchaſed to the beſt advantage; and, when bought at the retail ſhop, about 3d. The receipt was tried and found to anſwer; the beer being very good. It was fit for uſe in a fortnight; but it is not calculated for keeping, particularly in warm weather.

riſhment, moiſture, and warmth: they ariſe from the increaſe of ſome parts of the flower, and the conſequent excluſion of others. As they produce a greater blaze of colour in a ſmall ſpace, and continue in bloom for ſome weeks longer than ſingle flowers, the method of producing them from ſeeds is a matter of importance. Botaniſts very properly term ſuch multiplied flowers *vegetable monſters*, becauſe they poſſeſs no ſtamens or piſtils, and therefore can produce no ſeeds.—Nevertheleſs, they are frequently raiſed immediately from ſeeds; becauſe flowers cultivated with more manure, moiſture, and warmth than is congenial to them, not only grow larger and more vigorouſly, but likewiſe ſhew a tendency to become double, by having one or two ſupernumerary piſtils in each flower, ſuch as the ſtock July flower, cheiranthus, and anemone. It is ſtill more remarkable, that this duplicature is communicated to thoſe individual bloſſoms: hence floriſts tie a thread round ſuch flowers, to mark them, and to collect their ſeeds ſeparately, from which double or full flowers are ſaid to be uniformly produced, if they be cultivated with additional manure, moiſture, and warmth, as has been already obſerved.—There ſubſiſts a curious analogy, concludes Dr. DARWIN, between theſe vegetable monſters and thoſe of the animal world; for a duplicature of limbs frequently attends the latter, as chickens and turkeys with four legs and four wings, and calves with two heads. In mules, alſo, the moſt important organs become deficient, ſo that they cannot propagate their ſpecies; exactly analogous to theſe full flowers which, from the ſame cauſe, produce no ſeed. With reſpect to botanic ſyſtems, it may be obſerved from theſe vegetables of exuberant growth, that the ſtamens and piſtils are leſs liable to change than the corols and nectaries; conſequently, that they are more proper parts for arranging plants into claſſes; and that on this idea LINNÆUS conſtructed his unrivalled ſyſtem. Laſtly, the calyx, or perianth, being ſeldom found in a double or multiplied ſtate, is the next part of a flower that is liable to the leaſt changes; and may, therefore, on accurate inſpection, ſerve to detect the genera of double flowers.

FOCHABERS, a town in Banffſhire, ſeated in a plain, near the river Spey. Here is Gordon caſtle, the princely manſion of the Duke of Gordon; and in the town, many girls are employed in ſpinning, and the manufacture of ſewing thread, under the patronage of the ducheſs. It is 48 miles N.W. of Aberdeen.

FO-CHAN, a village of China, in the province of Quang-tong. It is called a village, becauſe it has no walls nor a preſiding governor, although it has a great trade, and contains more houſes and inhabitants than Canton. It is reckoned to be nine miles in circumference, and to contain 1,000,000 inhabitants. It is 12 miles from Canton.

FOCHIA NOVA, a ſea-port of Natolia, with a good harbour, and a caſtle. The Venetians beat the Turkiſh fleet, near this place, in 1650. It is ſeated on the gulf of Sanderley, at the mouth of the Hermus, 28 miles N.W. of Smyrna. Long. 26. 39. E. Lat. 38. 44. N.

FODWAR, a town of Hungary, ſeated on the Danube, oppoſite Colocza Long. 19. 16. E. Lat. 46. 39. N.

FOGARAS, a town and caſtle of Tranſylvania, on the river Alauta, 30 miles N.E. of Hermanſtadt. Long. 25. 25. E. Lat. 46. 30. N.

FOGGIA, a town of Naples in Capitanata, ſeated near the Cerbero, 20 miles S.W. of Manfredonia.

FOGLIA, a river of Italy, which riſes on the confines of Tuſcany, croſſes the duchy of Urbino, and falls into the gulf of Venice, and Peſaro.

FOGLISSO, a town of Piedmont, five miles N.W. of Chivas, and 13 W. of Creſcentino.

FOHR, or FORA, an iſland of Denmark, about 12 miles in circumference, near the coaſt of Sleſwick. Long. 5. 31. E. Lat. 54. 44. N.

FOIA, an ancient town of Natolia, on the gulf of Smyrna, with a good harbour and a ſtrong caſtle, 30 miles N. of Smyrna.

FOIX, a town of France, in the department of Arriege. Here is a manufacture of coarſe woollen cloths, and ſome copper-mills, which metal is a conſiderable object of commerce. It is ſeated on the Arriege, at the foot of the Pyrennées, eight miles S. of Paniers. Long. 1. 32. E. Lat. 43. 0. N.

FOLIGNI, an epiſcopal and trading town of Italy, in the duchy of Umbria; remarkable for its ſweetmeats, paper-mills, ſilk manufactures, and fairs. It is ſeated on the declivity of a mountain, near a fertile plain, 69 miles N. of Rome. Long. 12. 24. E. Lat. 42. 48. N.

FONDI, an epiſcopal town of Naples, in Terra di Lavoro, ſeated on a fertile plain, but in a bad air, near a lake of its own name, 42 miles N.W. of Capua, and 50 S.E. of Rome. Long. 13. 24. E. Lat. 41. 22. N.

FONG-TSIANG-FOU, a city of China, in the province of Chen-ſi. Its diſtrict contains eight cities of the ſecond and third claſs. It is 495 miles S.W. of Pekin.

FONS, a town of France, in the department of Lot, five miles N.W. of Figeac. Long. 1. 55. E. Lat. 44. 37. N.

FONTAINE L'EVEQUE, a town of France, in the department of the North, near the river Sambre, three miles W. of Charleroy. Long. 4. 18. E. Lat. 50. 23. N.

FONTANETTO, a town of Piedmont, ſeven miles E. of Creſcentino.

FONTELLO, a town of Portugal, in Beira, ſix miles N.E. of Lamego. Long. 7 27. W. Lat. 51. 36. N.

FONTENAI-LE-COMTE, a town of France, in the department of Vendee. It has a woollen manufacture, and its fair is famous for cattle, particularly for mules, on which laſt account it is reſorted to by the Spaniards. It is ſeated on the Vendee, near the bay of Biſcay, 25 miles N.E. of Rochelle. Long. 0. 55. W. Lat. 46. 30. N.

FONTEVRAULT, a town of France, in the department of Maine and Loire. Here was a famous abbey, founded by Robert d'Arbriſſel, in 1100. It was the chief of a religious order, which, by a ſingular whim of the founder, conſiſted of both ſexes, and the general of which was a woman. Queen Bertrade, ſo famous in hiſtory, was among the firſt nuns that entered this abbey. It is nine miles S.E. of Saumur, and 160 S.W. of Paris. Long. 0. 0. Lat. 47. 9. N.

FONTICULUS, or FONTANELLA, in ſurgery, an iſſue, ſeton, or ſmall ulcer, made in various parts of the body, in order to cauſe a diſcharge.

FORCALQUIER, an ancient town of France, in the department of the Lower Alps, ſeated on a hill, by the river Laye, 20 miles N.E. of Aix. Long. 5. 48. E. Lat. 43. 58. N.

FORCHEIM, a ſtrong town of Franconia, in the biſhopric of Bamberg, with a fine arſenal. It ſurrendered to the French in 1796, but the Auſtrians compelled them to abandon it ſoon afterward. It is ſeated at the confluence of the Wiſent and Rednitz, 16 miles S.S.E. of Bamberg. Long. 11. 2. E. Lat. 49. 44. N.

FORCING (*Encycl.*). The following deſcription of newly-invented moveable forcing-frames for plants, &c. by Bénard, a member of the Agricultural Society of Seine and Oiſe, was read at a public ſitting of that Society.

"It is uncertain," ſays the author, "whether the ancients were acquainted with any artificial means of accelerating vegetation; countries inhabited by the Greeks and Romans not compelling them to ſeek the aſſiſtance of art to ſupply any deficiency in the liberality of nature.

"With regard to our own anceſtors, it appears that the objects of induſtry being then equally rude with the hands em-

ployed in its labours, and governed by many ridiculous practices converted by ſuperſtition into irrefragable laws, agriculture was wholly deſtitute of that eſtimation which is ſo requiſite to animate every ſpecies of human induſtry.

" On this ſubject mention has been made of the kitchen-gardens eſtabliſhed by order of Francis I. at Anet, near the foreſt of Yvri, under the inſpection of a ſkilful gardener named Martin; but it appears that it was for Henry IV. at St. Germain-en-Laye, that arcades open to the ſouth were firſt erected for accelerating the growth of peas.

" La Quintinie, who formed the ſuperb kitchen-garden at Verſailles, ſcarcely made any further advances; it is well known that fruits and flowers were at that time brought by poſt from Provence to Lewis XIV. for the gratification of his court.

" Fagon, at the Jardin-des-plantes, at Paris, cauſed ſome glazed ſaſhes to be conſtructed for foreign plants, which, for want of ſufficient light, could not flouriſh in the green-houſes built for orange-trees, ſuch as the ſuperb *orangerie* at Verſailles. To thoſe ſaſhes were added ſtoves and furnaces. But theſe methods were ſcarcely applied to forcing fruit till the reign of Louis XV.

" We are aſſured that an Engliſhman named Gordon was the firſt who made experiments of this kind, in conſequence of obſerving that a vine-branch, which accidentally entered between two ſaſhes of a window, put out leaves long before the reſt of the ſtem, and that the forced grapes it produced ripened better.

" Hence aroſe all the hot-houſe ſaſhes, the frame-lights, head-glaſſes, or covers, formed of ſmall panes of glaſs, joined together in leaden frames, and thoſe formed of large plate-glaſs. At length Richard Senior built, both for himſelf at St. Germain, and afterwards for the king at Trianon, hot-houſes, in which were ſeen, for the firſt time in France, peaches, cherries, plums, ſtrawberries, apricots, and vines, bearing fruit in the depth of winter, and lilacs, roſes, honeyſuckles, ſeringas, hyacinths, narciſſuſes, and other flowers, in full bloom.

" In the *Ecole du Potager*, written by *Combles*, about 1750, are the details relative to the management of the glaſs covers and ſaſhes; but a great improvement ſtill remained, which has been accompliſhed in the invention of the forcing-frames *(Pavillons de primeurs)*, to which M. Bénard has been led by various and ſucceſſive attempts now ſubmitted by him to the public. As it has fallen to our lot to give an account of theſe attempts and of the management of them, we ought in the firſt place to ſtate the dimenſions of the frame-lights compoſed of only two parts.

" The lower part, *a* (ſee Plate 30, figs. 1, 2, 3), is formed by the union of two ſquare ſaſhes, the lower about 13 decimetres (4 feet French; ſee MEASURE, *Supp*), the upper only 9.

" The latter is raiſed above the former about 5 decimetres (13 inches French), and the two are joined by ſmall iron rods fit for the reception of the panes of glaſs.

" The upper part *b*, conſiſts of a wooden ſaſh, bearing alſo four iron rods at the corners, and four in the middle, joined together at a ſingle point *c*, where a heavy ring is affixed; the inclination of this upper part being leſs rapid, as in the broken roofs *(toits broiſés)* of the common green-houſes: it is only 3 decimetres by 8 for the half breadth.

" During the time when the vegetation, having grown up, requires more height in the building, a height of wood may be placed between the two portions ſo as to raiſe the upper part one decimetre, at leaſt; another placed below would raiſe the whole, when needful, more than two.

" From this arrangement of the glaſs ariſes a maſs of light extremely valuable to vegetation. The proximity of the glaſs is another advantage, which is the more important, as it is well known that plants kept under glaſs become *étiolé*, that is, grow weak by lengthening themſelves to exceſs in order to reach and touch the glaſs, near which the influence of the ſun is always greateſt. And, laſtly, the inclination of the glaſs, and its being placed in three different planes, increaſes more and more the effect of the ſolar heat.

" Shutters applied in ſucceſſion, whether toward the north or toward the ſun, protect the plants from the cold, or ſhield them from an exceſs of heat, and may be uſed throughout the whole during the winter nights.

" Thus, with mere glazed frame-lights, a great number of young and delicate plants may be reared, eſpecially the fineſt melons and cantaloups; or more common productions may be accelerated, as ſtrawberries, French-beans, and the early cabbages, as well as a variety of flowers: or ſmaller erections may be made for theſe various uſes: but the extent of the ground thus preſerved from the chilling moiſture of cold rains is an advantage not to be neglected or forgotten; and frame-lights, of 13 decimetres ſquare, being eaſily removed by one man, or cultivated to the midſt of them, that ſize appears moſt convenient.

" All this, however, conſtitutes but half the merit of theſe hot-houſes. It is evident they may be placed over a hot-bed, accompanied with chafing-diſhes, and their ſhutters covered and ſurrounded with horſe-dung when needful; though, as is well known the heat of that ſubſtance, which is often difficult to be obtained, is ſtill more difficult to be kept up.

" The heat of furnaces is liable to the ſame objections, on account of their extent, even in the ſmalleſt hot-houſes. Another defect in theſe buildings is the diſtance of the plants from the glaſs. A third ariſes from the great maſs of air heated to a loſs; not to mention the no leſs important maſs of the materials, naturally cold in themſelves, of which the walls are built. Laſtly, their being ſtationary is one of the greateſt obſtacles to their being employed in horticulture. They are an expence only to be incurred by land-owners, and by land-owners who live in affluence, or by an extremely ſmall number of gardeners, induſtrious enough to derive from their hot-houſes a quantity of fruit, which, if it does not enrich, indemnifies them at leaſt for the expences attending this method, which has hitherto been the only one known.

" All theſe inconveniences ſeem to be avoided by the frame-lights, to which M. Bénard has adapted an apparatus for procuring heat from a kind of fuel equally convenient and œconomical, namely, two ſmall furnaces, in one of which, *h*, is placed a ſtrong earthen pan filled with the dregs of oil, or two, in caſe of extreme need; a ſecond furnace, *g*, above, with another pan placed there at the time when the fire is lighted; an iron-pipe, *f*, placed at the bottom of the frame, to warm the wood and earth by means of the ſmoke paſſing through it; the circulation of which ſmoke is furthered by the ſecond furnace, where the end of the pipe paſſing through it receives a local heat, which rarefies the air throughout the whole pipe; a wooden box, *j*, to incloſe theſe parts, which are conſtructed of thin materials; an iron pipe, *i*, terminating, if needful, in a T, to carry off the ſmoke when it has become uſeleſs. This is the whole apparatus, and about a kilogram of oil *per* night, value 12 and 15 cents the whole expence. 5 or 600 francs at moſt laid out in conſtructing two of theſe forcing-frames with fire-apparatus, and four without, which are neceſſary for placing more at large the plants reared in the former, ought, according to M. Bénard's eſtimate, whoſe experience on this ſubject renders his opinion deciſive, to produce as much effect as a hot-houſe that has coſt 3 or 4000 francs, and which would require a conſumption of ſeveral fathoms of wood.

" The œconomical gardener alſo finds an advantage in having it in his power to keep the parts not actually in uſe

under cover, by which they laſt longer, and their expence is conſequently diminiſhed.

" Laſtly, by ſubſtituting a number of theſe forcing-frames for one hot-houſe, an advantage which muſt be conſidered as almoſt invaluable is obtained; that of varying the temperature, and accommodating it to the different plants they contain, as well as to their various periods of vegetation "

FORDINGBRIDGE, a town in Hampſhire, with a market on Saturday; ſeated on the Avon, 20 miles W.S W. of Winchester, and 87 W. by S. of London. Long 1. 49. W. Lat. 50. 56. N.

FOREZ, a late province of France, bounded on the W. by Auvergne, on the S. by Velay, and the Vivarais, on the E. by the Lyonnois, and on the N. by Burgundy and the Bourbonnois. It is watered by the Loire, and ſeveral other ſtreams, and has ſeveral mines of coal and iron. It now forms, with the Lyonnois, the department of Rhone and Loire.

FORFICULA (*Encycl.*). In that article, we omitted to refer the reader to (Plate 25, in vol. III.). To what has there been ſaid we wiſh again to enter our proteſt againſt the truly *vulgar* opinion that this harmleſs inſect (the *Earwig*) has the leaſt diſpoſition to enter the human ear *by choice*. Nothing, in fact, is ſo repugnant to its habits as moiſture, and particularly of that clammy kind which the ear ſupplies, and which muſt be a great impediment to the freedom of its motions. In the firſt ſummer of the militia encampments in the former war with France, a whole regiment were aſſigned ſome ground on the downs near Winchester, which literally *ſwarmed* with theſe inſects. During the whole ſeaſon not a ſingle inſtance occurred of an earwig's taking up its abode in the human ear. One ſoldier only, out of nine hundred, met with the *accident* of an earwig's *falling* into his ear from the *top* of the tent in which he lay aſleep; but even this occaſioned him no great inconvenience; the inſect was at once killed by pouring a little oil into the ear, and extracted by ſyringing with warm water.

FORGES, a town of France, in the department of Lower Seine remarkable for its mineral waters. It is 60 miles N.W. of Paris. Long 0. 40. E Lat 49. 38. N.

FORNELLO, a town of Naples, in the Moliſe, 17 miles W. of Moliſe.

FORNOVO, a town of Italy in the duchy of Parma; near which, in 1495, Charles VIII. of France obtained a victory over the princes of Italy. It is eight miles W S.W. of Parma.

FORTAL CE, in Scots law, ſignified anciently a ſmall place of ſtrength, originally built for the defence of the country; and which on that account was formerly reckoned *inter regalia*, and did not go along with the lands upon which it was ſituated without a ſpecial grant from the crown Now, fortalices are carried by a general grant of the lands; and the word is become ſynonimous with manor-place, meſſuage, &c.

FORTEVENTURA, one of the Canary Iſlands, 65 miles in length, and of a very irregular breadth, conſiſting of two peninſulas, joined by an iſthmus 12 miles in breadth It produces plenty of wheat, barley, beeves, and goats. Long. 14. 26. W. Lat. 28. 4. N.

FORTROSE, a borough in Roſsſhire, ſituate on the Frith of Murray, nearly oppoſite Fort George, and nine miles W. of Inverneſs.

FOSSANO, a ſtrong town of Piedmont, with a biſhop's ſee, ſituated on the Sture, 10 miles N.E. of Coni, and 27 S.E. of Pignerol. Long. 7. 56. E. Lat. 44. 45. N.

FOSSE, a town of Weſtphalia, in the biſhopric of Liege, ſituate between the Sambre and Meuſe, ſeven miles W. of Namur. Long. 4. 40. E. Lat. 50. 26. N.

FOSSIL ALKALI (*Encycl.*). The nature and chemical properties of this ſubſtance have been fully ſet forth; but it may not be improper to deſcribe ſome of the means by which it may be ſeparated from ſea-ſalt, of which it is the baſis.

In Auguſt, 1781, a patent was granted to Mr. ALEX. FORDYCE, for his new proceſſes, by which the alkali contained in ſea-ſalt, rock-ſalt, ſalt-ſprings, ſalt-cake, Glauber's ſalt, and vitriolated tartar, may be ſeparated from the marine or vitriolic acids.— He firſt converts ſalt-water, &c. into Glauber's ſalt, by the application of vitriolic acid, or of any ſubſtance containing the latter. This ſalt is then to be mixed with a double quantity of lime, chalk, or any other calcareous earth, or iron, or with any ſubſtance containing that metal. The whole is to be placed together in a vault, or other reſervoir, ſecured from the rain till it is completely decompoſed, when the alkali is to be extracted by diſſolving it in water and evaporating it to dryneſs. Or, the patentee employs 60lbs. of Glauber's ſalt, or vitriolated tartar; 10lbs. of charcoal, or any other ſubſtance capable of bearing heat, and containing the inflammable principle; and 10lbs. of iron: theſe ingredients are pounded together, and thrown into forty gallons of water; where they are ſuffered to digeſt for twenty-four hours. The clear ſolution is then to be ſeparated; and, by evaporating, filtering, and cryſtallizing, it is rendered fit for uſe.

Another patent was granted in March 1789, to Mr. ANTHONY BOURBOULON DE BONEUIL, of Liverpool, for his invention of an apparatus on a new conſtruction, and certain new proceſſes for the making of foſſil alkali, which is ſaid to be equal to that extracted from the beſt barilla. As, however, this ſpecification is ſo complex, that it could not be underſtood without the aid of an engraving; and, as the patent is not expired, we refer the reader to the 4th volume of the *Repertory of Arts and Manufactures.*

The laſt proceſs which merits our attention, is that of the Earl of DUNDONALD, for obtaining mineral, or foſſil, and vegetable alkali, from neutral ſalts compoſed of thoſe alkalies and an acid; or from the ſolutions of thoſe ſalts, whence ſeveral articles are diſengaged or formed, that may be collected and applied to various uſeful purpoſes. For theſe different inventions, his lordſhip obtained a patent in 1795* 1. The moſt important of the new proceſſes, is that of making Glauber's ſalt, or ſulphat of ſoda, which is one of thoſe neutral ſalts, conſiſting of an alkali and an acid, from which an alkaline ſalt is to be procured Thus, ſeveral other articles, ſuch as ſpirit of ſalt, ſal ammoniac, and an iron earth mixed with clay, as a pigment, are formed, or diſengaged, and may be collected: 2. Glauber's ſalt is decompoſed, forming mineral alkali, or *ſoda*, either in a mild or cauſtic ſtate: 3. Vitriolated tartar is prepared by decompoſing the muriat of pot-aſh; and 4. This preparation is converted into either a vegetable alkaline hepar, or mild or cauſtic vegetable alkali. The ſalts and other ſubſtances reſulting from theſe chemical operations, may be applied to various purpoſes, particularly for decompoſing ſoda from Glauber's ſalt.

As the principal article for which Lord DUNDONALD has eſtabliſhed manufactories, appears to be the SODA now generally ſold in the ſhops, we ſhall, in the alphabetical ſeries in this Supplement, deſcribe its manifold uſes, and content ourſelves at preſent with giving a ſummary of the inventions claimed by the noble patentee: namely, that ſea-ſalt is decom-

* We have authority to ſay, that ſome part of Lord Dundonald's claim has no juſt foundation, the diſcovery of the manufacture of *Glauber's ſalt* from the *refuſe of the alum works* having been many years ago made, and extenſively practiſed by Mr. Houlſton, an ingenious medical practitioner and chemiſt, now living in Liverpool.

poſed by alum, by vitriol of iron, and Epſom-ſalt, with the aid of heat, when a due proportion of clay, or a clayey iron earth, is mixed with the ſalts ſubmitted to the operation;—that ſea-ſalt is alſo decompoſed by Epſom-ſalt with the aid of heat, and without the intervention of clay;—laſtly, that it may likewiſe be reduced by ſulphat of lime, or gypſum, with the aid of heat, when a due proportion of clay, containing much iron, is mixed with the ſea-ſalt and gypſum.

Fossil-coal *(Encycl.)*. In December 1792, a patent was granted to Mr. John Barber, of Attleborough, Warwickſhire, for a method of ſmelting and purifying foſſil-coal, iron-ſtone, iron-ore, &c. by ſteam, air, and fire, and for impregnating the ſame with inflammable air, by which he produces a tough metal.

The patentee directs any portion of iron-ſtone, or ore, together with a quantity of foſſil-coal, to be put into a furnace, into which fire is to be admitted, and ſteam conveyed from a boiler, by means of pipes, through an aperture made in the hearth. Theſe pipes are not to project into the furnace, but only to extend ſo far as to permit the ſteam to convey along with it a quantity of atmoſpheric air; and thus a calx ſufficiently pure will be produced. The proceſs of purification may be facilitated, by placing a veſſel of water at the bottom of the furnace, or building, for the reception of the hot calx while it falls, or is diſengaged. And if ſometimes a proper proportion of ſal-ammoniac, or other menſtruum, be thrown in among the coals, &c. while purifying, that operation will be, in a conſiderable degree, facilitated.

When the calces are thus prepared, a portion of them, and alſo a portion of foſſil-coal, or purifying coals, are to be put into a ſmelting furnace, beneath which a fire is to be kindled. Apertures are alſo to be made for the introduction of inflammable air, from one or more retorts, by means of pipes, either ſingly or conjointly with *air-bluſt*. Lime-ſtone, charcoal, and other ſubſtances abounding with inflammable air, may be added in due proportions, and will have an effect ſimilar to that produced by the inflammable air alone, for which it may be occaſionally ſubſtituted. The patentee obſerves, that the proportionate quantities of the various materials employed, can only be aſcertained by experience; and the reſult of this proceſs will be the production of a tough metal, capable of being applied to ſeveral uſeful purpoſes.

Fossil-wood *(Encycl.)*. At one of their meetings, Citizen Villars announced to the National Inſtitute the diſcovery of foſſil woods buried on the ſummits of the higheſt mountains of the Alps, almoſt 2500 feet above the higheſt of the neareſt foreſts now in exiſtence. He has noticed larch, birch, alder, and aſpen, the trunks of which, as well as the roots, are in a ſtate of perfect preſervation. From this appearance, Villars concludes, they muſt have vegetated in the very ſpot where he found them, but is at a loſs to conceive how the cold could become ſo violent as to render it impoſſible for the ſame trees to live except at a great diſtance. He attempts to account for it by the melting away of the tops of the mountains, the attenuation of their chalk by rain, and the imprudent deſtruction of their foreſts by the hand of man. Poiret mentioned that he had found ſhells of freſh-water fiſh buried under beds of turf, over which again were other beds, containing ſea-ſhells. It ſhould thus appear, that the earth which exhibits theſe appearances had been firſt watered by ſtreams, then inundated by the ſea, and now was placed in the centre of a continent. Beauvois produced from North America proofs no leſs aſtoniſhing of changes in the ſtate of the earth, in which at different epochs had been found remains of monſtrous quadrupeds, at this day unknown; and he produced ſpecimens of ſkeletons which had been dug up, differing from thoſe obſerved at preceding times. Every day, every climate furniſhes documents of the revolutions which our globe has undergone, and which are indelibly impreſſed on its ſurface, and in its entrails. Thus does man, unable to develope the myſteries of his own exiſtence, attempt to explore the arcana of the created globe, which ſeem to deride the efforts of knowledge, and mock the exertions of ſcience! philoſophy furniſhes no means for penetrating into the cauſes of thoſe events which are buried from the ſearch in an inſcrutable antiquity.

FOSSOMBRONE, a town of Italy, in the duchy of Urbino, with a biſhop's ſee; ſeated near the river Metro, 16 miles S.W. of Peſaro, and 12 S.E. of Urbino. Long. 12. 48. E. Lat. 43. 40. N.

FOUE, an ancient town of Lower Egypt, ſeated on the Nile, 25 miles S. of Roſetto, and 40. E. of Alexandria. Long. 31. 15. E. Lat. 31. 12. N.

FOUGERES, a town of France, in the department of Maine and Loire, with an ancient caſtle. It is ſeated on the Coeſnom, 25 miles N.E. of Rennes, and 150 W. of Paris. Long. 1. 13. W. Lat. 48. 22. N.

FOULI, or Pholey, a country of Africa, ſituate on the ſides of the river Senegal, and extending about 500 miles from E. to W: the boundaries from N. to S. are unknown. It is populous and fertile. The inhabitants are, in general, of a tawny complexion, though many of them are entirely black. They lead a wandering life, and roam about the country with large droves of cows, ſheep, goats, and horſes. The king of this country is called the Siratick; and though he ſeldom appears with the badges of majeſty, he has great authority, and is as much reſpected as any one on the coaſt Though none but princes of the blood can be called to the throne, yet the crown deſcends not from father to ſon, but from brother to brother, or nephew to nephew. The people of Fouli are greatly praiſed by travellers for their hoſpitality: nor is their humanity, in other reſpects, leſs commendable; for, if one of their countrymen have the misfortune to fall into ſlavery, the reſt join ſtock to redeem him. Elephants are ſo numerous in this country, that they are frequently ſeen in droves of 200 together. The natives are very dexterous at hunting them, and other wild beaſts; as elephants' teeth and the ſkins of lions, leopards, and tigers, are their principal articles of trade; and their fleſh they dry for uſe and winter-ſtore.

FOULNESS, an iſland ſeparated by a narrow channel from the S.E. part of the county of Eſſex, ſix miles E. of Rochford.

FOULSHAM, a town in Norfolk, with a market on Tueſday, 16 miles N.W. of Norwich, and 111 N.E. of London. Long. 1. 7. E. Lat. 52. 51. N.

FOURNEAUX Island, a ſmall iſland in the S. Pacific Ocean. Long. 143. 2. W. Lat. 17. 11. S.

FOXFORD, a town of Ireland, in the county of Mayo, ſituate on the river May, eight miles N. of Caſtlebar.

FOX-GLOVE. See Digitalis in this Supplement, where an account is given of its medical properties.

FOYLE, Lough, a lake or bay of Ireland, in Londonderry. It is of an oval form, 14 miles long and eight broad, and communicates with the ocean by a ſhort and narrow ſtrait.

FOZ, a town of Portugal, in Alentejo, ſituate at the conflux of the Zaras and Tagus, 24 miles N.E. of Liſbon. Long. 8. 56. W. Lat. 38. 58. N.

Foz, a town of France, in the department of Var, four miles N.E. of Barjols.

FRAGNINO, a town of Naples, in Principato Ulteriore, eight miles N. of Benevento.

FRAGOAS, a town of Portugal, in Eſtremadura, ſeven miles N.W. of Santoren.

FRAMPTON, a town in Dorſetſhire, with a market on Thurſday, ſeated on the Frome, 12 miles N.W. of Weymouth, and 126. W. by S. of London. Long. 2. 50. W. Lat. 50. 45. N.

FRANCE (*Encycl.*). The following account of the Calendar of the French Republic, ſince the abolition of Royalty, we extract from the Britiſh Magazine.

The republican æra began,

Year	1	-	-	-	22	September	1792
——	2	-	-	-	22	——	1793
——	3	-	-	-	22	——	1794
——	4	-	-	-	23	——	1795
——	5	-	-	-	22	——	1796
——	6	-	-	-	22	——	1797
——	7	-	-	-	22	——	1798
——	8	-	-	-	23	——	1799
——	9	-	-	-	23	——	1800
——	10	-	-	-	23	——	1801

Each year conſiſts of 12 months.

1	Vendemiaire, year 8, was	-	-	23	September.
1	Brumaire,	-	-	-	-	23 October.
1	Frimaire,	-	-	-	-	22 November.
1	Nivoſe,	-	-	-	-	22 December.
1	Pluvioſe,	-	-	-	-	21 January.
1	Ventoſe,	-	-	-	-	20 February.
1	Germinal will be	-	-	-	22 March.
1	Floreal,	-	-	-	-	21 April.
1	Prairial,	-	-	-	-	21 May.
1	Meſſidor,	-	-	-	-	20 June.
1	Thermidor,	-	-	-	-	20 July.
1	Fructidor,	-	-	-	-	19 Auguſt.
5	Complementary days, 18	-	-	22	September.

Each month has 3 decades of 10 days.

1. Primedi.	6. Sextidi.
2. Duodi.	7. Septidi.
3. Tridi.	8. Octidi.
4. Quartidi.	9. Nonidi.
5. Quintidi	10. Decadi.

Once in four years there are ſix inſtead of five complementary days. Theſe days are named like the five or ſix firſt of the decade.

The republican year begins at the midnight preceding the autumnal equinox. Alm. nat. an. 9. The metre has been ultimately determined to be equal to 3 feet, 11.296 lines French, the gramme to be 18.827 grains, Journ. de Phyſique, an. 7. Prair. et Fruct. The metre is the ten millionth part of the diſtance from the pole to the equator: the gramme the weight of a cubic centimetre of water. The toiſe was 76.734 inches Engliſh, and 576 French grains were equal to 472.5 Engliſh. Phil. Tranſ. v. 58, p. 326, and v. 42, p. 187.

FRANCHEMONT, a town of Germany, in the biſhopric of Liege, 12 miles S.E. of Liege.

FRANCIS *of Aſſiſi* (St.), founder of the Franciſcan friars, was born at Aſſiſi in Italy in 1181. One of the moſt extraordinary things told of St. Francis of Aſſiſi is, that Jeſus Chriſt imprinted on him the marks of his five wounds; and there is a feſtival in memory of thoſe holy prints, and an office for it. His preaching to the fiſhes to make them Chriſtians, and his converſion of millions of them, is famous; as is his mercy to worms and lice. The order he founded, and which bears his name, was approved by Innocent III. in 1215, and confirmed by Honorius III. in 1223. It has ſince branched into ſeveral others, as Minims, Ricolets, Capuchins, &c. called in Roman Catholic countries, *Fratres Minores.*

FRANCOIS, CAPE, a town in the N. part of the iſland of St. Domingo. It ſuffered much by dreadful commotions that enſued after the French revolution. Long. 72. 18. W. Lat. 19. 46. N.

FRANEKER, or FRANKER, a town of the United Provinces, in Frieſland, with a caſtle and univerſity. The public buildings and palaces are magnificent It is ſeven miles W. of Lewarden Long. 5. 33. E. Lat 53. 11. N.

FRANKENAU, a town of Germany, in the principality of Heſſe, 24 miles S.W. of Caſſel.

FRANKENBERG, a town of Upper Saxony, ſeven miles N.N.E. of Chemnitz, and nine W. of Freyberg.

FRANKENHAUSEN, a town of Upper Saxony, with ſome extenſive ſalt-works. It is ſituate on a branch of the Wipper, 26 miles N. of Erfurt. Long. 11. 5. E. Lat. 50. 42. N.

FRANKENSTEIN, a town of Sileſia, on the Bautze, 12 miles S.S.W. of Glatz.

FRANKENSTEIN, a town of Sileſia, on the Bautze, 12 miles S.S.W. of Glatz.

FRANKLAND'S ISLANDS, a cluſter of iſlands in the South Pacific Ocean, on the N.E. coaſt of New Holland. Long. 146. 0. E. Lat. 17. 19. S.

FRANKLIN, a county of Pennſylvania, 30 miles long and 24 broad. In 1790, it contained 15,655 inhabitants. Chamberſberg is the capital.

FRANQUEMONT, a town of Switzerland, in the biſhopric of Baſle, often beſieged and taken in the Swiſs wars. It is ſeated on the Doubs, 16 miles N. of Neuchatel, and 23 W. of Soleure.

FRAUENFELD, a town of Switzerland, capital of the Thurgau. It is ſeated on an eminence, and is the place where, ſince 1712, the deputies of the Swiſs cantons hold their general diet. Long. 8. 56. W. Lat. 51. 48. N.

FREDENBERG, a town of Weſtphalia, 50 miles W. of Caſſel. Long. 8. 16. E. Lat. 51. 10. N.

FREDERICSHAM, a town of Ruſſia, in Carelia. It is neatly built, the ſtreets going off like radii from a centre; and is ſeated near the gulf of Finland, 68 miles W.S.W. of Wiburgh.

FREDERICSTOWN, a flouriſhing town of the United States, in Maryland, ſeated on the Potomac, 60 miles W. by N. of Annapolis. Long. 77. 30. W. Lat. 39. 20. N.

FREE-CHURCH, a name given to certain places of Proteſtant worſhip, eſtabliſhed of late years with a view to encourage among the poor a regular obſervation of the ſabbath. In London and Bath theſe eſtabliſhments have been found to anſwer an excellent purpoſe. The following extract from an account of the free-church at Bath, by Mr. Bernard, appears in the Reports of the Society for bettering the condition of the poor, &c.

The free-church, in the pariſh of Walcot, at Bath, was opened in November, 1798, for the general and indiſcriminate accommodation of the poor. The idea was originally ſuggeſted by the Rev. Mr. Daubeny, in a ſermon delivered at St. Margaret's chapel, at Bath, in April 1792; and afterwards, with the concurrence and approbation of the Rev. Mr. Sibley, the rector of the pariſh, publiſhed with an addreſs to the inhabitants.

In this diſcourſe, Mr. Daubeny, after enlarging upon the great characteriſtic of the Chriſtian religion, that, "*The poor have the goſpel preached to them,*" and upon the expected benefits of the Sunday ſchools then eſtabliſhed at Bath, proceeded to aſk "where are the children of that place when diſcharged from the Sunday ſchools, at a time of life the moſt dangerous—where are they to gain that inſtruction, which is calculated to bring to perfection the education which they

have received? If, in conformity to the ideas with which they have been brought up, they come to places of worſhip belonging to the eſtabliſhment, they find, alas! the doors, for the moſt part, ſhut againſt them."—He then goes on to obſerve, that this is, in ſome degree, to exclude them from the eſtabliſhed church, inſtead of inviting them, and providing places of worſhip for them; without which (he adds) "we cannot be ſurpriſed that they ſhould no longer continue members of a church which, in a manner, *excommunicates* them. In which caſe their infidelity, and conſequent immorality, will not ſo much lay at their own doors, as at the doors of thoſe who ought, in charity, to have taken their caſe into conſideration, and to have provided means for their inſtruction."

This diſcourſe had its due effect on the audience, and ſeveral hundred pounds were immediately ſubſcribed among them, before they quitted the church. With the example of ſome principal ſubſcribers, both among the clergy and laity, the ſubſcriptions, in a ſhort time, amounted to £.2700. Any objections which might have occurred to doubting minds, were obviated by the publication of the plan; which was, that though the church was to be free from all parochial duty and control, yet it was to be conſecrated by the biſhop of the dioceſe, and the officiating miniſters licenſed by the biſhop, in confirmation of their appointment by the rector of the pariſh: that the whole area of the building ſhould be appropriated to the free accommodation of the common people; and the ſeats in the galleries ſhould be let out to tradeſmen, and perſons in a ſuperior rank of life, at ſuch prices as might furniſh a ſum ſufficient for the ſervice and repairs: that there ſhould be a full ſervice both morning and afternoon every Sunday, and a ſacrament once a month; and laſtly, that the building itſelf ſhould be veſted in truſtees, with powers and proviſions adequate to the purpoſe of ſecuring it to the public for ever, in conformity to the deſign with which it was originally conſtructed.

The conductors of this exemplary undertaking having purchaſed for £.300. a leaſehold piece of ground, in an airy ſituation, in the centre of the pariſh, as a ſite for the new church, Lord Rivers, in whom the fee-ſimple of the ground was veſted, made them a handſome offer of his remaining intereſt in it; ſo that it was made *free ground* in perpetuity. This offer having been carried into effect, a plain but handſome gothic edifice was then erected; Mr. Daubeny taking upon himſelf the riſk of any expence beyond the amount of the ſubſcriptions. It is calculated to accommodate 1000 perſons in the area, which is the free part of the church; and between three and four hundred perſons in the galleries, the produce of which is appropriated to defray the annual outgoings. The church was conſecrated on the 7th of November, and opened for divine ſervice on Sunday, November 18, 1798. The coſt of the church rather exceeded £.3,500.; not including thoſe ornamental articles, which have been contributed as the donations of ſeveral perſons, in addition to their original ſubſcriptions; and an organ, which has been deemed neceſſary to lead ſo large a congregation to join in the ſinging part of the ſervice, and to operate as ſome additional inducement to their attendance.

Mr. Bernard attended the evening ſervice there, on the 24th March, 1799. The gallery, indeed, was not above half filled, the ſeats being reſerved for the renters of them; but the area below contained above a thouſand perſons, decently and cleanly dreſſed, and receiving the benefit of divine worſhip, with a degree of propriety and attention, that made the ſervice extremely awful and impreſſive. It was a ſight that muſt have given the greateſt ſatisfaction to every zealous Chriſtian, who had an opportunity of participating in this act of devotion; whilſt the gratitude that is expreſſed by the lower orders of people for the accommodation ſo liberally provided for them, and the eagerneſs with which they attend the ſervice of the church, furniſh the moſt favourable omens of the good effects that may be derived from an eſtabliſhment of this truly pious and charitable nature. The propriety and expediency of the proviſion made, in this inſtance, for the religious duties and inſtruction of the poor at Bath, are ſo obvious and unqueſtionable, that it is difficult to ſtate any reaſons in their favour, which will not have already occurred to the reader's mind, on the peruſal of the preceding account. It is very apparent that the free church at Bath muſt greatly contribute, in that place, to the improvement of moral and religious habits among the lower claſſes of ſociety, to the prevalence of the eſtabliſhed church, and to the permanence and ſtability of internal peace and civil order. It muſt be equally apparent to every one, who has turned his attention to the ſituation of the poor in London, and to their means and opportunities of exerciſing their religious duties, that ſeveral ſuch chapels, as the free church at Bath, are now wanted in our metropolis; and that, without ſuch chapels, the poor, though living in a Chriſtian country, do not poſſeſs the common benefits of that religion, which its divine Author addreſſed principally to them. If even with thoſe who have had the bleſſing of a religious education, and have had the books of revelation opened and explained to them,—if even in their inſtance "religion, the rewards of which are diſtant, and which is animated only by faith and hope, will glide by degrees out of the mind, unleſs it be invigorated and re-impreſſed by external ordinances, by ſtated calls to worſhip, and by the ſalutary influence of example," what muſt we expect of the ignorant and uneducated? of thoſe who are preſſed down by neceſſity, and have no ſupport derived from the truths of revelation, or from the principles of morality?

It is mere mockery to give the name of *accommodation*, to the ſpace that is left for the poor, in the aiſles of our churches, in London and Weſtminſter. They are neither adapted to the performance of the duties of religious worſhip, nor would they contain a *fiftieth* part of thoſe, *who ought to be accommodated there.* While the rich are conveniently ſeated for their money, the poor ſhould not be neglected. They ſhould, as far as kindneſs and attention will go, *be compelled to come in.* They ſhould have the advantage of their reſidence in a Chriſtian and Proteſtant country; and inducement ſhould be held out to them, ſuch at leaſt as decent and comfortable ſeats would afford, to attend regularly at the eſtabliſhed church, and to unite with the reſt of their fellow-ſubjects, in the conſtant obſervance of the ſabbath, and in religious worſhip.

In the following year, namely, on Sunday, the 25th of May, 1800, a free chapel was opened in Weſt-ſtreet, near the Seven Dials, in London, for the benefit of the poor. Thoſe who have witneſſed the pathos and energy with which the truly pious and learned Dr. Porteous, biſhop of London, delivers and enforces the divine truths and ordinances of the goſpel, may conceive how powerful and impreſſive his diſcourſe muſt have been, on this occaſion; addreſſed as it was to the feelings and underſtandings of his audience, and received by them with ſilent and unfeigned ſatisfaction.

The neceſſary arrangements were immediately made for the care of the chapel; which was placed under the direction of the biſhop of the dioceſe, the rector of the pariſh, and eight of the principal ſubſcribers. The duty has been ſince regularly attended, and the pſalms and hymns printed, and placed for the poor in their pews; and there has been gradually forming a pious and decent, though not, as yet, a numerous congregation.

It had been conceived that it would be better, and more conducive to the permanency of the inſtitution, that the poor ſhould *gradually* find their way into the chapel; rather than by any ſpecial means to preſs their premature attendance. No hope was entertained that their habits would be ſuddenly and entirely changed; and that thoſe who from infancy had paſſed the Lord's day in ſloth and brutal indulgence, ſhould be *at once* amended; and be prepared regularly to attend with cleanlineſs and decency, in a place of divine worſhip. A complete and permanent reform was not to be immediately expected; and a temporary conformity, a mere yielding for the time to preſſing inſtances, compelling them to come in, did not promiſe any ſtable improvement.

An organ has been lately provided for the chapel, and an organiſt engaged; and a reſpectable clergyman officiates as the miniſter of the chapel. Whoever takes a view of the parochial diſtricts, at the weſtern end of London, will find that, in the four pariſhes of Marylebone, St. James's, St. Giles's, and St. George's, Hanover-ſquare, with a population of ſome hundred thouſand inhabitants, there are only *four churches* for the reception of thoſe who are deſirous of attending divine worſhip, according to the rites of the church of England.

Three of theſe are of a moderate ſize; but the other, that of Marylebone *, only fit for the chapel of ſome petty, inſulated hamlet. In theſe four pariſhes, the *utmoſt* exertions of the parochial clergy, combined with the greateſt talents, muſt be utterly inadequate to the religious duties of their reſpective diſtricts †. Beſides which, in theſe, and in almoſt every other church in the metropolis, the pews are let; and the only places left for thoſe pariſhioners who wiſh to continue members of the eſtabliſhed church, and yet cannot afford to pay a very heavy rent for their ſeats, is the *ſtanding room* in the aiſles, and ſometimes an occaſional neglected bench; an accommodation, improper, indecent, and unfit for the ſacred and ſolemn ſervice then attended; and ſuch as, even if decent in itſelf, would not be adequate to the admiſſion of *one-hundredth part of thoſe who ought to have ſeats in their own pariſh church*.

It is of very little or no conſequence, that, in theſe four pariſhes, there are many private chapels. Thoſe chapels are let at *rack-rent*, to ſome ſpeculating undertaker: the pews, and every part of them, being laid out and diſpoſed (as other private property generally is) *ſo as to produce the greateſt poſſible income with the leaſt outgoings*; and the free admiſſion of the poor being directly oppoſite to the principle on which they are built and opened, and perfectly incompatible with the *great object*, of making a very large revenue, by the admiſſion of very genteel company.

The conſequence of this is, that many of the better and more ſerious of the labouring poor are driven and compelled to take refuge in the different places of worſhip, which the more accommodating ſpirit of other Chriſtian ſects provides for their religious duties. But this is not all: the greater number of theſe neglected Chriſtians *preſerve their orthodoxy, by never attending any church at all*; and, in a country, juſtly boaſting of the purity of its religious doctrines,—extremely fortunate in the poſſeſſion of a pious and learned clergy,—and conſecrating very ample funds to the ſupport of a moſt reſpectable church eſtabliſhment,—two thirds of the lower order of people in the metropolis, live as utterly ignorant of the doctrines and duties of Chriſtianity, and are as errant and unconverted pagans, as if they had exiſted in the wildeſt part of Africa.

To thoſe who view, with a fixed and attentive eye, the awful ſeries of events which is now defolating, and we may hope at the ſame time reforming, the Chriſtian world, much important obſervation will occur on the preſent ſubject. It is written in the recent Hiſtory of Europe, it is inſcribed in the ſummary of the ten preceding years, that there is no protection againſt the calamities which are now laying waſte our quarter of the globe, except that purity of faith and integrity of life which are to be derived from the vivifying influence of religion; extending, like the ſolar ray, *to every claſs* of our fellow ſubjects, and operating in the moral amendment of the great maſs of the people.

It has been the object of ſome individuals, and certainly a very deſirable object, that Sunday ſhould be obſerved among us with more decency and devotion than are at preſent apparent in the metropolis: and it has been frequently obſerved, that, in the gradual progreſs from petty offences to thoſe atrocious crimes which ſtrike at the very root of ſociety, the habitual neglect of the ſabbath, and of its ſacred ordinances, is always a prominent and peculiar feature. It is by the gradual effects of that neglect, that the reverence of the Divine Being, implanted as it is in our frame, and nouriſhed and confirmed by every object of creation, is at length eradicated from the human breaſt; and the hardened ſinner is ultimately left a prey to his own evil and corrupt imaginations.

But, ſurely, it muſt appear to be an obvious truth, that, if we would promote the religious obſervance of the Lord's day among the poor, we muſt not merely ſet them the example, but muſt ourſelves make the proviſion for their religious duties. Without this, there is no uſe in the increaſe of vain ſtatutes, which can never be executed to any good purpoſe; ſtatutes, which can, in no event, produce more than the *ſemblance* and *ſhadow* of religion in the country. It may, however, be confidently aſſerted, that with the benefit of ſuch a proviſion, effectually and properly made, and eventually accepted and enjoyed, we ſhould have little or no call for any new law or ordinance on the ſubject; but we ſhould find, among the great maſs of the people, the ſame attention to the religious duties of the Lord's day, as is now ſhewn by the individuals of thoſe Chriſtian ſects among us, who make a decent and proper proviſion for the religious duties of their neceſſitous brethren.

The periodical return of the ſeventh day, for the inſtruction of the minds of the poor in divine knowledge, and for the reſt and relaxation of their bodies from the cares and labours of life, is, in the Chriſtian world, a moſt important advantage; whether we regard the ſituation of the labouring claſs in this fleeting period of exiſtence, or whether we turn our views to the awful and intereſting concerns of futurity. But it is vain to expect, that the poor ſhould regard that day

---

* The population of Marylebone is now returned, and the ſize of that pariſh church may eaſily be known. It will therefore not be difficult to aſcertain whether the population of that pariſh requires 150 ſuch pariſh-churches as its preſent; or whether 120 ſuch churches would be ſufficient for the inhabitants.—June 27, 1801.

† Thoſe who attend the poor of the metropolis in their own habitations, have frequent and painful occaſion to lament their want of that inſtruction and conſolation in their dying moments, which Chriſtian charity would deſire them to receive. In other ſects, and in country pariſhes, where all the members of a congregation are perſonally known to the miniſters, theſe duties may be completely fulfilled; but in the populous and extended pariſhes of the metropolis, no zeal, however indefatigable, can enable the preſent number of clergymen to do *all* that *ought* to be done.—June 30, 1801.

as any thing but a privileged time for idleneſs and intemperance, exempt from the call to toil and labour, unleſs we ſupply them with other occupation, and furniſh their minds with that religious inſtruction *, and with thoſe precepts and motives, which may have an operative effect upon their lives and conduct: and, when ſo long and ſo general a neglect has taken place, it is vain and idle to expect that, without much time, much attention, and much anxiety on our part, the poor ſhould immediately and ſpontaneouſly flow into the chapels that may be opened for them. The evil (it muſt be allowed) is too deep, and the habit too inveterate, to admit any expectation of that kind. But the benefit of *ſuch a reform, in London*, is ſo great, and ſo important in its conſequences; it is ſo eſſential to the political exiſtence of this country, and to the ſecurity and happineſs of its inhabitants; that I know no object, the advantages of which I can name in preference to, or even in competition with it.

With theſe ſentiments, and with this conviction on his mind, Mr. Bernard ſubmits to thoſe, from whom only ſuch a meaſure can properly originate, the expediency of providing ſome remedy for this national evil.

His propoſal is, that a ſociety be formed *for promoting the foundation and eſtabliſhment of free chapels for the poor, and the increaſe and improvement of their religious habits, within the realm of England*:—that every ſubſcriber of fifty guineas in one ſum, or of five guineas a-year, ſhall be a governor of the ſociety; and that in caſe of a donation of 100 guineas or more, the donor ſhall, for every 50 guineas beyond what would conſtitute his own ſubſcription, have the power of naming one life governor: the ſpecific appropriation of the funds being for the eſtabliſhment and ſupport of free chapels for the poor, in the metropolis, and in any of the populous towns of England; ſubject, as all other chapels and churches of the eſtabliſhed church muſt be, to epiſcopal control and government.

Whenever ſuch a ſociety ſhall be formed, and the directing power placed in unexceptionable hands, we may venture to hope that ſome addition to its funds may be afforded by government. It may alſo be expected, that, with a proper and economical application of thoſe funds, every thouſand pounds entruſted to the direction of it, may afford the means of forming and eſtabliſhing a new free chapel for the poor, either in London, or in Mancheſter, Briſtol, Norwich, or in ſome other of our moſt populous towns.—What the effects may eventually and ultimately be, and what ſtrength and ſtability it may give to the civil and eccleſiaſtical eſtabliſhment of the country, and what renovation of vigour and force to the moral and religious habits of the poor, we leave to the reflection and appreciation of the reader. Our earneſt wiſhes are in uniſon with thoſe of the benevolent writer of theſe remarks, and we think ourſelves fortunate in contributing to ſo laudable a work, by giving circulation to the excellent arguments uſed to enforce its neceſſity.

FREHEL, a cape of France, in the department of the North Coaſt, 13 miles W. of St. Malo. Long. 2. 20. W. Lat. 48. 41. N.

FREJUS, a town of France, in the department of Var. By the Romans, it was called Forum Julii; and had then a port on the Mediterranean, which is now above a mile from it. It is the birth-place of that great Roman general and philoſopher Agricola; and near it ſome fine remains of antiquity are ſtill viſible. It is ſeated near the river Argens, in a moraſs. 40 miles N.E. of Toulon. Long. 6. 50. E. Lat. 43. 26. N.

FRENAY-LE-VICOMTE, a town of France, in the department of Sarte, nine miles S.S.W. of Alençon. Long. 0. 5. W. Long. 48. 15. N.

FREUDENSTADT, a ſtrong town of Suabia, in the Black Foreſt, built to defend the paſſage into this foreſt. It is 12 miles S.E. of Straſburgh. Long. 8. 21. E. Lat. 48. 28. N.

FREUDENTHAL, a town of Sileſia, celebrated for its breed of horſes, and manufacture of fine linen. It was taken by the Pruſſians in 1741 and 1744, but afterwards reſtored. It is 11 miles S.W. of Jagendorf, and 17 W. of Troppau. Long. 17. 21. E. Lat. 50. 3. N.

FREYBERG, or FRIEDBERG, a town of Upper Saxony, containing above 60,000 inhabitants. In the environs are mines of copper, tin, lead, and ſilver, which employ a great number of workmen, and produce above 10,000 rix-dollars a-year. Here is the uſual burying-place of the princes of the electoral houſe of Saxony. It is ſituate on a branch of the Muldau, 15 miles S.W. of Dreſden. Long. 11. 10. W. Lat. 51. 0. N.

FREYSINGEN, a town of Germany, capital of a biſhopric of the ſame name, in the circle of Bavaria. It was taken by the French in 1796. It is ſeated on a mountain, near the Iſer, 20 miles N. by E. of Munich. Long. 11. 50. E. Lat. 48. 26. N.

FREYSTADT, a town of Hungary, in the county of Neitra, with a ſtrong caſtle, ſeated on the Waag, oppoſite Leopoldſtadt. Long. 18. 10. E. Lat. 48. 32 N.

FREYSTADT, a town of Sileſia, in the duchy of Teſchen, 20 miles E of Troppaw. Long. 18. 15. E. Lat. 50. 0. N.

FRIAS, a conſiderable town of Spain, in Old Caſtile, ſeated on a mountain, near the river Ebro, 35 miles N. of Burgos. Long. 3. 46. W. Lat. 42. 52. N.

FRIDAW, a town of Germany, in the duchy of Stiria, 104 miles S. of Vienna Long. 16. 12. E. Lat. 48. 20. N.

FRIDING, a town of Suabia, on the Danube, 30 miles N E. of Conſtance. Long. 9. 31. E. Lat. 48. 11. N.

FRIDLAND, a town of Bohemia, on the confines of Sileſia. 55 miles E of Dreſden. Long. 15. 15. E. Lat. 52. 4. N.

FRIDLENGEN, a town of Suabia, three miles eaſt of the Rhine, and four N. of Baſle. Long. 7. 36. E. Lat. 47. 40 N.

FRIENDLY SOCIETIES, certain aſſociations of mechanics and labouring perſons, for the purpoſe of ſubſiſting themſelves and their families, when rendered incapable of labour by ſickneſs, &c. They have been otherwiſe called BENEFIT CLUBS, and the good effects of the few private ones that have exiſted, have induced government to countenance them, and benevolent individuals to increaſe their number in the united kingdom. The following extract from an account of a friendly ſociety at Caſtle-Eden, in the county of Durham, by Rowland Burdon, eſq. will afford an excellent example.

* "I ſubmit (ſays Mr. Bernard) to the reader's conſideration two leading queſtions, reſpecting what, in my view of this intereſting ſubject, is *due* to the poor.—The firſt, whether the poor have not a claim on the rich and independent, for a certain portion of that time which is not occupied by a proper attention to their domeſtic or public occupations, or by a reaſonable relaxation of leiſure and amuſement? (*care and wretched anxiety* being the conſequence of *exceſs of application* in reſpect of the firſt;—and of the latter, *wearineſs and liſtleſsneſs of ſpirit*). The ſecond queſtion is, whether the miniſters of the goſpel can *quite* ſatisfy themſelves, that the general duties of the clerical order are *completely* fulfilled, until the goſpel has been really and effectually preached (as far as may be done) to *every claſs* of men in the kingdom? And in the mean time, whether any thing which they can do in the performance of works of ſupererogation, or even in attempts to convert diſtant nations, can be admitted *as a commutation of their own peculiar and indiſpenſable ſervice*?

The truſtees of the ſociety are, the lord of the manor, the clergy and juſtices of that and the two adjacent pariſhes, within which its members for the moſt part reſide. All donors or ſubſcribers of one guinea and upwards, annually, are honorary members. Twelve principal inhabitants, with the churchwardens of the three pariſhes, and all honorary members, are directors for the time being. For the immediate management of the buſineſs of the ſociety, an annual committee, with a ſteward, clerk, and treaſurer, are elected, and two viſitors are appointed from each pariſh.

The number of members has never reached two hundred; conſiſting for the moſt part of farmers, artificers, labourers, and their families. The following are the accounts from Auguſt 10th, 1793, to December 31ſt, 1796.

Sixpence is paid for each ſhare on the deceaſe of every member, for whoſe funeral the ſociety has any diſburſement to make; and each member above twenty-one years of age (excepting women) pays, at each yearly meeting, one ſhilling for dinner and liquor: but no member is obliged to be at any expence at monthly or other meetings. A depoſit of two ſhillings and ſixpence is made on propoſing any perſon to become a member, which, if the perſon be not admitted, is returned. Any member, under forty-five years of age, may increaſe his or her original ſhare, on contributing according to his or her age, at the time of making ſuch increaſe.

The following are the benefits to men in ſickneſs, lameneſs, or infirmity; but women are not entitled to benefit in ſickneſs.

For one ſhare, and ſo in proportion for half a ſhare:

Six ſhillings a-week, when confined in bed, or unable to go out of the houſe, or to perform any kind of work; and

Three ſhillings a-week, when able to walk out, or to labour to a ſmall degree: but both theſe allowances ceaſe when the member is able to follow his uſual occupation, or even to earn three ſhillings a-week regularly.

A ſurgeon and apothecary are appointed to attend the ſick members.

In old age.—For each ſhare, and ſo in proportion for a half ſhare, each member is entitled to the following annuity:

	to men £. s. d.	to women £. s. d.
from 50 to 60 years of age, a yearly annuity (by quarterly payments) of - - -	—	4 — —
from 60 to 70 years of age -	6 — —	6 — —
from 70 to 80 - -	8 — —	8 — —
from 80 to 90 - -	10 — —	10 — —
from 90 until death - -	12 — —	12 — —

Such annuities to commence from the firſt of January next, after the member's attaining the age of fifty, ſixty, ſeventy, eighty, and ninety years reſpectively; but no annuity is payable to any member, until he ſhall have contributed for fifteen years, nor for any ſhare on which he may have received relief in ſickneſs, &c. but a man may take relief in ſickneſs for one ſhare, and receive annuities for other ſhares, which occaſion many of the members to ſubſcribe for more than one ſhare.

At death.—Five pounds for each ſhare, and fifty ſhillings for each half ſhare, is paid to the repreſentative of each member, who has contributed to the fund for twelve months, whether man or woman: and if the member die before contributing twelve months, the full amount of what he or ſhe may have paid, is returned. This is repaid to the fund, by contributions from the ſurviving members.

To the widow of each member, who ſhall die after contributing fifteen years, an annuity of four pounds, by quarterly payments, from the member's death, during widowhood, for each ſhare; and ſo in proportion for half a ſhare, for which no other benefit had been received during the member's lifetime; and, if he leave no widow, the ſame annuity to be applied for the benefit of orphan children (if any) under twelve years of age, until the youngeſt of them attain that age.

To young children.—Any member, who wiſhes to make proviſion for a child or children, is allowed to enter any of them on the following terms:

If under four years of age when entered, the member pays four-pence monthly for each child, till it attains twelve years of age, if the member ſhould live ſo long.

If four years, and under ſeven years, when entered, he pays three-pence monthly for each child.

If ſeven years, and under ten years, when entered, he pays two-pence monthly for each child.

If a member die and leave any child or children ſo contributed for, under twelve years of age, one ſhilling per week is applied out of the fund of the ſociety, towards the mainte-

tenance of each ſuch child, till it attains the age of twelve years; and, if the member chooſe to contribute double the above-mentioned ſums for each child, the child or children will be entitled to double benefit: but no child is entitled to any benefit (excepting the annuity to be paid in caſe of the member's dying after contributing for fifteen years, *without leaving a widow*) unleſs entered and paid for twelve calendar months before the death of its father.

By purchaſing cows.—A ſum of money, not exceeding ten nor leſs than five pounds, is lent to any one member for this purpoſe; on his giving a promiſſory note, ſigned by himſelf and two houſeholders (to be approved of by the ſteward, directors, and committee), for the repayment with intereſt by inſtalments, after the rate of two ſhillings a-week, or ſuch other rate as may be agreed on.

By certificates.—Each member may obtain a certificate, as ſoon as admitted, which, by the act of parliament, will prevent him or her from being removed until actually chargeable; and, in caſes of unmarried women having children in a pariſh to which they do not belong, the ſociety's certificates will be a better ſecurity than many bonds of indemnity. Queſtions alſo of ſettlement may be decided without the removal of the certificated perſon, under the ſaid act, 33d of Geo. III. ch. 54. ſec. 21, 22.

The calculations for the contributions, &c. were formed upon Dr. Price's tables, making them, however, more in favour of old than young members; by which the funds are not injured, but rather the reverſe, becauſe young men are more inclined to ſubſcribe than old; and, if the latter were to contribute according to the proportions of Dr. Price's tables, very few would become members. The compoſition table is lower alſo than Dr. Price's, notwithſtanding which very few are found to avail themſelves of the advantage.

The allowance in ſickneſs is one-third higher than Dr. Price's; but members, who receive in ſickneſs, are debarred from annuities for the ſame ſhares; and conſequently this allowance in ſickneſs may well be afforded.

In drawing the Caſtle-Eden tables, the object was to make the monthly contributions fully equal to the diſburſements, and to induce perſons of *all* ages under 46 to become members, without calculating exactly what each age ought to pay.

The preceding ſtatement ſhews the accounts of the ſociety, the gradation of its contributions, and the benefits derived by its members, in which the principal rules of the ſociety may be traced. Little has been the amount of donations or ſubſcriptions, and yet, during the ſevere trial of the late ſcarcity of bread-corn, few or none of the members omitted to keep up their ſubſcriptions; teſtifying thereby an anxious and ſteady wiſh to provide permanently for themſelves and families.

On the beneficial effects of an eſtabliſhment ſo much in its infancy, we ſhould be careful not to expatiate too much; but we may already aſcertain ſome unqueſtionable advantages. The families of the poor have a more ready ſupply of medical aſſiſtance at their own houſes; and, ſince they have been aſſociated for each other's ſupport, in more inſtances than one, they have collected little ſums among themſelves to preſent to their ſick and neceſſitous neighbours, over and above the allowance from the funds of the ſociety; which is probably an effect of philanthropy derived from the inſtitution. All the members are uniformly anxious to avoid taking relief for ſickneſs, during fifteen years, on their reſpective ſhares; a circumſtance which, whilſt it protects the fund, adds force to the habitual leſſon of thrift; and, as there is a regular ledger kept in which each member's ſeparate account is entered, no miſtake can ariſe on that ſubject. The encouragement given to buying and keeping cows (ſee the article COTTAGER, *Supp.*) promiſes conſiderable improvement to the eſtate; as Mr. Burdon finds it very well worth his while, to accommodate the members with paſture for a cow, and two tons of hay each, for ſix pounds per annum. This, to a poor family, is a great advantage, and will tend much to diminiſh the weight of poor upon the pariſhes to which they belong. The locomotive faculty alſo derived from the certificates of friendly ſocieties is a very obvious advantage.

The great deſideratum, with reſpect to the maintenance of the poor, has always appeared to be the encouragement of habits of economy, and of a ſyſtem of periodical ſubſcription towards their own ſubſiſtence. Where men derive ſupport in ſickneſs and old age * from their individual efforts, in conjunction with thoſe of their neighbours, they paſs through the various periods of trial without that degradation, which attends parochial relief; being neceſſarily amenable to each other for a certain degree of forethought, and good conduct, they learn, inſenſibly, to be regular in their attention to the earnings of their buſineſs, and by acquiring a permanent connection with their neighbours, they become incapable of thoſe acts of vagrancy, which are ſo waſteful of that main ſource of national wealth, the labour of the lower orders of the people.

Upon the whole, it is highly probable, that if the 33 Geo. III. chap. 54, for the encouragement of friendly ſocieties, be allowed ſufficient time to operate, the poor will, by degrees, be induced to take care of themſelves, aſſiſted by the contributions, and encouraged by the countenance, of their ſuperiors.

In May, 1798, there was eſtabliſhed at Winſton, in the county of Durham, in conſequence of a ſuggeſtion of the Biſhop of Durham, a friendly ſociety for the aged poor; the object of which is to promote among them the due obſervance

---

* In a late inſtance, in the neighbourhood of Ealing, a majority, compoſed of the *young* men of a friendly ſociety, agreed to diſſolve the ſociety, and divide the ſtock; and thereby at once defrauded all the *old* members of that proviſion for age and infirmity, which had been the object of many years' contribution. A new ſociety was immediately formed of the young perſons, and all the old members were left to the pariſh. This could not have happened, *if their rules had been regularly confirmed at the quarter ſeſſions.*—The advantages of the rules being confirmed and regiſtered (which by the act is to be without any fee or expence) are many and important;—their *bonds* are not chargeable with any *ſtamp duty*;—they have a copy of their rules on record, which they may always recur to;—if their ſteward or other perſon embezzles their money, they may apply to the court of chancery, and obtain a decree and *relief without any expence* whatever;—and in caſe any perſon, who has money or effects of the ſociety in his hands, dies, or becomes a bankrupt, the debt of the ſociety is to be diſcharged, *in preference to any other demand whatſoever.*—If all members of friendly ſocieties had been aware, how much their ſecurity and benefit are increaſed by the confirmation of their rules, there would have been none but would have taken advantage of the act.—There is an unneceſſary reſtriction in the ſtatute law, as to the time for the confirmation of the rules of any friendly ſocieties, eſtabliſhed *before* the paſſing of that act. The benefits, however, of the act may be obtained (and there is an example in the publication mentioned in a preceding note) by the members *forming their ſociety, and ſigning the rules anew*, with ſuch amendments as occur; carrying their fund to the account of the new ſociety, and giving to every member (inſtead of his divided ſhare of the money) the ſame benefit in the fund of the new ſociety, as he would have had in the old one.

of the ſabbath, the ſtudy of the Scriptures, and of other good books, and alſo frugality and good neighbourhood.

For this purpoſe, they make a point of attending church on Sundays, when not prevented by ſickneſs, infirmity, or ſome unavoidable impediment; and alſo on other days, whenever they have opportunity: they likewiſe agree not to countenance any games or improper paſtimes on a Sunday, by looking on, or ſitting near them; and to uſe all the influence which they poſſeſs, to diſſuade others from profaning the Lord's day:—they meet every Sunday evening at each other's houſes, for religious improvement: and make it a general rule, to lay by every week ſomething of their earnings, to accumulate till the end of the year; allotting however a tenth part thereof, and of the benefit they derive from the ſociety, towards the relief of any of their neceſſitous neighbours, who (though not belonging to the ſociety) ſhould appear to merit their charitable aſſiſtance. They likewiſe agree to make it their buſineſs to do every thing that in them lies, to promote good-will, good-neighbourhood, and Chriſtian charity, one amongſt another.

The following are the rules of the ſociety:

1. Any perſon may be a member of the ſociety, who is ſixty years of age or upwards.

2. Every ſubſcriber of one penny per week, who is ſixty years of age, or upwards, and under ſeventy, to be entitled to receive *double* his ſubſcription, at the end of the year; that is, his own ſubſcription, and as much more.

3. Every ſubſcriber of one penny per week, who is ſeventy years of age, or upwards, and under fourſcore, to be entitled to receive treble his ſubſcription at the end of the year; that is, his own ſubſcription, and twice as much more.

4. Every ſubſcriber of one penny per week, who is fourſcore years of age, or upwards, and under ninety, to receive *four times* his ſubſcription at the end of the year; that is, his own ſubſcription, and three times as much more.

5. And ſo in proportion for every increaſe of ten years.

6. Any blind perſon, of any age, may be a member of the ſociety; and, if under ſixty years of age, will be entitled to the ſame benefit as ſubſcribers who are ſixty years of age, and under ſeventy.

7. Every member who abſents himſelf from church on Sundays, except in caſe of ſickneſs, or ſome unavoidable impediment, to forfeit his benefit upon the ſubſcription of that week.

8. If any member of this ſociety ſhould die in the courſe of the year, his friends will be entitled to receive his ſubſcription, and ſo much benefit as is proportioned to the time of ſubſcribing.

9. Any perſon deſirous of promoting the purpoſes of the ſociety, without partaking of the benefit, may be an *honorary member*, by ſubſcribing annually a guinea, or half a guinea, or not leſs than two pence per week; for which they will be entitled to receive weekly one copy of ſuch publications as may be purchaſed for the uſe of the ſociety.

10. The ſubſcription to be paid at the time of the weekly meeting, to the member, at whoſe houſe the reading is held; to be delivered by him to the ſecretary, on the Monday following.

11. The annual ſubſcription to be paid at the time of commencing member.

12. No members to receive any publication, whoſe ſubſcription is in arrears.

13. No benefit member, who is in arrears, to receive any benefit till his arrears are paid.

This ſociety conſiſts of four honorary members (who ſubſcribe an annual guinea each for the benefit of the fund), and nine old men and women, one of the age of 101 years, one a poor blind woman, and the other ſeven of ages between 60 and 80. The honorary member have it in their power, by their weekly or annual ſubſcription, not only to enlarge and improve the means of aſſiſting the poorer members of the ſociety, but at the ſame time to contribute to the amuſement and inſtruction of their children and ſervants, and neighbours, by diſtributing among them the tracts of the Cheap Repoſitory, and thoſe of the Society for promoting Chriſtian Knowledge, which are purchaſed for the uſe of the ſociety.

The books which are ſelected for reading to them are, Orton's Diſcourſes to the Aged,--Biſhop Wilſon's Sermons,--Biſhop Wilſon on the Sacrament,—Biſhop Beveridge's Private Thoughts,—Flavell's Huſbandry ſpiritualized, adapted to preſent uſe,—Chriſtian Huſbandry,—Fawcett's Religious Weaver,—Burder's Village Sermons,—and Peers's Companion for the Aged.

Of the origin of this ſociety, the author ſays, "I ſpoke to one of the old men, who had ſome turn for reading, and offered to come and read to him on the Sunday evening. The old man thanked me for the offer, and afterwards appeared much gratified with what I had done. I then told him that I would viſit him the next Sunday evening; and that any other old perſons among his neighbours, who wiſhed it, might be preſent. A neighbour and his wife attended; and, on the Sunday after, other old perſons came, in conſequence of leave given them upon their application. Finding the Sunday readings gave pleaſure to them, I made an offer of forming a regular ſociety, on the terms before mentioned." This they gladly accepted, and have ſince expreſſed great ſatisfaction in this new employment of their Sunday evening.

There is a cheap but comfortable Sunday dinner provided, gratis, for all who attend church. It is prepared from one of the receipts in the firſt volume of the Society's Reports, the expence of it not exceeding three halfpence a-head. They dine at the houſe of one of the members, which from its ſituation is moſt convenient for the infirm members. The dinner is dreſſed at the rectory, and ſent on the Saturday evening to the houſe where they dine.

The oldeſt and moſt infirm members are now become very punctual in their attendance on church; and by their example and influence, have contributed very much to the better obſervance of the ſabbath at Winſton.

The Sunday readings were propoſed, and the ſociety which grew out of them, was eſtabliſhed, in conſequence of a ſuggeſtion in the Biſhop of Durham's charge to the clergy of the dioceſe of Durham, in 1797, where the reader will find a ſtrong recommendation of the eſtabliſhment of ſocieties of the poor for their religious improvement.

The inſtitution of ſuch ſocieties appears to be ſuſceptible of very extenſive advantages. It ſupplies, by very practicable means, what was before wanting in the religious inſtruction of the poor. Sunday ſchools provide for the inſtruction of the young;—theſe ſocieties will promote the edification and comfort of the old. The Sunday Friendly Society is founded on principles very favourable to religious and moral improvement, and to the cultivation of benevolence and philanthropy among the poor. It connects the aged poor in a friendly and Chriſtian-like manner with their miniſter, and with one another. It brings into exerciſe a virtue, which is too often conſidered as out of the poor man's ſphere; as by it they not only receive charity, but become alſo the diſpenſers of it to others.

The allotment of their charitable tithe to the benefit of neighbours, who are *not* of their ſociety, and the obliging of themſelves by their *rules* to the obſervance of the duties of religion and benevolence, may be the means of gaining two great points in the cultivation of the heart;—one, a correction of the ſelfiſh principle; the other, a deliberate reſolution of living and acting by rule and method. To the poor who cannot read at all,—to thoſe who cannot afford to buy books,—

to thoſe who are deſirous of ſpiritual improvement, and of employing their latter days in a way the moſt conducive to the comfort of their laſt hours,—to the frugal, the neighbourly, and the benevolent, ſuch an inſtitution cannot fail to be very acceptable.

The value of religious ſocieties, as helps to religious inſtruction and edification, has been long known to ſeveral ſects of Chriſtians. With them they have been the ſource of much uſeful inſtruction, and the means of keeping up a ſpirit of ſocial and vital religion; and they contribute to aid the force of example, and therefore operate very beneficially on individual conduct. It would be happy for the cauſe of Chriſtianity, if the friends of the eſtabliſhed church would unite in following their example. Happy indeed would it be, if, at length, all contention between the denominations of Chriſtians were reduced to an amicable rivalry, in the great work of ſaving ſouls;—in provoking one another to good works. In a word, if all our efforts, from however diſtant points they may originate, were to centre in a friendly competition in doing good.

To thoſe who look with an anxious eye on the progreſs of the poor's rate, every inſtitution that tends to encourage good conduct among the poor, muſt be the object of approbation; but thoſe muſt be peculiarly ſo, which are calculated to afford relief to the elder and more infirm poor, by an *annual* charity, as a benefit upon *frugality* and good behaviour.

In forming a Sunday friendly ſociety it is immaterial with how ſmall a number the commencement is made; except, indeed, that there may be rather more advantages in beginning only with a few, and letting others find out the benefits of being members from converſation with thoſe who are. The utmoſt that ſeems neceſſary (after two or three have agreed to meet together for reading the ſcriptures and other good books on Sunday evenings, and to bind themſelves to a punctual obſervance of religious duties) is to diſtribute the rules of ſuch ſocicty at ſome, or all, of the cottages in the pariſh.

It is a very deſirable circumſtance, that the meetings ſhould be at the houſes of the members by rotation; as it will not only be more ſatisfactory to them, but will conduce much to friendly intercourſe and charitable communion. If the elderly poor in any town or village, ſhould be too numerous to meet in one houſe, they may be divided into claſſes, and one or more of the members be employed as readers to the claſs, where the miniſter cannot attend regularly to more than one claſs.

The weekly penny ſhould not be conſidered as a ſubſcription, or condition of being admitted a member, but as a voluntary act of frugality. If they lay by their penny, and are not ſo regular as their rules require, they will ſtill receive their own again; but it will be their own ſingle talent unimproved. They may be members, if they pleaſe, without laying by their penny: a wiſh to partake of the Sunday readings, and to join in a religious obſervance of the ſabbath, is a ſufficient qualification.

They may, poſſibly, be devout without being frugal; and yet frugality is ſo great a virtue in the poor, that it might be worth while to encourage and recommend to them the weekly depoſit, as a means of benefiting themſelves by the charitable diſpoſition of their richer neighbours: a circumſtance that will render the charity not only more uſeful than if it was merely gratuitous, but generally (it may be ſuppoſed) on that account more acceptable to them.

In large families and populous towns, the benefit upon the weekly ſavings might be in a great degree, if not wholly, raiſed from the contributions of the honorary members. In ſmall pariſhes, the expence of the benefit will be inconſiderable: but even there, will be generally found ſome honorary members, to ſhare the expence with the landholder, and with the clergyman of the pariſh.

A ſociety of a ſimilar nature has been lately inſtituted at Biſhops Auckland by the Biſhop of Durham, who has the dinner provided for them, and ſupplies the extra fund, without the contribution of any honorary members. It conſiſts at preſent, October, 1798, of 20 members; all (as there is reaſon to believe) gradually advancing to a more comfortable ſtate of mind, and happy in their preparation for eternity. —In the formation of different ſocieties, ſome difference in the detail may be occaſioned by the circumſtances of the place or the parties, but the general idea and the object will probably be the ſame.

Friendly Female-Societies, aſſociations of the ſame nature as the foregoing, for the excluſive advantage of females. We ſelect the following examples from the Reports of the London Society for bettering the Condition and increaſing the Comforts of the Poor.

Among the many friendly ſocieties which have been inſtituted by day-labourers in different parts of the country, an idea was adopted at Lymington, that ſomething of this kind might be of great benefit to *diſtreſſed females*; and eſpecially in that place, which being a little ſea-port, and frequented by the ſeamen of ſmall coaſting veſſels, and boatmen, their wives are often put to inconveniences by the misfortunes, and even by the abſence of their huſbands.

Mrs. Pierce, a lady of Lymington, took an active part in the buſineſs. Her firſt ſtep was to conſult among her friends, what ſupport an inſtitution of this kind was likely to receive; and ſoon found there was ſufficient for the execution of her plan. Between thirty and forty inhabitants of Lymington, and its neighbourhood, were ready to ſubſcribe each 14s. a-year, or 3d. a-week, which was all the aſſiſtance ſhe deſired. A committee of ladies was then appointed to arrange the buſineſs; but Mrs. Pierce continued to be the moſt active member, by taking on herſelf the moſt troubleſome office—that of treaſurer.

On the 5th of April, 1790, the ſociety was eſtabliſhed. The regulations of it were chiefly theſe.—It was particularly intended for *lying-in* women, but was ſoon extended to the *ſick of every denomination.* No one could enter as an object of this charity under the age of 15, nor above 50. It was required that ſhe ſhould be a pariſhioner, of good character, and in good health at the time of her entrance. On putting down her name ſhe pays 6d. and three halfpence every week. Before ſhe receives relief, her name muſt have been a year on the books; ſhe is then entitled to 3s. a-week during any illneſs with which ſhe may be viſited: but ſhe receives it only during the term of 13 weeks; if ſhe is not then recovered, ſhe receives 1s. a-week only, while it is thought neceſſary. Once a-year a charity ſermon is preached, at which between 10l. and 16l. are generally collected. By this aid, and by great economy in the management of the fund, it has increaſed ſo much, that, inſtead of 3s. a-week, it already affords 4s. After the ſermon, which is generally preached on the ſecond Sunday in Auguſt, all the poor members who are able to go to church, walk in proceſſion to the town-hall, with their patroneſſes at their head, who treat them with cake and wine. This is a pleaſant day to them, and makes ſome return to the healthy, for not having had occaſion to draw upon the fund for ſickneſs. The grand murmur indeed againſt all theſe modes of relief, is, that they, who have had little occaſion for them, think their money has been ill ſpent, though at the ſame time it is a fact, that moſt of the members of this ſociety have at one time or other, received relief from it; not fewer in the whole than 65; of theſe 35 were women in child-bed. Two women have been

on the books, with lame hands, at 1s. a-week, for ſome years; and a third has been long relieved in a deep decline.

Indulgences are ſometimes added, when perſonal misfortune is not to be pleaded. In the late ſcarcity of bread-corn, each poor member received a half-gallon loaf every Wedneſday, for ſix weeks; and during the laſt two winters, each had three buſhels of coals.—The ſociety, at this time (June, 1798), conſiſts of 55 poor members.

At TOTTENHAM High-Croſs, a friendly ſociety for the benefit of women and children was eſtabliſhed on the 22d of October, 1798, under the reſpectable patronage of a number of ladies, who promiſed to ſupport it with perſonal attendance, as well as pecuniary aſſiſtance.

Combined with the main deſign of this inſtitution are two other objects; viz. a fund for loans, to prevent the uſe of pawnbrokers' ſhops, and a bank for the earnings of poor children.

The principal rules are as follow:—the honorary members pay five ſhillings on entrance, and twelve ſhillings annually. The benefited members pay two ſhillings on entrance: they are divided into three claſſes, according to their age. The firſt claſs, which conſiſts of thoſe between twenty and thirty, pay ſix pence monthly. Thoſe of the ſecond claſs are between thirty and forty, and pay nine pence monthly. Thoſe of the third claſs are between forty and fifty, and pay one ſhilling monthly.

No one is to contribute after ſixty. From ſixty-five to ſeventy, each member is to receive a penſion of one ſhilling weekly; and from ſeventy to the end of their lives, two ſhillings weekly, even ſhould they be obliged to retire into a workhouſe. In caſe of ſickneſs, four ſhillings weekly are allowed for four months in one year, and two ſhillings afterwards. And if a member dies, after having ſubſcribed ſix years, thirty ſhillings are allowed for the funeral.

The honorary members, thinking themſelves entitled to riſk part of their own contributions, have authoriſed the ſtewardeſſes, at their diſcretion, to lend ſmall ſums, from five ſhillings to thirty, to the benefited members on ſuch occaſions as they may approve. Theſe loans are directed particularly to the enabling of them to purchaſe neceſſaries at the wholeſale price: or to ſupply themſelves with articles for ſale, materials for work, a pig, or any other thing, likely to produce a profit. Theſe loans are repaid in ſmall monthly payments.

Children of either ſex, of whatever age, whether belonging to a member or not, are permitted to bring any ſum above one penny, to the monthly meeting of the ſtewardeſſes, to be laid up in the fund of the ſociety; where their ſmall earnings may accumulate in ſecurity, till wanted for an apprentice fee, clothing on going to ſervice, or ſome ſuch important purpoſe; and in caſe of death, the ſum laid up is returned to the parents of the child.

The buſineſs of the ſociety is managed by ſix ſtewardeſſes and a treaſurer, who meet monthly. Four of the ſtewardeſſes are choſen from the honorary members, and two from the benefited members. Theſe offices are filled in alphabetical order at an annual meeting of the whole ſociety. It ſhould be added, that great attention is paid to the moral character of thoſe who are admitted members; and a notorious irregularity of conduct incurs expulſion.

In the formation of all charitable inſtitutions, the increaſe of virtue and happineſs to ſociety at large, ſhould be conſidered as the great object of attainment, and the fundamental principle of action: an end which, it is preſumed, the eſtabliſhment in queſtion is particularly adapted to promote, by the reciprocal advantages of rendering the affluent acquainted with the character and the moral conduct, the wants and the reſources, of the indigent; whence they become better qualified to afford them judicious relief, and to diſtinguiſh between the deſerving and the worthleſs.

The economy and the induſtry of the poor are encouraged by judicious loans, which enables them to buy articles of domeſtic conſumption, and coals eſpecially, on the moſt advantageous terms; or to provide materials for increaſing their means of ſubſiſtence; as it is well known to thoſe who are converſant with the affairs of the labouring claſſes, that it is much eaſier for them to ſpare a ſmall ſum at ſtated periods, than to lay down what is ſufficient for either purpoſe at once.

Though the children receive no addition to the pittance they depoſit in the fund, yet it anſwers ſeveral purpoſes.—It ſtimulates them to earn and ſave that which would probably be idly ſpent, as of too ſmall importance for care; it often encourages their parents to lay by a little ſtore for them, which they would not have thought of doing, had they not been invited by this opportunity of placing it in ſafety. It habituates the children to induſtry, frugality, and foreſight; and, by introducing them to notice, it teaches the value of character, and of the eſteem of thoſe who, by the diſpenſations of Providence, are placed above them; and, in many inſtances, it may ſupply a reſource, when it is eſſentially requiſite.

The ſucceſs has already ſucceeded expectation. Above ſixty children bring their little treaſure monthly; the benefited members repay their loans with great regularity: and there is a viſible emulation to eſtabliſh a good character by reſpectable conduct, and by a regard to propriety on the part of the poor; whilſt kind attention, and active ſympathy, are exerted on the part of the opulent.

At EMPINGHAM, near Stamford, in Rutlandſhire, the following *female friendly ſociety for girls* was eſtabliſhed on the 1ſt of January, 1798; and ſixteen girls were immediately admitted at the deſire of their parents.

Female children, capable of ſpinning, knitting, or of any other profitable employ, which in that neighbourhood has been conſiderably increaſed by the Society of Induſtry there, ſubſcribe to the general fund one halfpenny a-day out of their earnings. This is to be accumulated by compound intereſt, and to form a fund, out of which each ſubſcriber, upon her marriage, is, after a contribution of fourteen years, entitled to receive two guineas; and, upon the birth of each child born in wedlock eight months or more after the expiration of the fourteen years' contribution, the like ſum of two guineas.

Girls are not permitted to ſubſcribe until ſeven years of age; and, if any girl dies under twenty-one, or before the expiration of the fourteen years of her ſubſcription, the amount of her contribution, but without intereſt, is paid to her repreſentatives at the expiration of the current half-year*: and if any ſubſcriber, for fourteen years or upwards, continues unmarried till the age of fifty years, ſhe is then entitled to two guineas a-year for life.

---

* It is ſubmitted to conſideration, whether it might not be better that there ſhould be no repayment of the contribution in caſe of death: but that, inſtead of it, the period of contribution ſhould be proportionably ſhortened; ſo as to entitle the ſubſcriber to the donation, upon her marriage, after a contribution of ten or twelve (inſtead of fourteen) years.

An eſtabliſhment of this nature is only adapted to thoſe parts of England, in which the induſtry of the children of the poor has been, of late, ſo ſucceſsfully and beneficially excited: it is more peculiarly applicable to places where ſchools of induſtry, with a cheap dinner for the children (ſee SCHOOL, Supp.), are eſtabliſhed, as by Lord Winchelſea at Oakham, and by Mr. Conyers at Epping; for the miſtreſs may there, regularly and without any trouble, deduct the ſubſcriptions from their weekly pay. The probable conſequences of ſuch female friendly ſocieties are, that girls, ſo contributing *out of their own earnings* to a proviſion for their future life, will learn to ſet a higher value on their own characters, and will become examples of virtue and good conduct; and that, poſſeſſing the double advantage of a certain proviſional aſſiſtance at periods when it is peculiarly wanted by the poor, and of habits of exertion and economy inſenſibly acquired during their youth, they will become objects of attention to all the well-diſpoſed young men in the neighbourhood, and will be more likely to marry early, and to continue in a courſe of virtue and induſtry.

FRIESACH, a town of Germany, in the archbiſhopric of Saltzburg, with a ſtrong caſtle, on a mountain, 56 miles S.E. of Saltzburg. Long. 14. 12. E. Lat. 47. 12. N.

FRINWALT, a town of Germany in the margravate of Brandenburg, ſeated on the Oder, 30 miles N.E. of Berlin. Long 14. 10. E. Lat. 52. 50. N.

FRIO, CAPE, a promontory of Braſil, in the province of Rio Janeiro. Long. 41. 31. W. Lat. 92. 54. S.

FRISCH HAF, a long and narrow bay of the Baltic Sea, at the mouth of the Viſtula.

FRISCHEN HAF, a bay of the Baltic Sea, at the mouth of the Oder. It lies between Stetin and the Baltic, with which it communicates by three mouths. See ODER.

FRITHELSTOKE, a village in Devonſhire, two miles W. of Torrington, noted for the remains of its priory.

FRITZLAR, a town of Germany, in the landgravate of Heſſe Caſſel, 20 miles S.W. of Caſſel.

FRIULI, or CITTA DI FRIULI, a town of Italy, in the province of Friuli, with a biſhop's ſee, 32 miles N.N.W. of Trieſte. Long. 13. 50. E. Lat. 46. 15. N.

FRODLINGHAM, a town in the E. riding of Yorkſhire, with a market on Thurſday, 36 miles E. of York, and 194 N. of London. Long. 0. 12. W. Lat. 53. 56. N.

FROG, in farriery, a part of a horſe's foot, the form and purpoſes of which Mr. Coleman, Profeſſor at the Veterinary College, deſcribes in the following terms:

"The natural frog of the horſe," ſays he, "is placed in the centre of the ſole, externally convex, and of a wedge-like form, pointed towards the toe, but expanded as it advances to the heels. In the centre of the broad part there is a fiſſure, or ſeparation. The frog is connected internally, with another frog, of a ſimilar figure, but different in ſtructure. The external frog is compoſed of ſoft elaſtic horn, and totally inſenſible. The internal frog has ſenſation, and is much more elaſtic than the horny frog; and at the extremity of the heels is connected with two elaſtic ſubſtances called cartilages. The toe of the ſenſible frog is united to the coffin bone; but more than nine-tenths of both frogs are behind the coffin bone. The toe of the ſenſible and horny frogs, from their connection with the coffin bone, are fixed points, and have no motion; but the heels of the frogs being placed poſterior to the coffin bone, and in contact with moveable, elaſtic (and not fixed or reſiſting) ſubſtances, a very conſiderable lever is formed, and whenever the horny frog comes in contact with the ground, it firſt aſcends, and then deſcends. The preſſure of the ground alſo expands the horny frog, and the ſenſible frog expands the cartilages, and at the heels and quarters immediately below the hair, totally governs the direction of the future growth of the cruſt.

"This aſcent of the frog, not only by its wedge-like form preſerves the heels and quarters from contraction, but affords to the horſe an elaſtic ſpring, and prevents the animal from ſlipping whenever it embraces the ground. Without any anatomical enquiry into its internal ſtructure and union with other parts, the ſhape and convexity of the horny frog clearly demonſtrates that it was formed to come into contact with the ground; and the more I inveſtigate this ſubject, the more I am convinced that the uſe of the frog is to prevent the horſe from ſlipping, to preſerve the cartilages and hoof expanded, and, by its motion, to act as an elaſtic ſpring to the animal."

Mr. Coleman contends that Mr. St. Bel, and many others, who ſuppoſe that the uſe of the frog is merely *to ſerve as a cuſhion*, or guard, to the tendon of the flexor muſcle of the foot, and who, on that account, were diſpoſed rather to *raiſe the frog from the ground*, by a *thick-heel'd* ſhoe, have been in an error. On the contrary, he maintains it to be a law of nature, *that unleſs the frog perform its functions, by being allowed to preſs the ground, it muſt become diſeaſed.* Accordingly the practice of ſhoeing very much depends on the functions of the frog being underſtood. "If the opinions here advanced reſpecting its uſes, be well founded, then it muſt follow, that paring the frog and raiſing it from the ground annihilates its functions, and ultimately, if not immediately, produces diſeaſe; and that expoſing the frog to preſſure, is the only proper method to keep it in health. Moreover, it has from experience been aſcertained, that unleſs the frog ſuſtain an uniform preſſure *when at reſt*, the heels as well as the frog contract; but if that organ be in cloſe contact with the ground, then it ſpreads and is free from thruſhes and canker, and operates as a wedge to keep open the heels of the hoof.

"Granite and other hard ſubſtances, give no pain to a frog expoſed to conſtant preſſure *in the ſtable*; but when above the pavement, it generally becomes *contracted*, and the ſenſible frog inflamed, and then one ſtroke from a projecting ſtone, will produce pain, perhaps lameneſs, while perpetual perpendicular preſſure is attended with ſalutary effects.

"When the hoof contracts, the frog muſt alſo become contracted, and inflammation and a ſuppuration follow, called a *thruſh*. No contraction, however, takes place, where the frog is made to receive conſtant preſſure, as the ſtanding perpetually on that wedge increaſes its growth, preſſes upward the ſenſible frog, and expands the cartilages of the hoof. And as the firſt ſhoot of the cruſt at the coronet is very thin, the direction of its fibres will be altogether regulated by the width of the cartilages immediately below the hair at the quarters and heels, and the cartilages will be always more or leſs expanded, and the hoof more or leſs circular, as the frog has more or leſs preſſure.

"On that principle," continues Mr. Coleman, "I long ſince recommended a ſhoe with *thin heels*, as the beſt formed ſhoe to bring the frog on the ſame level; and with great truth I can aſſert, that, although in ſome inſtances, from a ſudden miſapplication of the thin-heel'd ſhoe to improper feet, I have ſeen the tendons affected, yet from all the experience I have ſince had, and from all that I have ſeen or heard of the practice of others, I know of no inſtance where *the frog*, from conſtant preſſure, did not expand and receive great benefit.

"Where the frog is in a morbid ſtate, and unnaturally deprived of perpendicular preſſure, it is ſeldom ſafe to lower the heels at once, ſo as to make the frog on a level with the ſhoe; and, in many caſes, it is not poſſible, with any ſhoes, or even without ſhoes, to give the frog preſſure on ſmooth ſurfaces;

much leſs is it practicable for the frog to reſt on the ground when ſhod with common thick-heel'd ſhoes. In the ſtable, therefore, while at reſt, the frog is generally raiſed above the ſhoe, and as preſſure is eſſential to its health, particularly when the hoof is expoſed to heat, it appeared to me of great importance, in all caſes where the heels of the ſhoe and the frog cannot with ſafety be made on the ſame level, to apply *an artificial frog* (ſee Pl. 31.), to fit and give any degree of preſſure, in the ſtable, to the natural frog, with any ſhoes. While the horſe is in motion, and the hoof expoſed to unequal ſurfaces, the artificial frog ſhould be removed, as the natural frog, out of the ſtable, will receive frequent preſſure with any ſhoes; but that period is of ſhort duration, when compared to the length of time the horſe remains at reſt, and the frog raiſed from the ground.

" Artificial preſſure is moſt particularly wanted when the heat of the ſtable operates powerfully to contract the hoof. *In all caſes, therefore, where the pavement of the ſtable does not touch the natural frog, an artificial frog is neceſſary to reſiſt contraction* of the hoof, thruſhes, and canker. Sand-cracks, alſo, very generally ariſe from a contracted hoof, and may be prevented by the artificial frog.

" If the frog does not abſolutely reſt on the pavement, whatever ſhoes are employed, the hoof in the ſtable will be as much diſpoſed to contract, as if the frog was raiſed any greater diſtance. I wiſh this fact to be well conſidered; for it has been ſuppoſed that ſhoes with a flat ſeat, without preſſure to the frog, will prevent contraction. But I am fully convinced that neither thick nor thin heeled ſhoes, *where the frog is raiſed above preſſure, and expoſed to the heat of the ſtable*, can prevent contraction, or its effects; and where the frog receives that preſſure, the heels cannot contract even with the moſt common ſhoes. For very obvious mechanical reaſons, a wedge in the centre of the heels, aided by the preſſure from below, muſt be beſt calculated to preſerve them expanded, or when the heels are contracted, to force them open. The heat of the ſtable in all caſes tends to contraction of the hoof; but with common ſhoes, there is no preſſure on the wedge, or other cauſe to counteract that tendency. The artificial frog, which is intended to cover and give any degree of preſſure to the natural frog only, is made of iron. In order to fit the natural frog, it is requiſite to aſcertain its width, the length of the foot, and the diſtance between the lower ſurface of the ſhoe and the frog. But if the artificial frog be too long, the toe, which is flat and thin, may be ſhortened; and if the heels of the ſhoe are higher than the artificial frog, nothing more is requiſite than to introduce a quantity of tow between the natural and artificial frog, ſo as to raiſe it equal or above the level of the ſhoe. I have aſcertained by experiment, that no inconvenience takes place by raiſing the artificial frog even one quarter of an inch above the ſhoe; but in ordinary caſes, it ſhould not project more than one-ſixth of an inch above the ſurface of the ſhoe. It may, however, be imagined, that ſo much perpendicular preſſure to the frog would *retard rather than increaſe its growth*. But the very reverſe is the fact: for as the frog, when long elevated above the ground, is very generally contracted, this unnatural lateral preſſure excites inflammation of the ſenſible frog, and deprives in a great degree the blood veſſels of the power of ſecreting horn. When the horny frog is expoſed to a perpendicular preſſure, it gives health, and not diſeaſe, to the ſenſible frog. The blood veſſels ſecrete their due proportion of elaſtic horn, and then the cavity of the frog is preſerved, expanded, and fully equal to contain the ſenſible frog, without the ſmalleſt degree of lateral preſſure.

" It therefore follows, that perpendicular preſſure increaſes the bulk of the frog; while its abſence from the ground produces contraction, and leſſens its growth."

The following is an explanation of the plate in which Mr. Coleman's PATENT ARTIFICIAL FROG is repreſented, with other figures that illuſtrate the ſubject.

Fig. 1, exhibits a view of the natural hoof of the horſe, which is of a circular ſhape.

a a a The external ſurface of the ſole of a concave form.
b b b The inferior edge of the cruſt.
c c The junction of the bars with the cruſt.
d d The points of the bars.
e e The ſole between the heels of the cruſt and bars, the ſeat of corns.
f f Two cavities between the ſides of the bars and the ſides of the cruſt.
g The toe of the frog.
h h The heels of the frog.
i i The cleft between the heels of the frog, the ſeat of thruſhes.

Fig. 2. A view of the hoof with contracted heels, occaſioned by raiſing the frog above the preſſure of the pavement in the ſtable.

a a a The ſole.
b b The original ſeat of the bars, but improperly removed by the farrier.
c c The original ſeat of the cavities between the bars and cruſt, but now from contraction a ſolid horn.
d d The heels of the frog very much compreſſed, by the contraction of the hoof.
e e The width of the hoof at the heel, not being more than one half of the length from *f* to *g*.
f The extremity of the heels of the frog.
g The toe of the cruſt.

Fig. 3. The patent frog, made of caſt and wrought iron.

a a The lower ſurface oppoſite the ground, formed of caſt-iron.
b An irregular cavity for the reception of the elaſtic ſpring, fig. 4.
c The toe of the patent frog, formed of wrought iron, to be occaſionally ſhortened and adapted to the length of the foot, and placed under the toe of the ſhoe to confine the artificial frog from moving forwards.
d d A hole in the heels of the iron frog, for the paſſage of a ſtrap, to buckle at the outſide quarter or coronet.

Fig. 4. A flat ſteel ſpring to fix the artificial frog in its place.

a An irregular projection, to be received into a correſponding concavity in the patent frog.
b b The ends of the ſpring, to be placed under the heels of the ſhoe oppoſite *c c* in fig. 1.

" The toe of the artificial frog is intended to be inſerted under the toe of the ſhoe. This effectually fixes the frog forwards; and to prevent backward or lateral motion, an irregular groove is made in the iron frog, to receive a correſponding piece of ſteel, placed under the heels of the ſhoe. In general it is neceſſary to fix the frog more firmly, and, for that purpoſe, a hole is neceſſary, made in the heel of the artificial frog, to receive a ſtrap, and to buckle at the outſide quarter below the coronet. And that the artificial frog may give preſſure in all caſes with ſhoes thickened, or turned up for hunting or froſt, a variety of frogs are made, to be adapted to particular feet and particular ſhoes. In caſes of thruſhes and canker of the frog, where no remedies without preſſure are likely to be ſerviceable, an aſtringent thruſh powder may be applied between the natural and artificial frog. And in contracted hoofs (or what has improperly been termed chest

foundered), where it may not be advifable to lower the heels equal with the horny frog, the artificial frog is eſſentially neceſſary. But indeed in every horſe where the ſhoe and frog on a ſmooth ſurface are not on the ſame level, whatever ſhoes may be uſed, the iron frog in the ſtable ſhould be applied; and in order to fix it with facility, the ſpring ſhould firſt be laced under the ſhoe and brought backward to the heels of the hoof.

"The toe of the iron frog ſhould then be inſerted under the centre of the ſpring, and puſhed as far as the toe of the ſhoe, while the other hand confines the ſpring until the centre of the ſpring meets the centre of the groove. The ſtrap may then be buckled. And to diſlodge the ſpring and iron frog, after the ſtrap is unbuckled, nothing more is requiſite than a *ſmall* horſe picker, introduced into a hole at the bottom of the groove of the iron frog; and the ſpring being raiſed above the groove and carried gently forward, the frog may be withdrawn from under the ſhoe without the ſmalleſt difficulty."

Mr. Coleman, in concluſion, wiſhes it to be clearly underſtood, "*that in all caſes where the frog and the heels of the ſhoe are placed on the ſame level, the patent frog is unneceſſary.* But where the frog is ſmall, or the paſtern joint long, or the action of the animal high, or the heels low, ſo as to render the application of thin-heel'd ſhoes improper, or when the frog from any cauſe is raiſed above the ground in the ſtable, an artificial frog is uſeful in all ſuch caſes, and neceſſary to reſiſt contraction of the hoof." To this equally ingenious and candid ſtatement of Mr. Coleman, we are enabled to add our individual teſtimony as to the ſoundneſs of his reaſoning, and the great practical utility of his *artificial frog*, which is now very generally adopted in the ſtables of perſons of faſhion in the united kingdom.

FRONSAC, a town of France, in the department of Gironde, ſeated on the Dordogne, 22 miles N.E. of Bourdeaux. Long. 0. 16. W. Lat. 45. 5. N.

FRONTEIRA, a town of Portugal, in Alentejo, 17 miles N.E. of Eſtremos.

FRUTINGEN, a town of Swiſſerland, in the canton of Bern, which gives name to a bailiwic, and is eſteemed one of the moſt beautiful places in Swiſſerland. It is 30 miles S.E. of Friburg.

FUEL (*Encycl.*). The economy of fuel is an object of ſo much importance to the community at large, and more eſpecially to the indigent members of it, that we are truly glad of this opportunity of laying before our readers the following obſervations relative to the Means of increaſing the Quantities of Heat obtained in the Combuſtion of Fuel, by Count Rumford, from the Journals of the Royal Inſtitution of Great Britain.

"It is a fact which has been long known," ſays the Count, "that clays, and ſeveral other incombuſtible ſubſtances, when mixed with ſea coal, in certain proportions, cauſe the coal to give out more heat in its combuſtion than it can be made to produce when it is burnt pure or unmixed; but the cauſe of this increaſe of heat does not appear to have been yet inveſtigated with that attention which ſo extraordinary and important a circumſtance ſeems to demand.

"Daily experience teaches us that all bodies—thoſe which are incombuſtible, as well as thoſe which are combuſtible, and actually burning—throw off, in all directions, heat, or rather calorific (heat-making) rays, which generate heat wherever they are ſtopped, or abſorbed; but common obſervation was hardly ſufficient to ſhew any perceptible difference between the quantities of calorific rays thrown off by different bodies, when heated to the ſame temperature, or expoſed in the ſame fire; although the quantities ſo thrown off might be, and probably are, very different.

"It has lately been aſcertained, that when the ſides and back of an open chimney fire-place, in which coals are burned, are compoſed of fire-bricks, and heated red hot, they throw off into the room incomparably more heat than all the coals that could poſſibly be put into the grate, even ſuppoſing them to burn with the greateſt poſſible degree of brightneſs. Hence it appears that a red-hot burning coal does not ſend off near ſo many calorific rays as a piece of red-hot brick or ſtone, of the ſame form and dimenſions; and this intereſting diſcovery will enable us to make very important improvements in the conſtruction of our fire-places, and alſo in the management of our fires.

"The fuel, inſtead of being employed to heat the room *directly*, or by the direct rays from the fire, ſhould be ſo diſpoſed, or placed, as *to heat the back and ſides of the grate*; which muſt always be conſtructed of fire-brick or fire-ſtone, and *never of iron, or of any other metal.* Few coals, therefore, when properly placed, make a much better fire than a large quantity; and ſhallow grates, when they are conſtructed of proper materials, throw more heat into a room, and with a much leſs conſumption of fuel, than deep grates; for a large maſs of coals in the grate arreſts the rays which proceed from the back and ſides of the grate, and prevents their coming into the room; or, as fires are generally managed, it prevents the back and ſides of the grate from ever being ſufficiently heated to aſſiſt much in heating the room, even though they be conſtructed of good materials, and large quantities of coals conſumed in them.

"It is poſſible, however, by a ſimple contrivance, to make a good and an economical fire in almoſt any grate, though it would always be adviſable to conſtruct fire-places on good principles, or to improve them by judicious alterations, rather than to depend on the uſe of additional inventions for correcting their defects.

"To make a good fire in a bad grate, the bottom of the grate muſt be firſt covered with a ſingle layer of balls, made of good fire-bricks, or artificial fire-ſtone, well burnt, each ball being perfectly globular, and about $2\frac{1}{2}$ or $2\frac{3}{4}$ inches in diameter. On this layer of balls the fire is to be kindled, and, in filling the grate, more balls are to be added with the coals that are laid on; care muſt, however, be taken in this operation to mix the coals and the balls well together, otherwiſe, if a number of the balls ſhould get together in a heap, they will cool, not being kept red-hot by the combuſtion of the ſurrounding fuel, and the fire will appear dull in that part; but if no more than a due proportion of the balls are uſed, and if they are properly mixed with the coals, they will all, except it be thoſe perhaps at the bottom of the grate, become red-hot, and the fire will not only be very beautiful, but it will ſend off a vaſt quantity of radiant heat into the room; and will continue to give out heat for a great length of time. It is the opinion of ſeveral perſons who have for a conſiderable time practiſed this method of making their fires, that more than one-third of the fuel uſually conſumed may be ſaved by this ſimple contrivance. It is very probable that, with careful and judicious management, the ſaving would amount to one-half, or fifty *per cent.*

"As theſe balls, made in moulds, and burnt in a kiln, would coſt very little, and as a ſet of them would laſt a long time—probably ſeveral years—the ſaving of expence in heating rooms by chimney fires, with bad grates in this way, is

obvious; but ſtill it ſhould be remembered, that a ſaving quite as great may be made by altering the grate, and making it a good fire-place.

" In uſing theſe balls, care muſt be taken to prevent their accumulating at the bottom of the grate: as the coals go on to conſume, the balls mixed with them will naturally ſettle down towards the bottom of the grate, and the tongs muſt be uſed occaſionally to liſt them up; and, as the fire grows low, it will be proper to remove a part of them, and not to replace them in the grate till more coals are introduced:—a little experience will ſhew how a fire made in this manner can be managed to the greateſt advantage, and with the leaſt trouble.

" Balls, made of pieces of any kind of well-burnt hard brick, though not equally durable with fire-brick, will anſwer very well, provided they be made perfectly round; but if they are not quite globular their flat ſides will get together, and, by obſtructing the free paſſage of the air amongſt the coals, will prevent the fire from burning clear and bright.

" The beſt compoſition for making theſe balls, when they are formed in moulds, and afterwards dried and burnt in a kiln, is pounded crucibles mixed up with moiſtened Sturbridge clay; but good balls may be made with any very hard burnt common bricks, reduced to a coarſe powder, and mixed with Sturbridge clay, or even with common clay. The balls ſhould always be made ſo large as not to paſs through between the front bars of a grate.

" Theſe balls have one advantage, which is peculiar to them, and which might perhaps recommend the uſe of them to the curious, even in fire-places conſtructed on the beſt principles; they cauſe the cinders to be almoſt conſumed entirely; and even the very aſhes may be burnt, or made to diſappear, if care be taken to throw them repeatedly upon the fire when it burns with an intenſe heat. It is not difficult to account for this effect in a ſatisfactory manner; and in accounting for it we ſhall explain a circumſtance on which it is probable that the great increaſe of the heat of an open fire, where theſe balls are uſed, may, in ſome meaſure, depend. The ſmall particles of coal, and of cinder, which, in a common fire, fall through the bottom of the grate, and eſcape combuſtion, when theſe balls are uſed can hardly fail to fall and lodge on ſome of them; and, as they are intenſely hot, theſe ſmall bodies, which alight upon them in their fall, are ſoon heated red-hot, and diſpoſed to take fire and burn; and as freſh air from below the grate is continually making its way upwards amongſt the balls, every circumſtance is highly favourable to the rapid and complete combuſtion of theſe ſmall inflammable bodies. But if theſe ſmall pieces of coal and cinder ſhould, in their fall, happen to light upon the metallic bars which form the bottom of the grate—as theſe bars are conductors of heat, and, on account of that circumſtance, as well as of their ſituation—*below* the fire—never can be made very hot—any ſmall particle of fuel that happens to come into contact with them, not only cannot take fire, but would ceaſe to burn ſhould it arrive in a ſtate of actual combuſtion.

" Theſe facts are very important, and well deſerving of the attention of thoſe who may derive advantage from the improvement of fire-places, and the economy of fuel.

" There are ſome circumſtances which ſtrongly indicate that an admixture of incombuſtible bodies with fuel, and eſpecially with coal, cauſe an increaſe of the heat, even when the fuel is burnt in a cloſed fire-place. No fire-place can well be contrived more completely cloſed than thoſe of the iron ſtoves in common uſe in the Netherlands; but, in theſe ſtoves—which are heated by coal fires—a large proportion of wet clay is always coarſely mixed with the coal before they are introduced into the fire-place. If this practice had not been found to be uſeful, it would certainly never have been obtained generally; nor would it have been continued, as it has been, for more than two hundred years.

" The combination of different ſubſtances, combuſtible and incombuſtible, to form, artificially, various kinds of cheap and pleaſant fuel, particularly adapted for the different proceſſes in which the fuel is employed, is a ſubject well worthy the attention of enterpriſing and ingenious men. How much excellent fuel, for inſtance, might be made with proper additions, and proper management, of the mountains of refuſe coal-duſt that lie uſeleſs at the mouths of coal-pits; and how much would it contribute to cleanlineſs and elegance, if the uſe of improved coke, or of hard and light fire-balls, could be generally introduced in our houſes and kitchens, inſtead of crude, black, powdery, dirty ſea-coal? Of the great economy that would reſult from ſuch a change there cannot be the ſmalleſt doubt.

" It is a melancholy truth, but, at the ſame time, a moſt undiſputable fact, that, while the induſtry and ingenuity of millions are employed, with unceaſing activity, in inventing, improving, and varying thoſe ſuperfluities which wealth and luxury introduce into ſociety, no attention whatever is paid to the improvement of thoſe common neceſſaries of life on which the ſubſiſtence of all, and the comforts and enjoyments of the great majority of mankind, abſolutely depend.

" Much will be done for the benefit of ſociety," adds this truly patriotic philoſopher, " if means can be deviſed to call the attention of the active and benevolent to this long-neglected, but moſt intereſting ſubject." Till this, however, is effectually done, we think it of conſequence to ſhew what has been attempted in certain parts of the kingdom by way of ſupplying the poor with fuel, and inſtructing them in the economical and beneficial uſe of it. The following is an extract from an account of a proviſion made upon an incloſure, for ſupplying the poor with fuel, by Edward Parry, Eſq.

" Upon the incloſure of the pariſh of Little Dunham in the county of Norfolk, in the year 1794," ſays Mr. Parry, " being lord of the manor, I got a clauſe inſerted, directing the commiſſioners to ſet out a parcel of land, to be called '*the poor's eſtate*,' and to be veſted in the lord of the manor, rector, churchwardens, and overſeers of the poor for the time being, and to be let by them for 21 years on leaſe; the rents and profits to be laid out by them on fuel, to be delivered at the cottages of the poor, in ſuch proportions as the truſtees ſhould think proper.

" Although the prejudices of the poor, againſt the incloſure, were very great before it took place, the moment they ſaw the land incloſed, and let as *the poor's eſtate* for 21 years by auction, at the rate of 50l. a-year (although only eſtimated by the commiſſioners at 20l. a-year), they were highly gratified; and they have indeed great reaſon to rejoice, being now moſt amply ſupplied with that great comfort of life. This has been ſo apparent, that ſome neighbouring incloſures have followed the example, and it appears to me adviſable, that ſuch a plan ſhould be generally made known.

" The firſt idea was to ſell the land, and place the money in the public funds, in order to produce a larger income; but I found that was not underſtood by the poor: they ſaid, they might at any time be deprived of the money, and they had no intereſt in the land incloſed; whereas, in the mode purſued, they conſidered themſelves as having a permanent and improveable eſtate, which their children would inherit. Theſe prejudices are valuable; as in their conſequences they produce, if attended to, induſtry and content.

" I have had occaſion to obſerve as to fuel, which is certainly an important article to the poor, that, where there are commons, the ideal advantage of cutting flags, peat, or

whins, often cauſes a poor man to ſpend more time in procuring ſuch fuel, than, if he reckoned his labour, would purchaſe for him double that quantity of good firing."

An account of a proviſion of fuel for the poor at Lower Winchendon, by Scrope Bernard, eſq. appears, with the foregoing, in the Reports of the Society for bettering the Condition of the Poor, &c.

"There having been," ſays Mr. Bernard, "ſeveral proſecutions at the Ayleſbury quarter ſeſſions, for ſtealing fuel laſt winter, I was led to make ſome particular enquiries, reſpecting the means which the poor at Lower Winchendon had of providing fuel. I found that there was no fuel then to be ſold within ſeveral miles of the place; and that, amid the diſtreſs occaſioned by the long froſt, a party of cottagers had joined in hiring a perſon, to fetch a load of pit-coal from Oxford, for their ſupply. In order to encourage this diſpoſition to acquire fuel in an honeſt manner, and to induce the poor to burn coal inſtead of wood, in a country very bare of the latter article, a preſent was made to all this party (eight families in number) of as much more coal as they had purchaſed, and the carriage of the like quantity was further allowed them free of expence.—Having no grates, they had employed the village blackſmith to tack together a few iron bars by an iron rim at each end, which when raiſed above the hearth by looſe bricks, enabled them to keep up a good fire. I went to ſee one of thoſe grates: it was a foot ſquare, quite flat, and had been made out of an old ſcythe by the blackſmith, at the expence of one ſhilling.—In this manner ſome of the pooreſt families in the village got through the laſt hard winter. But they complained of the want of faggots to light their fires, which were not to be obtained by honeſt means. To remedy this, againſt the next winter, I had three waggon loads of the ſmall faggots called kindlers, made up from a fall of beechwood, in the Chiltern country, ten miles off, and brought to Winchendon in the ſummer ſeaſon. And as, in September, from the ſtate of the harveſt, it was foreſeen that it would be a trying winter for the poor, a veſtry was called, and it was propoſed to them, as one mode of relief, that they ſhould allow the poor the carriage of a limited portion of coal; which was then ſold at 1*s.* 4*d.* the hundred, at the Oxford wharf. At the ſame time they were informed that eleven hundred faggots were provided out of the Chiltern woods, as kindlers, to aſſiſt ſuch a plan; which it was intended to ſell, much under the real value, at a penny a piece. This plan was agreed to, and the neceſſary quantity ordered to be fetched at the charge of the pariſh. A few tons were fetched before the froſt ſet in, and were diſtributed at 1*s.* 4*d.* per hundred weight, with three kindlers to every hundred weight of coals, by a perſon reſiding in the centre of the pariſh; each family applying took a moderate quantity, ſuch as might be ſuppoſed to contribute to their comfort, without trenching on their means of ſubſiſtence. The price of coals at Oxford had in the interim riſen beyond what is here ſtated; but no alteration was made in the retail price on that account; the increaſe being defrayed out of a donation, which had been made at Chriſtmas, applicable to this charity. The expence of diſtribution, at 10*d.* per ton, was alſo paid out of the ſame fund. It had been ſaid that the poor would not find money to purchaſe them, when they were brought: inſtead of which, out of 35 poor families belonging to the pariſh, 29 came with ready money, huſbanded out of their ſcanty means, to profit with eagerneſs of this attention to their wants; and among them a perſon who had been lately impriſoned by his maſter for ſtealing wood from his hedges. The ſix, who did not purchaſe, were, as I learnt upon inquiry, prevented by ſome particular circumſtances, which rendered the ſupply unneceſſary.

"In this manner 29 poor families, conſiſting of 110 poor perſons, are ſupplied during the preſent ſeaſon with fuel, at an expence to the pariſh, aided by voluntary charity, of about three guineas per month; being the charge for carriage, diſtribution, and occaſional exceſs of price: the average wharf price of the article, which for the ſame period was leſs than five guineas, being paid by the poor themſelves, with thankfulneſs for the advantage which they derived from this mode of purchaſe.

"I have been the more particular in this detail, becauſe it exhibits, though on a ſmall ſcale, an inſtance of uniting pariſh relief with private ſubſcription, ſo as to lighten the weight of both; and I think it may ſometimes be convenient that they ſhould go hand in hand. At Whitchurch, in this county, the ſame kind of charity was eſtabliſhed laſt winter. It now continues by a private ſubſcription of between 17*l.* and 20*l.* for that object, during the ſeaſon: but one or two of the moſt opulent declined contributing; and though diſburthened of a part of the expence of the poor, ſhrunk from the duty of aiding ſuch a plan, becauſe it was voluntary.—In order therefore to prevent the covetous from entirely eſcaping, it ſeems to be beſter, where it can be adopted as the unanimous act of the pariſh, or where the manner of doing it can be made conſiſtent with the poor laws, that the foundation ſhould be laid by the pariſh in an allowance, as far as they think proper to go; and that the voluntary charity of individuals ſhould be grafted on that ſtock, for the purpoſe of effecting a further reduction of the price.

"I have often wiſhed to bring coal into general uſe at Winchendon; the poor however being jealous of any ſchemes, under the impreſſion that they are more calculated for the benefit of others, than of themſelves, and the farmer not being very fond of new expences, I had judged the attempt to be vain. But the circumſtances above recited having led both parties to make a trial, I believe that the one finds a great addition of comfort, and the other no great increaſe of expence.

"The attempt to introduce proper chimneys into cottages in this neighbourhood, inſtead of the preſent ſpacious and airy ones with ſeats in the corner, has met with conſtant reſiſtance; nor is it to be expected that any impreſſion will be made on the poor inhabitants, till they have had full opportunity of aſcertaining, by obſervation and experience, the comforts and advantages of chimneys on a different conſtruction. In the hope of effecting this change in their opinions, two cottage chimneys, on Count Rumford's * principles, are now building in this village.

---

* It is rather unfortunate for the public that the *pretended improvements of Count Rumford's grates*, ſo pompouſly announced by different ironmongers, are chiefly calculated to increaſe the expence, and to diminiſh the effect, of his uſeful invention. When the reader viſits the Royal Inſtitution, he will ſee that the new grates put up there are very cheap, and have as little iron as poſſible about them, and that *the fire always burns againſt fire bricks:* the back and ſides of the grate being compoſed of brick, which throws out heat in greater quantity, and is not ſubject to the diſagreeable ſmell and bad effects of heated iron. In thoſe ſhops *where theſe improvements are carried on to the greateſt perfection*, they will find nothing left of the benefit of Count Rumford's original invention, except the narrow throat to the chimney; and even that is not always preſerved. The diſtinguiſhing features are—an abundance of poliſhed ſteel,—as much iron as can be uſed on every ſide of the fire,—and a very liberal accumulation of expence.

" If we wiſh effectually to prevent the poor from ſtealing wood, and from ſimilar acts of theft, it ſhould be our firſt aim to put it perfectly in their power to obtain on fair terms the articles neceſſary to their exiſtence. When the means of life and the acquiſition of food and fuel are beyond the attainment of the *induſtrious* labourer, the inducement to guilt, and to invading the ſtore of his neighbour, become ſo powerful, as to put the virtue and integrity of the poor man to a very ſevere trial.—Perſons enjoying the ſuperior advantages of education, with minds formed to habits of honour and virtue, may feel confident in their own powers of forbearance, even under ſuch circumſtances: but it will not follow that it is either wiſe, or juſt, to expoſe the cottager to ſo great a temptation. Where the option is not given them of acquiring in an honeſt manner, and in exchange for the produce of their labour, the indiſpenſable neceſſaries of exiſtence (and ſuch is fuel in this northern climate), however we may condemn any crime which may follow, we have no great reaſon to be ſurpriſed at ſuch a reſult; nor perhaps ought we to conſider ourſelves as entirely exempt from a ſhare in the guilt."

FUEN-TCHEOU-FOU, a commercial city of China, in the province of Chang-ſi. Its baths and ſprings, almoſt as hot as boiling water, attract a great number of ſtrangers. Its diſtrict contains one city of the ſecond, and ſeven of the third claſs. It is ſeated on the Fuen-ho, 250 miles S.W. of Pekin.

FUENTE DUEGNA, a town of Spain, in New Caſtile, ſeated on the Tajo, 35 miles S.E. of Madrid. Long. 3. 0. W. Lat. 40. 14. N.

FUENTE GINALDO, a town of Spain, in Eſtremadura. In 1734 it was taken and plundered by the Portugueſe, under the marquis das Minhas. It is 16 miles N.W. of Coria.

FUESEN, a town of Suabia, belonging to the biſhop of Augſburgh, with an ancient caſtle. It is ſeated on the Leech, 50 miles S. by E. of Augſburg. Long. 11. 15. E. Lat. 47. 40. N.

FUIDENTALL, a town of Sileſia, in the duchy of Troppaw, taken by the king of Pruſſia in 1741 and 1744. It is ſeated near the Mohra, 16 miles W. by S. of Troppaw.

FULA, or THULE, one of the Shetland Iſlands, W. of Mainland. It is thought by ſome to be the ſame which the ancients reckoned the ultimate limit of the habitable globe, and to which, therefore, they gave the appellation of ultima Thule. It is doubtful, however, whether this be really the iſland ſo called; becauſe, had the ancients reached it, they muſt have ſeen land ſtill further to the N.E.; Mainland, Yell, and Unſt, being all further N.

FULMINATION *(Encycl.)*. Under the head of DETONATION, &c. we have given an account of the ſubſtances heretofore known to produce this extraordinary effect. We ſhall here add the highly curious Obſervations on a new fulminating Mercury, by EDWARD HOWARD, Eſq. F.R.S. publiſhed in the Tranſactions of the Royal Society of London.

I. The mercurial preparations which fulminate, when mixed with ſulphur, and gradually expoſed to a gentle heat, are well known to chemiſts: they were diſcovered, and have been fully deſcribed, by Mr. Bayen*.

" MM. Brugnatelli and Van Mons have likewiſe produced fulminations by concuſſion, as well by nitrate of mercury and phoſphorus as with phoſphorus and moſt other nitrates†. Cinnabar likewiſe is amongſt the ſubſtances which, according to MM. Fourcroy and Vauquelin, detonate by concuſſion with oxymuriate of potaſh‡.

" Mr. Ameilon had, according to Mr. Berthollet, obſerved, that the precipitate obtained from nitrate of mercury, by oxalic acid, fuſes with a hiſſing noiſe §.

II. " But mercury, and moſt if not all its oxides, may, by treatment with nitric acid and alcohol, be converted into a whitiſh cryſtallized powder, poſſeſſing all the inflammable properties of gun-powder, as well as many peculiar to itſelf.

" I was led to this diſcovery by a late aſſertion, that hydrogen is the baſis of the muriatic acid; it induced me to attempt to combine different ſubſtances with hydrogen and oxygen. With this view I mixed ſuch ſubſtances with alcohol and nitric acid as might (by prediſpoſing affinity) favour as well as attract an acid combination of the hydrogen of the one, and the oxygen of the other. The pure red oxide of mercury appeared not unfit for this purpoſe; it was therefore intermixed with alcohol, and upon both, nitric acid was affuſed. The acid did not act upon the alcohol ſo immediately as when theſe fluids are alone mixed together, but firſt gradually diſſolved the oxide: however, after ſome minutes had elapſed, a ſmell of ether was perceptible, and a white denſe ſmoke, much reſembling that from the *liquor fumans* of LIBAVIUS, was emitted with ebullition. The mixture then threw down a dark coloured precipitate, which by degrees became nearly white. This precipitate I ſeparated by filtration; and, obſerving it to be cryſtallized in ſmaller acicular cryſtals, of a ſaline taſte, and alſo finding a part of the mercury volatilized in the white fumes, I muſt acknowledge I was not altogether without hopes that muriatic acid had been formed, and united to the mercurial oxide; I therefore, for obvious reaſons, poured ſulphuric acid upon the dried cryſtalline maſs, when a violent effervescence enſued, and, to my great aſtoniſhment, an exploſion took place. The ſingularity of this exploſion induced me to repeat the proceſs ſeveral times; and finding that I always obtained the ſame kind of powder, I prepared a quantity of it, and was led to make the ſeries of experiments which I ſhall have the honour to relate in this paper.

III. " I firſt attempted to make the mercurial powder fulminate by concuſſion; and for that purpoſe laid about a grain of it upon a cold anvil, and ſtruck it with a hammer, likewiſe cold: it detonated ſlightly, not being, as I ſuppoſe, ſtruck with a flat blow; for, upon uſing three or four grains, a very ſtunning diſagreeable noiſe was produced, and the faces both of the hammer and the anvil were much indented.

" Half a grain, or a grain, if quite dry, is as much as ought to be uſed on ſuch an occaſion.

" The ſhock of an electrical battery, ſent through five or ſix grains of the powder, produces a very ſimilar effect: it ſeems, indeed, that a ſtrong electrical ſhock generally acts on fulminating ſubſtances like the blow of a hammer. Meſſrs. Fourcroy and Vauquelin found this to be the caſe with all their mixtures of oxymuriate of potaſh.

" To aſcertain at what temperature the mercurial powder explodes, two or three grains of it were floated on oil, in a capſule of leaf tin; the bulb of a Fahrenheit's thermometer was made juſt to touch the ſurface of the oil, which was then gradually heated till the powder exploded, as the mercury of the thermometer reached the 368th degree.

† Annales de Chimie, Tom. XXVII. p. 74 and 79.

‡ Ibid. Tom. XXI. p. 238.

§ This fact has been miſrepreſented in the introduction to a work entitled, The chemical Principles of the metallic Arts. by W. Richardſon, ſurgeon, F.A.S. page 57.

IV. "Deſirous of comparing the ſtrength of the mercurial compound with that of gunpowder, I made the following experiment in the preſence of my friend Mr. Abernethy.

"Finding that the powder could be fired by flint and ſteel, without a diſagreeable noiſe, a common gunpowder proof, capable of containing eleven grains of fine gunpowder, was filled with it, and fired in the uſual way: the report was ſharp, but not loud. The perſon who held the inſtrument in his hand felt no recoil; but the exploſion laid open the upper part of the barrel, nearly from the touch-hole to the muzzle, and ſtruck off the hand of the regiſter, the ſurface of which was evenly indented, to the depth of 0,1 of an inch, as if it had received the impreſſion of a punch.

"The inſtrument uſed in this experiment being familiarly known, it is therefore ſcarcely neceſſary to deſcribe it: ſuffice it to ſay, that it was of braſs, mounted with a ſpring-regiſter, the moveable hand of which cloſed up the muzzle, to receive and graduate the violence of the exploſion. The barrel was half an inch in caliber, and nearly half an inch thick, except where a ſpring of the lock impaired half its thickneſs.

V. "A gun, belonging to Mr. Keir, an ingenious artiſt of Camden-Town, was next charged with 17 grains of the mercurial powder, and a leaden bullet. A block of wood was placed at about eight yards from the muzzle, to receive the ball, and the gun was fired by a tuſe. No recoil ſeemed to have taken place, as the barrel was not moved from its poſition, although it was in no ways confined. The report was feeble: the bullet, Mr. Keir conceived, from the impreſſion made upon the wood, had been projected with about half the force it would have been by an ordinary charge, or 68 grains, of the beſt gunpowder. We therefore re-charged the gun with 34 grains of the mercurial powder; and, as the great ſtrength of the piece removed any apprehenſion of danger, Mr. Keir fired it from his ſhoulder, aiming at the ſame block of wood. The report was like the firſt in ſection four, ſharp, but not louder than might have been expected from a charge of gunpowder. Fortunately Mr. Kier was not hurt, but the gun was burſt in an extraordinary manner. The breech was what is called a patent one, of the beſt forged iron, conſiſting of a chamber, 0,4 of an inch thick all round, and 0,4 of an inch in caliber; it was torn open and flawed in many directions, and the gold touch-hole driven out. The barrel, into which the breech was ſcrewed, was 0,5 of an inch thick; it was ſplit by a ſingle crack three inches long, but this did not appear to me to be the immediate effect of the exploſion. I think the ſcrew of the breech, being ſuddenly enlarged, acted as a wedge upon the barrel. The ball miſſed the block of wood, and ſtruck againſt a wall, which had already been the receptacle of ſo many bullets, that we could not ſatisfy ourſelves about the impreſſion made by this laſt.

VI. "As it was pretty plain that no gun could confine a quantity of the mercurial powder ſufficient to project a bullet, with a greater force than an ordinary charge of gunpowder, I determined to try its comparative ſtrength in another way.—I procured two blocks of wood, very nearly of the ſame ſize and ſtrength, and bored them with the ſame inſtrument to the ſame depth. The one was charged with half an ounce of the beſt Dartford gunpowder, and the other with half an ounce of the mercurial powder; both were alike buried in ſand, and fired by a train communicating with the powders by a ſmall touch-hole. The block containing the gunpowder was ſimply ſplit into three pieces: that charged with the mercurial powder was burſt in every direction, and the parts immediately contiguous to the powder were abſolutely pounded, yet the whole hung together, whereas the block ſplit by the gunpowder had its parts fairly ſeparated. The ſand ſurrounding the gunpowder was undoubtedly moſt diſturbed; in ſhort, the mercurial powder appeared to have acted with the greateſt energy, but only within certain limits.

VII. "The effects of the mercurial powder, in the laſt experiments, made me believe that it might be confined, during its exploſion, in the centre of a hollow glaſs globe. Having therefore provided ſuch a veſſel, ſeven inches in diameter, and nearly half an inch thick, mounted with braſs caps, and a ſtop-cock (ſee plate 32.); I placed ten grains of the mercurial powder on very thin paper, laid on iron wire, 149th of an inch thick, acroſs the paper, through the midſt of the powder, and, cloſing the paper, tied it faſt at both extremities, with ſilk, to the wire. As the incloſed powder was now attached to the middle of the wire, each end of which was connected with the braſs caps, the packet of powder became, by this diſpoſition, fixed in the centre of the globe. Such a charge of an electrical battery was then ſent along the wire, as a preliminary experiment (with Mr. Cuthbertſon's electrometer) had ſhewn me would, by making the wire red hot, inflame the powder. The glaſs globe withſtood the exploſion, and of courſe retained whatever gaſſes were generated; its interior was thinly coated with quickſilver, in a very divided ſtate. A bent glaſs tube was now ſcrewed to the ſtop-cock of the braſs cap, which being introduced under a glaſs jar ſtanding in the mercurial bath, the ſtop-cock was opened. Three cubical inches of air ruſhed out, and a fourth was ſet at liberty when the apparatus was removed to the water tub. The exploſion being repeated, and the air all received over water, the quantity did not vary. To avoid an error from change of temperature, the glaſs globe was, both before and after the exploſion, immerſed in water of the ſame temperature. It appears therefore, that the ten grains of powder produced four cubical inches only of air.

"To continue the compariſon between the mercurial powder and gunpowder, 10 grains of the beſt Dartford gunpowder were in a ſimilar manner ſet fire to in the glaſs globe: it remained entire. The whole of the powder did not explode, for ſome complete grains were to be obſerved adhering to the interior ſurface of the glaſs. Little need be ſaid of the nature of the gaſſes generated during the combuſtion of the gunpowder: they muſt have been, carbonic acid gas, ſulphureous acid gas, nitrogen gas, and (according to Lavoiſier) perhaps hydrogen gas. As to the quantity of theſe, it is obvious that it could not be aſcertained; becauſe the two firſt were, at leaſt in part, ſpeedily abſorbed by the alkali of the nitre, left pure after the decompoſition of its nitric acid."

The following are the references to the figures of the glaſs globe, &c. in pl. 32.

A, is a ball or globe of glaſs, nearly half an inch thick, and ſeven inches in diameter. It has two necks, on which are cemented the braſs caps B, C, each being perforated with a female ſcrew, to receive the male ones D, E: through the former a ſmall hole is drilled; the latter is furniſhed with a perforated ſtud or ſhank G. By means of a leather collar H, the neck C can be air-tightly cloſed. When a portion of the powder is to be exploded, it muſt be placed on a piece of paper, and a ſmall wire laid acroſs the paper, through the midſt of the powder: the paper being then cloſed, is to be tied at each end to the wire, with a ſilken thread, as ſhewn at I. One end of this wire is to be faſtened to the end of the ſhank G, and the ſcrew D inſerted to half its length into the braſs cap B; the other end of the wire *a*, by means of the needle K, is to be drawn through the hole F. The ſcrew E being now fixed in its place, and the wire drawn tight, is to be ſecured by puſhing the irregular wooden plug L into the aperture of the ſcrew D, taking care to leave a paſſage for the air. The ſtop-cock M, the ſection of which is at N, is now to be ſcrewed on the part D, which is made air-tight by the leather collar *b*. The glaſs tube O is

bent, that it may more conveniently be introduced under the receiver of a pneumatic apparatus. P, ſhews the manner of connecting the glaſs tube with the ſtop-cock.

VIII. "From the experiments related in the fourth and fifth ſections, in which the gunpowder proof and the gun were burſt, it might be inferred, that the aſtoniſhing force of the mercurial powder is to be attributed to the rapidity of its combuſtion; and a train of ſeveral inches in length being conſumed in a ſingle flaſh, it is evident that its combuſtion muſt be rapid. From the experiments of the ſixth and ſeventh ſections, it is ſufficiently plain that this force is reſtrained to a narrow limit, both becauſe the block of wood charged with the mercurial powder was more ſhattered than that charged with the gunpowder, whilſt the ſand ſurrounding it was leaſt diſturbed, and likewiſe becauſe the glaſs globe withſtood the exploſion of 10 grains of the powder fixed in its centre; a charge I have twice found ſufficient to deſtroy old piſtol barrels, which were not injured by being fired when full of the beſt gunpowder. It alſo appears from the laſt experiment, that 10 grains of the powder produced by ignition four cubical inches only of air; and it is not to be ſuppoſed that the generation, however rapid, of four cubical inches of air, will alone account for the deſcribed force; neither can it be accounted for by the formation of a little water, which, as will hereafter be ſhewn, happens at the ſame moment; the quantity formed from 10 grains muſt be ſo trifling, that I cannot aſcribe much force to the expanſion of its vapour. The ſudden vaporition of a part of the mercury ſeems to me a principal cauſe of this immenſe yet limited force; becauſe its limitation may then be explained, as it is well known that mercury eaſily parts with caloric, and requires a temperature of 600 degrees of Fahrenheit, to be maintained in the vaporous ſtate. That the mercury is really converted into vapour, by ignition of the powder, may be inferred from the thin coat of divided quickſilver, which, after the exploſion in the glaſs globe, covered its interior ſurface; and likewiſe from the quickſilver with which a tallow candle, or a piece of gold, may be evenly coated, by being held at a ſmall diſtance from the inflamed powder. Theſe facts certainly render it more than probable, although they do not demonſtrate, that the mercury is volatilized; becauſe it is not unlikely that many mercurial particles are mechanically impelled againſt the ſurface of the glaſs, the gold, and the tallow.

"As to the force of the dilated mercury, Mr. Baumé relates a remarkable inſtance of it, as follows:

'Un alchymiſte ſe préſenta à Mr. Geoffroy, et l'aſſura qu'il avoit trouvé le moyen de fixer le mercure par une opération fort ſimple. Il fit conſtruire ſix boîtes rondes en fer fort épais, qui entroient les unes dans les autres; la dernière étoit aſſujettie par deux cercles de fer qui ſe croiſoient en angles droits. On avoit mis quelques livres de mercure dans la capacité de la première: on mit cet appareil dans un fourneau aſſez rempli de charbon pour faire rougir à blanc les boîtes de fer; mais, lorſque la chaleur eut pénétré ſuffiſamment le mercure, les boîtes crevèrent, avec une telle exploſion qu'il ſe fit un bruit épouvantable: des morceaux de boîtes furent lancés avec tant de rapidité qu'il y en eut qui paſsèrent au travers de deux planchers; d'autres firent ſur la muraille des effects ſemblables à ceux des éclats de bombes *.'

"Had the alchemiſt propoſed to fix water by the ſame apparatus, the neſt of boxes muſt, I ſuppoſe, have likewiſe been ruptured; yet it does not follow that the exploſion would have been ſo tremendous: indeed, it is probable that it would not, for if (as Mr. Kirwan remarked to me) ſubſtances which have the greateſt ſpecific gravity have likewiſe the greateſt attraction of coheſion, the ſuppoſition that the vapour of mercury exceeds in expanſive force the vapour of water, would agree with a poſition of Sir Iſaac Newton, that thoſe particles recede from one another with the greateſt force, and are moſt difficultly brought together, which upon contact cohere moſt ſtrongly.

IX. "Before I attempt to inveſtigate the conſtituent principles of this powder, it will be proper to deſcribe the proceſs and manipulations which, from frequent trials, ſeem to be beſt calculated to produce it. 100 grains, or a greater proportional quantity, of quickſilver (not exceeding 500 grains), are to be diſſolved, with heat, in a meaſured ounce and a half of nitric acid. This ſolution being poured cold upon two meaſured ounces of alcohol, previouſly introduced into any convenient glaſs veſſel, a moderate heat is to be applied until an effervescence is excited. A white fume then begins to undulate on the ſurface of the liquor; and the powder will be gradually precipitated, upon the ceſſation of action and re-action. The precipitate is to be immediately collected on a filter, well waſhed with diſtilled water, and carefully dried in a heat not much exceeding that of a water-bath. The immediate edulcoration of the powder is material, becauſe it is liable to the re-action of nitric acid; and, whilſt any of that acid adheres to it, it is very ſubject to the influence of light. Let it alſo be cautiouſly remembered, that the mercurial ſolution is to be poured upon the alcohol.

"I have recommended quickſilver to be uſed in preference to an oxyd, becauſe it ſeems to anſwer equally, and is leſs expenſive; otherwiſe, not only the pure red oxyd, but the red nitrous oxyd, and turpeth, may be ſubſtituted; neither does it ſeem eſſential to attend to the preciſe ſpecific gravity of the acid, or the alcohol. The rectified ſpirit of wine, and the nitrous acid of commerce, never failed, with me, to produce a fulminating mercury. It is indeed true, that the powder prepared without attention is produced in different quantities, varies in colour, and probably in ſtrength. From analogy, I am diſpoſed to think the whiteſt is the ſtrongeſt; for it is well known, that black precipitates of mercury approach the neareſt to the metallic ſtate. The variation in quantity is remarkable; the ſmalleſt quantity I ever obtained from 100 grains of quickſilver being 120 grains, and the largeſt 132 grains. Much depends on very minute circumſtances. The greateſt product ſeems to be obtained when a veſſel is uſed which condenſes and cauſes moſt ether to return into the mother liquor; beſides which, care is to be had in applying the requiſite heat, that a ſpeedy, and not a violent action, be effected. 100 grains of an oxyd are not ſo productive as 100 grains of quickſilver.

"As to the colour, it ſeems to incline to black when the action of the acid on the alcohol is moſt violent, and *vice verſa*.

X. "I need not obſerve, that the gaſes which were generated during the combuſtion of the powder in the glaſs globe, were neceſſarily mixed with atmoſpheric air; the facility with which the electric fluid paſſes through a vacuum, made ſuch a mixture unavoidable.

"The cubical inch of gas received over water was not readily abſorbed by it; and, as it ſoon extinguiſhed a taper without becoming red, or being itſelf inflamed, barytes water was let up to the three cubical inches received over mercury, when a carbonate of barytes was immediately precipitated.

"The reſidue of ſeveral exploſions, after the carbonic acid had been ſeparated, was found, by the teſt of nitrous gas, to contain nitrogen or azotic gas; which does not proceed from any decompoſition of atmoſpheric air, becauſe the powder may

* Chymie Expérimentale et Raiſonnée Tom. II. p. 393. Paris, 8vo. 1773.

be made to explode under the exhauſted receiver of an air-pump. It is therefore manifeſt that the gaſes generated during the combuſtion of the fulminating mercury, conſiſt of carbonic acid and nitrogen gaſes.

XI. "The principal re-agents which decompoſe the mercurial powder are the nitric, the ſulphuric, and the muriatic acids. The nitric changes the whole into nitrous gas, carbonic acid gas, acetous acid, and nitrate of mercury. I reſolved it into theſe different principles, by diſtilling it pneumatically with nitric acid: this acid, upon the application of heat, ſoon diſſolved the powder, and extricated a quantity of gas, which was found, by well-known teſts, to be nitrous gas mixed with carbonic acid gas. The diſtillation was carried on until gas no longer came over. The liquor of the retort was then mixed with the liquor collected in the receiver, and the whole ſaturated with potaſh; which precipitated the mercury in a yelloviſh brown powder, nearly as it would have done from a ſolution of nitrate of mercury. This precipitate was ſeparated by a filter, and the filtrated liquor evaporated to a dry ſalt, which was waſhed with alcohol. A portion of the ſalt being refuſed by this menſtruum, it was ſeparated by filtration, and recognized, by all its properties, to be nitrate of potaſh. The alcoholic liquor was likewiſe evaporated to a dry ſalt, which, upon the effuſion of a little concentrate ſulphuric acid, emitted acetous acid, contaminated with a feeble ſmell of nitrous acid, owing to the ſolubility of a ſmall portion of the nitre in the alcohol.

XII. "The ſulphuric acid acts upon the powder in a remarkable manner, as already has been noticed. A very concentrate acid produces an exploſion nearly at the inſtant of contact, on account, I preſume, of the ſudden and copious diſengagement of caloric from a portion of powder which is decompoſed by the acid. An acid ſomewhat leſs concentrate likewiſe extricates a conſiderable quantity of caloric, with a good deal of gas; but, as it effects a complete decompoſition, it cauſes no exploſion. An acid, diluted with an equal quantity of water, by the aid of a little heat, ſeparates the gas ſo much leſs rapidly, that it may with ſafety be collected in a pneumatic apparatus. But, whatever be the denſity of the acid (provided no exploſion be produced), there remains in ſulphuric liquor, after the ſeparation of the gas, a white inflammable and uncryſtallized powder mixed with ſome minute globules of quickſilver.

"To eſtimate the quantity, and obſerve the nature, of this uninflammable ſubſtance, I treated 100 grains of the fulminating mercury with ſulphuric acid a little diluted. The gas being ſeparated, I decanted off the liquor as it became clear, and freed the inſoluble powder from acid by edulcoration with diſtilled water; after which, I dried it, and found it weighed only 84 grains; conſequently had loſt 16 grains of its original weight. Suſpecting, from the operation of the nitric acid in the former experiment, that theſe 84 grains (with the exception of the quickſilver globules) were oxalate of mercury, I digeſted them in nitrate of lime, and found my ſuſpicion juſt. The mercury of the oxalate united to the nitric acid, and the oxalic acid to the lime. A new inſoluble compound was formed; it weighed, when waſhed and dry, 48,5 grains. Carbonate of potaſh ſeparated the lime, and formed oxalate of potaſh, capable of precipitating lime-water and muriate of lime: although it had been depurated from exceſs of alkali, and from carbonate acid, by a previous addition of acetous acid. That the mercury of the oxalate in the 84 grains had united to the nitric acid of the nitrate of lime was proved, by dropping muriatic acid into liquor from which the ſubſtance demonſtrated to be oxalate of lime had been ſeparated; for a copious precipitation of calomel inſtantly enſued.

"The ſulphuric liquor, decanted from the oxalate of mercury, was now added to that with which it was edulcorated, and the whole ſaturated with carbonate of potaſh. As effervescence ceaſed, a cloudineſs and precipitation followed; and the precipitate, being collected, waſhed, and dried, weighed 3,4 grains: it appeared to be a carbonate of mercury. Upon evaporating a portion of the ſaturated ſulphuric liquor, I found nothing but ſulphate of potaſh; nor had it any metallic taſte. There then remains, without allowing for the weight of the carbonic acid united to the 3,4 grains, a deficit from the 100 grains of mercurial powder of 12,6 grains, which I aſcribe to the gas ſeparated by the action of the ſulphuric acid. To aſcertain the quantity, and examine the nature, of the gas ſo ſeparated, I introduced into a very ſmall tubulated retort 50 grains of the mercurial powder, and poured upon it 3 drachms, by meaſure, of ſulphuric acid, with the aſſiſtance of a gentle heat. I firſt received it over quickſilver; the ſurface of which, during the operation, partially covered itſelf with a little black powder.

"The gas, by different trials, amounted from 28 to 31 cubical inches: it at firſt appeared to be nothing but carbonic acid, as it precipitated barytes water, and extinguiſhed a taper, without being itſelf inflamed, or becoming red. But, upon letting up to it liquid cauſtic ammoniac, there was a reſidue from 5 to 7 inches of a peculiar inflammable gas, which burnt with a greeniſh blue flame. When I made uſe of the water-tub, I obtained, from the ſame materials, from 25 to 27 inches only of gas, although the average quantity of the peculiar inflammable gas was likewiſe from 5 to 7 inches; therefore, the difference of the aggregate product, over the two fluids, muſt have ariſen from the abſorption, by the water, of a part of the carbonic acid in its naſcent ſtate. The variation of the quantity of the inflammable gas, when powder from the ſame parcel is uſed, ſeems to depend upon the acid being a little more or leſs dilute.

"With reſpect to the nature of the peculiar inflammable gas, it is plain to me, from the reaſons I ſhall immediately adduce, that it is no other than the gas (in a pure ſtate) into which the nitrous etherized gas can be reſolved, by treatment with dilute ſulphuric acid.

"The Dutch chemiſts have ſhewn, that the nitrous etherized gas can be reſolved into nitrous gas, by expoſure to concentrate ſulphuric acid, and that, by uſing a dilute inſtead of a concentrate acid, a gas is obtained which enlarges the flame of a burning taper, ſo much like the gaſeous oxyd of azote, that they miſtook it for that ſubſtance, until they diſcovered that it was permanent over water, refuſed to detonate with hydrogen, and that the fallacious appearance was owing to a mixture of nitrous gas with inflammable gas.

"The inflammable gas ſeparated from the powder anſwers to the deſcription of the gas which at firſt deceived the Dutch chemiſts; 1ſt, in being permanent over water; 2dly, refuſing to detonate with hydrogen; and, 3dly, having the appearance of the gaſeous oxyd of azote, when mixed with nitrous gas.

"The gas ſeparable by the ſame acid, from nitrous etherized gas, and from the mercurial powder, have therefore the ſame properties. Every chemiſt would thence conclude, that the nitrous etherized gas is a conſtituent part of the powder, and the inflammable and nitrous gas, inſtead of the inflammable and carbonic acid gas, been the mixed product extricated from it by dilute ſulphuric acid.

"It however appears to me, that nitrous gas was really produced by the action of the dilute ſulphuric acid; and that, when produced, it united to an exceſs of oxygen preſent in the oxalate of mercury.

"To explain how this change might happen, I muſt premiſe, that my experiments have ſhewn me that oxalate of mer-

cury can exiſt in two, if not in three ſtates. 1ſt. By the diſcovery of Mr. Ameilon, already quoted, the precipitate obtained by oxalic acid, from nitrate of mercury, fuſes with a hiſſing noiſe. This precipitate is an oxalate of mercury, ſeemingly with exceſs of oxygen. Mercury diſſolved in ſulphuric acid and precipitated by oxalic acid, and alſo the pure red oxyd of mercury digeſted with oxalic acid, give oxalates in the ſame ſtate. 2dly. Acetate of mercury, precipitated by oxalic acid, although a true oxalate is formed, has no kind of inflammability. I conſider it as an oxalate with leſs oxygen than thoſe above mentioned. 3dly. A ſolution of nitrate of mercury, boiled with dulcified ſpirit of nitre, gives an oxalate more inflammable than any other; perhaps it contains moſt oxygen.

" The oxalate of mercury remaining from the powder in the ſulphuric liquor is not only always in the ſame ſtate as that precipitated from acetate of mercury, entirely devoid of inflammability, but contains globules of quickſilver, conſequently it muſt have parted with even more than its exceſs of oxygen; and, if nitrous gas was preſent, it would of courſe ſeize at leaſt a portion of that oxygen. It is true, that globules of quickſilver may ſeem incompatible with nitrous acid; bnt the quantity of the one may not correſpond with that of the other, or the dilution of the acid may deſtroy its action.

" As to the preſence of the carbonic acid, it muſt have ariſen either from a complete* decompoſition of a part of the oxalate; or, admitting the nitrous etherized gas to be a conſtituent principle of the powder, from a portion of the oxygen, not taken up by the nitrous gas, being united with the carbon of the etherized gas.

XIII. " The muriatic acid, digeſted with the mercurial powder, diſſolves a portion of it, without extricating any notable quantity of gas. The diſſolution evaporated to a dry ſalt taſtes like the corroſive ſublimate; and the portion, which the acid does not take up, is left in a ſtate of an uninflammable oxalate.

XIV. " Theſe effects all tend to eſtabliſh the exiſtence of the nitrous etherized gas, as a conſtituent part of the powder; and likewiſe corroborate the explanation I have ventured to give of the action of the ſulphuric acid. Moreover, a meaſured ounce and a half of nitrous acid, holding 100 grains of mercury in ſolution and 2 meaſured ounces of alcohol, yield 90 cubical inches only of gas: whereas, without the intervention of mercury, they yield 210 inches. Upon the whole, I truſt it will be thought reaſonable to conclude, that the mercurial powder is compoſed of the nitrous etherized gas, and of oxalate of mercury with exceſs of oxygen. 1ſt. Becauſe the nitric acid converts the mercurial powder entirely into nitrous gas, carbonic acid gas, acetous acid, and nitrate of mercury. 2dly. Becauſe the dilute ſulphuric acid reſolves it into an uninflammable oxalate of mercury, and ſeparates from it a gas reſembling that into which the ſame acid reſolves the nitrous etherized gas. 3dly. Becauſe an uninflammable oxalate is likewiſe left, after the muriatic acid has converted a part of it into ſublimate. 4thly. Beeauſe it cannot be formed by boiling nitrate of mercury in dulcified ſpirit of nitre; although a very inflammable oxalate is by this means produced. 5thly. Becauſe the difference of the product of gas, from the ſame meaſures of alcohol and nitrous acid, with and without mercury in ſolution, is not trifling; and, 6thly. Becauſe nitrogen gas was generated during its combuſtion in the glaſs globe.

" Should my concluſions be thought warranted by the reaſons I have adduced, the theory of the combuſtion of the mercurial powder will be obvious to every chemiſt. The hydrogen of the oxalic acid, and of the etherized gas, is firſt united to the oxygen of the oxalate, forming water†; the carbon is ſaturated with oxygen, forming carbonic acid gas; and a part, if not the whole of the nitrogen of the etherized gas, is ſeparated in the ſtate of nitrogen gas; both which laſt gaſes, it may be recollected, were after the exploſion preſent in the glaſs globe. The mercury is revived, and, I preſume, thrown into vapour; as may well be imagined, from the immenſe quantity of caloric extricated, by adding concentrate ſulphuric acid to the mercurial powder.

" I will not venture to ſtate, with accuracy, in what proportions its conſtituent principles are combined. The affinities I have brought into play are complicated, and the conſtitution of the ſubſtances I have to deal with not fully known. But, to make round numbers, I will reſume the ſtatement, that 100 grains of the mercurial powder loſt 16 grains of its original weight, by treatment with dilute ſulphuric acid: 84 grains of the mercurial oxalate, mixed with a few minute globules of quickſilver, remained undiſſolved in the acid. The ſulphuric liquor was ſaturated with carbonic of potaſh, and yielded 3,4 grains of carbonate of mercury. If 1,4 grain ſhould be thought a proper allowance for the weight of carbonic acid in the 3,4 grains, I will make that deduction, and add the remaining 2 grains to the 84 grains of mercurial oxalate and quickſilver; I ſhall then have,

Of oxalate and mercury, - - -	86 grains.
And a deficit, to be aſcribed to the nitrous etherized gas and exceſs of oxygen, -	14
	100

" It may perhaps be proper to proceed ſtill further, and recur to the 48,5 grains, ſeparated by nitrate of lime from the 84 grains of mercurial oxalate and globules of quickſilver, in the 11th ſection. Theſe 48,5 grains were proved to be chiefly oxalate of lime; but they likewiſe contained a minute inſeparable quantity of mercury, almoſt in the ſtate of quickſilver, formerly part of the 84 grains from which they were ſeparated. Had the 48,5 grains been pure calcareous oxalate, the quantity of pure oxalic acid in them would, according to Bergmann, be 23,28 grains. Hence, by omitting the 2 grains of mercury, in the 3,4 grains of carbonate, 100 grains of the mercurial powder might have been ſaid to contain of pure oxalic acid 23,28 grains; of mercury 62,72 grains; and of nitrous etherized gas and exceſs of oxygen 14 grains. But, as the 48,5 grains were not pure oxalate, inaſmuch as they contained the mercury they received from the 84 grains, from which they were generated by the nitrate of lime, ſome allowance muſt be made for the mercury ſucceſſively intermixed with the 84 grains and the 48,5 grains. In order to make correſponding numbers, and allow for unavoidable errors, I ſhall eſtimate the quantity of that mercury to have amounted to 2 grains, which I muſt of courſe deduct from the 33,28

* Inflammable oxalate of mercury, made to fuſe in a retort connected with the quickſilver tube, gives out carbonic acid gas.

† Drops of water were obſerved on the internal ſurface of the globe, the day after ſeveral exploſions had been produced in its centre.

grains of oxalic acid. I ſhall then have the following ſtatement:

That 100 grains of fulminating mercury ought to contain of pure, oxalic acid, -		21,28 grains.
Of mercury formerly united to the oxalic acid, - - -	60,72	
Of mercury diſſolved in the ſulphuric liquor, - - -	2	
And of mercury left in the ſulphuric liquor after the ſeparation of the gaſes,	2	
Total of mercury, - -		64,72
Of nitrous etherized gas, and exceſs of oxygen,		14
		100

" Since 100 grains of the powder ſeem to contain 64,72 grains of mercury, it will be immediately enquired, what becomes of 100 grains of quickſilver, when treated as directed, in the deſcription of the proceſs for preparing the fulminating mercury.

" It has been ſtated (in ſection IX.) that 100 grains of quickſilver produce, under different circumſtances, from 120 to 132 grains of mercurial powder; and, if 100 grains of this powder contain 64,72 grains, 120 grains, or 132 grains, muſt, by parity of reaſoning, contain 78,06 grains, or 85,47 grains; therefore 13,34 grains, or 20,75 grains, more of the 100 grains are immediately accounted for; becauſe 64,72 grains + 13,34 grains = 78,06, and 64,72 grains + 20,75 grains = 85,47 grains. The remaining deficiency of 21,94 grains, or 14,53 grains, which, with the 78,06 grains, or 85,47 grains, would complete the original 100 of quickſilver, remains partly in the liquor from which the powder is ſeparated, and is partly volatilized in the white denſe fumes, which in the beginning of this paper I compared to the liquor fumans of Libavius. The mercury cannot, in either inſtance, be obtained in a form immediately indicative of its quantity; and a ſeries of experiments, to aſcertain the quantities in which many different ſubſtances can combine with mercury, is not my preſent object. After obſerving, that the mercury left in the reſiduary liquor can be precipitated in a very ſubtle dark powder, by carbonate of pot-aſh, I ſhall content myſelf with examining the nature of the white fumes.

XV. " It is clear, that theſe white fumes contain mercury: they may be wholly condenſed in a range of Woulfe's apparatus, charged with a ſolution of muriate of ammoniac. When the operation is over, a white powder is ſeen floating with ether on the ſaline liquor, which, if the bottles are agitated, is entirely diſſolved. After the mixture has been boiled, or for ſome time expoſed to the atmoſphere, it yields to cauſtic ammoniac a precipitate, in all reſpects ſimilar to that which is ſeparated by cauſtic ammoniac from corroſive ſublimate.

" I would infer from theſe facts, that the white denſe fumes conſiſt of mercury, or perhaps oxyd of mercury, united to the nitrous etherized gas; and that, when the muriate of ammoniac containing them is expoſed to the atmoſphere, or is boiled, the gas ſeparates from the mercury; and the exceſs of nitrous acid, which always comes over with nitrous ether, decompoſes the ammoniacal muriate of ſublimate, and forms corroſive mercurial muriate or ſublimate. This theory is corroborated by comparing the quantity of gas eſtimated to be contained in the fulminating mercury with the quantities of gas yielded from alcohol and nitrous acid, with and without mercury in ſolution; not to mention that more ether, as well as more gas, is produced without the intervention of mercury; and that, according to the Dutch chemiſts, the product of ether is always in the inverſe ratio to the product of nitrous etherized gas. Should a further proof be thought neceſſary of the exiſtence of the nitrous etherized gas in the fulminating mercury, as well as in the white denſe fumes, it may be added, that, if a mixture of alcohol and nitrous acid holding mercury in ſolution be ſo dilute, and expoſed to a temperature ſo low, that neither ether nor nitrous etherized gas are produced, the fulminating mercury, or the white fumes, will never be generated; for, under ſuch circumſtances, the mercury is precipitated chiefly in the ſtate of an inflammable oxalate. Further, when we conſider the different ſubſtances formed by an union of nitrous acid and alcohol, we are ſo far acquainted with all, except the ether and the nitrous etherized gas, as to create a preſumption, that no others are capable of volatilizing mercury, at the very low temperature in which the white fumes exiſt, ſince, during ſome minutes, they are permanent over water of 40° Fahrenheit.

XVI. " Hitherto, as much only has been ſaid of the gas which is ſeparated from the mercurial powder by dilute ſulphuric acid, as was neceſſary to identify it with that into which the ſame acid can reſolve the nitrous etherized gas: I have further to ſpeak of its peculiarity *.

" The characteriſtic properties of the inflammable gas ſeem to me to be the following: 1ſt. It does not diminiſh in volume, either with oxygen or nitrous gas. 2dly. It will not explode with oxygen by the electric ſhock, in a cloſe veſſel. 3dly. It burns like hydrocarbonate, but with a blueiſh-green flame; and, 4thly. It is permanent over water (ſection xii).

" It is of courſe either not formed, or is convertible into nitrous gas by the concentrate nitric and muriatic acids; becauſe by thoſe acids, no inflammable gas was extricated from the powder.

" Should this inflammable gas prove not to be hydrocarbonate, I ſhall be diſpoſed to conclude, that it has nitrogen for its baſis; indeed, I am at this moment inclined to that opinion, becauſe I find that Dr. Prieſtley, during his experiments on his dephlogiſtated nitrous air, once produced a gas which ſeems to have reſembled this inflammable gas, both in the mode of burning and in the colour of the flame.

" After the termination of the common ſolution of iron in ſpirit of nitre, he uſed heat, and got, ſays he, 'ſuch a kind of air as I had brought nitrous air to be, by expoſing it to iron, or liver of ſulphur; for, on the firſt trial, a candle burned in it with a much enlarged flame. At another time, the application of a candle to air produced in this manner was attended with a real, though not a loud exploſion; and, immediately after this, a greeniſh-coloured flame deſcended from the top to the bottom of the veſſel in which the air was contained. In the next produce of air, from the ſame proceſs, the flame deſcended blue, and very rapid, from the top to the bottom of the veſſel.'

" Theſe greeniſh and blue coloured flames, deſcending from the top to the bottom of the veſſel, are preciſely deſcriptive of the inflammable gas ſeparated from the powder. If it can be produced with certainty by the repetition of Dr. Prieſtley's experiments, or ſhould it by any means be got pure from the

* It muſt be firſt noticed, that it is never pure when obtained from the nitrous etherized gas; nor am I aware how it is to be purified, unleſs the nitrous gas could be taken from it, without being converted into nitrous acid; for, by that acid, it would probably be itſelf converted into nitrous gas.

nitrous etherized gas, my curiosity will excite me to make it the object of future research; otherwise, I must confess, I shall feel more disposed to prosecute other chemical subjects: for having reason to think that the density of the acid made a variation in the product of this gas, and having never found that any acid, however dense, produced an immediate explosion, I once poured 6 drachms of concentrate acid upon 50 grains of the powder. An explosion, nearly at the instant of contact, was effected: I was wounded severely, and most of my apparatus destroyed. A quantity moreover of the gas I had previously prepared, was lost by the inadvertency of a person who went into my laboratory, whilst I was confined by the consequences of this discouraging accident. But, should any one be desirous of giving the gas a further examination, I again repeat, that, as far as I am enabled to judge, it may with safety be prepared by pouring 3 drachms of sulphuric acid, diluted with the same quantity of water, upon 50 grains of the powder, and then applying the flame of a candle until gas begins to be extricated. The only attempt I have made to decompose it, was by exposing it to copper and ammoniac; which during several weeks did not effect the least alteration.

"I will now conclude (says Mr. Howard), by observing, that the fulminating mercury seems to be characterised by the following properties:

"It takes fire at the temperature of 368 Fahrenheit; explodes by friction *, by flint and steel, and by being thrown into concentrate sulphuric acid. It is equally inflammable under the exhausted receiver of an air-pump, as surrounded by atmospheric air; and it detonates loudly, both by the blow of a hammer, and by a strong electrical shock.

"Notwithstanding the composition of fulminating silver and of fulminating gold, differ essentially from that of fulminating mercury, all three have similar qualities. In tremendous effects, silver undoubtedly stands first, and gold perhaps the last. The effects of the mercurial powder and of gunpowder admit of little comparison. The one exerts, within certain limits, an almost inconceivable force: its agents seem to be gas and caloric, very suddenly set at liberty, and both mercury and water thrown into vapour. The other displays a more extended but inferior power: gas and caloric are, comparatively speaking, liberated by degrees; and water, according to Count Rumford, is thrown into vapour †.

"Hence it seems that the fulminating mercury, from the limitation of its sphere of action, can seldom, if ever, be applied to mining; and, from the immensity of its initial force, cannot be used in fire-arms, unless in cases where it becomes an object to destroy them; perhaps, where it is the practice to spike cannon, it may be of service, because I apprehend it may be used in such a manner as to burst cannon, without dispersing any splinters.

"The inflammation of fulminating mercury by concussion offers nothing more novel or remarkable, than the inflammation, by concussion, of many other substances. The theory of such inflammations has been long since exposed by the celebrated Mr. Berthollet, and confirmed by Messieurs Fourcroy, and Vauquelin: yet, I must confess, I am at a loss to understand why a small quantity of mercurial powder made to detonate by the hammer, or the electric shock, should produce a report so much louder than when it is inflamed by a match, or by flint and steel. It might at first be imagined, that the loudness of the report could be accounted for, by supposing the instant of the inflammation, and that of the powder's confinement between the hammer and anvil, to be precisely the same; but, when the electrical shock is sent through or over a few grains of the powder, merely laid on ivory, and a loud report is the consequence, I can [illegible] idea of what causes such a report.

"The operation by which the powder is prepared is perhaps one of the most beautiful and surprising in chemistry, and it is not a little interesting to consider the affinities which are brought into play. The superabundant nitrous acid of the mercurial solution must first act on the alcohol, and generate ether, nitrous etherized gas, and oxalic acid. The mercury unites to the two last in their nascent state, and relinquishes fresh nitrous acid, to act upon any unaltered alcohol. The oxalic acid, although a predisposing affinity seems exerted in favour of its quantity, is evidently not formed fast enough to retain all the mercury; otherwise, no white fumes, during a considerable period of the operation, but fulminating mercury alone, would be produced.

"Should any doubt still be entertained of the existence of the affinities which have been called predisposing or conspiring, a proof that such affinities really exist, will, I think, be afforded, by comparing the quantity of oxalic acid which can be generated from given measures of nitrous acid and alcohol, with the intervention of mercury, and the intervention of other metals. For instance, when two measured ounces of alcohol are treated with a solution of 100 grains of nickel in a measured ounce and a half of nitrous acid, little or no precipitate is produced; yet, by the addition of oxalic acid to the residuary liquor, a quantity of oxalate of nickel, after some repose, is deposited. Copper affords another illustration; 100 grains of copper dissolved in a measured ounce and a half of nitrous acid, and treated with alcohol, yielded me about 18 grains only of oxalate; although cupreous oxalate was plentifully generated, by dropping oxalic acid into the residuary liquor. About 21 grains of pure oxalic acid seem to be produced, from the same materials, when 100 grains of mercury are interposed. (See section XIV.) Besides, according to the Dutch paper, more than once referred to, acetous acid is the principal residue after the preparation of nitrous ether. How can we explain the formation of a greater quantity of oxalic acid, from the same materials, with the intervention of 100 grains of mercury, than with the intervention of 100 grains of copper, otherwise than by the notion of conspiring affinities, so analogous to what we see in other phenomena of nature?

"I have attempted, without success, to communicate fulminating properties, by means of alcohol, to gold, platina, antimony, tin, copper, iron, lead, zinc, nickel, bismuth, cobalt, arsenic, and manganese; but I have not yet sufficiently varied my experiments, to enable me to speak with absolute certainty. Silver, when 20 grains of it were treated with nearly the same proportions of nitrous acid and alcohol as 100 grains of mercury, yielded, at the end of the operation, about 3 grains of a grey precipitate, which fulminated with extreme violence. Mr. Cruickshank had the goodness to repeat the experiment: he dissolved 40 grains of silver in 2 ounces of the strongest nitrous acid diluted with an equal

* Consequently it should not be inclosed in a bottle with a glass stopper.

† See Philosophical Transactions for the year 1797, p. 222. The hard black substance mentioned by the Count, as remaining after the combustion of gunpowder, must, I believe, have been an alkaline sulphuret, mixed chiefly with sulphate and carbonate of pot-ash. The conjecture, that it is white when first formed, is certainly just, as my experiment with the glass globe evinced.

quantity of water, and obtained (by means of 2 ounces of alcohol) 60 grains of a very white powder, which fulminated like the grey precipitate above described. It probably combines with the same principles as the mercury, and of course differs from Mr. Berthollet's fulminating silver, before alluded to. I observe, that a white precipitate is always produced in the first instance; and that it may be preserved by adding water, as soon as it is formed; otherwise, when the mother liquor is abundant, it often becomes grey, and is re-dissolved."

Several trials of the mercurial powder were afterwards made at Woolwich, in conjunction with Colonel Blomefield and Mr. Cruickshank, upon heavy guns, carronades, &c. from which Mr. Howard generally infers, that any piece of ordnance might be destroyed, by employing a quantity of the mercurial powder equal in weight to one half of the service-charge of gunpowder; and, from the seventh and last experiment, we may also conclude, that it would be possible so to proportion the charge of mercurial powder to the size of different cannons, as to burst them without dispersing any splinters. But the great danger attending the use of fulminating mercury, on account of the facility with which it explodes, will probably prevent its being employed for that purpose.

"In addition to the other singular properties of the fulminating mercury (says Mr. Howard), it may be observed, that two ounces inflamed in the open air, seem to produce a report much louder than when the same quantity is exploded in a gun capable of resisting its action. Mr. Cruickshank, who made some of the powder, by my process, remarked that it would not inflame gunpowder. In consequence of which, we spread a mixture of coarse and fine-grained gunpowder upon a parcel of the mercurial powder; and, after the inflammation of the latter, we collected most, if not all, of the grains of gunpowder. Can this extraordinary fact be explained by the rapidity of the combustion of fulminating mercury? or is it to be supposed (as gunpowder will not explode at the temperature at which mercury is thrown into vapour) that sufficient caloric is not extricated during this combustion? From the late opportunity I have had of conversing with Mr. Cruickshank, I find that he has made many accurate experiments on gunpowder; and he has permitted me to state, that the matter which remains after the explosion of gunpowder consists of pot-ash united with a small proportion of carbonic acid, sulphate of pot-ash, a very small quantity of sulphuret of pot-ash, and unconsumed charcoal. That 100 grains of good gunpowder yielded about 53 grains of this residuum, of which three are charcoal. That it is extremely deliquescent, and, when exposed to the air, soon absorbs moisture sufficient to dissolve a part of the alkali; in consequence of which, the charcoal becomes exposed, and the whole assumes a black or very dark colour. Mr. Cruickshank likewise informs me, that after the combustion of good gunpowder under mercury, no water is ever perceptible."

FUMIGATION (*Encycl.*) This mode of affecting the human constitution with mercury, was much practised by the celebrated Astruc, and has since been revived in France, by Lalonette. Mr. Abernethy, who, in his Surgical Cases, p. 194, gives the following account of the use of mercurial fumigations, professes his approbation of that practice. He presents his readers with some cases which clearly shew the advantages that attend this method of treating lues venerea. The grounds of preference in favour of fumigation, are: *First*, from its affecting the constitution when other means have failed; and, *secondly*, from its producing its effects in a much shorter time than any other mode requires.

"I beg leave, however, previously to observe (says Mr. Abernethy), that the term, mercurial fumigations, is apt to excite wrong ideas of this method in the minds of surgeons. Fumigations have been, of late, generally employed to correct local diseases; and they have often, by design, been made of an acrid quality. And even when they were formerly employed with a view of affecting the constitution, it was at a time when the chemical compounds of quicksilver were not understood, and sufficient attention was not paid to those circumstances on which the success of their application depends.

"But, in the year 1776, the Chevalier Lalonette, a physician at Paris, laid before the public an account of a new mode of mercurial fumigation, free from the inconveniences of former ones, and which, in the space of thirty-five years, he had successfully employed in more than four hundred cases, that had resisted all the ordinary methods of cure. His method consisted in enclosing the patient, previously undressed, in a kind of box resembling a sedan chair, with an opening at the top to let out the head, and another at the bottom, to which was fitted a small grate or furnace, having in it a heated iron for converting the mercurial remedy into fume. The preparation he made use of was a kind of calomel, which, by repeated sublimation from iron-filings, was so far deprived of its muriatic acid, as to be in part reduced into running quicksilver; and, while it possessed considerable volatility, was perfectly irritating. Some of this powder being strewed upon the hot iron placed below, was immediately converted into smoke, which surrounded the patient's body, and after some time settled on his skin in the form of a white and very fine calx of quicksilver: a complete dress, having its inner surface fumigated with the same powder, was then put on.—The remedy being thus generally applied to the mouths of the cutaneous absorbents, soon got admission into the circulating fluids; and the constitution became thereby more speedily affected than by any other process known before."

For a more particular account of the chemical preparations used by M. Lalonette, and his manner of employing them, Mr. Abernethy refers to his treatise, which was published in 1776. He adds, "With regard to the process, I would only further observe, that the feelings of the patient during it, are not at all unpleasant, provided the heat be properly regulated; that there is nothing uncleanly or disagreeable in the powder applied to the skin; and that all who have had an opportunity of comparing it with the common method by inunction, have been highly pleased with the superior advantages attending it."

The fumigating powder of M. Lalonette being a very operose and expensive preparation, and having no advantage over one made by abstracting the muriatic acid from calomel, Mr. Abernethy employed the following in lieu of it: Two drachms of aqua ammoniæ were added to six ounces of distilled water, and four ounces of calomel thrown into this liquor, and shaken up with it; the powder was afterwards separated by a filter, and dried.

"The powder thus obtained (says the author), is of a grey colour, and contains a good deal of quicksilver in its metallic state, which of course is extremely volatile, but becomes oxydated when raised into fume, and afterwards condenses into a white and very fine dust.

"This mode of using mercury is not, however, so well adapted to hospital practice; for sometimes the iron was too much heated, and the patients were made by this means to perspire profusely, so that the powder was formed into a paste, which was irregularly incrusted on the skin; besides, the patients either could not or would not wear a complete undress; and in that case the powder was wiped away, and the plan of treatment frustrated: for the design is to allow of a

conſtant abſorption of this ſubtile preparation of quickſilver from the whole ſurface of the body."

Mr. Abernethy gives ſome caſes in which this remedy was very ſpeedy in its effects; and could relate (he aſſerts) many others in which fumigation accompliſhed with *facility* the cure of complaints which had reſiſted long-continued mercurial courſes both by friction and internal exhibition. "It is reaſonable to think (continues he), that this object will be more certainly obtained by the abſorption thus taking place from almoſt the whole ſurface of the body, than by any other method hitherto deviſed. Yet it is but right to ſay, that my hopes of ſucceſs from it have not always been fulfilled; and that, in ſome few caſes where mercury ſhewed a particular tendency to act on the bowels without affecting the mouth, the mercurial fumes ſeemed to produce this effect even ſooner than the ointment had done: and in one young man, whoſe mouth neither frictions nor the internal uſe of mercury could be made to affect, but in whom they occaſioned conſtant tremors of the muſcles, and ſpaſms of the bowels, the fumigations were not attended with any better ſucceſs. Happily, however, ſuch caſes are rare; and in general the fumigations affect the conſtitution ſpeedily, and in the uſual manner."

To the objections which have been brought againſt the cure by fumigations, Mr. Abernethy makes this reply. He ſays, "I have heard it objected, that fumigation cannot be depended on for the cure of lues. But I never knew it fail, nor do I ſee why mercury, uſed thus, ſhould, when abſorbed, prove leſs effectual than when this mineral is combined with lard in the common ointment. If fumigations in this mode have failed, it was more probably owing to their being improperly managed, than to any inſufficiency peculiar to them. Thus, if adminiſtered frequently and largely at firſt, they may have conſiderably affected the mouth without proportionally affecting the conſtitution in general; or, from the quickneſs with which they heal venereal ulceration, the cure may have been too ſoon ſuppoſed complete, and their uſe diſcontinued before they had entirely eradicated the diſeaſe. Under proper management, I have no doubt but mercury, employed in this manner, will be found adequate to the cure of every variety of the diſeaſe.

"Beſides their general application, there is another way in which mercurial fumigations may be occaſionally employed with advantage, though the benefit is leſs important; and perhaps this method may be regarded merely as a refinement in the practice of ſurgery. In local diſeaſe of the joints, ſuch, for inſtance, as frequently takes place in the knee, and in ſarcomatous enlargements of the breaſt in women, Mr. Sharp and Mr. Blicke have been long accuſtomed to direct fumigated ſtockings, or under-waiſtcoats, to be worn; when the complaints have been relieved, and the conſtitutions of the patients affected, without the trouble and unpleaſantneſs ariſing from the uſe of the common mercurial ointment."

FUNGIBLES, in Scots law, are ſuch things as are eſtimated by their number, weight, or meaſure; as coin, butter, ale, &c.

FUORLI, a town of Naples, in Abruzzo Citeriore, 21 miles S.S.E. of Solmona.

FURNES, a town of Flanders, ſeated near the German Ocean, on the canal from Bruges to Dunkirk. It was one of the barrier towns; but, in 1781, the emperor Joſeph II. expelled the Dutch garriſon. It was taken by the French in 1793, and is 12 miles E. of Dunkirk. Long. 2. 45. E. Lat. 51. 4. N.

FURRUCKABAD, a diſtrict of Hindooſtan Proper, contiguous to the W. bank of the Ganges, and ſurrounded by Oude. It is little more than 30 miles in extent, and belongs to a chief of the Patan Rohilla tribe. The principal town is of the ſame name, 70 miles E. of Agra, and 76 N. W. of Lucknow. Long. 79. 30. W. Lat. 27. 28. N.

FURSTENBURG, a principality of Suabia, bounded by the duchy of Wirtemberg, the county of Hohenburg and other territories of the houſe of Auſtria, by the Briſgaw, the Black Foreſt, and the lake and biſhopric of Conſtance. In this ſtate the river Danube takes its riſe.

FURSTENFELD, a town of Lower Stiria, with a caſtle, on the river Auſtnitz, 50 miles S. of Vienna. Long. 16. 5. E. Lat. 47. 23. N.

FURSTENWALD, a town of Germany, in the Middle Marche of Brandenburg, ſeated on the Spree, 20 miles W. of Francfort on the Oder. It was taken by the Swedes in 1631. Long. 14. 8. E. Lat. 52. 23. N.

FURSTENWERDER, a town of Upper Saxony, in the Ucker Marche of Brandenburg, 10 miles W.N.W. of Prenzlo.

FURT, a town of Lower Bavaria, ſituate on the Chample, 56 miles N.N.W. of Paſſau, and 86 N.N.E. of Munich. Long. 12. 46. E. Lat. 49. 13. N.

FURTH, a town of Franconia, in the principality of Anſpach, on the Redwitz, four miles W. of Nuremburg.

FUTTYPOUR, SICRI, a conſiderable town of Hindooſtan Proper, in the province of Agra. It is ſeated under a range of hills, the ſouthern boundary of an immenſe plain, in which, for the greateſt part, not a ſhrub is to be ſeen, and the ſoil is almoſt as fine as hair powder; a circumſtance productive of the moſt diſagreeable effects, when this fine duſt is taken up by the hot winds from the weſtward. Its ſituation, too, is unhealthy, from the indifferent water with which the whole country abounds; but the country immediately near the town, is in tolerable cultivation. On the ſummit of the higheſt hill is a large moſque, built by the emperor Acbar, in the firſt ſtyle of Mooriſh architecture; and at the foot of this hill are the ruins of an imperial palace, which occupy a great extent of ground. It is 42 miles W. of Agra. Long. 77. 45. E. Lat. 27. 0. N.

FYAL, one of the Azores, or Weſtern Iſlands. It is well cultivated; and has abundance of cheſnuts, beeches, myrtles, and aſpen-trees. The cottages of the common people are built of clay, thatched with ſtraw; and are ſmall, but cleanly and cool. The moſt conſiderable place is called Villa de Horta. Long. 28. 36. W. Lat. 38. 32. N.

FYERS, a river in Inverneſsſhire, which, deſcending from the S. flows toward Loch Neſs. Over this river is built a ſtupendous bridge, on two oppoſite rocks; the top of the arch being above 100 feet from the level of the water. A little below the bridge is the celebrated Fall of Fyers, where a great body of water darts through a narrow gap between two rocks, then falls over a vaſt precipice into the bottom of a chaſm.

FYNE, Loch, an inlet of the Atlantic, in Argyleſhire, nearly 40 miles in length. It receives and returns a tide on each ſide of the iſle of Arran, which is directly oppoſite its entrance. It is indented with bays; and at certain ſeaſons, its waters are filled with herrings, when it becomes the reſort of numerous fiſhing veſſels.

FYZABAD, a city of Hindooſtan Proper, in the territory of Oude, of which it was once the capital. Here are the remains of a vaſt building, the palace of the late nabob Sujah ul Dowlah. The city is very populous; but ſince the removal of the court of Oude to Lucknow, the people are of the loweſt claſs. It is ſeated on the Gogra, 80 miles E. of Lucknow, and 500 N.W. of Calcutta. Long. 82. 30. E. Lat. 26. 34. N.

G.

GABARET, a town of France, in the department of Gers, ſeated on the Geliſſe, 20 miles W. of Condom. Lon. 0. 6. E Lat. 44. 59. N.

GABEL, a town of Bohemia, where Prince Henry of Pruſſia entered that country, after having gained an advantage over the Auſtrians, in 1778. It is 45 miles N. of Prague.

GABIAN, a village of France, in the department of Herault, famous for its mineral waters, nine miles N.W. of Beziers.

GABIN, a town of Poland, in the palatinate of Rava, 50 miles N.W. of Warſaw. Long. 19. 45. E. Lat. 52. 26. N.

GADEBUSCH, a town of Lower Saxony, in the duchy of Mecklenburg, near which the Swedes defeated the Danes in 1712. It is 16 miles N.N.W. of Schwerin.

GAETA, an ancient town of Naples, in Terra di Lavoro, with a fort, a citadel, a harbour, and a biſhop's ſee. It was taken by the Auſtrians in 1707, and by the Spaniards in 1734. It is ſeated at the foot of a mountain, near the ſea, 30 miles N.W. of Capua. Long. 13. 47. E. Lat. 51. 30. N.

GAIRLOCH, a large bay of Scotland, on the W. coaſt of Roſsſhire, which gives name to a tract of land near it. The fiſhing of cod, and other white fiſh, is here very conſiderable.

GALACZ, or GALASI, a town of Bulgaria, ſeated near the Danube, between the mouths of the Pruth and Seret, 55 miles W. of Iſmael, and 120 S.S.W. of Bender. Long. 28. 24. E. Lat. 45. 24. N.

GALASHIELS, a village in Selkirkſhire, near the confluence of the Gala and Tweed. Here is a flouriſhing manufacture of woollen cloth, called Galaſhielſgray, being of a dark colour and coarſe texture; flannels and ſuperior cloths are alſo made here. It is 25 miles S. by E. of Edinburgh.

GALASO, a river of Naples, in Otranto, which riſes in the opening near Oria, and falls into the gulf of Taranto.

GALFALLY, a town of Ireland, in the county of Tipperary, 23 miles S.E. of Limerick. Long. 8. 20. W. Lat. 52. 15. N.

GALISTIO, a town of Spain, in Eſtremadura, 10 miles N.W. of Placentia. Long. 5. 8. E. Lat. 40. 2. N.

GALITSCH, a town of Ruſſia, in the government of Koſtroma, on the S. ſide of a lake to which it gives name, 56 miles E.N.E of Koſtroma. Long. 22. 54. E. Lat. 57. 56. N.

GALLAM, the capital of a kingdom of the ſame name, in Africa, on the river Senegal. Long. 9. 55. W. Lat. 14. 25. N.

GALLARDON, a town of France, in the department of Eure and Loire, 12 miles N.E. of Chartres.

GALLIPOLI, a ſtrait between European and Aſiatic Turkey. It forms the communication between the Archipelago and the ſea of Marmora, and is defended at the S.W. entrance by the Dardanelles. It is here two miles over, and is thirty-three miles long. It was anciently called the Helleſpont. See DARDANELLES.

GALVANISM, an appellation given to the influence of metals, by mere external contact with the human body, diſcovered by Prof. GALVANI, at Bologna, about ten years ſince, and which he called *Animal Electricity*. The following account of this intereſting diſcovery is given by Dr. Willich in THE DOMESTIC ENCYCLOPÆDIA.

"Certain convulſive motions on the nerves of living and dead animals," ſays the doctor, "may be excited by the application of metallic or other conductors of electricity; but theſe motions may alſo be induced, by ſimply touching the animal fibre with two *different* metals, that are brought in contact with each other at the ſame moment. This ſurpriſing phenomenon has lately been reſorted to, in order to aſcertain whether a drowned, ſuffocated, or otherwiſe ſuddenly deceaſed perſon, was really or apparently dead. For this purpoſe, Dr. CREVE, Prof. of Medicine in the Univerſity of Mayence, has contrived an inſtrument formed like a bow, both ends of which are furniſhed with two ſmall round plates. The whole is compoſed of two parts made of different metals; one-half of ſolid zinc, the other of fine ſilver; or gold and zinc, or lead, tin, and gold. The proportion of the firſt metal ſhould be leſs than the other combined with it; namely, the weight and ſize of the zinc-plate ſhould be leſs than the oppoſite one of gold. Both plates are only ſcrewed on the bow, which chiefly conſiſts of ſilver. But, where this inſtrument cannot be procured on the ſpur of the occaſion, a ſmall piece of tin or lead, and a ſilver coin of a moderate ſize (for inſtance a ſhilling, or half-a-crown piece) may be ſubſtituted. Although any part of the body may be fixed upon for making the experiment with perſons apparently dead, yet the upper arm will be the moſt proper. The ſkin, however, in that part where the inciſion is made, ought to be ſound, and not of a gangrenous appearance. The muſcles muſt be cleared of all fat and cellular texture, as far as this be practicable; and the blood is to be taken up by a ſponge dipped in water. Next, the muſcle ſhou'd be ſlightly extended, by ſtretching the arm; and, in order to keep the lips of the wound ſeparate, the ſkin ought to be expanded, and the muſcular fibres clearly expoſed. After theſe preparatory ſteps, either the inſtrument above deſcribed, or two looſe metallic plates, are to be applied towards the centre of the hollow place or wound made by the inciſion, and both flat plates brought into perfect contact with the bare muſcular fibres. If any irritability exiſt, or remain, in the ſyſtem of the ſubject, the muſcular fibres will be contracted and twiſted in a manner ſimilar to ſpaſms; or convulſive motions will be evident: every ſymptom, however, diſappears on withdrawing the inſtrument, and again becomes manifeſt on re-applying it as before. But no motion whatever will be perceptible, if all irritability be loſt or deſtroyed, in which caſe the body may be conſidered as *irrecoverably dead*.—In thoſe inſtances, where perſons have been deprived of life by intenſe cold, a moderate degree of warmth ſhould be previouſly applied, with a view to render the limbs flexible. Hence, this experiment cannot with propriety be undertaken, till all other means of reſtoring animation have been *unſucceſsfully* employed.

"Whatever two metals be choſen, they will, with few exceptions, produce thoſe remarkable contractions, when applied in the manner before deſcribed; but the moſt powerful are, zinc and ſilver, or zinc and gold; or in general, zinc, tin, or lead, when uſed in combination with gold, ſilver, molybdena, ſteel, or copper.

"Theſe ſingular phenomena take place in conſequence of a mutual communication between any two points of contact, whether more or leſs diſtant, in a ſyſtem of muſcular and nervous organs. The extent of this communication may be conſidered as a complete circle divided into two parts, one of which compriſing the organs of the animal under the experiment, is called the *animal arc*; the other, which is formed by

the metals or *galvanic* exciters, is denominated the *excitatory arc*; and conſiſts of more than one piece, of various kinds.

Beſides the effects thus produced on the muſcles, the impreſſions made on the organs of the ſenſe are equally remarkable. And as the experiments illuſtrating them may be eaſily repeated, we ſhall ſpecify ſome of the moſt intereſting. For inſtance, if a thin plate of zinc be placed on the upper ſurface of the tongue, and a half-crown, ſhilling, or ſilver tea-ſpoon, be laid on the lower ſurface of the tongue, and both metals after a ſhort ſpace of time be brought into contact, a peculiar ſenſation ſimilar to taſte, will be perceived at the moment when the mutual touch happens. If the ſilver be put beneath, and the zinc upon the tongue, the ſame ſenſation will ariſe, but in a weaker degree, reſembling diluted ammoniac, from which it in all probability derives its origin.

If a ſilver probe be introduced as far as convenient into one of the noſtrils, and then be brought into contact with a piece of zinc placed on the tongue, a ſenſation not unlike a ſtrong flaſh of light will be produced in the correſponding eye, at the inſtant of contact. A ſimilar perception will reſult, both at the moment of contact and at that of ſeparation, if one of the metals be applied as high as poſſible between the gums and upper lip, and the other in a ſimilar ſituation with the under lip, or even under the tongue.—Laſtly, when a probe or rod of zinc, and another of ſilver, are introduced as far back as poſſible into the roof of the mouth, the irritations produced by bringing the external ends into contact, are very powerful; and that cauſed by the zinc is ſimilar in taſte to the ſenſation ariſing from its application to the tongue.

No method has hitherto been diſcovered, of applying the Galvanic influence in ſuch a manner as to affect the ſenſes of ſmell, hearing, and touch; though ſeveral eminent philoſophers have carefully inveſtigated the ſubject. Nor are the *cauſes* of theſe phenomena clearly aſcertained; Galvani and ſome of his followers, ſuppoſing them to depend on the electric fluid, while others attribute them to the influence of various phyſical agency.

In this ſtate was Galvaniſm, when in the year 1800, Signor Volta, profeſſor of natural philoſophy, at Como, in the Milaneſe, communicated to Sir Joſeph Banks, a diſcovery of the vaſt accumulation of this power: it was accordingly preſented to the Royal Society, from the 2d part of whoſe Tranſactions, for 1800, we have ſelected the following account:

Signor Volta's apparatus conſiſts of a number of copper or ſilver plates (which laſt are preferable), together with an equal number of plates compoſed of tin, or ſtill better of zinc, and a ſimilar number of pieces of card, leather, or woollen cloth, the laſt of which ſubſtances appears to be the moſt ſuitable. Theſe laſt ſhould be well ſoaked in water ſaturated with common ſalt, muriat of ammonia, or, more effectually, with nitre.—The ſilver or copper may be pieces of money, and the plates of zinc may be caſt of the ſame ſize. A pile is then to be formed, by placing a piece of ſilver on a correſponding one of zinc, and on them a piece of wet cloth or card: which is to be repeated alternately, till the number required be arranged in regular ſucceſſion. But, as the pieces are apt to tumble down, if their numbers be conſiderable, unleſs properly ſecured, it will be adviſable to ſupport them by means of three rods of glaſs, or baked wood, fixed into a flat wooden pedeſtal, and touching the pieces of metal at three equi-diſtant points. Upon theſe rods may be made to ſlide a ſmall circular piece of wood, perforated with three holes, which will ſerve to keep the top of the pile firm, and the different layers in cloſe contact. The moiſtened pieces ſhould likewiſe be ſomewhat ſmaller than thoſe of metal, and gently ſqueezed before they are applied, to prevent the ſuperfluous moiſture from inſinuating itſelf between the pieces of metal. Thus conſtructed, the apparatus will afford a perpetual current of the animal-electric fluid, or Galvanic influence, through any conductor that communicates between the uppermoſt and loweſt plate; and, if one hand be applied to the latter, and the other to the higheſt metal, a ſhock will be perceived, which may be repeated as often as the contact is renewed. This ſhock greatly reſembles that given by the torpedo, or *gymnotus electricus*: and, according to the larger ſize of the metallic plates, the ſhock will be proportionably ſtronger. The intenſity of the charge, however, is ſo low, that it cannot penetrate the dry ſkin; it will therefore be neceſſary to wet both hands, and to graſp a piece of metal in each, in order to produce the deſired effect: its power may be conſiderably increaſed, both by an elevation of temperature, and by augmenting the number of pieces that compoſe the pile. Thus 20 pieces of each will emit a ſhock, that is very perceptible in the arms; if 100 be employed, a very ſevere but tremulous and continued ſenſation will extend even to the ſhoulders; and, if the ſurface of the ſkin be broken, the action of the Galvanic influence will be uncommonly painful.

The ſenſation of a flaſh, or ſhock with this apparatus, does not materially differ from that produced by two ſimple plates; but it may be effected in various ways, eſpecially if one or both hands be applied in a wet ſtate to the loweſt plate of the pile; or any part of the face be brought in contact with a wire communicating with the top piece. Further, if a wire be held between the teeth, ſo as to reſt upon the tongue, that organ, as well as the lips, will become convulſed, the flaſh will appear before the eye, and a very pungent taſte will be perceived in the mouth.

In an account of ſome experiments on Galvanic electricity, Mr. W. Cruickſhank, of the Royal Artillery, Woolwich, communicates the following particulars:

"In ſubjecting a number of fluids to the action of Galvaniſm," ſays he, "ſeveral facts have been diſcovered, which to me, at leaſt, are perfectly new, and which appear to throw ſome light on the nature and powers of this new influence.

"I ſhall, therefore, without any further apology, give a brief detail of ſome of the moſt important, hoping that they may prove acceptable to thoſe who are employed in the ſame purſuits.

"I ſhall not give any particular account of the apparatus employed, being a pile, and not differing materially from that in uſe. I ſhall only juſt obſerve, that it conſiſted of plates of zinc and ſilver, of about 1.6 inches ſquare, and that the number of each employed in the following experiments varied from 40 to 100, according to the power required.

"I found that a ſolution of the muriate of ammonia anſwered better for moiſtening the interpoſed papers than common water.

"When the machine was in full action, ſparks, which were perfectly viſible in the day-time, could be taken at pleaſure, by making a communication in the uſual way between the extremities of the pile, and a ſmall report or ſnap could be heard; the ſhock given at that time was very ſtrong, and a gold leaf electrometer, placed in the circle of communication was very ſenſibly affected: theſe circumſtances, ſome of which I believe have been already aſcertained by Meſſrs. Nicholſon and Carliſle, ſhew the ſtrong reſemblance of this influence to electricity. Theſe gentlemen have likewiſe diſcovered that Galvaniſm decompoſes water with much greater facility than electricity, but with phenomena ſomewhat different."

The following is an account of ſome Galvanic combinations formed by the arrangement of ſingle metallic plates and fluids, analogous to the new Galvanic apparatus of Mr. Volta, by Mr. Humphry Davy, lecturer on chemiſtry in the Royal In-

ſtitution.—Mr. Davy remarks that, "All the Galvanic combinations analogous to the new apparatus of Mr. Volta, which have been heretofore deſcribed by experimentaliſts, conſiſt (as far as my knowledge extends) of ſeries containing at leaſt two metallic ſubſtances, or one metal and charcoal, and a ſtratum of fluid. And it has been generally ſuppoſed, that their agencies are, in ſome meaſure, connected with the different powers of the metals to conduct electricity. But I have found that an accumulation of Galvanic influence, exactly ſimilar to the accumulation in the common pile, may be produced by the arrangement of ſingle metallic plates, or arcs, with different ſtrata of fluids."

Some facts, which the author then relates, induced him to ſuppoſe "that the alternation of two metallic bodies with fluids, was eſſential to the production of accumulated Galvanic influence, only ſo far as it furniſhed two conducting ſurfaces of different degrees of oxidability; and that this production would take place, if ſingle metallic plates could be connected together by different fluids, in ſuch a manner that one of their ſurfaces only ſhould undergo oxidation, the arrangement being regular.—On this ſuppoſition I made a number of experiments on different arrangements of ſingle metals and fluids; and after many various proceſſes, I was enabled to aſcertain, that many of theſe arrangements could be made active, not only when oxidations, but likewiſe when other chemical changes were going on in ſome of their parts."

Having made obſervations on the different combinations formed by ſingle metallic plates and fluids, which he divides into three claſſes, the ingenious author then proceeds to ſtate that "In all the ſingle metallic piles conſtructed with cloths, the action is very tranſient: the decompoſition of the acids, and of the ſulphurets, is generally completed in a few minutes; and, in conſequence, the Galvanic influence ceaſes to be evolved. The arrangement of all the different ſeries may, however (by means of an apparatus conſtructed after the ideas of Count Rumford), be made in ſuch a manner as to give conſiderable permanency to their effects. This apparatus is a box, covered with cement incapable of conducting electricity, and compoſed of three pieces of mahogany, each containing grooves capable of receiving the edges of the different plates proper for compoſing the ſeries. One half of theſe plates muſt be compoſed of horn, or glaſs, and the other half of metallic ſubſtances; and the conductors of electricity, and the non-conductors, muſt be alternately cemented into the grooves, ſo as to form water-tight cells.

"When the apparatus is uſed, theſe cells are filled, in the Galvanic order, with different ſolutions, according to the claſs of the combination; and connected in pairs with each other, by ſlips of moiſtened cloth, carried over the non-conducting plates.

"A combination of fifty copper-plates, arranged in this manner, with weak ſolutions of nitrous acid, or nitrate of ammoniac, and ſulphuret of potaſh, gives pretty ſtrong ſhocks, rapidly evolves gas from water, and affects the condenſing electrometer.

"It does not loſe its power of action for many hours; and, when this power is loſt, it may be reſtored by the addition of ſmall quantities of concentrated ſolutions of the proper chemical agents to the fluids in the different cells.

"From two experiments made on copper and ſilver, it would appear, that the ſingle metallic batteries act equally well, when the metals made uſe of are ſlightly alloyed, and when they are in a ſtate of purity."

Many other curious facts have tranſpired on this intereſting diſcovery; but, as they have not been hitherto applied to medical purpoſes (though we believe that *Galvaniſm* may be ſafely, and perhaps ſucceſsfully, reſorted to, in *paralytic* and other caſes, where the muſcles require excitement), we ſhall content ourſelves with referring the curious reader to Dr. Fowler's *Eſſay on Animal Electricity*, 8vo.;—for a further account of Signor Volta's diſcovery, to the volume of the *Philoſophical Tranſactions* above cited; and to the 4th volume of Mr. Nicholſon's *Journal of Natural Philoſophy*: and, for later diſcoveries, to the *Journals of the Royal Inſtitution of Great Britain*, where the ſubject is perſpicuouſly treated.

GAME-LAWS (*Encycl.*). The following is a ſhort ſketch of the laws, as they now ſtand (1802), relating to hares, partridges, pheaſants, and other game.

The penalty for killing in the night a hare, partridge, or pheaſant,—qualified or unqualified, is 5l.

Any unqualified perſon expoſing to ſale a hare, partridge, pheaſant, or other game, is liable to a penalty of 5l.

If any hare, pheaſant, partridge, or other game, be found in the ſhop, houſe, or poſſeſſion of any poulterer, ſaleſman, fiſhmonger, cook, or paſtry-cook, or of any perſon not qualified in his own right to kill game, or entitled thereunto under ſome perſon ſo qualified, it ſhall be deemed an expoſing thereof to ſale.

For ſelling a hare, partridge, pheaſant, or other game,—qualified or unqualified, 5l.

Any unqualified perſon uſing tunnels or other engines, to kill or deſtroy a hare, partridge, pheaſant, or other game, forfeits 5l.

Any unqualified perſon keeping and uſing greyhounds, ſeting-dogs, lurchers, tunnels or other engines, to kill or deſtroy hares, partridges, pheaſants, or other game, is liable to 5l. penalty—the 5l. penalty is either for keeping or uſing.

[Perſons taking, killing, deſtroying, carrying, ſelling, buying, or having in their poſſeſſion, any partridge, between the 1ſt of February and the 1ſt of September,—qualified or unqualified, 5l. 39 Geo. 3. c. 34.]

For uſing greyhounds, lurchers, or ſetting-dogs*, to kill a hare, partridge, or pheaſant,—unqualified, 5l.

For killing a pheaſant, between the 1ſt of February and 1ſt of October,—qualified or unqualified, 5l.

[The information in the above caſes muſt be laid within ſix calendar months, before a juſtice of the peace, or by action of debt, bill, plaint, or information. The whole penalty to be given to the informer, with double coſts, if brought on in the courts of Weſtminſter.] Half to the informer and half to the poor.

For tracing in the ſnow, or ſhooting with a gun or long bow, a hare,—qualified or unqualified, impriſonment for 3 months, or fine 1l.

For uſing ſnares to take or kill a hare,—qualified or unqualified, impriſonment one month, or fine 10s.

[The information in the above caſes muſt be laid before a juſtice of the peace within one year.]

The informer to be entitled to all coſts and charges, and to half the penalty, the other half to be given to the poor of the pariſh.

Any game-keeper killing or taking a hare, pheaſant, partridge, or other game, under colour of being for the uſe of the lord of the manor, and afterwards ſelling and diſpoſing thereof without the conſent of the ſaid lord of the manor—upon conviction, on the complaint of ſuch lord, and on the

* Greyhounds, lurchers, and ſetting-dogs, are the only dogs for keeping and uſing which the penalty of 5l. is levied. But by another ſtatute, a penalty not exceeding 20s. may be levied for keeping and uſing the above or any other dogs.

oath of one witneſs, before a juſtice, ſhall be committed to the houſe of correction for three months, and there kept to hard labour.

Any perſon who ſhall deſtroy, ſell, or buy any hare, pheaſant, &c. and ſhall in three months make diſcovery of any higler, chapman, carrier, innkeeper, alehouſe-keeper, or victualler, that hath bought or ſold, or offered to buy or ſell, or had in their poſſeſſion, any hare, pheaſant, partridge, &c. ſo as any one ſhall be convicted; ſuch diſcoverer ſhall be diſcharged of the pains and penalties hereby enacted for killing or ſelling ſuch game, and ſhall receive the ſame benefit as any other informer.

Any juſtice of the peace, and lord within his manor, may take away any ſuch hare, pheaſant, partridge, &c. from any higler, chapman, innkeeper, victualler, or carrier, or any other perſon not qualified, which ſhall be found in his cuſtody or poſſeſſion.

Any perſon that ſhall knowingly and wilfully kill, take, or deſtroy, or uſe any gun, dog, ſnare, net, or other engine, with intent to kill, take, or deſtroy, any hare, partridge, or other game, in the night, viz. between the hours of ſeven at night and ſix in the morning, from the 12th of October to the 12th of February, and between the hours of nine at night and four in the morning, from the 12th of February to the 12th of October; or in the day-time on a Sunday or Chriſtmas-day; ſhall forfeit for the firſt offence not exceeding 20l. nor leſs than 10l. For the ſecond offence not exceeding 30l. nor leſs than 20l. For the third and every other ſubſequent offence, 50l.

[The information to be laid within one calendar month before a juſtice of the peace. The informer to be entitled to all coſts and charges, and to half the penalty, the other half to be given to the poor of the pariſh.]

No perſon ſhall ſhoot with any croſs-bow, hand-gun, or demihake, unleſs ſuch perſon is really poſſeſſed of 100l. per annum, on pain of forfeiting 10l.

No perſon, of what eſtate or degree ſoever, ſhall ſhoot with, carry, keep, uſe, or have in his poſſeſſion, any hand-gun, not being in the ſtock and gun of the length of one yard; or any hagbut, or demihake, not being in the ſtock and gun of the length of three quarters of a yard, on pain of forfeiting 10l.

Any perſon having 100l. per annum as above, may ſeize every ſuch croſs-bow, hand-gun, &c. being ſo deficient in length; but ſhall break and deſtroy them in 20 days after ſuch ſeizure, on pain of forfeiting 2l.

No perſon ſhall command his ſervant to ſhoot with any croſs-bow, hand-gun, hagbut, or demihake, at any deer, fowl, or other thing, except at a butt or bank of earth, on pain of forfeiting 10l.

N. B. Perſons qualified to kill game, muſt be in poſſeſſion of lands, tenements, or ſome other eſtate of inheritance, either in right of themſelves or their wives, of the clear yearly value of 100l.—or for life, or leaſe of 99 years of 150l. per annum; other than the ſon and heir of an eſquire, or perſon of a higher degree, or lord of a manor, or keepers of parks, chaſes, or free warrens.

The following is Lord Mansfield's opinion: "An unqualified perſon may go out to beat the hedges, buſhes, &c. with a qualified perſon, and to ſee the game purſued or deſtroyed, provided the unqualified perſon has no gun or other engine with him for the deſtruction of the game, without being ſubject to a penalty."

The licences for killing game are under the following regulations:

By the 25 Geo. III. c. 50. and 31 Geo. III. c. 21. every perſon who ſhall uſe any dog, gun, net, or other engine, for the taking or deſtruction of game (not acting as gamekeeper), ſhall deliver in an account in writing, containing his name and abode, to the clerk of the peace, and annually take out a certificate thereof; and every ſuch certificate ſhall be charged with a ſtamp-duty of 2l. 2s. and 1l. 1s. making in the whole 3l. 3s.

Every deputation of a gamekeeper ſhall be regiſtered with the clerk of the peace, and ſuch gamekeeper ſhall annually take out a certificate thereof; which certificate ſhall be charged with a ſtamp duty of 10s. 6d. and 10s. 6d. making in the whole 1l. 1s.

Clerks of the peace delivering a certificate ſhall be entitled to 1s. for their trouble.

Every certificate to bear date the day when iſſued, and to continue in force until the 1ſt day of July then following.

Any perſon that ſhall uſe any greyhound, hound, pointer, ſetting-dog, ſpaniel, or other dog, or any gun, net, or engine, for taking or killing of game, without a certificate, is liable to a penalty of 20l.

If any gamekeeper ſhall, for the ſpace of twenty days after appointment, neglect or refuſe to regiſter his deputation and take out a certificate thereof, he is liable to the penalty of 20l.

This act not to extend to the royal family.

If any gamekeeper, who ſhall have regiſtered his deputation, and taken out a certificate thereof, ſhall be changed, and a new gamekeeper appointed in his ſtead, the firſt certificate is declared null and void, and the perſon acting under the ſame, after notice, is liable to the penalty of 20l.

Any perſon in purſuit of game, who ſhall refuſe to produce his certificate, or to tell his name and place of abode, or ſhall give in any falſe or fictitious name or place of abode to any perſon requiring the ſame, who ſhall have obtained a certificate, is liable to the penalty of 50l.

The certificates are not to authoriſe perſons to kill game at any time prohibited by law, nor give any perſon any right to kill game, unleſs ſuch perſon ſhall be qualified ſo to do by the laws now in being; and if he is not qualified, although he may have ſuch certificate, he is liable to the ſame penalties as if this act had not paſſed.

Witneſſes refuſing to appear on juſtice's ſummons, or appearing and refuſing to give evidence, forfeit 10l.

Penalties exceeding 20l. are to be recovered in any of his Majeſty's courts of record at Weſtminſter; and penalties not exceeding 20l. are recoverable before two juſtices, and may be levied by diſtreſs.

N. B. The above penalties go half to the king and half to the informer, if ſued for within ſix months. 26 Geo. III. c. 82.

GANDERSHEIM, a town of Lower Saxony, in the duchy of Brunſwick Wolfenbuttle, with a celebrated nunnery, 17 miles S.W. of Goſlar. Long. 18. 20. E. Lat. 51. 54. N.

GANDIA, a ſea-port of Spain, in Valencia, with a ſmall univerſity, 55 miles N. of Alicant. Long. 0. 20. E. Lat. 39. 6. N.

GANDICOTTA, a town of the peninſula of Hindooſtan, ſubject to the regent of Myſore, remarkable for a ſtrong fortreſs, and a diamond mine near it. It is ſeated on the river Pennar, between Gooty and Cuddapa.

GANDINA, a town of Italy, in the Bergamaſco, 10 miles N.E. of Bergamo.

GANGEA, or GANJA, a town of Perſia, in the province of Erivan, 105 miles S. by E. of Teflis. Long. 45. 50. E. Lat. 41. 10. N.

GANGELI, a town of Weſtphalia, in the duchy of Juliers, 12 miles S.S.E. of Ruremonde. Long. 5. 48. E. Lat. 51. 8. N.

GANGOTRI, a town of Thibet, on the Ganges, 138 miles N. of Delhi. Long. 76. 35. E. Lat. 33. 8. N.

GANGPOUR, a town of the peninſula of Hindooſtan, in the country of Oriſſa, 226 miles S. of Patna. Long. 83. 57. E. Lat. 21. 25. N.

GANJAM, a town of the peninſula of Hindooſtan, in one of the Northern Circars, ſubject to the Engliſh. It lies on the Bay of Bengal, between a river and the S.W. end of Chilka Lake. Long. 85. 20. E. Lat. 19. 22. N.

GANNAT, a town of France, in the department of Allier, 30 miles S. of Moulins.

GAOGA, a country of Africa, to the W. of Nubia. The inhabitants are ſaid to be barbarous and uncivilized. It has a town of the ſame name, ſituate on a large lake. Long. 26° E. Lat. 16° N.

GAP, an ancient town of France, in the department of the Upper Alps, and lately a biſhop's ſee. It was taken in 1692, by the Duke of Savoy, who burnt a great part of it. Gap is ſeated on the ſmall river Bene, at the foot of a mountain, in which ſome mineral waters are found, 27 miles N. of Siſteron. Long. 6. 10. E. Lat. 44. 34. N.

GAPSAL, a town of Ruſſia, in the government of Revel, 36 miles W.S.W. of Revel. Long. 60. 10. E. Lat. 59. 5. N.

GARACK, an iſland in the gulf of Perſia, remarkable for the fine pearls fiſhed upon its coaſts. Long. 48. 0. Lat. 28. 15. N.

GARD, a department of France, including part of the late province of Languedoc. Niſmes is the epiſcopal town.

GARD, PONT DU, a Roman aqueduct, in France, nine miles N.E. of Niſmes, erected, it is ſuppoſed, by Agrippa, in the time of Auguſtus. It is 160 feet in height, and conſiſts of three bridges riſing above each other, and uniting two craggy mountains. The higheſt of theſe bridges has ſix arches, of great blocks of ſtone, without cement; the centre one has eleven; and the loweſt (under which flows the Gardon, an inconſiderable, but rapid river) has 36. Lewis XIV. when he repaired, in 1699, the damages which this ſtupendous work had ſuſtained by time, cauſed a real bridge, over which paſſengers now paſs, to be conſtructed by the ſide of the lower range of arches. This aqueduct was built, in order to convey to Niſmes the water of the ſpring of Eure, which riſes near Uzes.

GARDA, a town of Italy, in the Veroneſe, ſeated at the end of a lake of its own name, 17 miles N.W. of Verona. Long. 11. 4. E. Lat. 45. 36. N.

GARDELEBEN, a town of Germany, in the Old Marche of Bradenburg. It has a trade in hops and excellent beer, and is ſeated on the river Beiſe, 32 miles N. by W. of Magdeburg. Long. 11. 35. E. Lat. 52. 41. N.

GARDENS, FOR COTTAGERS. The following extract from an account of cottagers' gardens, in the county of Cambridge, by the Rev. James Plumptree, is publiſhed by the Society for bettering the Condition of the Poor.

"At Arrington, in the month of July, 1800," ſays Mr. Plumptree, "I obſerved on the church door a notice from the Earl of Hardwick, addreſſed to the cottagers and labourers of the pariſh, 'that premiums of one guinea and a half, one guinea, and half a guinea, would be given to the three perſons of that deſcription, who ſhould appear to have taken the greateſt care of their gardens, and to have raiſed and brought to perfection, in the courſe of the ſummer, the greateſt quantities of peas, beans, carrots, turnips, cabbages, onions, or potatoes, in proportion to the extent of ground occupied.' The gardens were to be inſpected by his lordſhip's gardener, and three other perſons appointed for that purpoſe, as often, and at ſuch times, as they might think proper; and the premiums were to be adjudged on the 20th of October. Such perſons as wiſhed to be conſidered as candidates for the premiums, were previouſly to ſignify their intentions to the judges.

"A plan ſo well calculated to promote the induſtry, comfort, and reſources of the cottager, and even of thoſe candidates who ſhould not be ſo fortunate as to gain the rewards, naturally excited curioſity; and on further enquiry it appeared that his lordſhip had inſtituted the ſame premiums in his other pariſhes of Wimple and Whaddon.

"When the time for adjudging the premiums was paſt, anxious to know the reſult, I made enquiries, and found that the plan, both as to external neatneſs, and the internal comfort and ſupply of their families, had fully anſwered. In order that theſe means of promoting the induſtry and comforts, and conſequently improving the morals of the cottager, and rendering every village a pleaſing ſcene of rural plenty and happineſs, might be made known, and thereby the heads of other pariſhes be engaged to follow ſo benevolent an example, I inſerted a ſtatement of the above, with the names of the ſucceſsful candidates, in the Cambridge Chronicle, for November 29, 1800.

"In the pariſh of Hinxton, in the ſame county, upon the firſt mention of theſe premiums, the principal land-proprietor immediately came into the plan, and gave notice that ſimilar premiums would be diſtributed to the cottagers and labourers of that pariſh for the enſuing year. And as he and I purpoſed being two of the inſpectors, I reſolved to go over to Wimple, and ſee the gardens, and gain ſome further information reſpecting them.

"Accordingly, on the 18th of December, I went over to Wimple, and, accompanied by his lordſhip's gardener, viſited the gardens of the ſucceſsful candidates. All three of them lay together amongſt others, ſix in number, with a ſtrong outward fence encloſing them, and divided from each other by young quick hedges, in a very thriving condition. Each garden might be about 16 poles; and, though it was ſo late in the ſeaſon, and the principal crops were off the ground, yet the ground was in excellent order, and well ſtocked with cabbages, kale, &c. for winter vegetables. The potatoes and onions, of which each had a ſufficient ſtock, were ſome of the fineſt I have ſeen this year. The cottages, to which theſe gardens belong, have been built within a few years by his lordſhip, and are of brick and very commodious; beſides the garden, each has its pig-ſtye and other conveniences: a pond of water is near at hand. Even taſte is diſplayed in theſe ruſtic ſcenes; and a honey-ſuckle, twining round a pole, formed an arch over the entrance into ſome of the gardens. We next viſited the garden of another cottager, who, though he had not gained one of the premiums, had been diſtinguiſhed for his induſtry. It was not above three poles of ground, but it was well ſtocked, and in good order.

"The garden of the cottager who gained the firſt premium at Arrington, was larger than thoſe at Wimple. It might be about 20 poles. This had been kept in order by a very hard working man with a family of ſeven children; the eldeſt of which, a girl, was about 15 years of age: he uſed to work at it early and late. Beſides a variety of other vegetables, he had got from it 50 buſhels of potatoes, which at that time ſold at 4s. per buſhel. The gardens of the two other ſucceſsful candidates, and others which I viſited, were all in good order, and well ſtocked for the time of the year. As I thought I could not make a more acceptable preſent to theſe ſons of induſtry, I took with me ſome of the *Information to Cottagers*, publiſhed by the ſociety; a copy of which I gave at each cottage.

"Beſides the encouragement given to the cottagers in their

gardens, he permits them to plant potatoes in his new plantations, and on the fallows, provided they dung the ground. One man from ſix loads of dung, had got 70 buſhels of potatoes. Some waſte ground by the road ſide had likewiſe been encloſed for the poor, which they ſowed in what is called *lazy bed*. The method of doing this is, a ſpace of eight feet wide is marked out for the bed, and then another two feet wide for the path, and ſo on. The potatoes or eyes, are laid on the ſward, in alternate rows; the ſward is then dug up from the path, and laid over the potatoes, and as they grow they are earthed up with the ſoil out of the path, which likewiſe ſerves as a drain, if the weather ſhould prove wet.

"As I found it was with difficulty that three perſons were ſelected at Whaddon, deſerving of the premiums, and that the gardens* were not ſo well worth ſeeing, I did not go thither; but was happy to find that a ſpirit of exertion began to be excited among the cottagers there, and they had promiſed better for the enſuing year.

"When the premiums had been awarded, the nine ſucceſsful candidates, and ſix others (three from each of the pariſhes of Wimple and Arrington, recommended to Lord Hardwick's generoſity on account of their induſtry), attended at church on the Sunday following, after which the gardener conducted them into the great hall, where his lordſhip diſtributed the rewards, with a gratuity to each of the others, with ſome good advice on the occaſion; recommending induſtry and virtue in general, and promiſing his friendſhip ſo long as they were deſerving of it.

"The advantages ariſing from this plan, appear to be ſo very obvious, that it ſeems ſcarcely neceſſary to enumerate them. For the ſum of three guineas in a pariſh, a number of families†, perhaps all the cottagers, are excited to induſtry. A valuable ſtock of vegetables is produced, both for ſummer and winter conſumption; and great aſſiſtance given towards the keep of a pig. Beſides the good accruing to the cottager in thus finding uſeful and innocent employment for his leiſure hours, and in keeping him from the alehouſe, an example is ſet to his family; which will probably be trained up, under his care, to follow the ſame uſeful employment throughout life. At the ſame time the cottager muſt derive no ſmall degree of ſatisfaction, from the idea that he is become the object of the attention, and commendation, of his richer neighbour.

"The only difficulty which ſeems to occur, is in forming a correct eſtimate of the comparative merits of the gardens. This, however, I think is more in appearance, than in reality. I do not apprehend that the ſum total of the excellence will often be ſo nicely balanced as to make it difficult. The requiſites, in the judges, ſeem to be *ſcience* and *impartiality*. The firſt of theſe was, moſt unqueſtionably, poſſeſſed at Wimple, and there is no cauſe to doubt of the exiſtence of the other. At Hinxton, however, to the head and under gardener, we have added a very honeſt farmer and ourſelves; thinking that ſome additional advantage might accrue from our attention; and from our being able to judge in ſome degree of the other eſtimates, by going our rounds, keeping an eye to the cottager, and on his cottage, his family, and his garden; and thus getting an inſight into the real merits of our poorer neighbours.

"The *method* of eſtimating ſeems to be, to meaſure the ground of each candidate; and, at proper times, to go round, and value the reſpective crops. He, who produces moſt in proportion to his ground, is the moſt deſerving. A paper divided into columns, or a ſmall memorandum book, with the name of the candidates at the top of each column or page, and their reſpective portions of ground, ſhould be provided, and the memorandums and eſtimates placed under each. Two things ſeem eſpecially neceſſary to demand attention; one, that the viſits ſhould be uncertain, in order that the cottager may be obliged to be always prepared; and the other, that the cottager may have the power to invite a viſit, in order that his crops may be ſeen at the time when he himſelf thinks them in perfection."

GATEHOUSE, a conſiderable village in Kirkcudbrightſhire, at the mouth of the river Fleet. Here is a cotton-mill; and ſloops come up the river, within a ſhort diſtance of the town. It is nine miles N.W. of Kirkcudbright.

GAVARDO, a town of Italy, in the Breſciano, ſeated on the Weiſe, ſeven miles W. of Lake Garda. Long. 10. 9. E. Lat. 45. 40. N.

GAUDENS, St. a town of France, in the department of Upper Garonne, ſeated on the Garonne, eight miles N.E. of St. Bertrand. Long. 0. 56. E. Lat. 43. 1. N.

GAVEREN, or Waveren, a town of Auſtrian Flanders, ſeated on the Scheld, eight miles S. of Ghent. Long. 3. 51. E. Lat. 50. 56. N.

GAVI, a town of Italy, in the territory of Genoa, ſeated on the Lemo, 19 miles N.W. of Genoa. Long. 8. 57. E. Lat. 45. 40. N.

GAUTS, or Indian Appennines, a ſtupendous wall of mountains, extending from Cape Cormorin, the S. extremity of Hindooſtan, to the Tapty, or Surat River, at unequal diſtances from the coaſt; in one ſhort ſpace only, it approaches within ſix miles, the common diſtance is 40, and it ſeldom exceeds 70. They riſe abruptly from the low country, called the Concan, or Cockum; ſupporting, in the nature of a terrace, a vaſt extent of fertile and populous plains, which are ſo elevated, as to render the air cool and pleaſant. This celebrated ridge does not terminate in a promontory when it approaches the Tapty; but, departing from its meridional courſe, it bends eaſtward, in a wavy line, parallel with the river; and is afterwards loſt among the hills, in the neighbourhood of Burhampour. In its courſe along the Tapty, it forms ſeveral paſſes, or deſcents (that is Gauts, according to the original import of the word, which means a landing-place), toward that river.

GEARON, or Jaron, a town of Perſia, in Farſiſtan, in whoſe territory the beſt dates of Perſia are produced. Long. 51. 17. E. Lat. 28. 15. N.

GEFLE, the capital of the province of Geſtrike, in Sweden, ſeated on three branches of a river of the ſame name, which begins to be navigable here, and falls, in a ſhort diſtance, into a bay of the Baltic. It is the moſt commercial town in this northern part of Sweden; and its exports are principally iron, pitch, tar, and planks. It is 55 miles N. by W. of Stockholm. Long. 17. 0. E. Lat 63. 0. N.

GEGENBACH, a free imperial city of Suabia, and under the protection of the houſe of Auſtria. It is ſeated on the Kinzia, 12 miles S.E. of Straſburg. Long. 8. 2. E. Lat. 48. 24. N.

GEHMEN, a town of Weſtphalia, ſituate on the Aa, 16 miles N.E. of Weſel. Long. 6. 43. E. Lat. 51. 36. N.

---

* In a ſeparate ſheet is added a cottager's garden calendar; to inform and aſſiſt thoſe cottagers who wiſh *to make the moſt of their gardens*, for the benefit of themſelves and their families. Some of the articles are directed to a little profit by ſale. It may be had gratis, at Hatchard's, Piccadilly, London, by the members of the ſociety.

† There were 14 candidates at Wimple, 11 at Arrington, and 10 or 11 at Whaddon.

GEILEKIRCHER, a town of Weſtphalia, in the duchy of Juliers, eight miles N.W. of Juliers. Long. 5. 56. E. Lat. 51. 2. N.

GEILLDORF, a town of Suabia, near the river Kocher, with a caſtle belonging to the lords of Limpurg.

GEISLINGEN, an imperial town of Suabia, 17 miles N.W. of Ulm. Long. 10. 3. E. Lat. 48. 36. N.

GEISMAR, a town of Germany, in the principality of Heſſe, 14 miles N.N.W. of Caſſel, and 22 W. of Gottingen. Long. 8. 57. E. Lat. 51. 19. N.

GEMAPPE, a village of Auſtrian Hainault, three miles W. by S. of Mons, famous for a victory which the French obtained here over the Auſtrians, Nov. 5, 1792; in which the carnage on both ſides was ſo great, that three coal-pits adjacent were filled up with the dead bodies of men and horſes.

GEMBLOURS, a town of Auſtrian Brabant, with an ancient abbey. Don John of Auſtria gained a battle here over the Dutch in 1578; and it was twice burnt down, in 1628 and 1712. It is ſeated on the Orneau, 22 miles S.E. of Bruſſels. Long. 4. 51. E. Lat. 50. 37. N.

GEMINIANI, St. a town of Tuſcany, in the Florentino, ſeated on a mountain, in which is a mine of vitriol, 25 miles S.S.W. of Florence.

GEMMINGEN, a town of Germany, in the palatinate of the Rhine, 30 miles E. of Philipſburg. Long. 9. 13. E. Lat. 49. 6. N.

GEMUND, an imperial town of Suabia, with a manufacture of chaplets or beads. It was taken by the French in Auguſt 1796; and is ſeated on the Reims, 30 N. by W. of Ulm. Long. 9. 48. E. Lat. 48. 48. N.

GENAP, a town of Auſtrian Brabant, with an ancient caſtle, ſeated on the Dyle, 15 miles S.E. of Bruſſels. Long. 4. 40. E. Lat. 50. 40. N.

GENEVOIS, a duchy of Savoy, of which Geneva and its territory were formerly a part. Annecy is the capital.

GENGENBACH, a town of Suabia, 10 miles S.E. of Straſburg. Long. 7. 53. E. Lat. 48. 28. N.

GENGOUX DE ROYAL, St. a town of France, in the department of Saone and Loire, remarkable for its excellent wines. It is ſeated at the foot of a mountain, 17 miles S.W. of Chalons. Long. 4. 43. E. Lat. 46. 37. N.

GENIEZ, St. a town of France, in the department of Aveiron, 24 miles N.E. of Rhodez. Long. 3. 0. E. Lat. 44. 35. N.

GENIS, a town of Savoy, ſeated on the Guier, 12 miles W. of Chamberry. Long. 5. 30. E. Lat. 45. 40. N.

GENLIS, a town of France, in the department of Aiſne, 12 miles S. of St. Quentin.

GENOA, a territory and republic of Italy, extending along that part of the Mediterranean called the gulf of Genoa, 152 miles; but its breadth is very unequal, being from eight to twelve miles. Where it is not bounded by the ſea, it is bordered from W. to E. by Piedmont, Montferrat, Milan, Placentia, Parma, Tuſcany, and Lucca. It is populous, well cultivated, and fertile near the ſea; but the inner parts are mountainous, and barren in ſeveral places, having neither trees nor graſs upon them. The corn grown is inſufficient for its own conſumption; but this is amply compenſated by its vineyards, and abundance of excellent fruits, particularly lemons, oranges, pomegranates, almonds, and figs; and its mulberry and olive trees are innumerable.

GENTIAH, a town of the kingdom of Aſſam, 370 miles E. of Patna. Long. 92. 10. E. Lat. 25. 10. N.

GEOGRAPHY (*Encycl.*). In the Britiſh Magazine for 1800 are the following Obſervations on the Geography of Homer's Odyſſey, which are extremely curious and intereſting.

The occidental geography of Homer ſeems never to have been examined with due accuracy, and the received opinions concerning it are liable to very ſtrong objections. The learned Abbé Banier enquires *qui eſt ce qui peut dire où etoient les Cimmeriens d'Homere, et l'Iſle de Calypſo?* The Roman writers, whoſe national vanity arrogated the entire weſtern geography of Homer to Italy and Sicily, may be conſidered as the predeceſſors of Rudbeck; who, perhaps with equal reaſon, has drawn the whole of that geography to Scandinavia.

For the ſake of the general reader we ſhall omit the original paſſages, and content ourſelves with Mr. Pope's tranſlation of the Odyſſey. Hence it will appear; 1. That Ulyſſes leaving Troy attacked the *Cicones*, beneath the mountain of Iſmarus, in Thrace. Book ix. v. 41. *et ſeq.*

> The winds from Ilion to the Cicons' ſhore,
> Beneath cold Iſmarus, our veſſels bore;
> We boldly landed on the hoſtile place,
> And ſack'd the city, and deſtroy'd the race.

2. That a violent north wind drove them down on *Cythera*, an iſland at the ſouth-eaſtern corner of Peloponneſus. Book ix. v. 77. *et ſequent.*

> Strong was the tide, which by the northern blaſt,
> Impell'd our veſſels on Cythera caſt.

3. That the tempeſt, in *ten days*, conveyed him to the coaſt of the *Lotophagi*, in the middle of the northern ſhore of Africa.—*Ibid.* v 95. *et ſequent.*

4. From the land of the Lotophagi they were borne along unknown coaſts, and through unexplored ſeas, till they came to the land of the *Cyclops*, and the iſland of *Lachæa*. Verſe 119, &c.

> V. 133.—Oppos'd to the Cyclopean coaſts, there lay
> An iſle, whoſe hills their ſubject fields ſurvey;
> Its name Lachæa, crown'd with many a grove,
> Where ſavage goats thro' pathleſs thickets rove.

It would be difficult in this chorography to diſcover any reſemblance of Sicily. The land of the Cyclops appears evidently to belong to the continent; and the general geography of the voyage muſt lead us to infer that it was in that part of Africa where Carthage was afterwards to bid defiance to Rome.

5. From the land of the Cyclops, Ulyſſes returned to the iſland of *Æolus*, probably one of the Liparæ, on the weſtern coaſt of Sicily; and in ten days of rapid navigation with a favourable wind, the ſpecial and miraculous gift of Æolus, they diſcovered Ithaca. Book x. v. 31.

6. Driven back to the iſland of Æolus, v. 59, the tempeſt ſtill rages from the *eaſt*; and in ſix days and nights drives them to the ſhore of the *Leſtrigons*, and the city of *Lamos*, in all appearance ſituated in Spain.

7. The tempeſt further impels them to the iſland of *Circe*, ſeemingly one of the Fortunate Iſlands, or what are now called the Canaries. That the iſland of Circe belonged to the Fortunate group, is poſitively aſſerted by ſeveral ancient writers.

8. Hence, Book xi. he proceeded to the land of the *Cimmerii* in one day, by the potency of Circe's magic. All the ancient traditions bear that his voyage lay along Portugal (where ſtood *Ulyſſipona*); and thence even to Germany and Caledonia, where were the altars of Ulyſſes (Tacit. Germ. chap. 3.) Theſe circumſtances, however fabulous, evince the extenſive ideas entertained by the ancients concerning the navigation of Ulyſſes.

9. Upon leaving the iſland of Circe, Ulyſſes endeavours to navigate homewards, by the rocks of the *Syrens*, and Scylla and Charybdis. The Syrens in all appearance dwelled in the iſlands ſtyled the *Baleares*, now Majorca and Minorca.

The ſtrait of Scylla and Charybdis was certainly between *Corſica* and *Sardinia*; for,

10. Long after paſſing that ſtrait he arrived at *Trinacria*, which all grant to be Sicily; whereas if we take Scylla and Charybdis in the modern acceptation, when he had paſſed them he muſt in fact have paſſed Trinacria, inſtead of coming to it afterwards. An additional argument alſo here ariſes, that the Cyclops were not inhabitants of Sicily, for Homer mentions Trinacria as the iſland where the flocks of Apollo paſtured, and ſays not one word of the Cyclops.

11. The ſhip leaving Trinacria is wrecked, and a *ſouth* wind drives Ulyſſes *back*, through the ſtrait of Scylla and Charybdis, to *Ogygia*, the iſland of Calypſo, probably one of the *Hieres* on the coaſt of France.

12. *In ſeventeen* days and nights he reaches the coaſt of Phæacia. Book v. v. 345.

> And now rejoicing in the proſp'rous gales,
> With beating heart Ulyſſes ſpreads his ſails;
> Plac'd at the helm he ſat, and mark'd the ſkies,
> Nor clos'd in ſleep his ever-watchful eyes.
> There view'd the Pleiads, and the northern team,
> And great Orion's more refulgent beam;
> To which, around the axle of the ſky,
> The bear, revolving, points his golden eye;
> Who ſhines exalted on th' ethereal plain,
> Nor bathes his blazing forehead in the main.
> Far on the left thoſe radiant fires to keep,
> The nymph directed, as he ſail'd the deep.
> Full ſeventeen days he cut the foamy way,
> The diſtant land appear'd the following day;
> Then ſwell'd to ſight Phæacia's duſky coaſt,
> And woody mountains, half in vapours loſt,
> That lay before him, indiſtinct and vaſt,
> Like a broad ſhield amid the wat'ry waſte.

From Phæacia Ulyſſes ſailed to Ithaca, in *one night*. The iſland of Ogygia has been abſurdly placed on the eaſt of Italy, at about twice the diſtance of Phæacia from Ithaca: whereas Ulyſſes employed ſeventeen days and nights, even with a proſperous gale, to ſail from Ogygia to Phæacia, and only one night (Book xiii. v. 112) to paſs from Phæacia to Ithaca!

Some obſervations on the ſtate of geographical knowledge, at that remote period, here naturally ſuggeſt themſelves. There are two errors which have greatly impeded the progreſs of our knowledge of ancient geography. The firſt, and the moſt deſtructive of juſt ideas on the ſubject, is that of thoſe who have too far extended the knowledge of the ancients; the ſecond, and by far the moſt rational, is that which reſtricts it within narrow bounds.

Sir Iſaac Newton has attempted very much to reduce the Pagan chronology, by calculations from celeſtial appearances, which M. Bailly has ſince mathematically demonſtrated, in his *Aſtronomie Ancienne*, are anterior by four or five hundred years to the period affixed by our great Engliſh philoſopher. The chief cauſe of Sir Iſaac's failure was his approximation of celebrated events, while he ſeems to forget that tradition will preſerve equally freſh a remote event of vaſt conſequence, or of ſtriking ſplendour, with a more recent occurrence of inferior moment. Thus, in the darkneſs of night, a beacon at the diſtance of thirty miles may diſplay a ſimilar appearance to that of a torch at the diſtance of three.

In like manner, if we attempt to compreſs the priſtine, preciſe notions of geography, within too narrow and connected limits, we may fall into groſs errors. The Phœnicians, and other nations on the Mediterranean ſea, ever adventuring in queſt of freſh ſources of gain, or impelled by ſtorms, and the prevalence of certain winds, could not fail, even in very early times, to diſcover every region adjacent to that vaſt baſon. Nature had opened to them, as it were, a highway, which they could hardly help exploring to its furtheſt extremity. The *Tharſiſh* of Solomon is generally allowed to have been the *Tarteſſus* of the ancients near Cadiz, the port whence the ſilver from the Spaniſh mines was brought to the oriental world. But not to waſte time in learned diſcuſſion, it is well known that the Phœnicians had, many ages before the days of Homer, made numerous diſcoveries in the weſt of Europe. Of theſe diſcoveries, when retailed by tradition, ſeveral confuſed notions muſt have been formed. Homer, certainly no ſtranger to Phœnician ſcience, and deſirous to enrich his poem with the new and the marvellous, has no doubt availed himſelf of their furtheſt diſcoveries; and the confined limits within which we reſtrict the voyage of Ulyſſes, ſeems, in the firſt place, to have proceeded from the vanity of the Roman writers; and, in the next place, from the complete inattention which the moderns have paid to the ſubject.

GEORGE, St. *(Encycl.)*. To what has been ſaid in our original article, we wiſh to add the following curious diſquiſition on the figure of St. George, the patron of England, as it is found on the coins of Ruſſia. See plate 33.

St. George, the patron ſaint of England, and of the order of the Garter, is much revered in Ruſſia, and his figure occurs in all the churches. He is repreſented as uſual, riding on a horſe, and piercing a dragon with his lance. This ſame device alſo forms part of the arms of the Ruſſian ſovereign, and is obſerved upon ſeveral of the coins. As moſt perſons endeavour, if poſſible, to derive every cuſtom and alluſion from their own country, ſome of the Engliſh hiſtorians have conjectured, that Ivan Vaſſilievitch the Second, being preſented with the Garter by Queen Elizabeth, aſſumed the George and the Dragon for his arms, and ordered it to be ſtamped upon the current money. But this ſuppoſition is erroneous, as it by no means appears, that the Tzar was created a knight of the Garter; and it is certain that the ſovereigns of Moſcow bore this device before they had the leaſt connection with England; for the arms of Moſcovy are thus deſcribed by Chanceler, the firſt Engliſhman who diſcovered Ruſſia, as being affixed to a diſpatch ſent in 1554, from Ivan Vaſſilievitch to Queen Mary:—"This letter was written in the Moſcovian tongue, in letter much like to the Greeke letters, very faire written in paper, with a broade ſeale hanging at the ſame, ſealed in paper upon waxe. This ſeale was much like the broad ſeale of England, having on the one ſide the *image of a man on horſeback in complete harneſſe fighting with a dragon.*" Hackluyt, vol. i. p. 255.

The Ruſſian antiquaries find great difficulty in endeavouring to aſcertain the origin of St. George, and his firſt introduction into their country.

Among a liſt of the Ruſſian coins accompanied with engravings, publiſhed by Le Clerc, are ſeveral of a very early date, which repreſent the figure of a horſeman ſpearing a dragon: one particularly of Michael Androvitz, which appears to have been ſtruck in 1305, 40 years before the inſtitution of the order of the Garter. From this period numerous Ruſſian coins are ſucceſſively diſtinguiſhed by the ſame emblem. Another, ſtruck in the reign of Vaſili Vaſſilievitch in the 15th century, exhibits alſo the coarſe figure of a man on horſeback piercing a ſerpent or a dragon: of which device

a learned antiquary* has ingeniouſly given the following ſolution. The reign of Vaſſili Vaſſilievitch was an epoch of great troubles and inteſtine diſſenſions between the Great Duke and his relations. During theſe conteſts he was depoſed and impriſoned, and his eyes were put out; but having regained poſſeſſion of the throne, he ordered the money to be impreſſed with the figure of a man on horſeback piercing a ſerpent, as an emblem of ingratitude puniſhed and rebellion defeated. Soon after this period the ſucceeding great dukes uſed this device for their arms, inſtead of the cuſtom which before prevailed of adopting the head of the ſaint by whoſe name they were baptized. About the beginning of the ſeventeenth century, wings being added to the ſerpent, it was changed into a dragon, and the knight on horſeback into St. George. But this is conjecturing too curiouſly, and ſeems too far-fetched a ſolution for ſo barbarous an age. It is far more probable, that the Ruſſians received the image of St. George and the dragon either from the Greeks or from the Tartars, by both of whom he was much revered; by the former as a Chriſtian ſaint and martyr, and by the latter as a prophet, or a deity. With reſpect to the Greeks, we know from hiſtory that in the fourth or fifth century he was much worſhipped amongſt them; and that, afterwards, the cruſaders, during their firſt expedition into the Holy Land, found many temples erected in his honour. The Ruſſians, therefore, who were converted to Chriſtianity by the Greeks, certainly muſt have received at the ſame time a large catalogue of ſaints, which made an eſſential part of the Greek worſhip, and we have no reaſon to imagine that St. George was omitted.

In a villa of Prince Dolgorucki, near Moſcow, is an old baſſo-relievo of St. George and the dragon, found in a ruined church at Intermen, in the Crimea; it had a Greek inſcription almoſt eraſed, but the words ΑΙΟΟ ΓΕΟΡΓΟΟ, or St. George, and the date 1330, were ſtill legible. As it appears from this baſſo-relievo that he was worſhipped in the Crimea ſo near the court of Ruſſia, when the great dukes reſided at Kiof, his introduction into that country is eaſily accounted for.

Notwithſtanding, however, the probability of this opinion, it is very likely that the Ruſſians received from the Tartars the image of a horſeman ſpearing a ſerpent, as it is repreſented upon their moſt ancient coins, and which formed a part of the great duke's arms towards the beginning of the ſixteenth century. And firſt, with reſpect to their coins: the Ruſſians had no coins before they were conquered by the Tartars; and ſoon after they were brought under the Tartar yoke, they ſtruck money: the firſt Ruſſian coins bear a Tartar inſcription; afterwards they have Tartar letters on one ſide, and Ruſſian characters on the other; and there is ſtill preſerved in the cabinet of St. Peterſburgh, a piece of money, exhibiting a horſeman piercing a dragon, with the name of the great duke in Ruſſian, and on the reverſe a Tartar inſcription.

With reſpect to the arms, Herberſtein, in his account of his embaſſy to Moſcow in 1518, under Vaſſili Ivanovitch, has given a wooden print of that prince, at the bottom of which are engraved his arms, repreſenting a naked man on horſeback† piercing a ſerpent with his lance. See fig. A. The equeſtrian figure in this device has a Tartar-like appearance, and is ſo coarſe and rude, that it ſeems to have been derived from a people in a far more unciviliſed ſtate of ſociety than the Greeks: add to this, as the Greeks always repreſented St. George clad in armour, what could have induced the Ruſſians, if they had adopted this emblem from them, to have figured the horſeman naked?

Shall we conclude, therefore, that the Tartars were not unacquainted with an emblem ſimilar to that of St. George and the Dragon? In proof of this opinion, we may venture to remark, that the ſtory of a ſaint or a deity ſpearing a dragon was known over the eaſt; that among the Mahometans (ſee Herbelot Biblioth. Orientalis, article Gergis), a perſon called Gergis or George, under a ſimilar figure, was much revered as a prophet; and that ſimilar emblems have been diſcovered among many barbarous nations of the eaſt. Whether theſe nations took it from the Greeks, or the latter from them, is a matter that cannot be aſcertained; for with reſpect to the real exiſtence of ſuch a perſon as St. George, no poſitive proofs‡ have ever been advanced.

But whether we conclude that the Ruſſians received the emblem of St. George from the Greeks, or from the Tartars, it will ſtill be difficult to reconcile how under Vaſſili Ivanovitch the arms of the great dukes exhibited a naked man on horſeback ſpearing a dragon, and under his ſon, Ivan Vaſilievitch II. the horſeman is repreſented in armour. But perhaps we may reconcile theſe two opinions by ſuppoſing, that the naked man on horſeback, ſpearing a dragon, is the Tartar emblem; and the knight in complete armour (which is evidently the figure of St. George) was adopted as the arms of the great dukes, and not improbably introduced by Ivan Vaſſilievitch II. in compliment to his grand-mother, Sophia, a Greek princeſs.

Since this period, the emblem of St. George and the dragon has uniformly been repreſented on the reverſe of Ruſſian coins, as may be ſeen by the engraving of a rouble of the late Empreſs, Catharine II. See fig. B.

Although any enquiry into the origin of St. George, and his introduction into England, is foreign to the preſent purpoſe, yet it may be obſerved, that amongſt us ſeveral contradictory opinions have been held of St. George; and a whimſical controverſy has ariſen, whether the patron of England

---

* See Tſcherebetoff's Verſuch neber die alten Ruſſis. Muenzen in Journ. of St. Pet. for 1781, part II. p. 66.

† In unâ parte hominis nudi equo inſidentis, et draconem haſtâ ferientis imaginem habet; in alterâ verò parte, nomen magni ducis exprimitur. Herberſtein Moſc. Deſcr. p. 157.

‡ The arguments brought by the ingenious Mr. Pegge to aſcertain the exiſtence and martyrdom of St. George, will ſerve equally to prove the exiſtence of St. Januarius, or any other ſaint in the Roman Calendar. "We may depend upon it," he ſays, "that though at this diſtance of time we can recover ſo few particulars of St. George's ſtory, and can arrive at ſo little certainty about the circumſtances of it; yet the adventurers in the cruſades undoubtedly regarded him as a real perſon, a moſt glorious and illuſtrious martyr. They found his name in the calendars; they met with various places denominated from him; they frequented his tomb and heard him invoked, and heard much of his apparitions; they ſaw churches and monaſteries dedicated to him, and even received, as they thought, ſeaſonable and ſpecial aſſiſtance from Heaven, through his mediation; and laſtly, not to mention his reliques, they could not but obſerve proper ſervices appointed for him in the Greek and Roman Liturgies. After all which, it is not poſſible that our anceſtors, on their return from the Eaſt, and in particular in the reign of King Edward III. ſhould deem of him otherwiſe, than as having been once a true man, and more than an ideal figment of the brain." See Pegge's Obſervations on the Hiſtory of St. George, in the fifth vol. of the Archæologia, p. 5.

was a real or imaginary perſonage. Some are of opinion, that this hiſtory is an allegory; others maintain that the device is borrowed by the Chriſtian church from the ancient ſtory of Perſeus and the ſea-monſter, of Bellerophon and the Chimera, or of Apollo and the ſerpent Pithon, or from ſome Egyptian hieroglyphics, or from charms and amulets worn by the Pagans*; others have traced his legend from the hiſtory of George† of Cappadocia, the Arian archbiſhop of Alexandria. Amongſt the authors who have written upon this ſubject with the greateſt ſucceſs, muſt not be omitted, Mr. Byrom (Miſcellaneous Poems, vol. I. p. 100), who has compoſed a metrical rhapſody addreſſed to Lord Willoughby, preſident of the Antiquarian Society, in which he endeavours to prove that St. George is a corruption of St. Gregory; and to uſe his own words:—

Now, my lord, I would aſk of the learn'd and laborious,
If Ge-orgius ben't a miſtake for Gregorius?
In names ſo like letter'd it would be no wonder,
If haſty tranſcribers had made ſuch a blunder;
And miſtake in the names, by a ſlip of their pen,
May, perhaps, have occaſion'd miſtake in the men.
That this has been made, to omit all the reſt,
Let a champion of yours, your own Selden atteſt;
See his book upon titles of honour—that quarter
Where he treats of St. George, and the knights of the Garter.

And again:

This, my lord, is the matter—the plain ſimple rhimes
Lay no fault, you perceive, upon Proteſtant times:
I impute the miſtake, if it ſhould be one, ſolely
To the pontiffs ſucceeding, who chriſten'd wars holy;
To monarchs who, madding around their round tables,
Preferr'd, to converſion, their fighting and fables:
When ſoldiers were many, good Chriſtians but few,
St. George was advanc'd to St. Gregory's due.
One may be miſtaken—and therefore would beg
That a Willis, a Stukely, an Ames, or a Pegge,
In ſhort, that your lordſhip, and all the fam'd ſet,
Who are, under your auſpices, happily met
In perfect good humour—which you can inſpire,
As I know by experience—would pleaſe to enquire,
To ſearch this one queſtion, and ſettle, I hope;
Was old England's old patron, a knight, or a pope?

In oppoſition to theſe opinions, ſeveral authors have entered the liſts: particularly Heylin, Selden, and Fuller; and lately, Mr. Pegge endeavours to reſcue this ſaint from annihilation, and to prove, at the ſame time, that he was a different perſonage from St. Gregory. But unfortunately for the arguments of the learned antiquarian, Mr. Byrom's treatiſe, which he oppoſes, is written in verſe with ſo much eaſe, humour, and whimſical rhyming, that the reader is abſolutely almoſt diveſted of his judgment, and with difficulty is prevented by the moſt weighty reaſons from ſiding with the poet, who, inſtead of dull and dry diſquiſitions, treats us with much wit, couched in an eaſy flow of doggrel metre. However, after reading all (if any one can have patience‡ to read all) the diſquiſitions upon this ſubject, the reader retires without being convinced, or without yielding abſolutely to any other opinion than this, that the ſtory of St. George is immerſed in fable, and loſt amid the uncertainty of ancient lore.

GERBSTADT, a town of Upper Saxony, 30 miles S.W. of Deſſau, and 36 S. of Magdeburg.

GERMAINS, St. a borough in Cornwall, with a market on Friday. It was once the largeſt town in the county, and a biſhop's ſee. What remains of the cathedral is uſed as the pariſh-church; and near it is the priory. The town now conſiſts chiefly of fiſhermen's cottages, but is governed by a mayor, and ſends two members to parliament. It ſtands near the ſea, 10 miles W. of Plymouth, and 224 W. by S. of London. Long. 4. 24. W. Lat. 50. 22. N.

GERMAIN-LAVAL, St. a town of France in the department of Rhone and Loire, remarkable for excellent wine. It is 18 miles S. of Roanne, and 225 S.E. of Paris. Long. 4. 2. E. Lat. 45. 50. N.

GERMAN DRAMA. See Drama in this Supplement.

GERMANO, St. a town of Naples, in Terra di Lavoro, at the foot of Mount Caſſano, and belonging to an abbey at the top of that mount. Long. 13. 59. E. Lat. 41. 13. N.

GERMERSHEIM, a town of Germany, in the palatinate of the Rhine, ſituate near the Rhine, five miles W. of Philipſburg. Long. 17. 19. E Lat. 49. 10. N.

GERMS, a town of the archduchy of Auſtria, 62 miles W.N.W. of Vienna. Long. 14. 57. E. Lat. 48. 32. N.

GEROLDSTEIN, a town of Weſtphalia, ſituate on the Kill, 24 miles N. of Treves. Long. 6. 19. E. Lat. 50. 19. N.

GERS, a department of France, which includes the late provinces of Gaſcony and Armagnac. It has its name from a river that waters Auch and Lectoure, and falls into the Garonne, above Agen. Auch is the capital.

GERSAU, a town of Switzerland, on the N. ſide of the lake of Schweitz, at the foot of the Rigi. It is a republic, the ſmalleſt in Europe. Its territory is two leagues in length and one in breadth. It contains 1000 inhabitants, who have their general aſſembly of burgeſſes, their landamman, council of regency, courts of juſtice, and militia. Gerſau is compoſed entirely of ſcattered houſes and cottages, of a very neat and pictureſque appearance. The inhabitants are much employed in preparing ſilk for the manufacture at Baſle. This republic is under the protection of the cantons of Lucern, Vri, Schweitz, and Underwalden; and, in caſe of war, furniſhes its quota of men. Gerſau is 12 miles S.W. of Schweitz.

GERTRUDENBURG, an ancient town of Dutch Brabant, one of the principal bulwarks of the Dutch. It has a good harbour on the Maeſe, which here expands into a large lake, called Bies Boſch. It has been often taken, the laſt time by the French in 1795. It is 10 miles N. of Breda. Long. 4. 52. E. Lat. 52. 44. N.

GERUMENHI, an ancient town of Portugal, in Alentejo, with a ſtrong caſtle; but was taken, in 1662, by the Spaniards. It is ſeated on a hill, near the river Guadiana, 18 miles below Badajoz.

GESEKE, a town of Weſtphalia, ſeated on the Weyck, eight miles from Lippe.

GESTRIKE, a province of Sweden, bounded on the N. by Helſingia, on the E. by the gulf of Bothnia, on the S. by Upland, and on the W. by Dalecarlia. It is diverſified by foreſts, rocks, hills, and dales, paſture and arable land, lakes

† See Gibbon's Hiſtory of the Decline and Fall of the Roman Empire, vol. II. p. 404, where the hiſtory of George of Cappadocia is inveſtigated with great judgment and learning.

‡ Heylin's Hiſtorie of that moſt famous Saint and Soldier of Chriſt Jeſus, St. George of Cappadocia, in quarto, contains 426 pages, printed very cloſely.

and rivers; and theſe beauties are much heightened by the Dam, the fineſt river in Sweden, which meanders through the whole extent of the province.

GEVAUDAN, a late territory of France, in Languedoc, bounded on the N. by Auvergne, on the W. by Rouergue, on the S. by the Cevennes, and on the E. by Velay. It is a mountainous, barren country; and now forms the department of Lozere.

GEX, a town of France, in the department of Ain, noted for excellent cheeſe. It is ſeated at the foot of Mount St. Claude, between the Rhone, the lake of Geneva, and Switzerland, 10 miles N.W. of Geneva. Long. 6. 1. E. Lat. 46. 20. N.

GEZIRA, a town of Diarbeck, in an iſland formed by the Tigris, 70 miles N.W. of Mouſul. Long. 40. 50. E. Lat. 36. 36. N.

GEZULA, a province of Morocco, which is very productive, and contains mines of iron and copper. The inhabitants are numerous, and conſidered as the moſt ancient people of Africa: they live in tents, and are ſo independent, that they are rather the allies than the ſubjects of the emperor of Morocco.

GHANAH, or GHINNAH, a town of Caſhna, ſeated between a lake and the river Niger, which is here called Neel-il-Abeed, or the Nile of the Negroes. It is 90 miles N.E. of Caſhna, and 208 S. of Agadez. Long. 13. 12. E. Lat. 15. 55. N.

GHERGONG, a city and the capital of the kingdom of Aſſam. It is ſeated on a river which runs, in a ſhort diſtance, into the Burrampooter, 400 miles N.E. of Calcutta. Long. 93. 15. E. Lat. 25. 55. N.

GHIZNI, or GAZNA, a town of Hindooſtan Proper, in Cabul, once the capital of a powerful empire of the ſame name. It is called the ſecond Medina, from the great number of illuſtrious perſons who have been interred there. It is 54 miles S. of Cabul, and 150 E. of Candahar. Long. 68. 20. E. Lat. 16. 12. N.

GHOURBOND, a town of Hindooſtan Proper, in the country of Cabul, 42 miles N.W. of Cabul. Long. 67. 52. E. Lat. 34. 55. N.

GIBBON (Edward), a celebrated Engliſh hiſtorian, was born at Putney in Surrey, on the 27th of April, 1737. He was the firſt-fruit of the marriage of Edward Gibbon, eſq. and Judith Porten, the youngeſt daughter of a merchant in London. Mr. Gibbon appears to delight in tracing his pedigree from John Gibbon architect to King Edward III. who poſſeſſed lands in the hundred and pariſh of Rolvenden, in the diſtrict which is now called the *Weald* of Kent. In that diſtrict the elder branch of the family ſtill adheres to its native ſoil, without much increaſe or diminution of property; but the fortunes of the younger branch, from which our hiſtorian ſprung, were fluctuating.

So feeble was he, and ſo precarious his life during his childiſh years, that at the baptiſm of each of his brothers (five in number) his father ſucceſſively repeated the name of Edward, that, in caſe of the death of the eldeſt, this patronymick appellation might ſtill be perpetuated in the family. His brothers and a ſiſter died in their infancy; and, in terms of affectionate gratitude, he attributes his own preſervation to the more than maternal care of a maiden aunt, his mother's eldeſt ſiſter.

At the age of ſeven years he was delivered into the hands of Mr. John Kirby, who exerciſed, about eighteen months, the office of his domeſtic tutor; but he afterwards was ſent to Kingſton-upon-Thames, to a ſchool of ſeventy boys kept by Dr. Wooddeſon. He does not repreſent himſelf either as happy or as having made great progreſs at that ſchool. The want of ſtrength and activity diſqualified him for the ſports of the field; his companions reviled him for the ſins of his Tory anceſtors; and his ſtudies were frequently interrupted by ſickneſs. After paſſing nearly two years at Kingſton, he was, in Dec. 1747, called away by the death of his mother. By this time he was well acquainted with Pope's Homer, the Arabian Nights Entertainments, Dryden's Virgil, and a tranſlation of Ovid's Metamorphoſes; and the entertainment which he received from theſe books gave him a taſte for deſultory reading.

After living a year with his maternal aunt, during which period he read many books on religious ſubjects too deep for the comprehenſion of a boy, he was in January 1749 entered at Weſtminſter ſchool, of which Dr. John Nicoll was then head maſter. "There (ſays he) in the ſpace of two years, interrupted by danger and debility, I painfully climbed into the third form; and my riper age was left to acquire the beauties of the Latin and the rudiments of the Greek tongue. Inſtead of audaciouſly mingling in the ſports, the quarrels, and the connections of our little world, I was ſtill cheriſhed at home under the maternal wing of my aunt, who now lived in College-ſtreet; and my removal from Weſtminſter long preceded the approach of manhood."

He was firſt carried to Bath for the recovery of his health; then to Wincheſter, where he lived in the houſe of a phyſician; then to Bath again, where he read with a clergyman ſome odes of Horace and ſome epiſodes of Virgil; after which an unſucceſsful trial was made to renew his attendance at Weſtminſter ſchool. "It might now be apprehended (ſays he) that I ſhould continue for life an illiterate cripple; but as I approached my ſixteenth year, Nature diſplayed in my favour her myſterious energies: my conſtitution was fortified and fixed; and my diſorder, inſtead of growing with my growth, and ſtrengthening with my ſtrength, moſt wonderfully vaniſhed." In conſequence of this he was ſent to Oxford; and before he had accompliſhed his fifteenth year, was, on April 3, 1752, matriculated a gentleman-commoner of Magdalen College, the tutors of which he repreſents as wholly regardleſs of his morals or his ſtudies. Speaking of the beſt he ſays, "No plan of ſtudy was recommended for my uſe; no exerciſes were preſcribed for his inſpection; and at the moſt precious ſeaſon of youth, whole days and weeks were ſuffered to elapſe without labour or amuſement, without advice or account." His contemporaries however have given different accounts of the college; and it is ſurely a very ſingular circumſtance, that at this period of *idleneſs*, our author ſhould have become enamoured of Sir John Marſham's *Canon Chronicus*, and have conceived the idea of writing an *Eſſay on the Age of Seſoſtris*. Such, however, was the caſe; and there is great reaſon to ſuppoſe Mr. Gibbon deſirous of attributing to this negligent conduct of his tutors, his having at the age of ſixteen bewildered himſelf in the errors of the church of Rome. On the 8th of June, 1753, at the feet of a prieſt in London, he ſolemnly, though privately, abjured the errors of hereſy, and an elaborate controverſial epiſtle, approved by his director, and addreſſed to his father, announced and juſtified the ſtep he had taken. The old gentleman, however, in the firſt ſally of paſſion having divulged the ſecret, the gates of Magdalen College were ſhut againſt the convert, and as it then was neceſſary therefore to form a new plan of education, our young Catholic was ſettled, on the 30th of June, under the roof of Mr. Paviliard, a Calviniſt miniſter at Lauſanne in Switzerland.

Under this amiable preceptor's tuition he deſcribes his progreſs in the French and Latin claſſics, in hiſtory, geography, logic, and metaphyſics, as uncommonly rapid; and he allows to the ſame man a handſome ſhare of the honour of reclaiming him from the errors of popery. The various diſcriminating articles of the Romiſh creed diſappeared like a dream;

and, after a full conviction, on Chriſtmas-day 1754 he received the ſacrament in the church of Lauſanne. Thus had our author communicated with three different ſocieties of Chriſtians before the completion of his eighteenth year; and as ſuch changes from church to church are always dangerous, we need not wonder that, in a mind ſo ill furniſhed as Mr. Gibbon's then was for theological inveſtigations, they paved the way for his laſt change to Deiſm, of which he has ſince been the notorious advocate.

In 1757 Voltaire arrived at Lauſanne, and our ſtudent's deſire to ſee the man who was at once a poet, an hiſtorian, and, as he deemed himſelf, the prince of philoſophers, was ardent, and eaſily gratified. He was received by the vain and arrogant Frenchman with civility as an Engliſh youth, but could not boaſt of any peculiar notice or diſtinction. "The higheſt gratification (ſays he) which I received from Voltaire's reſidence at Lauſanne, was the uncommon circumſtance of hearing a great poet declaim his own productions on the ſtage. His declamation was faſhioned to the pomp and cadence of the old ſtage; and he expreſſed the enthuſiaſm of poetry rather than the feelings of Nature."

Mr. Gibbon now became enamoured of Mademoiſelle Suſan Curchod, the daughter of the miniſter of Craſſy, in the mountains which ſeparate the Pays de Vaud from the county of Burgundy. In terms of rapture he deſcribes this lady as poſſeſſed of every accompliſhment which could adorn her ſex. She liſtened to the voice of truth and paſſion; her parents honourably encouraged the connection; and our author indulged in the dream of felicity: but on his return to England, he diſcovered that his father would not hear of this ſtrange connection, and that without his conſent he was deſtitute and helpleſs. "After a painful ſtruggle (ſays he) I yielded to my fate. I ſighed as a lover, I obeyed as a ſon; and my wound was inſenſibly healed by time, abſence, and the habits of a new life." The lady conſoled herſelf by giving her hand to the celebrated M. Neckar, then a rich banker of Paris, afterwards the miniſter, and at laſt one of the deſtroyers of the French monarchy.

In the ſpring of the year 1758 our author returned to London, where, having but few acquaintances, and hardly any friends, and being accuſtomed to a very ſmall ſociety at Lauſanne, he was far from finding himſelf agreeably ſituated. This at length determined him once more to preſer the retirement of the country to the buſtle of an over-grown metropolis, where he found hardly any entertainment but in the theatres.

Before he quitted Lauſanne, however, he had begun a work on the ſtudy of ancient literature, which was ſuggeſted by the deſire of juſtifying and praiſing the object of a favourite purſuit. "In France (ſays he), to which my ideas were confined, the learning and language of Greece and Rome were neglected by a philoſophic age. The guardian of thoſe ſtudies, the Academy of Inſcriptions, was degraded to the loweſt rank among the three royal ſocieties of Paris: the new appellation of *Erudits*, was contemptuouſly applied to the ſucceſſors of Lipſius and Caſaubon; and I was provoked to hear, that the exerciſe of the memory, their ſole merit, had been ſuperſeded by the nobler faculties of the imagination and the judgment. I was ambitious of proving by my own example, as well as by my precepts, that all the faculties of the mind may be exerciſed and diſplayed by the ſtudy of ancient literature." This laudable ambition continued; and in his father's houſe at Beriton in Hampſhire he finiſhed his *Eſſai ſur l'Etude de la Littérature;* which, after being reviſed by Mallet the poet and Dr. Maty of the Britiſh Muſeum, was, in 1761, publiſhed in a ſmall 12mo. volume.

At the end of the war he again went abroad, and reached Paris on the 28th of January, 1763, only 36 days after the diſbanding of the militia in which he had borne the commiſſion of a captain. In that metropolis he viſited the palaces, churches, gardens, and theatres, was introduced to D'Alembert and Diderot, then conſidered as at the head of French ſcience, and then proceeding to Switzerland, he once more took up his reſidence at his favourite Lauſanne. Voltaire's impieties had forced him from that town to his own caſtle at Ferney, where our author once viſited him, without (he ſays) "courting his more intimate acquaintance."

The ſociety in which Mr. Gibbon moſt delighted during his ſecond reſidence at Lauſanne was a very ſingular one. "It conſiſted of fifteen or twenty unmarried ladies of genteel families; the eldeſt perhaps about twenty, all agreeable, ſeveral handſome, and two or three of exquiſite beauty. At each other's houſes they aſſembled almoſt every day, without the control, or even the preſence, of a mother or an aunt; they were truſted to their own prudence, among a crowd of young men of every nation in Europe. They laughed, they ſung, they danced, they played at cards, they acted comedies; but in the midſt of this careleſs gaiety, they reſpected themſelves, and were reſpected by the men; the inviſible line between liberty and licentiouſneſs was never tranſgreſſed by a geſture, a word, or a look, and their virgin chaſtity was never ſullied by the breath of ſcandal or ſuſpicion."

We readily agree with our author that this ſingular inſtitution was expreſſive of the innocent ſimplicity of Swiſs manners; and we only regret that he had not the ſame reſpect for the ladies of his own country as for thoſe frolic females of Switzerland. He would not, in that caſe, have ſtained ſome of his moſt brilliant pages with obſcene ribaldry.

We ſhall not follow him in his ramble through Italy, or repeat his remarks on the towns which he viſited. It is ſufficient to obſerve, that it was at Rome, on the 15th of October, 1764, while he ſat muſing amidſt the ruins of the Capitol, that the idea of his great work firſt aroſe into his mind.

To that great work, The Hiſtory of the Decline and Fall of the Roman Empire, he ſat down ſeriouſly in 1768; and the hiſtory which he gives of his preparatory ſtudies ſufficiently accounts for the inaccuracy of his quotations. Through the darkneſs of the middle ages he explored his way in the annals and antiquities of Italy by the learned Muratori and other moderns; and ſeems to acknowledge that, from the beginning to the end of his work, he frequently contented himſelf with authorities furniſhed at ſecond hand.

In 1776, the firſt volume of his hiſtory was publiſhed; and the ſucceſs of it far ſurpaſſed his expectation. The encomiums laviſhed on it by Dr. Robertſon and Mr. Hume in letters to the author, and the fulſome compliments which thoſe three eminent hiſtorians paid to each other, are melancholy ſpecimens of lettered littleneſs and vanity. The ſecond and third volumes appeared in 1781; the fourth, fifth, and ſixth in 1787; and Mr. Gibbon's fame was eſtabliſhed as an hiſtorian. The work was admired both by natives and by foreigners, and tranſlated into ſeveral of the languages of Europe. Dr. Zimmermann repreſents the author as excelling perhaps Hume and Robertſon, who were hiſtorians of the firſt rank. "All the dignity (he adds), all the charms of hiſtoric ſtyle, are united in Gibbon: his periods are melody itſelf, and all his thoughts have nerve and vigour." This praiſe, however, muſt not be admitted without exception. Few writers, indeed, were poſſeſſed of ſuch popular talents as our hiſtorian. The acuteneſs of his penetration, and the fertility of his genius, have been ſeldom equalled, and ſcarcely ever ſurpaſſed. He ſeizes, with ſingular felicity, on all the moſt intereſting facts and ſituations, and theſe he embelliſhes with the utmoſt luxuriance of fancy and elegance of ſtyle. His periods are full

and harmonious; his language is always well choſen, and is frequently diſtinguiſhed by a new and peculiarly happy adaptation. His epithets, too, are in general beautiful and happy; but he is rather too fond of them. The uniform ſtatement of his diction ſometimes imparts to his narrative a degree of obſcurity, unleſs he deſcends to the miſerable expedient of a note, to explain the minuter circumſtances. His ſtyle, on the whole, is much too artificial; and this gives a degree of monotony to his periods, which extends, we had almoſt ſaid, to the turn of his thoughts.

A more ſerious objection is his attack upon Chriſtianity; the looſe and diſreſpectful manner in which he mentions many points of morality regarded as important on the principles of natural religion; and the indecent alluſions and expreſſions which too often occur in the work. An attack upon Chriſtianity is not cenſurable merely as ſuch; it may proceed from the pureſt and moſt virtuous motives: but, in that caſe, the attack will never be carried on in an inſidious manner, and with improper weapons; and Chriſtianity itſelf, ſo far from dreading, will invite every mode of fair and candid diſcuſſion. Our hiſtorian, it muſt be confeſſed, often makes, when he cannot readily find, an opportunity to inſult the Chriſtian religion. Such, indeed, is his eagerneſs in the cauſe, that he ſtoops to the moſt deſpicable pun, or to the moſt awkward perverſion of language, for the pleaſure of turning the Scripture into ribaldry, or calling Jeſus an impoſtor.

Yet of the Chriſtian religion has Mr. Gibbon himſelf obſerved, that it "contains a pure, benevolent, and univerſal ſyſtem of ethics, adapted to every duty and every condition of life." Such an acknowledgment, and from ſuch a writer too, ought to have due weight with a certain claſs of readers, and of authors likewiſe, and lead them ſeriouſly to conſider, how far it is conſiſtent with the character of good citizens, to endeavour, by ſly inſinuations, oblique hints, indecent ſneer, and profane ridicule, to weaken the influence of ſo *pure* and *benevolent* a ſyſtem as that of Chriſtianity, acknowledged to be admirably calculated for promoting the happineſs of individuals, and the welfare of ſociety.

The part of the Hiſtory which gave ſuch offence to his own friend, as well as to the friends of the Chriſtian religion in general, was the account which our hiſtorian has given of the progreſs and eſtabliſhment of Chriſtianity in the two laſt chapters of his firſt volume; in which he endeavours to prove that the wonderful triumph of that religion over all the eſtabliſhed religions of the earth, was not owing to any miraculous atteſtations to its truth, but to five ſecondary cauſes which he enumerates; and that Chriſtianity, of courſe, could not be of divine origin. Several anſwers appeared on this occaſion, written, as we may naturally ſuppoſe, with different degrees of temper and ability. His principal oppoſers were Dr. Chelſum, Dr. Randolph, Dr. Watſon (biſhop of Llandaff), Lord Hailes, Dr. White, Mr. Apthorpe, Mr. Davis, and Mr. Taylor, author of The Letters of Ben Mordecai. One of them only, Mr. Davis, who had undertaken to point out various inſtances of miſrepreſentation, inaccuracy, and even plagiariſm in his account, did our hiſtorian condeſcend particularly to anſwer, and that in a tone of proud contempt and confident ſuperiority. To this Mr. Davis replied; and it is but juſtice to obſerve, that his reply bears evident marks of learning, judgment, and critical acumen, and that he has convicted our author of ſometimes quoting inaccurately to ſerve a purpoſe. At his other anſwerers Mr. Gibbon merely glanced, treating Dr. Watſon, however, with particular reſpect; but his poſthumous memoirs ſhew how much he felt the attacks made on him by Lord Hailes, Dr. White of Oxford, and Mr. Taylor. To Dr. Prieſtley, who, in his *Hiſtory of the Corruptions of Chriſtianity*, threw down his gauntlets at once to Biſhop Hurd and the hiſtorian of the Roman empire, and who preſented the latter with a copy of his book, declaring, at the ſame time, that he ſent it not as a gift but as a *challenge*, he wrote in ſuch terms as produced a correſpondence, which certainly added not to the honour of the diſſenting divine.

At the beginning of the conteſt between Great Britain and America, our author was returned, by the intereſt of Mr. Eliot (now Lord Eliot), for the borough of Liſkeard, and ſupported, with many a ſincere and ſilent vote, the rights, though not, perhaps, the intereſt, of the mother country. "After a fleeting illuſive hope, prudence condemned me (ſays he) to acquieſce in the humble ſtation of a mute. I was not armed by Nature and education with the intrepid energy of mind and voice. '*Vincentem ſtrepitus, et natum rebus agendis.*' Timidity was fortified by pride; and even the ſucceſs of my pen diſcouraged the trial of my voice."

That pen, however, was uſeful to the miniſtry whom he could not ſupport by his eloquence in the houſe. At the requeſt of the Lord Chancellor and Viſcount Weymouth, then ſecretary of ſtate, he vindicated, in a very able manner, againſt the French manifeſto, the juſtice of the Britiſh arms; and his *Mémoire Juſtificatif* was delivered as a ſtate paper to the courts of Europe. He was rewarded for this ſervice with the place of one of the lords commiſſioners of trade and plantations; and kept it till the board was aboliſhed by Mr. Burke's reform bill. For accepting this place he was ſeverely, but moſt unjuſtly, blamed by ſome of the leaders of the oppoſition, as if he had deſerted a party in which he had never enliſted, and to the principles of which he was rendered inimical both by family prepoſſeſſion and by his own judgment.

On the downfal of Lord North's adminiſtration, Mr. Gibbon was of courſe in the oppoſition, deprived of an office, without the ſalary of which he could not conveniently ſupport the expence of living in London. The coalition was indeed ſoon formed, and his friends were again in power; but having nothing to give him immediately, they could not detain him in parliament or even in England. He was tired of the buſtle of the metropolis, and ſighed once more for the retirement of Lauſanne, at which he arrived before the overthrow of the coalition miniſtry, and where he lived happily till the laſt years of his life. It was in this retreat that he wrote the fourth, fifth, and ſixth volumes of his hiſtory; and he left it only for a year, to ſuperintend the publication of theſe volumes in London. This great work being concluded, he returned to the banks of the Leman lake, but found his enjoyments damped by the diſtreſs, and ſoon afterwards by the death, of his oldeſt and deareſt Swiſs friend. Lauſanne had now loſt much of its attraction; the French revolution had crowded it with unfortunate emigrants, who could not be cheerful themſelves or excite the cheerfulneſs of others; and the demons of democracy had begun to poiſon the minds of the ſober citizens with principles which Mr. Gibbon had always held in abhorrence. From the effects of this Gallic phrenſy, which began to be very viſible ſo early as the beginning of the year 1792, Mr. Gibbon reſolved to take ſhelter in England, and to abandon, for ſome time at leaſt, what he called his paradiſe at Lauſanne. Difficulties intervened, and forced him to poſtpone his journey from week to week, and from month to month; but on receiving the accounts of Lady Sheffield's death, he haſtened to adminiſter conſolation to his friend, and arrived in London in the beginning of June 1793.

He continued well through the whole of that ſummer; but his conſtitution had ſuffered much from repeated attacks of the gout, and from ſymptoms of dropſy, under which he at laſt ſunk, and died at his lodgings in St. James's ſtreet, London, on the 16th of January 1794.

To draw at once a general and juſt character of this extraor-

dinary man, would be difficult perhaps to one who had enjoyed the pleafure of his acquaintance, and muft be impoffible to thofe to whom his perfon was a ftranger. Of the extent of his erudition there can be but one opinion; but various opinions may be held refpecting the accuracy of his knowledge. Lord Shefficld, who knew him well, and loved him much, aflures us, that his converfation was ftill more captivating than his writings: but this could not refult from the brilliancy of his wit; for of wit he declares, himfelf, that he had none. His memory was capacious and retentive, his penetration uncommon, and his colloquial eloquence ready and elegant; fo that he could illuftrate almoft any topic of converfation from the copious ftores of his own mind. From his private correfpondence, and a journal not written for the public eye, he appears to have been a dutiful fon, a loyal fubject, and an affectionate and fteady friend; but it is difficult to reconcile with fo much moral and political worth his unfair and unmanly fneers at the religion of his country.

GIEN, a town of France, in the department of Loiret, feated on the Loire, 76 miles S.E. of Paris. Long. 2. 43. E. Lat. 47. 34. N.

GIENGEN, an imperial town of Suabia, 16 miles N.N.E. of Ulm, and 28 N.W. of Augfburg. Long. 10. 18. E. Lat. 48. 37. N.

GIENZOR, a town of Barbary, in Tripoli, 10 miles from the town of Tripoli.

GIERACE, an epifcopal town of Naples, in Calabria Ulteriore, feated on a mountain, near the fea, 32 miles N.E. of Reggio. Long. 16. 40. E. Lat. 38. 13. N.

GIESEN, a town of Germany, in the landgravate of Heffe-Caffel, with a caftle and a univerfity. It belongs to the houfe of Darmftadt, and furrendered to the French in 1796, but was foon after taken by the Auftrians. It is feated on the Lohn, 16 miles W.S.W. of Marpurg. Long. 8. 41. E. Lat. 50. 30. N.

GIGA, a fmall ifland on the W. coaft of Scotland, between the ifle of Skye and the peninfula of Cantyre, in Argyleffhire, in which county it is included. The inhabitants annually export a confiderable quantity of grain.

GIGNAC, a town of France, in the department of Herault, fituate on the Herault, 14 miles W. of Montpellier. Long. 3. 44. E. Lat. 43. 39. N.

GILCHRIST (Dr. Ebenezer), an eminent Scots phyfician, was born at Dumfries in 1707. He began the ftudy of medicine at Edinburgh, which he afterwards profecuted at London and Paris. He obtained the degree of doctor of medicine from the univerfity of Rheims; and in the year 1732 he returned to the place of his nativity, where he afterwards conftantly refided, and continued the practice of medicine till his death.

It may with juftice be faid, that few phyficians of the prefent century have exercifed their profeffion in a manner more refpectable or fuccefsful than Dr. Gilchrift; and few have contributed more to the improvement of the healing art. Having engaged in bufinefs at an early period of life, his attention was wholly devoted to obfervation. Endowed by nature with a judgment acute and folid, with a genius active and inventive, he foon diftinguifhed himfelf by departing, in various important particulars, from eftablifhed but unfuccefsful modes of practice. Several of the improvements which he introduced have procured him great and deferved reputation, both at home and abroad.

His practice, in ordinary cafes, was allowed to be judicious, and placed him high in the confidence and eftcem of the inhabitants of that part of the country where he lived. But his ufefulnefs was not confined to his own neighbourhood. On many occafions he was confulted by letter from the moft diftant parts of the country.

In different collections are to be found feveral of his performances, which prove that he had fomething new and ufeful to offer upon every fubject to which he applied himfelf. But thofe writings which do him the greateft honour, are two long differtations on nervous fevers, in the Medical Eflays and Obfervations publifhed by a Society in Edinburgh; and a treatife on the ufe of fea-voyages in medicine, which firft made its appearance in the year 1757, and was afterwards reprinted in 1771. By means of the former, the attention of phyficians was firft turned to a fpecies of fever which is now found to prevail univerfally in this country; and the liberal ufe of wine, which he was the firft among the moderns to recommend, has fince been adopted in thefe fevers by the moft judicious phyficians of the prefent age, and has probably contributed not a little to the fuccefs of their practice. His treatife on fea-voyages points out in a manner fo clear, and fo much on the fure footing of experience, their utility in various diftempers, particularly in confumptions, that there is now a profpect of our being able to employ a remedy in this untractable difeafe much more efficacious than any hitherto in ufe. Dr. Gilchrift died in 1774.

GIMONT, a town of France, in the department of Gers, in the department of Gers, 12 miles E. of Auch. Long. 9. 48. E. Lat. 43. 37. N.

GIODDA, or GIDDAH, a fea-port of Arabia, on the Red Sea. It is the port of Mecca, and carries on a great trade. Long. 39. 27. E. Lat. 21. 30. N.

GIOVENAZZO, a town of Naples, in Terra di Bari, with a caftle. It has high walls of ruftic architecture, and high houfes and towers, rifing in narrow rows, built of polifhed ftone with flat roofs, which give it a fingular appearance. It is feated on a mountain, near the fea, 10 miles N.W. of Bari. Long. 16. 50. E. Lat. 41. 26. N.

GIREST, a large town of Perfia, in Kerman. Its trade confifts in wheat and dates. Long. 57. 55. E. Lat. 27. 30. N.

GIRGE, a town of Egypt, the capital of the Said, and refidence of the bey of Upper Egypt, fituate near the left bank of the Nile. It is about three miles in circumference; and is about 160 miles N. of Syene and 215 S. of Cairo. Long. 31. 22. E. Lat. 26. 30. N.

GIRVAN, a village in Ayrfhire, at the mouth of a river of the fame name, almoft oppofite the rock of Ailfa. Here are fome manufactures; particularly in the tanning of leather, and the making of fhoes and boots. It is 16 miles S. by W. of Ayr.

GISBURN, a town in the W. riding of Yorkfhire, with a market on Monday, 60 miles W. of York, and 219 N.W. of London. Long. 2. 22. W. Lat. 53. 55. N.

GISORS, a town of France, in the department of Eure. It belonged to the famous marfhal Belleifle, whofe only fon, the count de Gifors, being killed at the battle of Grevcldt, in 1758, the marfhal, at his own death, in 1761, prefented it to Lewis XV. It is feated on the Ept, 28 miles S.E. of Rouen. Long. 1. 43. E. Lat. 49. 15. N.

GITSCHIN, a town of Bohemia, which fuffered greatly during the long war of the Swedes in Germany. It is 22 miles N.W. of Koningfgratz, and 44 N.E. of Prague.

GIVET, a fortified town in the bifhopric of Liege, divided in two by the river Maefe, 21 miles S.W. of Namur. Long. 4. 34. E. Lat. 50. 13. N.

GIVIRA, a town of Italy, in the Milanefe, feated on a lake of the fame name, eight miles from Anghiera.

GLADBACH, a town of Weftphalia, in the duchy of Juliers, 16 miles N. of Juliers. Long. 6. 10. E. Lat. 51. 14. N.

GLADENBACH, a town of Germany, in the principality of Upper Heffe, 12 miles N. of Giefen.

GLAMMIS, a village in the S.W. part of Angusfhire.

Near it is Glammis caſtle, the ancient ſeat of the earl of Strathmore, in which is ſhewn the apartment where Malcolm II. was aſſaſſinated in 1034.

GLANFORDBRIDGE, or Brigg, a town in Lincolnſhire, with a market on Thurſday; ſeated on the Ancholme, which is noted for fine eels, and has been lately made navigable for ſloops to the Humber. It is 23 miles N. of Lincoln, and 156 N. by W. of London. Long. 0. 23. W. Lat. 53. 35. N.

GLASS-PAINTING. Having often been delighted with the grand effect produced by the windows of ſtained glaſs in old churches and monaſteries, we have regretted that ſuch fine and durable colouring ſhould, in ſo many caſes, have been proſtituted upon wretched deſigns inferior to the productions of our ſign-poſt daubers. We have wiſhed that ſome mode could be deviſed of copying and *multiplying* pictures upon glaſs—ſome mechanical mode, which ſhould require the aid of the artiſt in the firſt inſtance only, and leave all the ſubſequent operations to be performed by inferior hands, as in the caſe of copper-plate printing. Portraits at leaſt, on a ſingle piece of glaſs, which ſhould perpetuate the features of great men and beautiful women, ſecure from that decay of colour and of canvas which has already begun to obliterate the fineſt paintings of the greateſt artiſts whom the world has ever produced, might poſſibly be produced in the following way:

Suppoſe, after the outline of a likeneſs is drawn, that blocks were cut from it after the ſame manner as for callicoes, or paper-hangings, only with ſuperior nicety, and in greater number for the purpoſe of multiplying and better blending the tints.

Enamelers muſt determine what ſhall be the proper ſubſtances for the different colours, and with what liquid they ſhall be moiſtened, that they may be readily taken up by the blocks, and thence transferred to another body by preſſure.

From theſe blocks, and with theſe colours, let the figure be printed on paper; and, to prevent inaccuracy in bringing the ſeparate parts, cut on the different blocks, to unite into a complete whole, let the paper be placed under a frame ſecured in an immovable poſition during the operation. The blocks being accurately ſquared, all exactly of the ſame dimenſions, and each nicely fitting the frame, cannot, in paſſing through it to deliver their ſeveral impreſſions, make the ſmalleſt deviation from their intended places, but muſt produce an exact picture—at leaſt on the paper.

To *transfer* that impreſſion *to glaſs*, is, indeed, a work of nicety and difficulty. Were it not for ſome ſmaller ſtrokes which muſt neceſſarily be in wood, the entire impreſſion might in the outſet be made on the glaſs itſelf, without any intervention of paper; ſince experience has proved to the callico-printers that the great maſſes of colour cannot be ſucceſsfully delivered from wood; wherefore they are obliged, in thoſe parts of their patterns, to uſe bits of ſmooth worn-out beaver-hat, which might very well be preſſed on the glaſs-plate.

However, from what we every day ſee effected in the caſe of prints affixed to glaſs without any of the paper remaining, and alſo of copper-plate embelliſhments upon porcelain and queen's ware, we doubt not that the picture, while freſh, may, by well-managed preſſure, be transferred from the paper to an even plate of ground glaſs coated with a proper gluten which ſhall not, at leaſt not materially, offuſcate its tranſparency: and experiment muſt determine whether the paper may afterward be gently drawn or peeled off, or muſt be burned away, or deſtroyed by a corroſive liquid, if any ſuch can be found which will not injure the colours.

Suppoſe, however, the operation of removing the paper to be ſatisfactorily performed, proceed we now to ſecure the indelibility of the picture.

Let a ſquare plate of caſt-iron, an inch or two in thickneſs, and as level and ſmooth as poſſible, be furniſhed on every ſide with a metal ledge riſing an inch or more in height, which ought to be in two ſeparate pieces, the one permanently faſtened to the plate, the other capable of being removed at pleaſure, for the purpoſe of laying in and taking out the glaſs without violence.

Within that ledge let the glaſs be fitted, cloſely touching it on every ſide, and lying with the painted ſurface uppermoſt. Upon this lay another plate of glaſs, fitted in the ſame manner.

Let, now, the metal frame, with the incloſed glaſſes, be expoſed to the action of fire until the glaſs plates, without being melted to abſolute fluidity, ſhall nevertheleſs become ſufficiently ſoft to coaleſce into one body under a ſtrong preſſure. The body which conveys the preſſure, and lies in immediate contact with the glaſs, muſt equally fit and completely fill the entire ſpace between the ledges, that there be no room for the ſoft glaſs to ſpread in any direction, ſo as to diſtort any of the lines of the picture.

Thoſe who have witneſſed the proceſs purſued in ſoftening tortoiſe-ſhell in the fire, and preſſing it into the various ſhapes of ſnuff-boxes, *étuis*, &c. &c. will not conceive much difficulty in this uſe of the glaſs. It may be managed by the aid of a machine ſomewhat ſimilar to, but more powerful than, a common printing-preſs, with a ſolid metal platine, to fit and fill the frame, as above; though much better contrivances may be found among the multifarious engines employed at Birmingham for the purpoſes of coining, and ſtriking the heavy dies, than any we can poſſibly ſuggeſt.

In whatever manner the two glaſſes may be preſſed into union, the united body may be afterward ground and poliſhed: and, in proportion to the greater ſmoothneſs of the two compreſſing bodies, the leſs grinding and poliſhing will be afterward required.

GLAUCHAU, a town of Upper Saxony, which has conſiderable manufactures of ſtuffs. It is ſeated on the Muldaw, 46 miles W.S.W. of Dreſden. Long. 12. 35. E. Lat. 50. 45. N.

GLAZING *(Encycl.)*. The glazing of all our earthen ware is very apt to crack, both from moiſture and heat, being compoſed of *lead*, one of the moſt pernicious metals that could be deviſed for ſuch an important purpoſe. It is well known that lead is eaſily volatilized by heat, and readily decompoſed by any vegetable acid: hence it has been affirmed by various eminent writers, that we are under the neceſſity of inhaling or ſwallowing, perhaps every day, a minute portion of a metal which is one of the ſloweſt, but moſt deſtructive poiſons, and lays the foundation of many fatal diſorders, ſuch as palſy, dry colic, conſumption, &c. the remote cauſe of which has not, till lately, been ſuſpected. In fact, there appears to be ſufficient reaſon to believe, that our *glazed* culinary veſſels are a latent ſource of diſeaſe; and when fruit or acids are allowed to remain in them for ſome time, the liquors or ſubſtances thus preſerved will neceſſarily acquire a very dangerous impregnation from the metal. We therefore recommend various ſubſtitutes for *lead* to the attention of the public, both for this and other purpoſes.

M. Weſtrumb, an eminent German chemiſt, was required by the government of Hanover to deviſe a leſs pernicious method of glazing earthen ware than any hitherto practiſed. In conſequence of numerous experiments, he has at length publiſhed the ſucceſsful reſult of ſeveral compoſitions, in which not a particle of lead was employed, and which is

his opinion will prove an uſeful glazing for ordinary veſſels. *Firſt:* 32 parts of ſand; 11, 15, or 20 parts of purified potaſh; and from 3 to 5 parts of borax. *Second:* 32 parts of glaſs (we ſuppoſe *flint-glaſs*); 16 parts of borax; and 3 parts of pure potaſh. *Third:* 150 parts of cryſtallized Glauber's-ſalt, with 8 parts of pulverized charcoal, previouſly roaſted, till it has acquired a grey colour; 16 parts of ſand; and 8 parts of borax.

Another method of *glazing without lead* has been invented by M. Nieſeman, a potter at Leipzig: it conſiſts of half a pound of ſaltpetre, half a pound of potaſh, and one pound of common ſalt. This compoſition is not very expenſive, and ſaid to produce an enamel not inferior to that prepared with lead. Profeſſor Leonhardi has inveſtigated, and found it eminently uſeful. We truſt, therefore, our potters will in future conſcientiouſly deſiſt from uſing that pernicious and ſlowly poiſonous metal.

GLENARM, a ſmall ſea-port of Ireland, in the county of Antrim, with a caſtle; ſeated near a bay of its own name, 20 miles N.N.W. of Carrickfergus. Long. 6. 16. W. Lat. 55. 3. N.

GLENCOE, Vale of, a valley, near the head of Loch Etive, in Argyleſhire; noted for a cruel maſſacre of its inhabitants in 1691. William III. having offered a general amneſty to the Highlanders who had been in arms for James II. provided they accepted it before the firſt of January, on pain of military execution after that period; the laird of Glencoe, on the laſt day of December, went to Fort William, the governor of which referred him to a civil officer. This made it the firſt of January before he could reach Inverary, where he ſurrendered to the ſheriff, who, however, accepted his ſubmiſſion, in conſideration of his offer to ſurrender the day before. The laird having taken the oaths, returned to Glencoe, in full aſſurance of ſafety; notwithſtanding which, he, and his whole clan, were butchered, on the 15th of February, and all the houſes in the valley were burnt.

GLENCROY, Vale of, a wild and romantic tract, near the N.E. extremity of Loch Loung, in Argyleſhire. The two ranges of mountains, which overhang this valley, approach each other, and between theſe the traveller is immured. Their ſtupendous height, and the roaring of numerous cataracts, that pour over their broken ſurface, produce an awful effect.

GLENLUCE, a town in Wigtonſhire, ſeated on the river Luce, near its entrance into the bay of that name, 16 miles W. by S. of Wigton.

GLENSHEE, Spital of, a noted paſs of the Grampian mountains, in Scotland, a little S. of the point where the counties of Perth, Angus, and Aberdeen meet. In 1718, a ſmall body of Highlanders, with 300 Spaniards, took poſſeſſion of this paſs: but they retired at the approach of the king's forces, and were driven from one eminence to another till night, when the Highlanders diſperſed; and, the next day, the Spaniards ſurrendered.

GLOMME, a river of the province of Aggerhuys, in S. Norway, which flows into the North Sea, at Fredericſtadt. It receives the river Worme, which iſſues from Lake Mios. It is not navigable in any part of its courſe from this lake to Fredericſtadt, its ſtream being intercepted by ſuch frequent cataracts and ſhoals, as, in ſome places, to render it neceſſary to drag the trees, which are floated down, over the ground. At leaſt 50,000 trees are annually floated by this river to Fredericſtadt.

GLOUCESTER (*Encycl.*). See next article to Globule.

GNESEN. See Gnesna.

GOAR, St. of Gower, a town of Germany, in the circle of Lower Rhine, ſubject to the landgrave of Heſſe Caſſel. It is ſeated under the ſtupendous rock and caſtle of Rheinfels, with which it ſurrendered to the French in 1794. It has a conſiderable commerce in wines and hides, and is 15 miles S.E. of Coblentz.

GOBCEIN, a town of Germany, in the palatinate of the Rhine, 18 miles S.E. of Philipſburgh. Long. 8. 56. E. Lat. 49. 6. N.

GOCH, a town of Germany, in the duchy of Cleves, ſeated on the Neers, ſix miles S. of Cleves. Long. 5. 52. E. Lat. 51. 39. N.

GOCHSHEIM, or Gochsen, a town of Suabia, in the duchy of Wurtemberg, 16 miles S. of Heidelberg, and 24 N.N.W. of Stutgard.

GOCIANO, a town of Sardinia, capital of a county of the ſame name, with a caſtle, ſeated on the Thurſo, 25 miles E. of Alghero.

GODERVILLE, a town of France, in the department of Lower Seine, nine miles N.E. of Montivilliers.

GODRA, a town of Hindooſtan Proper, in Guzerat, 55 miles E. of Amedabad. Long. 73. 40. E. Lat. 22. 50. N.

GOES, or Ter Goes, a ſtrong town of the United Provinces, in Zealand, and capital of the iſland of S. Beveland. It communicates with the Scheld by a canal, and is 20 miles E. of Middleburg. Long. 3. 50. E. Lat. 51. 33. N.

GOGMAGOG-hills, are hills ſo called, three miles from Cambridge, remarkable for the intrenchments and other works caſt up here: whence ſome ſuppoſe it was a Roman camp; and others, that it was the work of the Danes.

GOGRA, or Soorjew River, a large river, which riſes in Lake Lankee Dhe, in Thibet, and forcing its way through Mount Himmaleh, takes a S.E. direction, and unites with the Ganges, above Chuprah, in the province of Bahar.

GOHUD, a territory of Hindooſtan Proper, in the province of Agra; ſubject to a rajah, who is tributary to the Poonah Mahrattas. Gwalior is the capital.

GOLDBERG, a town of Sileſia, in the duchy of Lignitz. It receives its name from a gold-mine near it, which was formerly very rich. The inhabitants are engaged in manufactures of woollen and linen. It is nine miles S.W. of Lignitz, and 36 W. of Breſlaw. Long. 16. 23. E. Lat. 51. 3. N.

GOLD-FINCH, in ornithology. See Fringilla.

Theſe are ſeed-birds of very curious colours, and which, were they not ſo common in this country, would probably be very much eſteemed.

They are uſually taken about Michaelmas, and ſoon become tame; but they differ very much in their ſong.—They frequently breed in the upper part of plum-trees, making their neſts of the moſs that grows upon apple-trees, and of wool; quilting the inſide with all ſorts of hairs they find upon the ground. They breed three times a-year; and the young are to be taken with the neſt at about ten days old, and fed as follows:—Pound ſome hemp-ſeed very fine in a mortar; then ſift it through a ſieve, and add to it as much wheat-bread as hemp-ſeed; and likewiſe a little flower of canary-ſeeds: then with a ſmall ſtick or quill, take up as much as the bigneſs of a white-pea, and give them ſeveral times a-day. This ought to be made freſh every day: for if it is ſuffered to ſour, it will ſpoil their ſtomachs, cauſing them to caſt up their meat; which if they do, it is very probable that they will die.—Theſe young birds muſt be carefully kept warm till they can feed themſelves, for they are very tender. In feeding, be ſure to make your bird clean his bill and mouth. If any of the meat falls upon his feathers, take it off, or elſe he will not thrive. Such as eat hemp-ſeed, to purge them, ſhould have the ſeeds of melons, ſuccory, and mercury; or elſe let them have lettuce and plantane for that

purpoſe. When there is no need of purging, give them two or three times a-week a little ſugar or loam in their meat, or at the bottom of the cage; for all ſeeds have an oilineſs, ſo that if they have not ſomething to abſorb it, in length of time it fouls their ſtomachs, and brings on them a flux, which is very dangerous.

GOLDEN ISLAND, a barren iſland at the mouth of the river or gulf of Darien, where the Scots attempted to make a ſettlement in 1698. Long. 77. 10. W. Lat. 9. 0. N.

GOLDEN RULES, a diſtinguiſhing name for any precepts, worthy of univerſal obſervation. A better inſtance cannot be given than in "The twelve true old golden rules for thoſe who like to fare better than they now do, and at the ſame time to thrive and grow rich," publiſhed during the late ſcareity, by the Society for bettering the Condition of the Poor:

1. The *ready penny* always fetches the beſt bargain. He who buys upon truſt, muſt not complain if he is cheated. The ſhopkeeper ſuſpects his cuſtomer *who buys on truſt*, and thinks that he means to cheat, and never to pay; and therefore he takes good care to be beforehand, and charges high accordingly.

2. The beſt pennyworth is to be had where moſt ſit together, in the open market; and bargains are often cheaper in the latter end of the day.—When honeſt men have done their work, it is better for them to go to market, than to the alehouſe.

3. When times are hard, why ſhould we make them harder ſtill? Is it not enough to be taxed once by government, without being taxed twice by folly, thrice by drunkenneſs, four times by lazineſs, and ſo on?—A good man, even in hard times, will do twice as well, as a bad man will in the beſt of times. Let us all then riſe up *againſt ourſelves*, who thus *tax and injure ourſelves:* and we ſhall ſoon find that the times will mend. *Let us do good to ourſelves at home*, and we ſhall become happy in our own habitations; and learn that it is a true ſaying, that "God helps thoſe who help themſelves."

4. *Time is our eſtate;* it is our moſt valuable property. If we loſe it, or waſte it, we can never—*never* purchaſe it back again. We ought, therefore, not to have an idle hour, or throw away an idle penny. While we employ our time and our property (however ſmall that property may be) to the beſt advantage, we ſhall find that *a fortune may be made in any ſituation of life;* and that the poor man, who once wanted aſſiſtance himſelf, may become able to aſſiſt and relieve others.

5. *Induſtry* will make a man a purſe, and *frugality* will find him ſtrings for it. Neither the purſe nor the ſtrings will coſt him any thing. He who has it, ſhould only draw the ſtrings as frugality directs; and he will be ſure always to find a uſeful penny at the bottom of it. *The ſervants of induſtry* are known by their livery; it is always *whole* and *wholeſome*. Idleneſs travels very leiſurely, and poverty ſoon overtakes her. Look at the *ragged ſlaves of idleneſs*, and judge which is the beſt maſter to ſerve;—Induſtry, or Idleneſs.

6. *Marriage is honourable:* and the married ſtate, when entered into with prudence, and continued in with diſcretion, is of all conditions of life the *moſt happy;* but to bring a wife home, before we have made proviſion by our induſtry and prudence, for her and our children, or to chooſe a wife, who has not, by attention and economy on her part, proved herſelf fit to manage a family, is *extremely imprudent and improvident.* Let, therefore, the young prepare themſelves for the married ſtate, by treaſuring up *all the ſurplus of their youthful earnings*, and they will marry with confidence, and live together in comfort.

7. Of all *idolatry*, that ever debaſed any ſavage and ignorant nation, the worſhip of the *gin bottle* is the moſt diſgraceful. The worſhipper of the gin bottle becomes unfit for any thing; he ſoon rots his liver, and ruins himſelf and his family.

8. He who does not make his family comfortable, will himſelf never be happy at home; and he who is not happy at home, will never be happy any-where.—Charity begins at home: the huſband and wife, who can hardly keep themſelves and their children, ſhould not keep a dog to rob the children of part of their food.

9. She who roaſts or broils her meat, waſtes half of it in the *fire*. She who boils it, loſes half of it in the *water*. But when the good wife ſtews her meat gently, thickening the liquor with a little meal, ground rice, or peaſe and vegetables, and making it ſavoury with fried onions, herbs, and ſeaſoning, her huſband and ſhe fare much better, their children thrive and grow hearty and ſtout, and their money goes twice as far.

10. When you ſtew or boil your meat, if you leave the veſſel uncovered, a great deal of the beſt part goes off and is waſted in ſteam; and when you make the fire in a wide chimney, with a large open throat, there is at leaſt twice as much of the heat goes up the chimney, as ever comes into the room to warm the family.

11. Sinning is a very expenſive occupation.—Aſk thoſe who have practiſed it; they can tell you what it has coſt them. The man who attempts to make you laugh at the fear of God is your worſt enemy. In ſo doing, he endeavours to teach you to be alſo your own *bitter and irreconcileable enemy for ever*, both in this world, and in the next.

12. Sin is the greateſt of all evils; the ſalvation of the ſoul our beſt good; and the grace of God our richeſt treaſure. Let the poor man find his way to the cheapeſt market on Saturday, to a place of divine worſhip on Sunday, and, like an honeſt man, go to his labour on Monday. Following theſe plain directions, he may be *twice happy*:—happy here, and happy hereafter to all eternity.

GOLEITA, an iſland of Africa, at the entrance of the bay of Tunis; taken by the emperor Charles V. when he attempted the ſiege of Tunis, and kept by the Chriſtians ſeveral years. It is 29 miles N. of Tunis. Long. 10. 20. E. Lat. 37. 10. N.

GOLLING, a town of Germany, in the archbiſhopric of Saltzburg, 14 miles S.S.E. of Saltzburg.

GOLNAW, a town of Pruſſian Pomerania, ſeated on the Ilna, 18 miles N.E. of Stetin. Long. 14. 59. E. Lat. 53. 46. N.

GOMORRAH (anc. geog.), one of the cities of the plain or of the vale of Siddim in Judæa, deſtroyed together with Sodom by fire from heaven, on account of the wickedneſs of the people. To determine its particular ſituation at preſent, is impoſſible.

GOMMERN, a town of Upper Saxony, ſituate on the Ehle, eight miles S.E. of Magdeburg, and 20 N.W. of Deſſau. Long. 11. 50. E. Lat. 52. 5. N.

GOMS, a town of Swiſſerland, which gives name to one of the departments of the Valais. It is 33 miles E. of Sion.

GONAIVES, a ſea-port of the iſland of St. Domingo, with an excellent harbour. Long. 72. 26. E. Lat. 19. 36. N.

GONAVE, an iſland in the W. Indies, near the W. coaſt of St. Domingo. Long. 73. 4. W. Lat. 18. 51. N.

GONDEGAMA, or GONDLACOMMA, a river of the peninſula of Hindooſtan, which riſes near Combam, forms the nominal boundary of the Carnatic on the N. and enters the bay of Bengal, at Mootapilly.

GONDRECOURT, a town of France, in the department

of Meuſe, ſeated on the Orney, 20 miles S. of St. Michel. Long. 5. 37. E. Lat. 48. 30. N.

GONDREVILLE, a town of France, in the department of Meurthe, with a caſtle, and a magnificent hoſpital. It ſtands on a hill, on the river Moſelle, eight miles from Nanci. Long. 6. 9. E. Lat. 48. 40. N.

GONESSE, a town of France, in the department of Seine and Oiſe. It is the birth-place of King Philip Auguſtus, and noted for the goodneſs of its bread, which is brought twice a-week to Paris. It is ſeated on the Crould, 10 miles N.E. of Paris. Long. 2. 30. E. Lat. 48. 58. N.

GONGA, an ancient town of Romania, ſeated near the ſea of Marmora, 37 miles N. E. of Gallipoli. Long. 37. 31. E. Lat. 40. 53. N.

GONJAH, a kingdom of Africa, between the coaſt of Guinea on the S. and Tombuctou on the N. Gonjah, the capital, is 870 miles W. by S. of Caſhna. Long. 6. 10. W. Lat. 13. 20. N.

GOORACPOUR, a town of Hindooſtan Proper, in the country of Oude, 65 miles E. of Fyzabad. Long. 83. 35. E. Lat. 26. 45. N.

GORITZ, the capital of a county of the ſame name, in the duchy of Carniola, with a caſtle, ſeated on the Liſonzo, 16 miles N.E. of Aquileia. Long. 13. 30. E. Lat. 46. 20. N.

GORKAH, the capital of a country of the ſame name, in Aſia, on the borders of Napaul, 35 miles N.W. of Catmandu, and 200 N. of Benares. Long. 84. 36. E. Lat. 28. 25. N.

GORZE, a town of France, in the department of Moſelle. It had lately a rich abbey, and is ſeated on a hill, eight miles S.W. of Metz.

GOSSWEINSTEIN, or Gossmanstein, a town of Germany, in the circle of Franconia, and biſhopric of Bamberg, 20 miles E.S.E. of Bamberg, and 23. N.N.E. of Nuremberg. Long. 11. 19. E. Lat. 49. 45. N.

GOSTYNEN, or Gostavin, a town of Poland, in the palatinate of Rava, 36 miles N.E. of Rava. Long. 20. 40. E. Lat. 51. 54. N.

GOTTSBERG, a town of Sileſia, in the duchy of Schweidnitz, remarkable for its ſilver mines. Near it is likewiſe a mine of gold, but it is not worked. It is 12 miles S. W. of Schweidnitz.

GOTTSCHEE, a town of Germany, in Carniola, 23 miles S.S.E. of Laybach, and 160 S.S.W. of Vienna. Long. 14. 43. E. Lat. 45. 53. N.

GOUDHURST, a town in Kent, with a market on Wedneſday, 12 miles S.W. of Maidſtone, and 44 S.E. of London. Long. 0. 31. E. Lat. 51. 8. N.

GOVERNOLO, a town of Italy, in the Mantuan, ſeated on the Mincio, 12 miles S.E. of Mantua. Long. 10. 56. E. Lat. 45. 4. N.

GOURA, or Gura, a town of Poland, in the palatinate of Maſovia, belonging to the biſhop of Poſnania. Long. 21. 50. E. Lat. 52. 1. N.

GOURAINCOURT, a town of France, in the department of Meuſe, 15 miles N. E. of Verdun.

GOURDON, a town of France, in the department of Lot, 18 miles N.W. of Cahors. Long. 1. 24. E. Lat. 45. 43. N.

GOUROCK, a town in Renfrewſhire, on a bay of the frith of Clyde. In its neighbourhood, a copper mine was lately worked.

GOWER, the peninſulated extremity of Glamorganſhire, to the W. of the bay of Swanſey. It has very lofty lime-ſtone cliffs next the ſea, whence large quantities of lime are exported to the Engliſh counties acroſs the Briſtol channel. The coaſt abounds with oyſters. The land is a fertile tract of arable and paſture.

Gower, or Gever. See Goar, St. *Supp.*

GOZZI, or Gozes, an iſland of the Mediterranean, to the S. of the iſle of Candia, 12 miles from fort Selino.

GOZZO, a fortified iſland of the Mediterranean, five miles N.W. of Malta, and belonging to the knights of that iſland.

GRABOW, a town of Lower Saxony, in the duchy of Mecklenburg, 18 miles S. of Schwerin. Long. 11. 44. E. Lat. 53. 26. N.

GRACCHUS (Tiberius), elected tribune of the Roman people, demanded in the ſenate, in their name, the execution of the Agrarian law; by which all perſons poſſeſſing above 200 acres of land were to be deprived of the ſurplus, for the benefit of the poor citizens, amongſt whom an equal diſtribution of them was to be made; having carried his plan into execution by violent meaſures, he fell a victim to his zeal, being aſſaſſinated by his own party, 133 B.C. Caius, his brother, purſuing the ſame ſteps, was killed by the conſul Opimius, 121 B.C.

GRACIAS A DIOS, a town of Mexico, in the province of Honduras, 140 miles E. of Guatimala. Long. 72. 15. W. Lat. 14. 30. N.

GRACIOSA, one of the Azores, or Weſtern Iſlands. Its inhabitants are about 300, and its produce is wheat, wine, butter, and cheeſe. Long. 27. 58. W. Lat. 39. 2. N.

Graciosa, a rocky, barren, uninhabited iſland, one of the Canaries, to the N. of Lacerota. It is three miles long, and two broad.

GRAFTON, a village in Northamptonſhire, between Stony Stratford and Northampton, where there is a manor-houſe and park, given by Charles II. to the Duke of Grafton, whence the title is derived.

GRAHAM's Muir, between the Carron Works and Falkirk, in Scotland, a field celebrated for being the ſpot where Sir William Wallace, in 1298, cut his way through the midſt of his victorious enemies.

GRAMAT, a town of France, in the department of Lot, 22 miles N.N.E. of Cahors. Long. 1. 37. E. Lat. 44. 47. N.

GRAN, a town of Lower Hungary, with an archbiſhop's ſee. It has been ſeveral times taken and retaken, but laſt of all by the Auſtrians, in 1683. It is ſeated on the Danube, 87 miles E. by S. of Vienna. Long. 18. 6. E. Lat. 47. 46. N.

GRANARY (*Encycl.*) In the 8th vol. of the "*Letters and Papers of the Bath and Weſt of England Society*," &c. Thomas South, eſq. gives a deſcription of a cheap and efficacious ventilator, for preſerving corn on ſhip-board. This machine conſiſts of a forcing pump, with perforated tubes annexed to it; and by means of which freſh air may be communicated to every part of the cargo.—Mr. South's air-veſſel is, for the ſake of cheapneſs, confined to a diameter of 10 inches; but he obſerves that, if the latter be enlarged to 14 inches, the effect of the machine will be nearly doubled; and if the length of the trough (by the ſuction-valve) be extended 10 inches, a power will be obtained capable of ventilating a cargo of 400 tons in the courſe of one hour. The price of a ventilator on the ſmaller plan, is computed by Mr. South at about five or ſix guineas; one on a larger ſcale might perhaps amount to twenty guineas: a ſum which, in either caſe, enhances the price of corn only at a rate of leſs than four pence per quarter, on the firſt cargo. Theſe machines, if well painted and properly preſerved, will continue uſeful for many years.—A more minute account of Mr. South's invention is

contained in the volume of the "*Letters*," &c. before quoted, where its various parts are ſpecified and illuſtrated by an engraving.

To preſerve corn in barns or granaries, Dr. Darwin obſerves, it is requiſite firſt to make them dry, and, ſecondly, to keep them in that ſtate; becauſe no ſeeds will vegetate without moiſture. In order to dry ſeeds, the heaps ſhould be frequently turned over in warm dry weather: hence, in this climate, the doors and windows of granaries ſhould open towards the ſouth, for the reception of the warmth of the ſun, with air-holes round the building, for ſufficient ventilation; and which apertures ought to be ſheltered from rain or ſnow, by boards placed for that purpoſe on the outſide.—Heaps of corn ſhould be ſurrounded with planks, in order to prevent them from touching either brick or ſtone walls; becauſe, when cold north-eaſt winds are ſucceeded by moiſt and warm ſouth-weſt winds, ſuch walls frequently precipitate the moiſture from the atmoſphere, and communicate it to thoſe bodies which are in contact with them.—According to Mr. Tull, the ſafeſt method of preſerving a large quantity of wheat is, to dry it gradually in a malt-kiln on a hair-cloth, with no other fuel than clean ſtraw, and with a heat ſcarcely exceeding that produced by the rays of the ſun.—In this temperature, the grain is to remain from 4 to 12 hours, in proportion to its previous dampneſs. The vegetative principle of the corn is not deſtroyed by this proceſs; as inſtances have occurred of its growing when ſown, after it had been thus kept for ſeven years.

GRANDEUR *and* SUBLIMITY. Theſe terms have a double ſignification: they commonly ſignify the quality or circumſtance in objects by which the emotions of grandeur and ſublimity are produced; ſometimes the emotions themſelves.

In handling the preſent ſubject, it is neceſſary that the impreſſion made on the mind by the magnitude of an object, abſtracting from its other qualities, ſhould be aſcertained. And becauſe abſtraction is a mental operation of ſome difficulty, the ſafeſt method for judging is, to chooſe a plain object that is neither beautiful nor deformed, if ſuch a one can be found. The plaineſt that occurs, is a huge maſs of rubbiſh, the ruin perhaps of ſome extenſive building; or a large heap of ſtones, ſuch as are collected together for keeping in memory a battle or other remarkable event. Such an object, which in miniature would be perfectly indifferent, makes an impreſſion by its magnitude, and appears agreeable. And ſuppoſing it ſo large, as to fill the eye, and to prevent the attention from wandering upon other objects, the impreſſion it makes will be ſo much the deeper. See ATTENTION.

But though a plain object of that kind be agreeable, it is not termed *grand*: it is not entitled to that character, unleſs, together with its ſize, it be poſſeſſed of other qualities that contribute to beauty, ſuch as regularity, proportion, order, or colour: and according to the number of ſuch qualities combined with magnitude, it is more or leſs grand. Thus St. Peter's church at Rome, the great pyramid of Egypt, the Alps towering above the clouds, a great arm of the ſea, and above all a clear and ſerene ſky, are grand; becauſe, beſide their ſize, they are beautiful in an eminent degree. On the other hand, an overgrown whale, having a diſagreeable appearance, is not grand. A large building agreeable by its regularity and proportions, is grand; and yet a much larger building deſtitute of regularity, has not the leaſt tincture of grandeur. A ſingle regiment in battle-array, makes a grand appearance; which the ſurrounding crowd does not, though perhaps ten for one in number. And a regiment where the men are all in one livery and the horſes of one colour, makes a grander appearance, and conſequently ſtrikes more terror, than where there is confuſion of colour and dreſs. Thus greatneſs or magnitude is the circumſtance that diſtinguiſhes grandeur from beauty: agreeableneſs is the genus, of which beauty and grandeur are ſpecies.

The emotion of grandeur, duly examined, will be found an additional proof of the foregoing doctrine. That this emotion is pleaſant in a high degree, requires no other evidence but once to have ſeen a grand object: and if an emotion of grandeur be pleaſant, its cauſe or object, as obſerved above, muſt infallibly be agreeable in proportion.

The qualities of grandeur and beauty are not more diſtinct, than the emotions are which theſe qualities produce in a ſpectator. All the various emotions of beauty have one common character, that of ſweetneſs and gaiety. The emotion of grandeur has a different character: a large object that is agreeable, occupies the whole attention, and ſwells the heart into a vivid emotion, which, though extremely pleaſant, is rather ſerious than gay. And this affords a good reaſon for diſtinguiſhing in language theſe different emotions. The emotions raiſed by colour, by regularity, by proportion, and by order, have ſuch a reſemblance to each other, as readily to come under one general term, viz. *the emotion of beauty*; but the emotion of grandeur is ſo different from theſe mentioned, as to merit a peculiar name.

Though regularity, proportion, order, and colour, contribute to grandeur as well as to beauty, yet theſe qualities are not by far ſo eſſential to the former as to the latter. To make out that propoſition, ſome preliminaries are requiſite. In the firſt place, the mind, not being totally occupied with a ſmall object, can give its attention at the ſame time to every minute part; but in a great or extenſive object, the mind, being totally occupied with the capital and ſtriking parts, has no attention left for thoſe that are little or indifferent. In the next place, two ſimilar objects appear not ſimilar when viewed at different diſtances: the ſimilar parts of a very large object, cannot be ſeen but at different diſtances; and for that reaſon, its regularity, and the proportion of its parts, are in ſome meaſure loſt to the eye; neither are the irregularities of a very large object ſo conſpicuous as of one that is ſmall. Hence it is, that a large object is not ſo agreeable by its regularity, as a ſmall object; nor ſo diſagreeable by its irregularities.

Theſe conſiderations make it evident, that grandeur is ſatisfied with a leſs degree of regularity, and of the other qualities mentioned, than is requiſite for beauty; which may be illuſtrated by the following experiment. Approaching to a ſmall conical hill, we take an accurate ſurvey of every part, and are ſenſible of the ſlighteſt deviation from regularity and proportion. Suppoſing the hill to be conſiderably enlarged, ſo as to make us leſs ſenſible of its regularity, it will upon that account appear leſs beautiful. It will not, however, appear leſs agreeable, becauſe ſome ſlight emotion of grandeur comes in place of what is loſt in beauty. And at laſt, when the hill is enlarged to a great mountain, the ſmall degree of beauty that is left, is ſunk in its grandeur. Hence it is, that a towering hill is delightful, if it have but the ſlighteſt reſemblance of a cone; and a chain of mountains not leſs ſo, though deficient in the accuracy of order and proportion. We require a ſmall ſurface to be ſmooth; but in an extenſive plain, conſiderable inequalities are overlooked. In a word, regularity, proportion, order, and colour, contribute to grandeur as well as to beauty; but with a remarkable difference, that in paſſing from ſmall to great, they are not required in the ſame degree of perfection. This remark ſerves to explain the extreme delight we have in viewing the face of nature, when ſufficiently enriched and diverſified with objects. The

bulk of the objects in a natural landscape are beautiful, and some of them grand: a flowing river, a spreading oak, a round hill, an extended plain, are delightful; and even a rugged rock, or barren heath, though in themselves disagreeable, contribute by contrast to the beauty of the whole; joining to these the verdure of the fields, the mixture of light and shade, and the sublime canopy spread over all; it will not appear wonderful, that so extensive a groupe of splendid objects should swell the heart to its utmost bounds, and raise the strongest emotion of grandeur. The spectator is conscious of an enthusiasm which cannot bear confinement, nor the strictness of regularity and order: he loves to range at large; and is so enchanted with magnificent objects, as to overlook slight beauties or deformities.

The same observation is applicable in some measure to works of art. In a small building, the slightest irregularity is disagreeable: but in a magnificent palace, or a large gothic church, irregularities are less regarded. In an epic poem, we pardon many negligences that would not be permitted in a sonnet or epigram. Notwithstanding such exceptions, it may be justly laid down for a rule, that in works of art, order and regularity ought to be governing principles; and hence the observation of Longinus, "In works of art we have regard to exact proportion: in those of nature, to grandeur and magnificence."

The same reflections are in a good measure applicable to SUBLIMITY: particularly, that, like grandeur, it is a species of agreeableness; that a beautiful object placed high, appearing more agreeable than formerly, produces in the spectator a new emotion, termed *the emotion of sublimity;* and that the perfection of order, regularity, and proportion, is less required in objects placed high, or at a distance, than at hand.

GRANICUS (*Encycl.*). Authors disagree very much about the number of the Persians engaged in this remarkable battle, though all agree that they were vastly more numerous than the Greeks. Justin and Orosius tell us, that the Persian army consisted of 600,000 foot and 20,000 horse; Arrian makes the foot amount to 200,000; but Diodorus tells us, that they were not more than 100,000 foot, and 10,000 horse. The Macedonian army did not exceed 30,000 foot, and 5000 horse. The Persian cavalry lined the banks of the Granicus, in order to oppose Alexander wherever he should attempt a passage; and the foot were posted behind the cavalry on an easy ascent. Parmenio would have had Alexander to allow his troops some time to refresh themselves; but he replied, that, after having crossed the Hellespont, it would be a disgrace to him and his troops to be stopped by a rivulet. Accordingly a proper place for crossing the river was no sooner found, than he commanded a strong detachment of horse to enter, he himself following with the right wing which he commanded in person; the trumpets in the mean time sounding, and loud shouts of joy being heard through the whole army. The Persians let fly such showers of arrows against the detachment of Macedonian horse, as caused some confusion; several of their horses being killed or wounded. As they drew near the bank a most bloody engagement ensued; the Macedonians attempting to land, and the Persians pushing them back into the river. Alexander, who observed the confusion they were in, took the command of them himself; and landing in spite of all opposition, obliged the Persian cavalry, after an obstinate resistance, to give ground. However, Spithrobates, governor of Ionia, and son-in-law to Darius, still maintained his ground, and did all that lay in his power to bring them back to the charge. Alexander advanced full gallop to engage him; neither did he decline the combat, and both were slightly wounded at the first encounter. Spithrobates having thrown his javelin without effect, advanced sword in hand to meet his antagonist, who ran him through with his pike as he raised his arm to discharge a blow with his scymitar. But Rosaces, brother to Spithrobates, at the same time gave Alexander such a furious blow on the head with his battle-ax, that he beat off his plume, and slightly wounded him through the helmet. As he was ready to repeat the blow, Clitus with one stroke of his scymitar cut off Rosaces's head, and thus in all probability saved the life of his sovereign. The Macedonians then, animated by the example of their king, attacked the Persians with new vigour, who soon after betook themselves to flight. Alexander did not pursue them; but immediately charged the enemy's foot with all his forces, who had now passed the river. The Persians, disheartened at the defeat of their cavalry, made no great resistance. The Greek mercenaries retired in good order to a neighbouring hill, whence they sent deputies to Alexander, desiring leave to march off unmolested. But he, instead of coming to a parley with them, rushed furiously into the middle of this small body; where his horse was killed under him, and he himself in great danger of being cut in pieces. The Greeks defended themselves with incredible valour for a long time, but were at last almost entirely cut off.—In this battle the Persians are said to have lost 20,000 foot, and 2,500 horse, and the Macedonians only 55 foot, and 60 horse.

GRANT (Francis), Lord Cullen, an eminent lawyer and judge in Scotland, was descended from a younger branch of the family of the Grants of Grant in that kingdom, and was born about the year 1660. When he commenced advocate he made a distinguished figure at the Revolution, by opposing the opinion of the old lawyers, who warmly argued on the inability of the convention of estates to make any disposition of the crown. The abilities he shewed in favour of the revolution recommended him to an extensive practice; in which he acquired so much honour, that when the union between the two kingdoms was in agitation, Queen Anne unexpectedly, and without application, created him a baronet, with a view of securing his interest in that measure; and upon the same principle, she soon after created him a judge, or one of the lords of session. From this time, according to the custom of Scotland, he was styled, from the name of his estate, Lord Cullen; and the same good qualities that recommended him to this honourable office, were very conspicuous in the discharge of it; which he continued for 20 years with the highest reputation, when a period was put to his life by an illness which lasted but three days. He expired without any agony on March 16th, 1726.

His character is drawn to great advantage in the Biographia Britannica; where it is observed, among other remarks to his honour, "that as an advocate he was indefatigable in the management of business; but at the same time that he spared no pains, he would use no craft. He had so high an idea of the dignity of his profession, that he held it equally criminal to neglect any honest means of coming at justice, or to make use of any arts to elude it.

"In respect to fortune, though he was modest and frugal, and had a large practice, yet he was far from being avaricious. His private charities were very considerable, and grew in the same proportion with his profits. He was, besides, very scrupulous in many points; he would not suffer a just cause to be lost through a client's want of money. He was such an enemy to oppression, that he never denied his assistance to such as laboured under it; and with respect to the clergy of all professions (in Scotland), his conscience obliged him to serve them without a fee. He saw their wrongs required assistance, and he knew their circumstances would not admit of expence. His additions, therefore, to his paternal estate were much infe-

rior to what might have been expected, and a large acceſſion of character was the principal produce of that activity and diligence by which he was diſtinguiſhed at the bar.

" When his merit had raiſed him to the bench, he thought himſelf accountable to God and man for his conduct in that high office; and that deep ſenſe of his duty, at the ſame time that it kept him ſtrictly to it, encouraged and ſupported him in the performance. The pleadings in Scotland are carried on chiefly in writing, which renders them ſometimes very prolix, ſo as to take up much of the judge's time, and to exerciſe alike his parts and his patience in going through and making himſelf maſter of them. In this the diligence and dexterity of Lord Cullen were equally conſpicuous: he went through every thing that came into his hands very carefully, and ſifted it thoroughly; ſo that the lawyers at the bar never found themſelves too ſtrong for the bench, but on the contrary were often told many things by his lordſhip, which had either eſcaped their notice, or which the intereſt of their client had engaged them to conceal. As his attention to the pleadings guided him to the real merits of the cauſe; ſo when he was once maſter of theſe, his ſecond care was to diſpatch it. He knew, that, in judicature, the next fault to denying, was delaying juſtice; by which families are always injured, and too often ruined. Whenever, therefore, he had provided againſt being miſtaken, he was deſirous of bringing the matter to a ſhort deciſion; and as he was very ſolicitous about the former, ſo the parties themſelves helped him not a little as to the latter. Whenever he ſat as lord ordinary; the paper of cauſes was remarkably full, for his reputation being equally eſtabliſhed for knowledge and integrity, there were none, who had a good opinion of their own pretenſions, but were deſirous of bringing them before him, and not many who did not ſit down ſatisfied with his deciſion. This prevailed more eſpecially after it was found that few of his ſentences were reverſed; and when they were, it was commonly owing to himſelf: for if, upon mature reflection, or upon new reaſons offered at the re-hearing, he ſaw any juſt ground for altering his judgment, he made no ſcruple of declaring it; being perſuaded, that it was more manly, as well as more juſt, to follow truth, than to ſupport opinion: and his conduct in this reſpect had a right effect; for inſtead of leſſening, it raiſed his reputation.

" He would not, however, with all his great ſtock of knowledge, experience, and probity, truſt himſelf in matters of blood, or venture to decide in criminal caſes on the lives of his fellow-creatures; which was the reaſon that, though often ſolicited, he could never be prevailed upon to accept of a ſeat in the juſticiary court.

" He was ſo true a lover of learning, and was ſo much addicted to his ſtudies, that notwithſtanding the multiplicity of his buſineſs while at the bar, and his great attention to his charge when a judge, he nevertheleſs found time to write various treatiſes, on very different and important ſubjects: ſome political, which were remarkably well-timed, and highly ſerviceable to the government: others of a moſt extenſive nature, ſuch as his eſſays on law, religion, and education, which were dedicated to his preſent Majeſty when Prince of Wales; by whoſe command; his then ſecretary, Mr. Samuel Molyneaux, wrote him a letter of thanks, in which were many gracious expreſſions, as well in relation to the piece, as to its author. He compoſed, beſides theſe, many diſcourſes on literary ſubjects, for the exerciſe of his own thoughts, and for the better diſcovery of truth; which went no further than his own cloſet, and from a principle of modeſty were not communicated even to his moſt intimate friends.

" In his lordſhip's private character he was as amiable as he was reſpectable in his public. There were certain circumſtances that determined him to part with an eſtate that was left him by his father; and it being foreſeen that he would employ the produce of it, and the money he had acquired by his profeſſion, in a new purchaſe, there were many decayed families who ſolicited him to take their lands upon his own terms, relying entirely on that equity, which they conceived to be the rule of his actions. It appeared that their opinion of him was perfectly well grounded. For being at length prevailed upon to lay out his money on the eſtate of an unfortunate family, who had a debt upon it of more than it was worth; he firſt put their affairs into order, and by claſſing the different demands, and compromiſing a variety of claims, ſecured ſome thouſand pounds to the heirs, without prejudice to any, and of which they had never been poſſeſſed but from his interpoſition and vigilance in their behalf: ſo far was he either from making any advantage to himſelf of their neceſſities, or of his own ſkill in his profeſſion; a circumſtance juſtly mentioned to his honour, and which is an equal proof of his candor, generoſity, and compaſſion. He was charitable without oſtentation, diſintereſted in his friendſhips, and beneficent to all who had any thing to do with him. He was not only ſtrictly juſt; but ſo free from any ſpecies of avarice, that his lady, who was a woman of great prudence and diſcretion, finding him more intent on the buſineſs committed to him by others, than on his own, took upon herſelf the care of placing out his money; and to prevent his poſtponing, as he was apt to do, ſuch kind of affairs, when ſecurities offered, ſhe cauſed the circumſtances of them to be ſtated in the form of caſes, and ſo procured his opinion upon his own concerns, as if they had been thoſe of a client. Theſe little circumſtances are mentioned as more expreſſive of his temper, than actions of another kind could be; becauſe, in matters of importance, men either act from habit, or from motives that the world cannot penetrate; but, in things of a trivial nature, are leſs upon their guard, ſhew their true diſpoſition, and ſtand confeſſed for what they are."

GRASMERE-WATER, a ſmall lake of Weſtmoreland, to the W. of Ambleſide. Its margin is hollowed into ſmall bays, with bold eminences; ſome of rock, ſome of turf, that half conceal and vary the figure of the lake. From the ſhore, a low promontory projects far into the water; and on it ſtands a white village, with the pariſh church riſing in the midſt of it.

GRASON, an iſland in the gulf of Bothnia, near the coaſt of Sweden. Long. 18. 20. E. Lat. 60. 12. N.

GRASSANO, a town of Naples, in Baſilicata, 18 miles E.S.E. of Cirenza.

GRASSE, a town of France, in the department of Var. It was lately a biſhop's ſee; and is ſeated on an eminence, 15 miles W. of Nice. Long. 6. 56. E. Lat. 43. 39. N.

GRASSE, a town of France, in the department of Aude, ſeated on the river Othieu, at the foot of the mountain of Courbiere, 18 miles S E. of Carcaſſonne.

GRATELEY, a village in Hampſhire, on the S.E. ſide of Quarley hill, in the road from Andover to Saliſbury, where, in 926, King Athelſtan held a grand council of the nobility. Near it is a great Roman camp, and on Quarley hill is a large Britiſh camp.

GRATES (*Encycl.*) Grates are peculiarly adapted to the uſe of pit-coal, which requires a greater draught of air to promote its burning freely, than any other kind of fuel. Moſt of them however are ill conſtructed for the purpoſe, and are eſpecially injudicious, Count Rumford obſerves, when made of, or connected to, large maſſes of iron, which being a rapid conductor of heat, ſends off a large portion of what the fuel ſupplies, and which would otherwiſe be reflected into the room. No ſubſtance in nature, he ſays, has *a ſtronger power*

of reflecting heat than brick, a fact both underſtood and applied in the culture of wall-fruit: it is therefore of conſequence to have as *little iron* as poſſible in our fire-places, and as much *brick* or fire-ſtone. See FIRE-PLACE.

Count Rumford's *cottage* and *gridiron* grates, are important contrivances to thoſe who wiſh to derive a great deal of comfort from a ſmall quantity of fuel. But for this end it is neceſſary to have the fire-place conſtructed with a ſcrupulous regard to his inſtructions, and to the models to be ſeen at the Royal Inſtitution.

In the year 1791, a patent was granted to Mr. BENJAMIN CHARLES COLLINS, of Saliſbury, Wilts, for a grate on a new conſtruction, to be uſed either in or out of a chimney. This invention is ſaid to be calculated to increaſe the action of the air upon fire, by augmenting and directing the paſſage of the former through the latter. Thus the fire may be rendered ſo intenſe as to preſent a perfect white heat; and, as the draught of air is very great, the patentee obſerves, that "all, or nearly all of the unignited ſmoke is carried down into the fire and there conſumed, inſtead of paſſing off in the common way." To effect this purpoſe, he conſtructs one or more air-flues provided with ſtops, by which he may at pleaſure promote the draught of air to the requiſite degree of heat.

Grates of this conſtruction are aſſerted to be very uſeful for light-houſes, and other places requiring a ſtrong fire, ſuch as laboratories, brew-houſes, ſmelting-furnaces, glaſs-houſes, &c. —For a more circumſtantial account of this patent, we muſt refer the reader to the 8th vol. of the *Repertory of Arts and Manufactures*.

A later invention is that of Mr. BURNS's for fire-grates and ſtoves.

The object of this ſuppoſed improvement is to prevent thoſe diſagreeable currents of air which guſh from every opening and crevice in an apartment toward the fire-place, and alſo to impart greater equality to the temperature of the air in the different parts of the room. Theſe objects he accompliſhes by a contrivance ſimilar to that uſed by many chemiſts for ſupplying their furnaces with freſh air. In lieu of our preſent ſtoves or grates, he ſubſtitutes an urn-ſhaped ſtove ſtanding in the chimney, having an opening in front to ſhew the fire, and ſupplied with air from without the houſe, where practicable, by means of a tube communicating with the fire, paſſing through the pedeſtal of the ſtove, and conducted through the hearth, in whatever manner is moſt convenient, to the outſide of the houſe. Where the tube cannot be thus made to communicate with the external atmoſpheric air, it is conducted to a cellar or any other cool part of the houſe, whence the fire draws its requiſite ſupplies of air, and at the ſame time creates a wholeſome circulation in the air of that cellar or other room. The aſhes fall into a metal drawer, where they remain concealed from view, and in which they are removed at once without raiſing any duſt in the apartment.

Thoſe who attempt to appreciate inventions of this kind, ſhould examine well whether they are not (many of them) conſtructed on falſe principles; not perhaps as to the *production* but the *application* of heat.

GRAUDENTZ, a town of Poland, in the palatinate of Culm, with a caſtle; ſeated on the Viſtula, 30 miles N. of Thorn, and 110 N.W. of Warſaw. Long. 18. 52. E. Lat. 53. 36. N.

GRAVEN MACHEREN, a town of Luxemburg, on the Moſelle, 18 miles E.N.E. of Luxemburg. It was ſacked and burnt, in 1552, by the Marquis of Brandenburg.

GRAVENWERT, a town of Lower Bavaria, 42 miles E.N.E. of Nuremberg.

GRAVESANDE, a town of Holland, where the ancient counts of Holland reſided. It is ſeven miles W. of Delft.

GRAULHET, a town of France, in the department of Tarn, 12 miles N.W. of Caſtres.

GRAY'S THURROCK, a town in Eſſex, with a market on Thurſday, ſeated on the Thames, 24 miles E. of London. Long. 0. 24. E. Lat. 51. 26. N.

GREBENSTEIN, a town of Germany, in the principality of Heſſe Caſſel, 12 miles N.W. of Caſſel, and 16 N.N.E. of Naumburg. Long. 8. 58. E. Lat. 51. 16. N.

GREENLAW, the county-town of Berwickſhire, ſeated on a river that joins the Tweed, before it reaches Berwick. It is 17 miles W. by S. of that town. Long. 2. 18. W. Lat. 53. 43. N.

GREENSBURGH, the county-town of Weſtmoreland, in Pennſylvania, 178 miles W. by N. of Philadelphia. Long. 78. 36. W. Lat. 40. 8. N.

GREENSTED, a village in Eſſex, one mile W. of Chipping Ongar, remarkable for its little church (built prior to the Conqueſt), the walls of which are formed of the trunks of trees placed in rows.

GREIFFENHAGEN, a town of Upper Saxony, 37 miles N. of Caſtrin. Long. 15. 9. E. Lat. 53. 12. N.

GREIN, a town of the archduchy of Auſtria, ſituate on the Danube, 62 miles W. of Vienna. Long. 18. 5. E. Lat. 48. 16. N.

GREITZ, a town of Upper Saxony, in Voightland, with ſome ſtuff manufactures; ſituate on a ſmall river, which runs into the Elſter, 12 miles S.W. of Zwickau.

GRENADA (*Encycl.*). See GRANADA.

GREVENBROICH, a town of Weſtphalia, in the duchy of Juliers, 10 miles E.N.E. of Juliers. Long. 6. 18. E. Lat. 51. 6. N.

GREUSSEN, a town of Upper Saxony, in the county of Schwaitzburg, 16 miles N. of Erfurt, and 18 E. of Muhlhauſen. Long. 10. 45. E. Lat. 51. 6. N.

GRIESSEWALDE, a town of Upper Saxony, 24 miles S.S.E. of Stralfund. Long. 11. 18. E. Lat. 54. 4. N.

GRIFFENHAKEN, a town of Pruſſian Pomerania, in the duchy of Stetin, ſeated on the Oder, oppoſite Gartz. Long. 14. 42. E. Lat. 53. 25. N.

GRIMBERGEN, a town of Auſtrian Brabant, with an abbey and a caſtle, ſix miles N. of Bruſſels. Long. 4. 27. E. Lat. 50. 57. N.

GRIMM, a town in the electorate of Saxony, with a citadel, ſeated on the Muldaw, 10 miles S.E. of Leipſic. Long. 12. 35. E. Lat. 51. 15. N.

GRIMMEN, a town of Swediſh Pomerania, five miles S. of Stralſund. Long. 13. 27. E. Lat. 54. 12. N.

GRIMPERG, a town in the electorate of Treves, with a biſhop's ſee, 17 miles S.E. of Treves. Long. 6. 59. E. Lat. 49. 35. N.

GRIMSBY, GREAT (*Encycl.*). The market at this place is on *Friday* only.

GRINDELWALD, a town of Switzerland, in the canton of Bern, ſeated among mountains, at the foot of a celebrated Glacier, 25 miles S.E. of Thun. Long. 7. 43. E. Lat. 46. 27 N.

GROHNDE, a town of Lower Saxony, on the Weſer. Near it is a monument of ſtone, erected in memory of a bloody battle fought there in 1421. It is nine miles S. of Hamelin.

GROLL, a town of Dutch Guelderland, in the county of Zutphen. It was often taken and retaken in the wars between the Dutch and Spaniards. The French took it in the year 1672, and demoliſhed the fortifications. It is ſeated on the Slinghe, 15 miles S.E. of Zutphen.

GROSSA, an iſland of Dalmatia, in the gulf of Venice, near the coaſt of the county of Zara. It is 50 miles in circumference, and belongs to the Venetians.

GROSE (Francis), a diſtinguiſhed antiquarian, born about the year 1731, was the ſon of Mr. Francis Groſe of Richmond, jeweller, who filled up the coronation crown of George II. By his father he was left an independent fortune, which he was not of a diſpoſition to add to, or even to preſerve. Having once had a commiſſion in the army, he entered into the Surrey militia, of which he became adjutant and paymaſter; but ſo much had diſſipation taken poſſeſſion of him, that in a ſituation which above all others required attention, he was ſo careleſs as to have for ſome time (as he uſed pleaſantly to tell) only two books of accounts, viz. his right and left hand pockets. In the one he received, and from the other paid; and this too with a want of circumſpection which may be readily ſuppoſed from ſuch a mode of book-keeping. His loſſes on this occaſion rouſed his latent talents. With a good claſſical education he united a fine taſte for drawing; and encouraged by his friends, as well as prompted by his ſituation, he undertook the work from which he derived both profit and reputation; we mean, his Views of Antiquities in England and Wales, which he firſt began to publiſh in numbers in the year 1773, and finiſhed in the year 1776. The next year he added two more volumes to his Engliſh Views, in which he included the iſlands of Guernſey and Jerſey, which were completed in 1787. This work anſwered his moſt ſanguine expectations; and, from the time he began to the end of his life, he continued without intermiſſion to publiſh various works (a liſt of which we ſubjoin), generally to the advantage of his literary reputation, and almoſt always to the benefit of his finances. His wit and good-humour were the abundant ſource of ſatisfaction to himſelf, and entertainment to his friends. He viſited almoſt every part of the kingdom, and was well received wherever he went. In the ſummer of 1789 he ſet out on a tour in Scotland; the reſult of which he began to communicate to the public in 1790 in numbers. Before he had concluded this work, he proceeded to Ireland, intending to furniſh that kingdom with views and deſcriptions of her antiquities, in the ſame manner as he had executed thoſe of Great Britain; but ſoon after his arrival in Dublin, being at the houſe of Mr. Hone there, he died ſuddenly of an apoplectic fit, on the 6th of May, 1791, and was interred in Dublin. His natural tendency was to humour, in which he excelled both by the ſelection of anecdotes and his manner of telling them: it may be ſaid, too, that his figure (extremely uncouth and bulky) rather aſſiſted him, for it was in fact the very title page to a joke. He had neither the pride nor malignity of authorſhip: he felt the independency of his own talents, and was ſatisfied with them, without degrading others. His friendſhips were of the ſame caſt; conſtant and ſincere, overlooking ſome faults, and ſeeking out greater virtues. He had a good heart; and, abating thoſe little indiſcretions natural to moſt men, could do no wrong.

He married at Canterbury, and reſided there ſome years, much beloved and reſpected for his wit and vivacity. He had two ſons, Francis Groſe, a major in the army, who, after ſeveral campaigns in America, was appointed in 1790 deputy governor of the new ſettlement at Botany Bay; and Onſlow Groſe, in the ſervice of the Eaſt-India Company, lately deceaſed. Beſides theſe he had two daughters both living.

His works are as follow: 1. The Antiquities of England and Wales, 8 vols. 4to. and 8vo. 2. The Antiquities of Scotland, 2 vols. 4to. and 8vo. 3. The Antiquities of Ireland, 2 vols. 4to. and 8vo. 4. A Treatiſe on ancient Armour and Weapons, 4to. 1785. 5. A Claſſical Dictionary of the Vulgar Tongue, 8vo. 1785. 6. Military Antiquities; being a Hiſtory of the Engliſh Army from the Conqueſt to the preſent time, 2 vols. 4to. 1788. 7. The Hiſtory of Dover Caſtle, by the Rev. Wm. Danell, 4to 1786. 8. A Provincial Gloſſary, with a Collection of local Proverbs and popular Superſtitions, 8vo. 1788. 9. Rules for drawing Caricatures, 8vo, 1788, 10. Supplement to the Treatiſe on Ancient Armour and Weapons, 4to. 1789. 11. A Guide to Health, Beauty, Honour, and Riches; being a Collection of humourous Advertiſements, pointing out the Means to obtain thoſe Bleſſings; with a ſuitable introductory Preface, 8vo. 12. The Olio; being a Collection of Eſſays in 8vo. 1793.

GROSETTO, a town of Tuſcany, with a caſtle and a biſhop's ſee; ſituate near the ſea, 30 miles S.W. of Sienna. Long. 11. 1. E. Lat. 42. 40. N.

GROYNE, a river of Spain, in Gallicia, which enters the bay of Biſcay, at Corunna.

GRUCKFELDT, a town of Carinthia, with a caſtle, on the river Save. Long. 15. 45. E. Lat. 46. 7. N.

GRUNBERG, a town of Germany in the principality of Upper Heſſe, where the kings of the Merovingian race and Charlemagne held their court. It is 10 miles E. of Gieſen, and 28 W. of Fulda.

GRUNBERG, a town of Sileſia, in the principality of Glogau, ſurrounded with vineyards. Here is a manufacture of cloth. It is 12 miles N. of Freyſtadt, and 24 N.W. of Glogau.

GRUNDE, a town of Germany, in the duchy of Brunſwick, and in the mountains of Hartz. Long. 13. 35. E. Lat. 52. 10. N.

GRUNHAYN, a town of Upper Saxony, in the circle of Ergzeburg, 46 miles W.S.W. of Dreſden. Long. 12. 46. E. Lat. 50. 32. N.

GRUNINGEN, a town of Lower Saxony, in the principality of Halberſtadt, on the river Felke. Long. 11. 41. E. Lat. 52. 4. N.

GRUNSTADT, a town of Germany, in the circle of Upper Rhine, and county of Leiningen, 22 miles N.N.W. of Spire, and 28 S. of Mentz. Long. 7. 58. E. Lat. 49. 32. N.

GUACOCKINGO, a town of New Spain, 30 miles S.E. of Mexico. Long. 99. 45. W. Lat. 19. 36. N.

GUADARAMA, a town of Spain, in Old Caſtile, remarkable for its great trade in cheeſe. It is ſeated on the Guadarama, 25 miles N.W. of Madrid. Long. 3. 48. W. Lat. 41. 45. N.

GUADRAMIRO, a town of Spain, in Leon, 33 miles W.S.W. of Salamanca.

GUARDAMAR, a ſea-port of Spain, in Valentia, at the mouth of the Segura. The chief trade conſiſts in the exportation of ſalt. It is 17 miles S.S.W. of Alicant. Long. 0. 18. W. Lat. 38. 7. N.

GUARMA, a ſea-port of Peru, 120 miles N.W. of Lima. Long. 77. 49. W. Lat. 10. 10. S.

GUASTO, or VASTO, a town of Naples, in Abruzzo Citeriore, on the Gulf of Venice, 15 miles S.E. of Lanciano, Long. 15. 6. E. Lat. 42. 15. N.

GUAYAQUIL, a ſea-port of Peru, in the audience of Quito, and the capital of a juriſdiction of the ſame name. It is defended by three ſtrong forts, and ſituate on the river Guayaquil, at its entrance into the gulf of Guayaquil, 140 miles N.N.E. of Paita, and 150 S.S.W. of Quito. Long. 78. 36. W. Lat. 2. 12. S.

GUERCHE, a town of France, in the department of Iſle and Vilaine, 20 miles E.S.E. of Rennes. Long. 1. 20. W. Lat. 47. 57. N.

GUERGELA, a town of Barbary, in Biledulgerid, 80 miles S. of Mount Atlas. Long. 4. 50. E. Lat. 31. 45. N.

GUERNSEY *(Encycl.)*. Of this iſland, Dr. Campbell gives the following account: "It lies 20 leagues ſouth-weſt from Weymouth in Dorſetſhire, between eight and nine leagues weſt from the coaſt of Normandy, 13 ſouth of Bre-

tagne, ſeven north-weſt from Jerſey, five ſouth-weſt of Alderney, and two weſt from Sarke. In length from north-eaſt to ſouth-weſt, about twelve miles; in breadth, from ſouth to north, about nine; in circumference, upwards of 30; containing 30 ſquare miles, or 32,000 acres. The climate is mild and temperate; not ſubject to exceſſive heats, much leſs to ſevere cold; ſomewhat windy; but, taking all things together, equally healthy and pleaſant. The ſoil is, generally ſpeaking, rich and fertile; the country, though ſufficiently encloſed with ſtone fences, yet more open than in Jerſey, and as capable of cultivation of every kind. On the north ſide, the coaſt is commonly low and flat, riſing gradually, ſo that on the ſouth ſide the cliffs are of a prodigious height. The face of the country is variegated with hills and little eminences, and tolerably well watered with ſprings and ſharp gravelly ſtreams. There was formerly a fine lake, about half a league in extent, now filled up, and turned into a meadow; but many gentlemen have ſtill very beautiful and convenient fiſh-ponds.

"There are very few countries in the world more capable of improvement. Moſt of the riſing grounds afford a ſhort thick graſs, equally beautiful to the eye, and ſucculent as paſture. Roots and herbs it produces of all kinds, eſculent, medicinal, and aromatic; with a profuſion of flowers that grow wild, and are exquiſitely fragrant. All ſort of ſhrubs and fruit-trees flouriſh here: and there is ſome, though but little, timber; not through any defect of ſoil or climate, but becauſe they cannot conveniently afford it room. Grain they have of every ſpecies we cultivate in Britain, but more eſpecially wheat; and though they have not either lime, chalk, or marle, yet the ſea-wreck anſwers all the intention of manure, ſo well as to keep their ground in conſtant heart. They have large quantities of ſheep, but ſmall in ſize; and had formerly a very ſingular breed, of which the ewes had four horns, and the rams ſix; but theſe are now become very ſcarce. Their black cattle are in ſuch abundance, as not only to ſupport their own uſes, but to furniſh alſo a conſiderable exportation; and their horſes, though but little, are equally ſtrong and hardy. The ſea alſo furniſhes a prodigious variety as well as plenty of fiſh, more eſpecially red and grey mullet, excellent mackarel, and above all, conger-eels. To theſe advantages we may add, the ſingular privilege of being free from all venomous creatures.

"There are in this iſland ten pariſhes, each of which is divided into ſeveral vintons, for the more eaſy management of affairs, civil, eccleſiaſtical, and military, and the choice of their reſpective officers and magiſtrates. Though the country is very fully peopled, yet the houſes are ſcattered up and down, according to the humour or the conveniency of the inhabitants: ſo that there is, properly ſpeaking, but one town in the iſland, which is likewiſe the only haven of any reſort; though there are ſome creeks on the north and weſt ſides of the iſland, ſuch as Bazon, L'Aucreſſe, Ferminer, St. Sampſon, and the Weſt Paſſage. All theſe ports are in a ſtate of nature; but might be certainly improved and fortified, which would be productive of many advantages to the iſland; as was long ago obſerved and propoſed to government by Captain Yarranton. In the reign of King Charles II. when the French formed an inſidious deſign of making themſelves maſters of this iſle by treachery, it left ſuch an impreſſion on his majeſty's mind, that ſome years after he ſent over the Lord Dartmouth, accompanied by certain engineers, who diſcovered on the north-weſt ſide of the iſle, a deep bay, which, by the help of a mole, might cover a numerous ſquadron, even of ſhips of the line, under the protection of what was alſo intended to be built, a ſtrong caſtle: but his exchequer being exhauſted, this neceſſary work was never carried into execution. As this port would look full into the channel, it deſerves conſideration, how far it might be uſeful to us in the time of a French war, and of what infinite detriment it might prove if this iſland ſhould ever fall into the hands of our enemies.

"The inhabitants are very induſtrious in their reſpective employments; naturally ſober, frugal in their manner of living, honeſt in their dealings, ſincere in their religion, which is that of the church of England, and loyal to their princes, as well as ſteady to the Britiſh intereſt. They are, however, reſerved to a degree that makes them ſometimes thought moroſe; they are ſomewhat ſuſpicious; and, which is their greateſt error, they are, or at leaſt were, very litigious. They are good huſbandmen in their own way, and manage the ſea-wreck (which firſt ſerves the poor people for fuel, and then its aſhes are employed by thoſe in better circumſtances for manure) with great ſkill, and under very prudent regulations. The wreck is cut in ſummer, and about the vernal equinox, by the proclamation of the magiſtrates, and when dried, diſtributed by their order. As for the winter-wreck, which after ſtorms is thrown in large quantities on the coaſt; this is alſo equitably divided, and being ſtrewed wet, and ſo ploughed into the ground, renders it continually fertile. They have a ſtronger turn, however, to grazing, than to agriculture; and though they bring in annually ſome corn, yet in the ſame ſpace they ſend out a few hundred cattle. They are ſtill more inclined to orchards, which enables them to make many thouſand hogſheads of cyder every year; of which, it being the common drink of the people, they export but little. The woollen is their principal manufacture, for the carrying on of which they are allowed to import 2000 tons from England, which they work up chiefly in ſtockings, waiſtcoats, and breeches. They might certainly make their fiſhery turn to profit, more eſpecially as of late years they have ſet up ſalt works; and yet, except lobſters, I never heard that any of their fiſh went to a foreign market. Our French and Portugal merchants have large ſtocks of wine here, which they import as they have occaſion. As they are enabled, by this method, to keep it to a proper age before they are obliged to pay the duty, it ſeems to be a benefit to the mother country, by putting it in their power both to buy and ſell cheaper: as on the other hand, from the rent of warehouſes, the ſubſiſting factors and their ſervants, the reſort of ſhips employed in this trade, it muſt be very advantageous to the inhabitants of this iſland. It is a point of juſtice to obſerve, that this manner of depoſiting wines, has nothing at all to do with ſmuggling; a practice equally injurious to the intereſts of this country and to the people of Guernſey, as it breeds few ſeamen, is carried on in very ſmall veſſels, and upon the whole is not only an infamous, but a very unprofitable kind of traffic. Heretofore, merchants of this iſle traded to moſt parts of Europe, and had ſeveral ſtout ſhips of their own; and if this vile practice was aboliſhed, as it might eaſily be, without any violation of the liberties of the people, they would ſoon find their account in it, by the revival of many lucrative branches of commerce. As they take away from England ſome of the neceſſaries, and almoſt all the conveniences, of life, ſuch as corn, malt-liquor, ſugars, ſpices, coals, houſehold-furniture, many ſpecies of the iron and leather manufactures, grocery, haberdaſhery, and hard-wares, the balance is greatly in our favour; and muſt continually increaſe, in proportion as they augment in number, and grow eaſier in circumſtances. At preſent, upon a very moderate computation, there are in Guernſey upwards of 15,000 ſouls.

"The ſeveral iſlets and vaſt chains of rocks that ſurround this country on every ſide, and cauſe ſuch a variety of tides and currents, add much to the ſecurity of the place, by reu-

dering it equally difficult and dangerous for ſhips to approach it, unleſs they have pilots aboard extremely well acquainted with the coaſt. On the ſouth ſide, the cliffs are prodigiouſly high; ſo that the old writers ſay, it looks like a park in the ſea, impaled with rocks. On the weſt ſide lie the Hanoys, or, as the French write them, *Hanovaux*, which cover that coaſt ſo effectually, that a deſcent there is little to be feared. At the north-weſt extremity lies a little iſland called *the Howe*; which would be a very convenient place for a ſalt-work, glaſs-houſe, or manufactory of ſoap. At the north-eaſt extremity we meet with St. Michael in the Vale, a peninſula ſome miles in extent, connected with Guernſey by a very narrow iſthmus, with bays that might be rendered uſeful on both ſides. This peninſula is likewiſe guarded by rocks and iſlets, the moſt conſiderable of which are the Bryants, the Hummet, and the Hays. South-eaſt from the vale, lies the iſland of Harnet, or Arne, about a league in compaſs, formerly deſert, but now cultivated. At a league ſouth from thence lies Briehoe, of leſs extent; and between both, the little iſland of Gythau, or Jethau, which ſerves the governor for a kind of park, or rather paddock.

GUETA, a town of Spain, in New Caſtile, 60 miles E. of Madrid. Long. 1. 56. W. Lat. 40. 22. N.

GUGLINGEN, a town of Suabia, in the duchy of Wirtemberg, ſituate on the Zaber, 18 miles N. of Stutgard, and 22 S.S.E. of Heidelberg. Long. 8. 56. E. Lat. 49. 2. N.

GUILLAIN, St. a town of Auſtrian Hainault, ſeated in marſhy land, on the river Haiſne, ſix miles W. of Mons. Long. 3. 53. E. Lat. 50. 27. N.

GUILLESTREE, a town and caſtle in the Alps, once belonging to Dauphiny, in France, It was taken by Prince Eugene in 1692, and is nine miles N.E. of Embrun. Long. 6. 36. E. Lat. 44. 41. N.

GUIMALAENS, an ancient town of Portugal, in the province of Entre-Douero-e-Minho. It has formerly been the reſidence of their kings, and is divided into the Old and New. The public buildings are magnificent, and the collegiate church is ſaid to be founded on the ruins of a temple of Ceres. It is 10 miles S.E. of Braga. Long. 8. 21. W. Lat. 41. 35. N.

GUM (*Encycl.*). The following account of a diſcovery made by Citizen Leroux, of a gummy ſubſtance contained in the bulbous root of the *Hyacinthus non ſcriptus*, is given by Citizen Deyeux, in the Annales de Chimie.

"It had long ſince been obſerved," ſays Citizen Leroux, "that the bulbous roots of ſome plants contained a mucilaginous ſubſtance; but no one had yet attempted to extract it, and ſtill leſs to analize it. A particular circumſtance having given me occaſion to employ the bulbs of the *Hyacinthus non ſcriptus*, I was ſo much ſurpriſed at the great degree of viſcoſity which I found them to poſſeſs, that I did not ſuffer the favourable opportunity to eſcape me, which preſented itſelf, for ſubjecting theſe roots to various experiments. It would be ſuperfluous here to give an account of all the different trials which I have made: it will be ſufficient for the preſent to inform you, that, having reduced 50 kilogrammes of the above-mentioned bulbs into a paſte, by pounding them in a mortar, I diluted this paſte with a ſufficient quantity of water: the liquor, having been ſtrained through a fine piece of linen, was afterwards evaporated to the conſiſtence of a thick ſyrup. In this ſtate it was poured into moulds of tinned iron, which were immediately placed in a ſtove.

The deſiccation took place pretty rapidly; and when it was completed I found, at the bottom of each mould, a brittle tranſparent ſubſtance, which exhibited all the external characters of a real gum.

The 50 kilogrammes of the bulbs, which I employed, yielded me 8 kilogrammes of this gummy product. On comparing this product with various kinds of gums, it poſſeſſes the ſame properties; for, 1. treated with nitric acid, it yielded a twelfth of its weight of oxalic acid.

2. Diſſolved in water, it rendered this fluid very (tinctucent).

3. This ſolution, left to itſelf in a rather warm temperature, ſoon grew ſour and mouldy

4. Mixed with alcohol, it became turbid, and depoſited a white flaky matter.

5. By diſtilling the dried gummy matter in a retort, the following products were obtained: phlegm, a very ſmall quantity of oil, and the pyro-mucous acid. All theſe fluids had the ſmell of burnt bread, &c.

It is probable that this matter, as it exiſts in this root, is perfectly colourleſs; on cutting ſeveral pretty large bulbs tranſverſely, the fluid, which flowed out ſpontaneouſly, dried upon the ſurface that had been laid bare, and formed a very tranſparent, and entirely colourleſs, pellicle.

The quantity of gum that may be extracted from theſe roots is ſufficiently conſiderable to render its extraction an object worthy of attention. On calculating the expence with which it would be attended, it already appears, that if the extraction were carried on upon a large ſcale, it would not only repay the coſts, but one might alſo hope to obtain ſome profit from it.

Citizen Leroux, after having proſecuted theſe experiments, imagined that he had ſucceeded, by a very ſimple proceſs, in converting the above-mentioned gum into a ſubſtance analogous to the amylaceous matter.

A patent was obtained in June, 1788, by Mr. Francis Blaikie, of Glaſgow, merchant, for the invention (diſcovered to him) of a ſubſtitute for gum, in thickening colours for printing, which fully anſwers the purpoſe, and at a more reaſonable rate.—This article is prepared by boiling flax-ſeed in water, till the whole ſubſtance is completely extracted; the liquor is next to be ſtrained through a linen or woollen cloth, and boiled down to the conſiſtence of a jelly. It is then to be put into a cloſe veſſel, and a ſmall quantity of ſpirits, or ſweet oil, poured on the top, in order to preſerve it in a freſh ſtate. In uſing this ſubſtitute, the printer is directed to put a certain portion into a gallon of *colour*, according to the nature of the latter, and the particular kind of work; while he ſhould regulate himſelf by trial, in the ſame manner as is practiſed in employing common gum.

GUM (*Gumma*), in medicine, is a tumour ariſing out of the ſubſtance of a bone; it is ſo ſoft as to yield to the finger. When theſe tumours are harder they are called *tophs*; when harder ſtill, they receive the name of *nodes*: but the hardeſt tumours in bones are *exoſtoſes*. In venereal patients ſuch tumours often happen on the head, and even in the middle of the moſt ſolid bones. They ſeem to be produced when the veſſels running between the bony laminæ, being either obſtructed or inflamed, are dilated, and ſo raiſe the incumbent laminæ. Perhaps the bone degenerates too into a morbid ſoftneſs. A ſoftneſs of the bones ſometimes ſucceeds abſceſſes of the adjacent parts; and ſometimes the origin of the diſorder is lodged in the ſubſtance of the bone, eſpecially in the lues venerea; gummata have, however, been diſcovered, when no ſuch adequate cauſe could be obſerved. See SURGERY.

GUN (*Encycl.*) The following is the ſpecification of a patent granted to Mr. Proſſer, of Charing Croſs, ſword-cutler, for a water-proof pan and hammer for gun and piſtol locks, and alſo a breech for gun and piſtol barrels, for the purpoſe of a quicker and more forcible exploſion of gunpowder. It

is dated Dec. 9, 1800, and the proprietor thus deſcribes and aſcertains the nature of his invention, and in what manner it is to be performed. A, in plate 32, is the hammer, perforated with a large hole, a little conical, to receive the cylinder B, round which A moves forward and backward. The end, No. 1, of the hammer A, in the inner ſide, has a circular groove, to receive the ward No. 2, which is on the ſcrewed end of the cylinder B. This ward is for the purpoſe of preventing the admiſſion of any water (which may fall between the hammer and the barrel of the gun or piſtol) into the joint. The heel, No. 2, when the cock ſtrikes the hammer A, falls upon the hammer ſpring, and prevents the hammer A going further round on the cylinder B than is neceſſary to expoſe the pan on the cylinder B. At the bottom of the face of the hammer A is a hole, made exactly the ſhape and ſize of the pan in the cylinder B; which hole, when the hammer A is turned round to its extent, admits the fire to fall into the pan on the cylinder B. Inſide of the end, No. 3, of the hammer A, is a female ſcrew, to receive the male ſcrew C into it, which, when ſcrewed into the end No. 3 of A, completely encloſes the end of the cylinder B, ſo as to prevent the admiſſion of water. B, is the cylinder, round which the hammer A acts, and which cylinder may be made of iron, ſteel, or metal, and is made a little conical. In this cylinder the pan and touch-hole are made; at the end of which is a male ſcrew, No. 1, of a ſmaller diameter than the cylinder. This ſcrewed end, No. 1, paſſes through the whole of the end No. 1 of the hammer A, and ſcrews into the female ſcrew of the hole No. 1 of the breech D. This ſcrew goes quite into the chamber of the breech D, and a large conical hole is made in it, quite up to the touch-hole in the pan. This hole is made ſo large as to admit with eaſe the powder that falls into the chamber into it, and brings the bottom of the charge of powder quite cloſe to the prime in the pan. The ſhoulder or ward No. 2, on the end of the cylinder B, when the cylinder B is in the hammer A, works in the circular groove, which is in the inner ſide of the end No. 1 of the hammer A, for the purpoſe before deſcribed. One ſide of the cylinder B is filed away to the ſame ſhape as the hole in the face of the hammer A, ſo as to give no impediment to the falling water of the face of the hammer A, when it is turned round over the pan. The hammer A is prevented falling too near the cock by having a knob of iron on the falſe breech of the barrel. The toe, No. 4, of the hammer A, works upon the uſual kind of hammer ſprings, and might be uſed either with a roller or ſwivel ſpring. The breech D is made of two parts, and are ſcrewed into each other, there being a male and female ſcrew, each half being concaved into nearly equal parts, ſo as to form an oval chamber; at the bottom of which the touch-hole is placed, and at the top the chamber is contracted, ſo as to prevent the ramrod entering into the chamber; by which means the powder is left all looſe, and free from preſſure, and conſequently will more forcibly, and with greater quickneſs, explode on the ſide of the breech D. A ſmall ſcrew, No. 2, is made to ſcrew into the ſcrewed end of the cylinder B, to prevent its turning round with the hammer A when it is operating. The above water-proof hammer and pan can be applied to any gun or piſtol already made, either ſeparate from, or in conjunction with, the breech D. The ſection E is a true repreſentation of the form of the chamber in the breech D, when both parts are ſcrewed together; and of the cylinder B, when ſcrewed into the hole No. 1 of breech D."

GUNDELSINGEN, a town of Bavaria, in the duchy of Neuberg, ſituate on the Brenz, near the Danube, 19 miles N.E. of Ulm. Long. 10. 12. E. Lat. 48. 34. N.

GUNPOWDER *(Encycl.)* Some writers having lately attributed the invention of gunpowder to the Indians, and aſſerted that they employed it in their wars againſt Alexander, the writer of the following remarks was induced to examine the ſubject with ſome attention: he found the beſt account of gunpowder, as known to the Aſiatics in early ages, given by the learned *Caſiri*, in his *Biblioth. Hiſpan.-Arabica*, or Catalogue of the Oriental Manuſcripts depoſited in the Library of the *Eſcurial* in Spain (vol. II. p. 6.) He there digreſſes into a curious little eſſay entitled, "*De Tormentorum bellicorum et nitrati pulveris apud Arabas antiquitate et uſu:*" from which we have extracted and tranſlated the following paſſages:

It is ſufficiently known to thoſe who have made ancient tactics the ſubject of their ſtudy, that the Greeks and Romans uſed miſſile fires, ſuch as torches or flambeaux, burning arrows, and other inſtruments of fiery deſtruction, which they either caſt by means of certain engines and machines, or flung with the hand into the places beſieged.

Vegetius, in his book *De re militari*, and *Leo*, in his *Tactica*, treat very fully of theſe matters. The former, among his precepts to thoſe who ſtudy the art of war, has the following paſſage: "If there ſhould be houſes in the fortreſs, or place beſieged, of ſuch materials as may be eaſily kindled, you may burn them by means of fiery arrows directed various ways, eſpecially if the wind blow violently. You may alſo uſe ſquared ſtones full of fire and *manganica alacotia*, which project ſtones," &c. But among the Greeks and Romans we do not find any mention of *pulvis nitratus*, or gunpowder; and the time of its invention is not exactly aſcertained by the antiquaries. *Charles Du Freſne*, in his *Gloſſar. Med. et inf. Latinit.* (in the word *Bombarda*), informs us, that "the inventor of gunpowder is ſaid to have been a certain chemiſt, a monk, named Berthold *Schwartz*, or *Black;* and, according to the calculation of Bartholomew du Drach, it was uſed in France ſince the year 1338. But the invention has been aſcribed to many others more modern than Schwartz.

The records, however, of the Arabians, trace the uſe of gunpowder to ages of far greater antiquity, among the Perſians and the Africans. Whence it is very probable that the knowledge and uſe of it paſſed from the Arabians to the Spaniards, and from the Spaniards to the French, who, in proceſs of time, improved on the original invention by reducing the crude powder to grains, and blending the various ingredients according to certain rules of compoſition. That this was the caſe, appears from ſeveral Arabic manuſcripts depoſited in the Eſcurial library, and particularly from one (No. MDCXXXIV), of which the author (who flouriſhed in the year 1249) thus deſcribes the various inſtruments of deſtruction by fire uſed in his time among the Arabians: "Scorpions (ſays he), twiſted round and blazing with *nitrous powder*, creep along, hiſſing as they go, and at length exploding, they ſend forth flames like lightning, and burn: then you may behold a *manganum* diſcharged, ſtretching like a cloud through the air, making a noiſe like thunder, and vomiting out fire on all ſides, overthrowing, burning, and reducing all things to aſhes."

From this paſſage it would appear, that our author alluded to the globes or bombs of iron, burſt by means of artificial fire; for he uſes the words *naphta* and *barud*, of which, in thoſe times, gunpowder was compoſed. By the word *barud*, the Perſians, Turks, and Arabians, formerly underſtood *nitre*. At preſent they uſe it to expreſs *nitrous powder*, or gunpowder. *Naphta* ſignifies a kind of bitumen mixt with ſulphur. A noble writer of Granada, *Abu Abdallah Ebn Alkatib*, in his *Hiſtory of Spain* (about the year of Chriſt 1312 and 1323), ſpeaking of the globes or balls exploded by means of naphta over the heads of enemies, has the following paſſage: "Abalvalid Iſmael ben Naſſer, at that time king of Granada,

moving his camp, laid ſiege to the town of *Beza*, where he exploded at the fortified tower, by means of fire, an immenſe machine furniſhed with *naphta* and a globe or ball, making a loud noiſe."

That the uſe of ſuch inſtruments of war obtained among the Arabs, may be gathered from the *Chronicle of Alfonſo XI.* cap. 223, wherein we read, that whilſt Algezira was beſieged (in 1380), the Moors diſcharged many *peals of thunder* upon the army, caſting iron balls equal in ſize to very large apples, ſome of which went ſo far as to paſs the ſtation of the troops, &c. In the ſame work (cap. 227) the matter is more clearly expreſſed: "In the year 1382, five veſſels entered the port, laden with corn, honey, butter, and the powder with which *thunder was darted forth*," &c.

Of the former tranſaction Peter Mexia takes notice in his *Sylva Variæ Lectionis*, lib. 1, cap. 8; but he is ſilent on the other: proving, however, the great antiquity of thoſe machines (in the edition of his work publiſhed in 1570), he mentions a ſea fight between the Tuniſians and Spaniards, in which the ſhips of the Mahometans were furniſhed with iron ordnance, or *bombardas*, diſcharged by means of fire, with great effect upon the enemy. From this circumſtance the author infers, that the inſtruments of deſtruction which we now denominate *artillery*, muſt have exiſted among the Mahometans above four hundred years ago, but leſs perfect than at preſent (1570).

There is alſo a paſſage of *Elmakine* (tranſlated from Arabic into Latin, by Erpenius), which ſhews that the uſe of gunpowder was known to the very ancient Arabs; for he tells us, that in the year of the Hegira 71 (of Chriſt, 690), Hejaje beſieged Mecca, and deſtroyed, by means of fire, the holy Caaba, uſing *manganas* and mortars, with fire and *naphta*.

To theſe may be added the teſtimonies of European writers (apud Fabric. Biblioth. Antiq. p. 636). *Hyde*, in his Hiſt. Shahiludii, p. 175, informs us, that the Indians had for many centuries the uſe of gunpowder, and of machines for ſending forth fire; and that the Chineſe learned the knowledge of them from the Indians; and it appears in his *Var. Obſervat.* p. 89, that the Saracens learned it from the Chineſe; and Joinville, an eye-witneſs, acknowledges that the Saracens uſed inſtruments of fiery deſtruction againſt St. Louis, king of France.

GUNTOOR, one of the Northern Circars, in the peninſula of Hindooſtan. It is alſo called Mortinazagur and Condavir, and occupies the ſpace between Condapilla, the ſouthernmoſt of the four Engliſh Circars, and the N. part of the Carnatie; extending more than 30 miles along the bay of Bengal. The maritime parts of this circar are flat and open, but the interior parts contain ſome very ſtrong fortreſſes and poſts. It is ſubject to the Nizam of the Deccan.

GUNTZBERG, a town of Suabia, in the Margravate of Burgaw, with a caſtle, ſeated on the Danube, 16 miles N.E. of Ulm. Long. 10. 25. E. Lat. 48. 35. N.

GUNTZENHAUSEN, a town of Franconia, 5 miles from Weiſſemburg. It is ſeated on the Altmul, near a foreſt, and ſubject to the King of Pruſſia.

GURIEF, a town of Ruſſia, in the government of Aſtracan, ſeated near the Caſpian Sea, between the mouths of the Ural, 210 miles E. by N. of Aſtracan. Long. 52. 50. E. Lat. 46. 32. N.

GURRAH, a town of Hindooſtan Proper, ſituate near the river Nerbuddah, 168 miles S.S.W. of Allahabad, and 208 S.W. of Benares. Long. 80. 23. E. Lat. 23. 9. N.

GURRAMCONDA, a town of the peninſula of Hindooſtan, in the kingdom of Myſore, 73 miles N.E. of Bangalore, and 112 N.N.W. of Madras. Long. 78. 36. E. Lat. 13. 47. N.

GUSTROW, a city of Germany, in the duchy of Mecklenburg-Schwerin, and capital of the circle of Wenden. The chief courts of judicature for the duchy are held here; and it has an elegant palace, in which the dukes ſometimes reſide. It is 35 miles E. by N. of Schwerin. Long. 12. 13. E. Lat. 53. 57. N.

GUTTA, a town of Hungary, ſeated on the E. ſide of the Danube, oppoſite the iſland of Schut, 25 miles E. by S. of Preſburg. Long. 17. 47. E. Lat. 48. 10. N.

GUTSKOW, a town of Swediſh Pomerania, capital of a county of the ſame name. It is ſeated on the Peene, 14 miles W. of Wolgaſt. Long. 13. 39. E. Lat. 54. 0. N.

GUZERAT, a peninſula of Hindooſtan Proper, 200 miles long and 140 broad, formed by the Arabian Sea and the gulfs of Cambay and Cutch. The weſt part is mountainous and woody, inhabited by a wild hardy race, and governed by rajahs of their own; but the largeſt and fineſt part is included within the extenſive empire of the Mahrattas. Amedabad is the capital.

GWALIOR, an ancient fortreſs of Hindooſtan Proper, in the province of Gohud. It ſtands on a vaſt rock, about four miles in length, but narrow and of unequal breadth, and nearly flat on the top. The ſides are ſo ſteep as to appear almoſt perpendicular in every part; for where it was not naturally ſo, it has been ſcraped away; and the height from the plain below, is from 200 to 300 feet. The rampart conforms to the edge of the precipice all around; and the only entrance is by ſteps running up the ſide of the rock, defended on the ſide next the country by a wall and baſtions. The area within is full of noble buildings, reſervoirs of water, wells, and cultivated land; ſo that it is a little diſtrict within itſelf. At the N.W. foot of the mountain is the town, pretty large, and well built, the houſes all of ſtone. This place is conſidered as the Gibraltar of the Eaſt; but, in 1780, Major Popham took it by an unexpected nocturnal eſcalade. It is 80 miles S. of Agra. Long. 78. 30. E. Lat. 26. 9. N.

GYFHORN, a town of Lower Saxony, in the duchy of Lunenburg, ſeated on the rivers Aller and Iſer, 25 miles N. of Brunſwick. Long. 10. 49. E. Lat. 52. 49. N.

H.

HABITATION, a general name given to any dwelling or place of reſidence calculated for ſhelter and domeſtic accommodation. The term, however, is moſt commonly applied to dwellings of an inferior order: ſuch as the low houſes and cottages in which the poor reſide. The following obſervations on the ſituation of cottages, with a plan for enabling cottagers to build them, is extracted from "An Addreſs to the Landed Intereſt," by William Morton Pitt, Eſq. M.P. publiſhed in 1797.

"There are few pariſhes," ſays the author, "without ſeveral rough, encumbered, and uncultivated tracts of land, which might be converted into large gardens, and on which cottages might be erected, either by ſome of the poor themſelves, to be held on lives, or at the expence of the pariſh, or of the proprietors of eſtates. Where there is no land uncultivated, other grounds, which can be moſt conveniently ſpared, ſhould be allotted to them. Many young men, having ſaved a little money, would be very deſirous of taking ſuch ſpots of ground on leaſes for three lives, and of building cottages thereon. I have frequently remarked that the labourers who poſſeſs this kind of property, are the moſt induſtrious, ſober, and frugal, that they ſeldom apply to their pariſhes for relief, and that their houſes have an appearance of neatneſs and comfort, not often met with elſewhere. If theſe were more attainable by the poor, frugality would revive amongſt them, and young people would ſtrive to lay up a ſum of money for this purpoſe. Every labourer poſſeſſing ſuch property of his own, would conſider himſelf as having a permanent intereſt and ſtake in the country. The hope of improving their lot is the main ſpring of induſtry in all other ſtations in life. Would it not then be policy as well as humanity, to afford to the agricultural poor the ſame opportunity? The wealth and greatneſs of this country has been attributed, not only to the ſpirit of enterpriſe of our merchants and manufacturers, but to the effect which the poſſeſſion and the ſecurity of property, enjoyed under our free and excellent conſtitution, have on the minds of men. If this effect has been ſo ſalutary among other claſſes, why may not ſimilar encouragement create the ſame energy among the cultivators of the land, and why ſhould thoſe alone remain in a diſpirited, and diſtreſſed ſtate?

"To attach this numerous, hardy, and leſs corrupted body of men more and more to their country, nothing would ſo much contribute, as allowing them the means of improving by induſtry their own ſituation in life, or that of their children. A man who owns a houſe, with a large garden annexed to it, on a leaſe for lives, for which he only pays a moderate quit-rent, is richer by far than he who receives much higher wages, but who has to pay a conſiderable rent for a cottage, with little or no garden ground, and who is obliged to purchaſe all he conſumes. The produce of a garden diminiſhes the conſumption of bread, which is the moſt conſiderable article of a poor man's expenditure: it is an advantage wholly created by the cultivator's induſtry, at times when not otherwiſe engaged, and by that of his wife and children; and is therefore ſo much labour, or in other words riches, gained to the community: and the employment gives health and vigour to his children, inures them to fatigue, and trains them to induſtry. The value to him who receives the ground is immenſe, yet it is no loſs to him who grants it. It procures the poor man comfort and plenty; and, by ſo doing, keeps within moderate bounds the wages of labour. Every man, who is averſe to raiſing the wages of labour in huſbandry, ſhould at leaſt encourage the culture of gardens.

"As the land, on which ſuch cottages would be built, will uſually be of an inferior value, it will be enough to eſtimate it, at an average, at 10s. an acre; where the land is better, a higher rent may be added without injuſtice; for, the better the land, the greater will be the advantage to the leſſee from its produce as a garden. The quantity of land to be attached to ſuch a cottage ſhould be half an acre; if it be more than ſufficient to produce the vegetables wanted for a family, a part of it may be ſown with a little wheat for bread, peaſe to fatten the pigs, and barley for malt, to enable them to brew a little ſmall-beer; the want of which induces many to frequent the alehouſe, and proves the ſource of vicious courſes.

"The corn in theſe gardens ſhould be raiſed by dibbling, which is already very much practiſed in many parts of the kingdom. The cultivation of the garden will be chiefly conducted by the wife and younger children of the family (who will thus very ſoon contribute largely to their own ſupport, if not wholly maintain themſelves, ſo that a numerous offſpring will ceaſe to be a great burthen), to which muſt be added a certain proportion of aſſiſtance from the father, at his extra hours. Where 10s. an acre is the value of the land, 5s. per annum muſt of courſe be added, for the half acre of ground, to the quit-rent for the houſe. Let that be 5s. and the whole annual payment will be 10s.; and, when it is conſidered that the proprietor of the eſtate has been at no expence whatſoever in building or repairing the cottage, and that he receives annually the quit-rent for the houſe, in addition to the full rent of the land on which it is built, I think the fine, to be required in putting in a life, ſhould not exceed one year's purchaſe, computed on the real value. The cottager then, who builds a houſe upon this principle, acquires the following advantages; permanency of property, that all improvements are for the benefit of himſelf and his family, reſpectability of ſituation, a diminution of annual expenditure, and that he cannot be removed under any circumſtances.

"This arrangement will anſwer in all caſes, where a labourer has a ſufficiency of money to enable him to build a cottage; but that cannot be the lot of all. Yet a plan may be deviſed, by means of which, a man, having but a ſmall proportion of the ſum requiſite for ſuch an undertaking, may be enabled to adopt it. The owner of the land may, without riſk, advance to any labourer in want of ſuch aſſiſtance, 10l. or even 15l. towards carrying on his work, not to be paid to him in money, but laid out for his uſe as wanted, in the purchaſe of materials, or in wages to the workmen whom he is obliged to call in to aſſiſt him in the conſtruction of his houſe. The cottage itſelf would be a ſufficient ſecurity for the loan; ſince the money will only be iſſued, in proportion, as the work advances. The cottager ſhould pay intereſt, at 5 per cent. and part of the principal, at leaſt 10 per cent. every year. If he fail in making theſe payments, his effects ſhould be liable: or, if the demand be not otherwiſe ſatisfied in a reaſonable time, the houſe itſelf. The ſooner he diſcharges his debt, the better it will be for him; and he will look forward with

impatience to the time of its liquidation, that he may enjoy the effects of his induſtry and ſo comfortable a ſituation. In 10 years, however, at all events, he will be clear from incumbrances, and in the mean while he will have to pay each year not more, and in many parts of England not ſo much as he would have given as annual rent for an ordinary cottage. The landlord would alſo be benefited, by being relieved from the expence of repairs, and by the reduction of poor's rate; he would receive his quit-rent annually, and a fine from time to time, in addition to the full rent of his land, as well as 5 per cent. intereſt on the money lent, the whole debt being diſcharged in 10 years at furtheſt."

To theſe judicious remarks we ſhall annex ſome obſervations on the larger ſort of cottages, and the mode of erecting them, extracted from "Hints to Gentlemen of Landed Property," by Nathaniel Kent, Eſq. publiſhed in 1775.

"The *larger ſort of cottage*," ſays Mr. Kent, "which may ſometimes be preferred, will coſt, when built of brick and tiles, 70l. Theſe might be appropriated to the uſe of labourers of the moſt induſtrious diſpoſition. And, as it would have an excellent effect to make ſome gradation among cottages, as well as farms, it would be highly proper, and uſeful, to lay (beſides half an acre of garden-ground) a ſmall portion of paſture-land, about 3 acres, to each of theſe larger cottages, to enable the occupiers of them to ſupport a cow; which would be a real comfort to their families, as milk is the natural food of children. If we value theſe three acres and a half of land at a guinea an acre upon an average, and add it to the rent of the houſe, it will bring the rent to 6l. 9s. 6d. The value of the cow, if her produce were even ſent to market, would at leaſt amount to 4l.; but being uſed in the family, would, with the aſſiſtance of the garden, enable them to keep a ſow, or two ſtore pigs, which would at leaſt double the market price. As one acre or more of this ground might be mowed every year for hay, the cow might be kept in good order with this quantity; and it would be better worth a cottager's while, to give this rent for this lot of land, than to truſt to the precarious advantage of a common, which always ſtarves his cow in the winter. If it ſhould be alleged, that there is not one cottager in twenty who can afford to buy a cow; this difficulty may be eaſily obviated, by the landlord's letting him a cow, as well as the land, in the manner that dairies are generally let.

"This would be dealing with the poor as we would wiſh to be dealt with ourſelves, in a ſimilar ſituation; but, inſtead of this, cottagers are chiefly left by gentlemen to the farmer's diſpoſal; and, when they are accommodated with a ſmall quantity of land, are obliged to pay, at leaſt, a *double* proportion of rent for it, to what the farmers pay themſelves.

"Warm cottages of this ſort would require much leſs fuel than thoſe in the preſent ſtyle, which is a very conſiderable article to a cottager.

"The next conſideration is, to chooſe a convenient ſituation for cottages. Great farmers are very unwilling to admit them cloſe to their farms; and nothing is more common, than for a poor labourer to be obliged to come a mile, and ſometimes more, to his labour, and return home again at night, in all kinds of weather, after he has done a hard day's work. Cottages ſhould therefore be erected, if poſſible, on ſome ſheltered ſpot, near the farm where the labour lies; and true policy points out, that every farm ought to have a ſufficient number of ſuch uſeful appendages, in proportion to its ſize. Such cottages, under ſome ſuch regulations as theſe, would be of great uſe and ornament to a country, and a real credit to every gentleman's reſidence; as, on the contrary, nothing can reflect greater diſgrace upon him, than a ſhattered miſerable hovel at his gate, unfit for human creatures to inhabit. Upon encouragement like this good tenants would never be wanting. Induſtry would meet with a reward, the poor-rates would neceſſarily be lightened, and population increaſed. A farm thus provided with ſuch a ſufficient number of labourers as might, at all times and ſeaſons, be depended upon, would be of more value on that account. The tenant of ſuch farm would not be ſubject to pay exorbitant wages, as he otherwiſe muſt, on particular occaſions. He would not be obliged to court the vagrant to lend him a precarious aſſiſtance, or to have recourſe to towns, to pick up diſorderly people. In ſummer, beſides the uſual buſineſs of haymaking, he might employ even the women and children, in weeding, and other uſual buſineſs.

"Almoſt every pariſh is, in a great meaſure, ſubject to ſome particular gentleman, who has ſufficient power and influence over it, to correct the preſent grievance, and to ſet a better example. Such gentlemen ſhould conſider themſelves as guardians of the poor, and attend to their accommodation and happineſs: it is their particular buſineſs, becauſe they and their families have a laſting intereſt in the proſperity of the pariſh; the farmers only a temporary one. If a gentleman's fortune be ſo large, that he cannot attend to objects of this ſort, he ſhould, at leaſt, recommend the cottagers to the attention of his agent; and give him ſtrict inſtructions, to act as their friend and protector: for unleſs ſome ſuch check be put upon great farmers, they are very apt to contribute to the demolition, inſtead of the protection of cottages; and when the neſt is deſtroyed, the bird muſt emigrate into ſome other pariſh. A cottager, in this caſe, has no other choice, unleſs it be to make application to the neighbouring juſtice of the peace, for his order to the pariſh-officers to find him ſome other place to lay his head in. If it were not for this excellent law, which obliges pariſh-officers to find habitations for their poor, I am ſorry to remark, that in many pariſhes they would be literally driven into the open fields.

"There is another plan relative to cottages, which generally anſwers extremely well, and that is, to leaſe them off to induſtrious labourers, for the term of three lives, at their nomination; taking a very moderate fine, not exceeding 10l. or 12l. upon a cottage worth about 40s. a-year; reſerving a ſmall quit-rent, not exceeding half a crown a-year, and making it a point to renew any life which drops off, upon one year's value only. This ſcheme is beneficial for landlord and tenant; for though the farmer does not let his cottages for ſo much as he might at rack-rent, yet what he does get is all clear money; and by this means he preſerves the value of all other parts of his eſtate, by keeping up a proper number of inhabitants. The latter finds his account in it, becauſe he makes a ſettlement for his family; and can repair and improve his cottage at leiſure hours with his own hands; and if he be an induſtrious man, he can generally find a friend to lend him his firſt fine on ſuch an occaſion, if he cannot raiſe it himſelf.*

---

* "I am perſuaded that if there were a certain number of comfortable cottages, with two or three acres of graſs land each, in proportion to the ſize of the eſtates, to be beſtowed as a reward to labourers of particular good conduct, it would do wonders towards the reduction of the rates, and the preſervation of order; for I have been witneſs to ſeveral ſtriking proofs of this, in two or three labourers, who have been thus favoured; whoſe attachment to their maſters was exemplary, as they were not only

"I ſhould recommend that cottages ſhould be built double; becauſe it will be a conſiderable ſaving in the expence of their erection.—Where pollards are plenty, and bricks ſcarce, it will ſometimes be proper to prefer the wooden-lath and rough-caſt cottages, becauſe half the quantity of timber may be pollards; but, where they are built with brick, the following particulars ſhould be attended to:

"The walls ſhould be fourteen inches thick to the bottom of the chamber-floor, except in the window ſpaces; and the upper part of the walls nine inches. In theſe brick buildings no framed timber ſhould be uſed: but the lintel of the windows ſhould be laid the whole length of the building, nine inches ſcantling by two and a half; and then the ſame piece will ſerve to lay joiſts upon, which ſhould be pinned with oaken pegs, which will prove a great tie to the walls. The joiſts ſhould be cut eight inches by two and a half, and laid edgeways. The length of the ſpur to be 10 feet, being a proper pitch for tiling; and to be cut two inches and a half thick, five at bottom, and three and a half at the top. The lower rooms to be ſeven feet high, in the clear, under the joiſts. In the largeſt ſized brick cottages, the roof to be hipped in at the ends, which will have the two peaks of brickwork, and will not require more tiling, than would be made uſe of without it. One great advantage derived from hipping, is, in the building's being better braced together, and more ſecure from the effect of tempeſts; for, where the gable ends are carried up in peaks, to any conſiderable height, without chimneys to ſtrengthen them, they are not ſo well fitted to reſiſt an end-wind.

"The ceiling ſhould be between the joiſts, nailing firſt a few laths at about a foot apart, croſs-ways, and the other laths length-ways over them; otherwiſe the mortar has nothing to get hold of. This makes leſs expence than ceiling over the joiſts; and is beſides better calculated to retain the mortar, and will afford more ſpace; for the joiſts, being left naked, will be very uſeful to hang many things to. The ceiling joiſts upon the top of the chamber need be only five inches by one and a quarter, and may be nailed to the ſpars-feet, and not pinned. The other ſcantlings are as follow: The partition ſtuds three inches by two. The lower cills ſix inches by five. The window-frames three inches by three. Lower door-caſes five inches by four. Croſs mantle-pieces for the chimneys eight inches by eight.

"In the wooden cottages, the frame-ſtuds are to be ſix inches by five. The intermediate, or ſmaller ſtuds, five inches by three. The girt-pieces ſix inches by five, and the upper cill five inches ſquare."

HABITE *and* REPUTE, in Scots law, the common opinion of the people, among whom a perſon lives, with reſpect to any circumſtance relating to him.

HADAMAR, a town of Germany, in Weteravia, with a caſtle, ſeated near the Elſs, 22 miles N.W. of Mentz. Long. 8. 0. E. Lat. 50. 23. N.

HADLEY, a village in Eſſex, five miles S.W. of Rochford. Here are ſome conſiderable ruins of a caſtle, on the brow of a ſteep hill, on a channel of the Thames between Canvey Iſland and the ſhore.

HADLEY, a village in Middleſex, N. of Barnet. Over the weſt door of the church is the date 1498, and on the top of the ſteeple is an iron pitch-pot, originally placed there as a beacon.

HAGENBACH, a town of Germany, in the palatinate of the Rhine, 12 miles S.E. of Landau. Long. 8. 7. E. Lat. 48. 59. N.

HAGENBURG, a town of Weſtphalia, in the county of Schauenburg, 15 miles W. of Hanover, and 46 S.S.E. of Bremen. Long. 9. 7. E. Lat. 52. 30. N.

HAGGERSTOWN, or ELIZABETH TOWN, a flouriſhing town of Maryland, in the fertile valley of Conegocheague. It carries on a conſiderable trade with the weſtern country, and is 73 miles N.W. of Baltimore.

HAGIAR, a town of Arabia Deſerta, 87 miles N. of Medina. Long. 39. 25. E. Lat. 25. 30. N.

HAILBRON, a free imperial town of Suabia, in the duchy of Wirtemburg. The inhabitants, who are Proteſtants, derive a great advantage from the baths near it, whence the town has its name, which ſignifies the fountain of health. It is ſeated on the Neckar, over which is a ſtone bridge, 25 miles N. by E. of Stutgard. Long. 9. 15. E. Lat. 49. 9. N.

HAIMBURG, a town of Lower Auſtria, on the Danube, 10 miles W. of Preſburg, and 25 E. of Vienna. Long. 16. 58. E. Lat. 48. 12. N.

HAIN, a town of Upper Saxony, in Miſnia. It has a manufacture of cloth, and is ſeated on the Rhedar, 12 miles N.W. of Dreſden.

HAINBURG, a town of Auſtria, on the Danube, 35 miles E. of Vienna. Long. 17. 18. E. Lat. 48. 14. N.

HAINGEN, a town of Suabia, in the lordſhip of Gundelfingen, 21 miles W.S.W. of Ulm. Long. 10. 2. E. Lat. 48. 12. N.

HAIR-POWDER. On the licence for wearing this, there is a tax of one guinea per annum, with the following exemptions: Nothing in the act ſhall extend to any of the royal family, or to any of the immediate ſervants of his majeſty, or any of the royal family, ſerving in any of the capacities deſcribed in the act impoſing a duty on ſervants.

Neither ſhall it extend to charge any clergyman who ſhall not be poſſeſſed of an annual income of one hundred pounds, or upwards, whether ariſing from eccleſiaſtical preferment or otherwiſe. Nor any preacher of any congregation of Diſſenters, or any perſon diſſenting from the church of England in holy orders; or pretended holy orders, entitled to the benefit of the ſeveral ſtatutes made for the relief of diſſenters; or perſons profeſſing the Popiſh religion; and who ſhall not be poſſeſſed of an annual income of one hundred pounds or upwards, however ariſing.

Neither ſhall the act extend to charge any ſubaltern or non-commiſſioned officer, or private man, in the army, artillery, militia, marines, corps of engineers, or fencible corps;—nor any officer employed in the navy under the rank of commander;—nor any officer or private man in any corps of yeomanry or volunteers, either cavalry or infantry, *voluntarily enrolled for the defence of the kingdom during the war.*

Parents having more than two unmarried daughters, being aſſeſſed for them in twice the duty of a ſingle perſon wearing hair powder, ſuch aſſeſſment ſhall exempt the whole.

Perſons claiming exemption are to prove their right; and the income of beneficed clergymen is to be eſtimated on the average of ſeven years.

If a maſter pay the hair-powder duty for his ſervants (returning a liſt), they ſhall be exempted from it during their continuance in his ſervice, and their ſucceſſors during the year for which it is paid.

ſteady in themſelves, but by their example kept others from running into exceſs. *I know of no law that can enforce induſtry; it may be encouraged and great good will reſult from it; but it never can be effected by compulſion."—Kent's Agricultural Survey of Norfolk.*

HALDENSLEBEN, a town of Lower Saxony, in the principality of Magdeburg, 12 miles N. of Magdeburg.

HALLENBERG, a town of the duchy of Weſtphalia, 62 miles E. of Cologne.

HALVA, a town of the kingdom of Fez, ſeated on the Cebu, eight miles S. of Fez. Long. 5. 5. W. Lat. 33. 32. N.

HAMAR, a town of Norway, in the government of Aggerhuys, 60 miles N.E. of Chriſtiana. Long. 11. 5. E. Lat. 60. 30. N.

HAMBLEDON HILL, near Sturminſter, in Dorſetſhire. Here was a Roman camp, and many Roman coins have been dug up. It is the antagoniſt camp to that of Hog Hill, and extends E. and W. three quarters of a mile.

HAMBURGH (*Encycl.*). The following is extracted from an account of the management of the poor at Hamburgh, by that truly benevolent prelate, the Biſhop of Durham.

In the beginning of the year 1788, an inſtitution was formed for the poor at Hamburgh. Of 110,000* inhabitants in Hamburgh, there were above 7000 diſtreſſed perſons in want of regular relief, beſides an average of 2500 in the hoſpitals.—There were peculiar circumſtances attending this great and commercial city, which contributed to increaſe the number of poor, requiring aſſiſtance;—ſevere winters, heavy taxes on the neceſſaries of life, fluctuation of trade, the attraction of the poor from neighbouring countries in expectation of employment; and a great number of female ſervants at very low wages, of whom many muſt neceſſarily remain unprovided for, when age or ſickneſs ſhould unfit them for active ſervice.

As ſoon as the outline of the plan was agreed upon, an arrangement was formed, that ſuch revenues as till then had been expended in alms by the ſeveral churchwardens, and thoſe the adminiſtration whereof had been connected with the workhouſe, ſhould be united under one adminiſtration with the monies to be collected from private benevolence. The moſt reſpectable inhabitants went round perſonally to collect ſubſcriptions; and the town was divided into ſixty diſtricts, each being allotted to the care of three overſeers; and the whole being under the direction of a board, or committee of fifteen directors, elected from among the overſeers.

The general object was to provide comfort and ſubſiſtence for the aged, and for thoſe afflicted with incurable diſeaſe, or labouring under temporary ſickneſs; to ſupply the means of occupation for thoſe who could work; and, by giving education and employment to children, to afford the moſt beneficial relief to thoſe burthened with large families.

For the reception of the aged, a public building, or aſylum, was provided; but in caſes where they had friends, who would receive them, they were allowed as much as their expence in the aſylum would have amounted to. For the ſick, and particularly for women at a period when they have the greateſt need of charitable relief, medical aſſiſtance was provided. For the different diſtricts in the town there were appointed five phyſicians, five ſurgeons, and five midwives, who upon notice were to attend the lodging of the patient, if not capable of going abroad. Food and medicine were immediately ſupplied, with ſo much attention and economy, that, in the courſe of the three firſt years, 12,969 poor perſons had been attended in ſickneſs, whoſe cure (including broth and an occaſional ſupply of other food) had not coſt more, upon an average, than 3*s*. 6*d*. each.

For a proviſion for the children of the poor, where, from the vice or the deceaſe of a parent, no ſuitable home remained for the child, they boarded them in the houſes of the better ſort of poor. In other caſes they allow the mother † a weekly ſum for the younger children. They alſo prepared a warm room in every pariſh, and bread, milk, and potatoes in plenty; ſo that parents, who went out to work, might leave their young children there during the day, and thus prevent any obſtacle to their own induſtry, or to that of their elder children. At the ſame time they came to a determination, "that no family ſhould be allowed any relief for any child above ſix years of age; but that ſuch child, being ſent to ſchool ‡, ſhould receive not only payment for its work, but alſo an allowance in the compound ratio of attendance at ſchool, good behaviour, and application to work." For the inſtruction of the children, three ſorts of ſchools were opened:—the firſt for thoſe who had no other employment; theſe were ſchools of occupation as well as inſtruction: the ſecond, evening ſchools for the education of children who worked with their parents during the day;—the third were Sunday ſchools, which continued alike open to all, as well to thoſe who had gone into ſervice in Hamburgh, as to children on the ſchool liſt. The average number in theſe ſchools were 600; the expence of them about £.700. a-year.

The moſt difficult part of the undertaking ſtill remained:—

---

* This account is extracted from an excellent publication on the ſubject by Mr. Voght, publiſhed in 1796, by Kay, No. 332, Strand; and from the twenty-third report of the directors, publiſhed in German at Hamburgh in January, in 1798. The firſt is earneſtly recommended to the attention of thoſe who intereſt themſelves in the welfare of the poor: the latter, it is hoped, the ſociety will be able to get tranſlated, and publiſhed for the peruſal of the Engliſh reader.

† See Mr. Voght's excellent work, publiſhed by Kay, as above ſtated. His obſervations on the removal of children from their parents are feeling and judicious.—"We were averſe (ſays he) to place the children in a general hoſpital, and the poor mothers would have been ſtill more ſo."—May all the favourers of thoſe houſes, ſuch as they are, ſeriouſly reflect whether the advantages they offer, can compenſate for the education of the heart, which nature yields in thoſe huts of poverty, where both parties become ſo neceſſary to each other; and where heroic exertions of parental and filial piety are not ſeldom become habitual. Would the humane and philoſophical obſerver look through the rags of pale miſery; calculate the ſacrifices daily made there in many families, and amongſt neighbours; and enjoy the rapture with which a mother embraces her ſon, whom ſhe ſees eagerly devour *the crumb of bread that ſhe had refuſed to her own wants*; the annals of the poor might reconcile him to human nature, when diſguſted with the liſt of crimes which blacken the page of its hiſtory.

‡ It ſhould be obſerved that this was in a *town*, where children can attend ſchool conveniently. In the country (we ſpeak from obſervation) great prejudice, both to the health and to the morals of children, attends their being ſent to and returning from a diſtant ſchool, or manufactory, at early and late hours, and in all variety of weather and ſeaſon.

that of procuring regular and ſuitable employment for thoſe who could work; and of aſcertaining who were, and who were not able. A reſolution was adopted, "not to permit any one to receive a ſhilling, which he would have been able to have earned for himſelf; and at the ſame time to reduce the ſupport of thoſe, who required relief, below the ſcale of what any induſtrious perſon, in ſuch circumſtances, could earn." Printed queries were ſent to the poor, the anſwers to which were written on the blank column of the page, verified by the evidence of their neighbours, and by the perſonal attendance of the overſeer, or (where the ſtate of health was in queſtion) of the phyſician. Many of the queries were calculated to aſcertain the average earning of each member of the family: but in this reſpect the truth was, for ſome time, very difficult to be obtained; it being the intereſt of the party, to make his capacity for work appear leſs than it really was.

A manufactory for ſpinning flax exiſted at that time in Hamburgh. The proprietor gave it up to the inſtitution, together with the ſtock, the teachers, and the experience of ſeveral years. As the poor who wanted relief, were chiefly women and children, this was adopted as their general work. The clean flax was ſold to the women at a certain and low price; and the yarn which they ſpun, purchaſed of them at £.30. per cent. above the uſual rate. To whatever fineneſs the yarn was ſpun, the whole profit was received by the poor. Every poor woman brought with her work a book, in which the pieces delivered in by her were noted; ſo that ſhe thereby received a certificate of induſtry, and the inſtitution had a regular account always before them of the employment of the poor. In the mean time, the men and larger boys (who were not the numerous or neceſſitous part of the poor) were employed in mending the roads, cleaning the ſtreets, making rope yarn, and other labour, at a certain allowance per day.

After theſe general preparations were made, the committee conceived that they could now offer relief to all ſorts of poor; as they had the means of enforcing the only condition required;—that of their contributing towards their own ſupport, the degree of exertion which they were capable of. The overſeers therefore went through the ſtreets, and made enquiries if any inhabitants were in need of relief. Thoſe who applied, if capable of work, were ſupplied with employment; if prevented by want of ſkill, they were admitted into a ſchool opened for that purpoſe; and in the courſe of three months were taught to ſpin; being allowed for the firſt week a gratuity of two ſhillings: every week after, two pence leſs; and, in the twelfth week, diſmiſſed with the donation of a pound of flax, and a ſpinning wheel.

The quantity of work, which the diſabled poor were capable of, was eaſily and accurately aſcertained by a week's trial at the ſpinning ſchool. The reſult was produced weekly before a ſub-committee; and the ſum that each poor perſon could earn, was entered in a book: from that time they were paid weekly, what their earnings fell ſhort of 1*s.* 6*d.* a-week, whenever it appeared by their book, that they had earned to the known extent of their abilities. The means of ſubſiſtence however, are much cheaper at Hamburgh than in London.

In the proportion of two ſhillings a-week, an allowance was made for their lodging. But as this is paid every ſix months, and the pauper's allowance is weekly, it was thought proper (except in caſes where the lodging was otherwiſe provided for) to retain four pence a-week, for the purpoſe of paying the landlord's rent; thereby keeping the poor out of debt, and giving them a more comfortable habitation, than what otherwiſe they could have expected.

Clothing and bedding were at firſt much wanted; but in order to prevent their being pawned or ſold, it was thought proper to mark them as the property of the inſtitution, which the pauper was to keep while he behaved well. The committee purchaſed the materials by wholeſale, and employed ſome of the poor in making them up. They were delivered to the pauper on the recommendation of the overſeer, counterſigned by the director of the diſtrict; or to children, upon the recommendation of the ſub-committee of the ſchools.

A complete liſt of the poor being at length obtained, public notice was given, in the month of October, 1788, that no deſerving poor perſon could or would, in future, remain unnoticed. Inſtructions were very generally diſtributed among the poor, as to the mode of obtaining relief; and the public was intreated to inform the committee, if any pauper had not been duly attended to.—No ſuch caſe has hitherto occurred.

It was eſtabliſhed as a general rule, that three years' reſidence in Hamburgh ſhould entitle the party to relief; allowance being alſo made for accidents, illneſs, or child-bed; which, in all caſes, were held to be proper objects of charity. A place of reception was opened for foreign poor, where they were taken care of for three days, and then diſcharged with the means of ſubſiſtence home. At the ſame time, in order to prevent the further influx of other poor, it was prohibited to receive any ſtranger, without informing the magiſtrate or overſeer, under pain of bearing all the expence of ſupporting ſuch ſtranger, if he ſhould become an object of charity within three years.

Theſe general regulations have been ſtrictly adhered to for ten years; except in the caſes of poor perſons being ill, when they have ſick tickets given them, which exempt them from the general rules; and during the moſt ſevere winter weeks, when a regular increaſe of allowance is ordered by the committee. But no inequality of diſtribution is ever admitted, whatever may have been the prior ſituation of the party. Thoſe who had formerly been in a more reſpectable ſituation, continued to be the proper objects of private benevolence; of which no public inſtitution ought to ſuperſede the exertions.

The conduct of the inſtitution is in the general committee, conſiſting of fifteen directors. They appoint four ſub-committees from among themſelves; one for manufactures, another for the ſchools, a third for clothing, and a fourth for the police of the poor. The ſub-committees have each their ſeparate officers, and keep diſtinct accounts, which are given in every month to the treaſurer and the board.

Ten of the directors are ſelected; each one of them ſuperintending ſix of the ſixty diſtricts, to receive from the overſeers accounts of what is wanted in the reſpective diſtricts for fixed ſupport, for occaſional relief, for accidents, and for diſcretionary aſſiſtance; which, when certified by the director of the diſtrict, is ſent for payment to the treaſurer; whoſe accounts are laid every month before the committee, and checked by the director's certificate. Theſe ten directors may be conſidered as "the advocates for the inſtitution," to prevent, in their ſeveral diſtricts, exceſs of expence.

From the enquiries made at the commencement of the inſtitution, it appeared that there were more than 4,000 women, 2,000 children, and 1,000 men, then in Hamburgh in the utmoſt want * of immediate relief. The whole number conſiſted of 7,391 individuals, and compoſed 3,903 families.

---

* The poor at Hamburgh had been habituated to live almoſt entirely on a miſerable beverage, which was *called coffee*, and ſold in meſſes, with about half a pound of indifferent bread. This wretched ſubſtitute for food they took twice a-day. About

The firſt clothing of ſo great a number of deſtitute perſons, would have exceeded the powers of the inſtitution, but for the quantity of ready-made ſhirts and other apparel, which the ladies ſupplied with a liberal hand. Clothing and ſchools for inſtruction are now wanted only for the children.

The purchaſe of ſpinning wheels, and of other inſtruments of employment, and the ſupport of ſchools where 500 grown perſons were at the ſame time inſtructed in ſpinning, added to the allowance made to the poor for the loſs of time while they were learning to ſpin, occaſioned a very enormous expence at the commencement of the inſtitution. But this was not of long continuance. The ſchools for teaching ſpinning to grown perſons ſoon became unneceſſary; 3,354 ſpinning wheels had been given to thoſe who had proved themſelves able to ſpin. Theſe were employed in ſpinning, when more lucrative employment was not to be found. 2,000 poor, who at the time they entered the ſchool could do nothing at all, have ſince earned from eight pence to twenty pence a-week, at times, and during hours, which were formerly entirely loſt to them. The average of all expences attending the employment of the poor during three years, up to December, 1796, including the loſs upon the ſale of manufactured goods, has been only £.611 per annum; and, in the worſt caſes that have occurred, the expence of enabling a pauper to earn five guineas a-year, has not been more than half-a-guinea.

It will not be a ſmall recommendation to many perſons, that ſince the year 1788 *ſcarce a beggar has been ſeen at Hamburgh.* But there is another much more important circumſtance; the decreaſe of ſickneſs and miſery among the poor. The average mortality of the medical inſtitution at Hamburgh, before 1788, had been above one in ten. In the year 1789, it was greatly reduced, and has ſince, by a gradual progreſs, diminiſhed to leſs than one in twenty.—This and the extenſion of the ſchools, and of the benefit of the medical inſtitution to perſons *not actually entitled to relief*, has greatly diminiſhed, and muſt ſtill have a much greater effect in diminiſhing, the liſt of diſtreſſed poor, and in increaſing the number of induſtrious and thriving citizens at Hamburgh.

Observations.—The diviſion of *labour* has not produced more extraordinary effects in a well-conducted manufactory, than the diviſion of *attention* in a well-arranged inſtitution. The giving to every acting member his peculiar and appropriate duty, not interfered in by any other perſon, as has been done with great effect at Hamburgh, is of the utmoſt importance in every eſtabliſhment. Thoſe who have attended much to the conduct of charities, muſt have had frequent occaſion to regret, that, even among the beſt-intentioned men, more time, and more power, is often waſted in the counteraction and controverſion of petty and trivial meaſures, than in the furtherance of the real objects of the inſtitution. This is the *friction*, the impediment of action, the obſtruction to progreſs, which it is moſt eſſential to prevent; and it is in this reſpect, that the benevolent and enlightened founders of the inſtitution at Hamburgh, have been peculiarly judicious and ſucceſsful.

The maxims adopted at Hamburgh in the execution of their plan, are very deſerving of attention:——"That every allowance, which ſuperſedes the neceſſity of working, becomes a premium to idleneſs:—that labour, not alms, ſhould be offered to all who have any ability to work, however ſmall that ability may be:—that one ſhilling, which the poor man earns, does him more real ſervice than two which are given him:—that, if the manner in which relief is given is not a ſpur to induſtry, it becomes in effect a premium to ſloth and profligacy;—and that, if the mere ſupport of a pauper is above what any induſtrious perſon in the ſame circumſtances could earn, idleneſs will become more profitable than induſtry, and *beggary* a better trade than the *workſhop*." In proportion as the conductors of the inſtitution at Hamburgh have rigidly adhered to theſe maxims, they have found the benefit extended and increaſed; whenever they have relaxed, the *thermometer of induſtry* has been lower, and leſs work has been done.

One great cauſe of the ſucceſs of the inſtitution at Hamburgh has been the *publicity* and *regularity* of the accounts. Without this all charities become jobs, the directors grow indifferent to public approbation or cenſure, and the adminiſtration falls into the hands of under officers, who ſoon learn ſo to entangle the buſineſs, that no ſubſequent director is ever able to unravel the clue.

That which has been done in Hamburgh, by the cooperation of its beſt and wiſeſt citizens, has been effected at Munich by the abilities and perſeverance of one truly diſtinguiſhed individual, Count Rumford. (See Soup in this Supplement.) The particulars of that eſtabliſhment are ſo well and ſo generally known, that it is unneceſſary for us to enter into the detail of them. The inſtitution has, in both inſtances, been wiſely adapted to the circumſtances and condition of the reſpective places;—at Munich with additional power, from the eſtabliſhment being blended with the government of the ſtate, and producing an influence on the country, of which that city is the capital; and from its being connected with a variety of uſeful and extraordinary inventions and improvements, which Count Rumford has made, and *is now making*, for the benefit of mankind.

HAMERSTEIN, a caſtle and village of Germany, belonging to the elector of Treves. The caſtle is ſeated on a lofty mountain, on the E. ſide of the Rhine, two miles N. by W. of Andernach.

HANSBACH, a town of Bohemia, in the circle of Leitmeritz, with manufactures of cotton, thread, and paper, 12 miles N. of Kamnitz.

HANSFELDEN, a town of Germany, in the duchy of Stiria, eight miles N.N.W. of Judenburg.

HAN-TCHONG-FOU, a large and populous city of China, in the province of Chenſi. It has 16 cities of the ſecond and third claſs under its juriſdiction, and is ſeated on the river Han, 845 miles S.W. of Pekin. Long. 106. 55. E. Lat. 32. 45. N.

HARDENBERG, a town of Weſtphalia, in the duchy

---

two years ago, the directors introduced the uſe of Count Rumford's ſoups, with great benefit to the poor at Hamburgh. It has been a ſaving of 9 parts in 16, or rather more than half the former expence of their food. Children, in particular, have derived great advantage in health and ſtrength from the uſe of theſe ſoups. The ſaving to the inſtitution in reſpect of fuel, by the introduction of Count Rumford's boilers, is ſtated in the Report (which contains a great deal of minute and curious detail in reſpect to fuel as well as food) to have been rather more than 61 parts in 66; the coſt of their fuel, which is very ſcarce at Hamburgh, being at preſent not a tenth of what it was.—*Hamburgh Report of Jan.* 1798.

of Berg, 13 miles E.N.E. of Duſſeldorp. Long. 6. 43. E. Lat. 51. 19. N.

HARDENBURG, a town of Overyſſel, ſituate on the Vecht, 10 miles S.W. of Covoerden.

HARLEBECK, a town of Auſtrian Flanders, on the river Lis, three miles N.E. of Courtray. Long. 3. 29. E. Lat. 50. 52. N.

HARLESTON, a town in Norfolk, with a market on Wedneſday, ſeated on the Waveney, 16 miles S. of Norwich, and 100 N.E. of London. Long. 1. 20. E. Lat. 52. 26. N.

HARMONDSWORTH, a village in Middleſex, two miles E. by N. of Colnbrook. It is remarkable for one of the largeſt barns in England, whoſe ſupporting pillars are of ſtone, and ſuppoſed to be of great antiquity.

HARNESS (*Encycl.*). The following is the ſpecification of a patent granted to Mr. Dickinſon, of Long-acre, for certain improvements in the conſtruction of ſaddles, harneſs, and other gear, uſed for the employ of horſes and other animals in riding or carrying loads, or in drawing carriages of any deſcription. It is dated November 10, 1801.

"Whereas (ſays the inventor), in the conſtruction of the ſaddles, and other gear and appendages hitherto made or manufactured, the ſeveral parts have generally poſſeſſed no elaſticity, except that ſlight degree which might depend upon the nature of the materials themſelves, and it conſequently follows, that ſaddles and cruppers are either girthed too tight, ſo as to impede the reſpiration of the animal, and ſo as to endanger their breaking, or ſo looſely as to render the ſeat of the rider more or leſs unſafe, and very ſeldom can be fixed with that exact degree of tenſion which is beſt adapted to every uſeful purpoſe. And, moreover, in the adjuſtment of the crupper, and with the breaſt-plate, a difficulty of the ſame nature preſents itſelf, namely, that in the firſt tenſion of theſe, if the ſame be too looſe, the ſaddle will not be duly confined to its place, or if the ſame be too tight, the animal will be very much incommoded, and in either caſe, when by ſudden jerks, or other motions, the breaſt-plate or crupper, or girth, ſhall be required to produce their reſpective effects, the parts will either break, or elſe the action, particularly of the crupper upon the tail of the animal, will be ſudden, unqualified, and pernicious. Now my ſaid improvements in the conſtruction of, and additions to the ſaddles, harneſs, and other gear aforeſaid, conſiſt in certain ſprings, or elaſtic portions, interpoſed between, and in effect conſtituting parts of the ſaid inſtruments or parts; that is to ſay, more particularly, I improve the conſtruction of ſaddles, by affixing one or more ſpiral ſprings, ſimilar to thoſe uſed in the ſmall inſtrument for weighing, commonly called ſpring ſteel-yards, unto thoſe parts of the ſaddle to which the girths, the crupper, and the breaſt-plate, are reſpectively to be faſtened. The ſaid ſpiral ſprings are ſo lodged in certain cavities, ſheaths, or receptacles, that a piece of catgut or wire, or chain, or other fit material, paſſing within the cavity of the ſpring, and faſtened to, or bearing againſt one end of the ſaid ſpring, ſhall, when drawn or acted upon, cauſe the turns of the ſpring to approach more nearly together, and conſequently cauſe it to re-act againſt the ſaid catgut or rod, or chain, or other fit material, and tend to draw the ſame towards the ſaddle itſelf. I fix to the end of the ſaid catgut, rod, chain, or other fit material, ſtraps or buckles, or other faſtenings, for the ready fixing of the girth, breaſt-plate, and crupper, in the uſual manner. And moreover, in ſome caſes, where convenience or choice may cauſe the preference, I fix the ſaid ſpiral ſprings within proper ſheaths or receptacles, of metal, wood, cloth, leather, or other fit material, ſo as to form a ſeparate piece capable of being applied or attached between the ſaddle, and the extremity of the girth, breaſt-plate, or crupper, reſpectively, ſo as to communicate to the ſaid appendages the effect of its own elaſtic extenſibility in the longitudinal direction or otherwiſe. I fix the ſaid ſprings ſo fitted up in the breaſt-plate and crupper in ſuch a manner, that the ſame ſhall conſtitute parts of thoſe appendages to the ſaddle, and communicate the ſame effect as in the other caſes juſt deſcribed. And further, I do hereby declare, that I do not confine myſelf in the ſtructure and uſe of the ſprings or elaſtic parts of my ſaid invention to any ſuch preciſion of figure or material as not to allow of conſiderable variations. The ſprings may be made to act by drawing the convolutions or turns further apart, inſtead of compreſſing the ſame together, as before deſcribed. The wire of which the ſprings are made, may be taken of any fit metal, but ſteel is the beſt, and it may be either round, ſquare, or of any other figure, as to its ſection or baſe, and the ſprings may be either ſtraight or curved, according to the numerous well-known forms of ſprings, and the application thereof; but I conſider the ſpiral or helix, as before deſcribed and applied, as the cheapeſt, moſt convenient, and as good as any. On ſome occaſions I make uſe of a ſimple ſtrap or piece of Indian rubber, or *caoutchouc*, inſtead of the ſprings; the uſe of which ſprings is ſupplied by the natural elaſticity of the ſaid *caoutchouc*; but I do not conſider this laſt material as deſerving any general preference, becauſe its ſpring or elaſtic force is greatly weakened by heat, and in cold weather it becomes rigid, and liable to ſnap."

HARO, a town of Spain, in Old Caſtile, the chief place of a county; ſeated on the Ebro, 32 miles N.E. of Burgos. Long. 2. 23. W. Lat. 42. 40. N.

HARPONELLY, a town of the peninſula of Hindooſtan, capital of a diſtrict of the ſame name, in the Myſore country, 152 miles N.N.W. of Seringapatam. Long. 75. 28. E. Lat. 14. 40. N.

HARRISBURG, a town of Pennſylvania, capital of the county of Dauphin, ſituate on the E. branch of the Suſquehanna, 86 miles W. by N. of Philadelphia. Long. 76. 55. W. Lat. 40. 15. N.

HARRODSBURG, a town of Kentucky, in the county of Mercer, on the head waters of the Salt River, 60 miles S.E. of Louiſville.

HARTENSTEIN a town of Upper Saxony, in the lordſhip of Schonburg, ſix miles S.E. of Zwickau.

HARTFORD, a commercial town of Connecticut, divided by a ſmall river, over which is a bridge. It is ſeated on the W. ſide of the river Connecticut, 50 miles from its entrance into the Sound, and 30. S.W. of Boſton. Long. 72. 35. W. Lat. 41. 50. N.

HARTZGERODE, a town of Upper Saxony, in the principality of Anhalt Bernburg, ſituate near the Hartz mountain. The walls and houſes are built of a motley kind of marble. It has a mine office and a caſtle; and is 24 miles S.W. of Bernburg, and 44 W.S.W. of Deſſau. Long. 11. 2. E. Lat. 51. 46. N.

HASLINDEN, a town in Lancaſhire, with a market on Wedneſday, 16 miles N. by W. of Mancheſter, and 196 N.N.W. of London. Long. 2. 16. W. Lat. 53. 40. N.

HASTENBECK, a town of Lower Saxony, in the principality of Calenberg, near which the French, under Marſhal d'Eſtrees, gained a victory over the Duke of Cumberland, in 1757. It is five miles S.E. of Hamelin.

HAT (*Encycl.*). A patent was granted in January 1782 to Mr. Robert Golding, of Southwark, hat-dyer; for his method of dyeing, ſtaining, and colouring beaver hats green, or any other colour. The inventor directs the nap of the hat to be raiſed by means of a *card*, on the ſide intended to be dyed, and then boiled in alum argol. A thin paſte ſhould be made of flour, or clay, which is ſpread over every part that is not

to be dyed, and then cloſed; or the hat may be previouſly paſted, and inſtead of being boiled, it ſhould only be ſimmered in the ſame liquor. As ſoon as the paſte is ſpread, plates of copper or other metal, ſhaped like a common funnel, are fixed over the paſte, to prevent the dye from penetrating through. In this ſtate the hat is immerſed in the dye, till the colour be ſufficiently fixed; when it is taken out, opened, and cleanſed from the paſte: but if any colouring particles have penetrated through the felt, they may be removed by rubbing them with a ſmall quantity of ſpirit of ſalt, aqua fortis, &c. The compounds employed in dyeing, are fuſtic, turmeric, ebony, ſaffron, alum, argol, indigo, and vitriol, with urine, or pearl-aſh, at the option of the dyer; all of which are uſed together, or ſeparately, according to the colour required.

Among the different patents granted to hatters, for diſcovering new materials in this manufacture, ſuch as that of Mr. J. Burn, in 1792, for *mole-fur*; and another to Mr. J. Tilſtone, in 1794, for *kid-hair*; we ſhall firſt notice an invention of Mr. George Dunnage, who, in November 1794, obtained a patent for his *Water-proof Hats*, in imitation of beaver.

The articles he employs are ſimilar to thoſe commonly uſed for the making of hats, with which he mixes Bergam, Piedmont, or Organzine ſilk. Theſe are dreſſed and worked in a peculiar manner; though we underſtand that hats thus prepared become heavy and oppreſſive to the wearer, while they acquire an ugly colour.—The curious reader will find the patentee's ſpecification inſerted, at full length, in the 4th vol. of the *Repertory of Arts and Manufactures*. The ſame manufacturer procured another patent in November 1798, for a method of ventilating the crowns of hats. This invention conſiſts in ſeparating the top from the ſides of the crown, ſo that the tip, or top-crown, may be either raiſed or let down at pleaſure, in order to admit the external air, or to exclude it from circulating in the crown of the hat. The whole contrivance is effected by means of ſprings, ſliders, ſockets, grooves, loops, and caſes, which are connected with the top and ſide-crown: thus the admiſſion or excluſion of atmoſpheric air in front, behind, or on either ſide, may be regulated accordingly.—As this invention is ingenious, we refer the reader to the 10th vol. of the work laſt quoted, where he will find a minute account given of it.

The following is the ſpecification of a patent granted to Meſſrs. Walker and Alphey, for making and manufacturing caps and hats, and rendering them perfectly water-proof; as alſo all kinds of leather, ſilks, linen, cotton, ſtuffs, paſteboard, and other manufactures and ſubſtances, for the purpoſe of being worked up into boots, ſhoes, gaiters, women's hats or bonnets, and other wearing apparel, ſo as to be uſed on all occaſions, where the repelling of wet or moiſture may be required. It is dated November 3, 1801, and the patentees expreſs themſelves in the following terms:

"For the making and manufacturing of our new-invented caps, which are principally intended for the uſe and wear of the military, we take a ſuitable piece or pieces of manufacture, called paſteboard, and cover both ſides thereof with linen cloth, or any other texture wrought in a loom, which we cement thereto by glue or paſte, or paſte and glue mixed, out of which the cap is then cut and ſhaped on a block, or otherwiſe, according to the ſhape and faſhion the ſame is ordered to be made, and as circumſtances may require. The ſeams or joinings of the paſteboard are united by ſewing, and by glue or paſte, or paſte and glue mixed; and alſo by ſlips of leather, linen, or other wove texture, glued or paſted over the ſame, both inſide and outſide, where found neceſſary. It is then painted both inſide and outſide, with any kind of oil-paint, or oil and lamp-black (which latter is greatly to be preferred), with one or more coats, as circumſtances may require: when this is dry, it is then to be covered with one or more coats of Japan or varniſh, mixed with lamp-black or ivory-black. The peak or rim of the cap, together with the cape behind, agreeable to the quality and faſhion ordered to be made, is alſo to be painted, japanned, or varniſhed, on one or both ſides, as may be thought neceſſary, in like manner as the other parts of the cap are. When the peak or rim, together with the cape and lining, are affixed to the crown, in the uſual manner, the cap is then finiſhed, excluſive of any ornament or ornaments that may be thought proper to affix to the ſame. The men's hats are made in the ſame manner, and with the ſame materials as the crown of the cap, except being principally covered with ſilk, linen, cotton, or other texture, wrought in a loom, cemented to the paſteboard in like manner as deſcribed for the cap. And alſo except that ſuch breadth is given to that ſide or inner part, or edge of the flap, or rim, that is next the crown, as will admit of its being notched and turned up, ſo as to lie cloſe to the ſide of the crown, and is to be united thereto by ſewing. And, with the ſame cement as applied to the cap and other articles, the parts ſo turned up, ſewed, and cemented to the crown, are to be covered with leather, or any texture wove in a loom: the whole is then to be painted, japanned, or varniſhed, on one or both ſides, as may be thought proper, and in like manner as the caps. The preparation of leather for boots, ſhoes, gaiters, or other articles where a power of repelling wet is required, is to be painted, japanned, or varniſhed, in like manner as the caps are, on one or both ſides as may be found neceſſary. When this operation is performed upon leather, it muſt be upon ſuch leather only which has not been dreſſed with oil, or any other greaſy ſubſtance. The preparatinns of paſteboard, and ſilk, linen, cotton, ſtuffs, or any other texture wrought in a loom, for the purpoſe of making ſhoes, gaiters, women's hats or bonnets, are to be painted, japanned, or varniſhed on one or both ſides, as may be found neceſſary, in like manner as the caps are herein-before ſpecified to be done."

The following duty on hats commenced October 2, 1784, by the act 24 Geo. III. c. 51.

	£.	d.
Licence to ſell hats retail in London, Weſtminſter, Borough, and within the Bills of Mortality	2	0 0
Ditto in other parts of the kingdom	0	5 0
No hats to be ſold without ſuch licence, under forfeiture of	50	0 0
And "Dealers in hats" to be written over the door, under forfeiture of	2	0 0
Duty on every hat of 4s. or under	0	0 3
Ditto above 4s. and not exceeding 7s.	0	0 6
Ditto above 7s. and not exceeding 12s.	0	1 0
Ditto above 12s. and upwards	0	2 0

And by *the New Act*, 36 *Geo.* III. *c.* 125, it is enacted that, after Aug. 5, 1796, the above duty ſhall be calculated according to the full price of the hat, and of all the mountings and other ornaments (except gold and ſilver lace) ſold therewith.

And every hat made wholly of felt, wool, ſtuff, beaver, or leather, or any mixture therewith, ſhall be liable to the duties.

And every ſuch hat, after Aug. 5, 1796, ſhall, previous to the ſale and delivery, be lined or covered in the inſide of the crown with ſilk, linen, or other proper materials, with a durable ſtamp affixed thereon to denote the above duties.

And, after Aug. 5, 1796, if any perſon (other than licenſed dealers buying hats from other licenſed dealers) ſhall

receive on ſale, or if any perſon ſhall, after April 5, 1797, *wear or uſe* any hat wherein no lining or inſide covering ſhall be affixed, or if the lining or covering ſhall not be ſtamped according to this act, or not have the ſtamp placed therein in a viſible manner, every ſuch perſon ſhall forfeit 10l.

And no perſon (other than manufacturers or dealers ſelling to other dealers) ſhall ſell or exchange any hat wherein no lining or inſide covering ſhall be affixed, or wherein there ſhall be a lining that ſhall not be ſtamped, or that ſhall not be ſtamped with a ſtamp placed in the inſide of the crown ſo as to be viſible, or that ſhall be ſtamped with a ſtamp of leſs value than required, on pain to forfeit 10l.

Perſons carrying about hats for ſale without any lining, or with a lining not duly ſtamped, may be apprehended and carried before a magiſtrate, and the apprehender, on conviction of the offender, is to be entitled to 40s. and the offender in ſuch caſe is to be committed to the houſe of correction for not exceeding ſix nor leſs than two calendar months.

And if any perſon ſhall take out of any hat the ſtamped lining after the ſame ſhall have been uſed or worn, with intent to affix the ſame to any other hat, or ſhall affix any ſuch ſtamped lining after the ſame ſhall have been uſed or worn, ſuch perſon ſhall forfeit 20l.

Shapes for linings may be ſent to the office to be ſtamped; and an account of the numbers brought, and the duties, are to be entered in a book, and the ſhapes to be then ſtamped, on payment of the duty. Or the commiſſioners may open accounts at the Stamp Office with dealers or manufacturers, and ſtamp the linings on credit, if ſuch dealers or manufacturers enter into ſuch bond as the commiſſioners ſhall direct for payment of the amount of the duty, at ſuch times as the commiſſioners may fix, not being at leſs than two payments in the year.

And the commiſſioners are to make ſuch regulations as they ſhall think fit, as well to prevent the concealment of the ſtamp upon the linings, as to prevent the ſtamps from being made uſe of again; which regulations, being printed, ſhall be delivered to all dealers upon their taking out their licence.

Dealers may ſend any number of hats, not leſs than one dozen at one time, wherein a lining ſhall then be affixed, to be ſtamped; and they may ſell to other dealers lined hats for ſale for home conſumption, or to any perſons for exportation, without being ſtamped.

Perſons are not liable to penalty for wearing hats ſtamped according to the former act, if they were worn before Aug. 5, 1796; but proof of that, and alſo that the duty has been paid, lies on the owner of the hat.

Perſons offending, diſcovering the other party, if convicted, freed from the penalty.

Stamped linings damaged, or ſtamps under the former act not uſed, may be cancelled by the commiſſioners, and exchanged for others.

Such diſcount to be made on purchaſing ſtamps to the amount of 10l. as the commiſſioners of the Treaſury ſhall direct.

Price of hats in bargains or bills to be diſtinguiſhed from duties.

Hats, not leſs than a dozen in a package, may be exported unlined, or with unſtampt linings.

Perſons counterfeiting ſtamps, &c. guilty of felony.

The pecuniary penalties are to be divided (if ſued for within the ſpace of ſix calendar months), one moiety to his Majeſty and the other to the informer; and may be recovered, with coſts, either in the Court of Exchequer, or before one Juſtice of the Peace, in a ſummary way. And if witneſſes neglect or refuſe to give evidence, the penalty is 5l.

HATTENGEN, a town of Weſtphalia, in the county of Marek, ſeated on the Roer, 17 miles E.N.E. of Duſſeldorp. Long. 7. 14. E. Lat. 51. 17. N.

HATTENHEIM, a town of Germany, in the electorate of Mentz, ſituate on the Rhine, 12 miles W. of Mentz.

HAUENSTEIN, a town of Suabia, capital of a county of the ſame name, in the Auſtrian Briſgau. The county contains rich mines of iron, and is divided into eight communities. The town is ſituate near the Rhine, 13 miles N.W. of Baden.

HAVERING BOWER, a village in Eſſex, three miles N.E. of Rumford. It was once the ſeat of a royal palace, in which died Joan queen of Henry IV.

HAUTE-RIVE, a town of France, in the department of Upper Garonne, ſeated on the Arriege, 10 miles S. of Toulouſe. Long. 1. 26. E. Lat. 43. 26. N.

HAUTVILLIERS, a town of France, in the department of Marne, with a late famous rich abbey. It is ſeated on the Marne, 20 miles S. by E. of Rheims.

HAWICK, a town in Roxburgſhire, ſeated on the Tiviot, amid wooded rocks, cataracts, and bridges, 15 miles S.W. of Kelſo.

HAWKERS *(Encycl.)*. The following are abſtracts from the Acts for granting duties on hawkers, pedlars, and petty chapmen; and for regulating their trade.

By 29 Geo. III. c. 26. from Auguſt 1, 1789, the following duties ſhall be paid by every hawker, pedlar, petty chapman, and every other trading perſon or perſons, going from town to town, or to other men's houſes, and travelling either on foot, or with horſe, horſes, or otherwiſe, in England, Wales, or the town of Berwick-upon-Tweed, carrying to ſell, or expoſing to ſale, any goods, wares, or merchandizes, a duty of 4l. per annum.

Every perſon ſo travelling with a horſe, aſs, or mule, or other beaſt bearing or drawing burthen, the additional ſum of 4l. yearly for each beaſt he or ſhe ſhall ſo travel with, over and above the firſt-mentioned duty of 4l.

Perſons applying for licences to produce a certificate of their good character, ſigned by the clergyman of the pariſh and two reputable inhabitants.

Hawkers are to mark on every pack, box, bag, trunk, caſe, cart, waggon, or other vehicle of conveyance, and every room or ſhop in which they ſhall trade, and likewiſe upon every handbill or advertiſement which they ſhall diſtribute, the words *licenſed hawker*, with the number, name, or other mark of diſtinction, written or printed upon the reſpective licences, in large Roman capitals, under a penalty of 10l. for every offence. Unlicenſed perſons ſo marking their packs, &c. to forfeit 10l.

Hawkers ſelling ſmuggled goods, or goods fraudulently procured, either by themſelves or others, with their privity or knowledge, ſhall forfeit their licences, and for ever be incapable of obtaining a new licence, over and above the penalties inflicted on illegal trafficking.

Nothing herein ſhall authorize any hawker to open a room or ſhop, and expoſe to ſale any goods by retail, in any town, pariſh, or place, not being a houſeholder there, or the ſame not being an uſual place of his abode, or of his carrying on buſineſs, nor to ſell any goods by auction, on the penalty of 50l. for every offence.

Every perſon forging or travelling with a forged or counterfeit licence ſhall forfeit 100l.

Every perſon lending or letting his licence to hire, and every perſon travelling or trading with a borrowed licence, ſhall forfeit 40l. and the licence of the perſon lending it ſhall be from thenceforth forfeited and void, and he or ſhe ſhall be utterly incapable of having any licence again.

It ſhall be lawful for any perſon whatſoever to ſeize and detain any hawker who ſhall be found trading without a licence, or ſhall refuſe to produce to ſuch perſon a licence according to this act, or after being required ſo to do, for a reaſonable time, in order to give notice to a conſtable, headborough, tithingman, or other peace officer, who are hereby required to carry ſuch perſons ſo ſeized, unleſs they ſhall in the mean time produce their reſpective licences, before ſome juſtice of the peace, who upon proof by confeſſion of the party offending, or by the oath of one or more credible witneſſes of the like offence, and no licence being produced by ſuch offender before the ſaid juſtice, he is required by warrant under his hand and ſeal to cauſe the ſaid ſum of 40l. [this is a miſtake in the act, for the penalty of trading without a licence is only 10l.] to be levied by diſtreſs, rendering the overplus, if any, to the owner of the goods, after deducting the charges of the ſaid diſtreſs.

It ſhall and may be lawful for any perſon or perſons authorized by two commiſſioners, ſhewing that ſuch authority, or upon demand of any juſtice of the peace, mayor, conſtable, or other officer of the peace where the hawker ſhall trade, or by any officer of the cuſtoms or exciſe, to demand any hawker found trading to produce a licence according to this act, and upon refuſal, or not having his licence ready to produce, ſhall forfeit 10l. and for non-payment thereof the juſtice may, by 35 Geo. III. c. 91. levy the ſame by diſtreſs and ſale of goods, and in the mean time he may commit the offender to gaol, there to remain until the penalty is levied by diſtreſs, or until the ſame ſhall be paid thereon.

Every conſtable, &c. refuſing to aſſiſt in the execution of this act, ſhall on conviction by the oath of one or more credible witneſs or witneſſes before a juſtice of the peace, forfeit 10l. for each offence.

The clauſes reſtricting hawkers from ſelling in market towns, except on a fair or market day, is repealed by 35 Geo. III. c. 91.

Hawkers, &c. who were licenſed on May 1, 1789, may ſet up, occupy, uſe, or exerciſe, any craft, myſtery, or occupation, in the place where they are reſident inhabitants, though not brought up thereto by apprenticeſhip, and may employ therein perſons who have not been apprentices, notwithſtanding the act of 5 Eliz. and if they ſhall be proſecuted may plead the general iſſue.

Nothing in this act ſhall extend to prohibit any perſons from ſelling any printed papers, licenſed by authority, or any fiſh, fruits, or victuals, nor to hinder any perſons who are the real workers or makers of any goods, wares, or manufactures of Great Britain, or his, her, or their children, apprentices, agents, or ſervants, from carrying abroad, expoſing to ſale, and ſelling by retail or otherwiſe, any of the ſaid goods, wares, or manufactures, in any mart, market, or fair, and in every city, borough, town corporate, and market town; nor any tinkers, coopers, glaziers, plumbers, harneſs-menders, or other perſons uſually trading in mending kettles, tubs, houſehold goods, or harneſs whatſoever, from going about and carrying with him or them proper materials for mending the ſame.

No wholeſale dealer in Britiſh goods, ſelling by wholeſale only from houſe to houſe, to be deemed a hawker.

Penalties above 20l. are to be recovered with coſts in any of his Majeſty's courts of record at Weſtminſter, by action of debt, &c. one moiety to his Majeſty, and the other moiety to the perſon who ſhall inform or ſue for the ſame.

Penalties under 20l. ſhall be recoverable before a juſtice, either by confeſſion of the party, or by oath of one or more credible witneſs or witneſſes, and appropriated as above. And in caſe of non-payment, ſhall be levied by diſtreſs; and if not ſufficient diſtreſs, to be committed to priſon for any term not leſs than one and not exceeding three months.

Perſons aggrieved may appeal to the quarter-ſeſſions.

Witneſſes who ſhall neglect to appear, or refuſe to be examined on oath, ſhall forfeit 10l. Defendants may plead the general iſſue, and recover treble coſts.

HAWKINS (Sir John), was the youngeſt ſon of a man who, though deſcended from the great admiral of that name, followed the buſineſs of a carpenter, though he became afterwards a ſurveyor and builder. He was born in London, March 30, 1719, and educated for his father's profeſſion; having, however, previouſly acquired ſome knowledge of Latin at two different ſchools. He changed his plan after this, and was articled to Mr. John Scott, an eminent attorney and ſolicitor, who, it ſeems, took little pains to make him acquainted with the practice of the law. This marked neglect, however, rather ſharpened the diligence of his pupil, who, by abridging himſelf of his reſt, and devoting all his hours of leiſure to private ſtudy, not only rendered himſelf an able lawyer but acquired a knowledge of general literature, particularly of poetry and muſic, for which he had a natural taſte. More eſpecially to cultivate the latter, in the year 1741, he, with others, inſtituted a muſical club under the name of the *Madrigal Society*; and he afterwards became a member of the Academy of Ancient Muſic.

His advancement in life was greatly promoted by his marriage with the daughter of Peter Stover, eſq. of Highgate, in 1753; and his fortune was a few years afterwards conſiderably augmented by the death of that lady's brother in 1759, on which occaſion he quitted the buſineſs of an attorney. In 1761, on the recommendation of his friend Paul Whitehead, his name was inſerted in the commiſſion of the peace for Middleſex; and he did himſelf much credit, not only as an active and uſeful magiſtrate, but by framing an act of parliament, now in force, for the repair of the highways. In 1763 he aſſiſted Dr. Johnſon, and Sir Joſhua, then Mr. Reynolds, in forming a literary club at the Turk's Head in Gerard-ſtreet. In 1764 he ſtood forward as an oppoſer of the unreaſonable claims, made on the public purſe, by the city of London, on the rebuilding of Newgate. His oppoſition being ſucceſsful, he was afterwards (in 1765) appointed to the vacant ſituation of Chairman of the Quarter-ſeſſions; and in 1772 his activity, as a magiſtrate, in ſuppreſſing riots, at the time of the Middleſex elections, procured him the honour of knighthood. Dr. Johnſon, who, at the commencement of Sir John's profeſſional career as a ſolicitor, had occupied an apartment in his houſe, in Clement's-lane, Lombard-ſtreet, and who had always entertained ſentiments of kindneſs towards him, on making his will, in 1783, appointed him one of his executors. Sir John Hawkins, as a literary character, was more remarkable for induſtry than genius. Beſides contributing to an edition of Shakſpeare by Johnſon and Stevens, he wrote: 1. The Complete Angler. 2. An hiſtory of the Science and Practice of Muſic. 3. The Life and Writings of Dr. Samuel Johnſon, in 11 vols. 8vo.: and alſo many fugitive pieces. He died on the 21ſt of May, 1789, of a palſy, and was interred in the cloiſters of Weſtminſter abbey.

HAWKSHEAD, a town in Lancaſhire, with a market on Monday, 24 miles N.N.W. of Lancaſter, and 273 of London. Long. 3. 6. W. Lat. 54. 24. N.

HAWS-WATER, a lake in Weſtmoreland, S. of Penrith, three miles long, and half a mile over in ſome places. It is almoſt divided in the middle by a promontory of incloſures, ſo that it conſiſts of two ſheets of water.

HAYE, a town of France, in the department of Indre

and Loire. It is the birth-place of Des Cartes, and ſeated on the Creuſe, 25 miles S. of Tours, and 135 S.W. of Paris. Long. 0. 46. E. Lat. 46. 56. N.

HAYLSHAM, a town in Suſſex, with a market on Saturday, 12 miles E. of Lewes, and 58 S.E. of London. Long. 0. 20. E. Lat. 50. 55. N.

HAZEBROUCK, a town of France, in the department of the North, 18 miles W. of Liſle, and 19 S. of Dunkirk. Long. 2. 26. E. Lat. 50. 43. N.

HEADFORD, a town of Ireland, in the county of Galway, 12 miles N. of Galway. Long. 0. 3. W. Lat. 53. 29. N.

HEAD OF ELK, or ELKTON, a town of the United States, in Maryland, ſituate near the head of Cheſapeak Bay, on a ſmall river of its own name. It enjoys great advantages from the carrying trade between Baltimore and Philadelphia, being about 50 miles from each.

HEAN, a town of Tonquin, on the river Domea, 20 miles S. of Cachao, and 80 N. of the bay of Tonquin.

HEAT *(Encycl.)*. The following important obſervations on the uſe of ſteam as a vehicle for conveying heat from one place to another, by Count Rumford, are inſerted in the Journals of the Royal Inſtitution of Great Britain.

"More than fifty years ago," ſays Count Rumford, "Colonel William Cook, in a paper preſented by him to the Royal Society, and publiſhed in their Tranſactions, made a propoſal for warming rooms by means of metallic tubes filled with ſteam, and communicating with a boiler ſituated out of the room; which propoſal was accompanied by an engraving, which ſhewed, in a manner perfectly clear and diſtinct, how this might be effected. Since that time this ſcheme has frequently been put in practice with ſucceſs, both in this country and on the Continent*.—Many attempts have likewiſe been made, at different periods, to heat liquids by means of ſteam introduced into them; but moſt of theſe have failed: and, indeed, until it was known that fluids are non-conductors of heat, and, conſequently, that heat cannot be made to *deſcend* in them (which is a recent diſcovery), theſe attempts could hardly ſucceed; for, in order to their being ſucceſsful, it is abſolutely neceſſary that the tube which conveys the hot ſteam ſhould open into the *loweſt part* of the veſſel which contains the liquid to be heated, or on a level with its bottom; but as long as the erroneous opinion obtained, that heat could paſs in fluids *in all directions*, there did not appear to be any reaſon for placing the opening of the ſteam-tube *at the bottom of the veſſel*, while many were at hand which pointed out other places as being more convenient for it.

"But to ſucceed in heating liquids by ſteam, it is neceſſary, not only that a ſteam ſhould enter the liquid at the bottom of the veſſel which contains it, but alſo that it ſhould enter it *coming from above*. The ſteam-tube ſhould be in a vertical poſition, and the ſteam ſhould *deſcend* through it previous to its entering the veſſel, and mixing with the liquid which it is to heat; otherwiſe this liquid will be in danger of being forced back by this opening into the ſteam-boiler; for the hot ſteam being ſuddenly condenſed on coming into contact with the cold liquid, a vacuum will neceſſarily be formed in the end of the tube; into which vacuum the liquid in the veſſel—preſſed by the whole weight of the incumbent atmoſphere—will ruſh with great force, and with a loud noiſe; but if this tube be placed in a vertical poſition, and if it be made to riſe to the height of ſix or ſeven feet, the liquid which is thus forced into its lower end will not have time to riſe to that height before it will be met by ſteam, and obliged to return back into the veſſel.—There will be no difficulty in arranging the apparatus in ſuch a manner as effectually to prevent the liquid to be heated from being forced backwards into the ſteam boiler; and, when this is done, and ſome other neceſſary precautions to prevent accidents are taken, ſteam may be employed with great advantage for heating liquids; and for keeping them hot, in a variety of caſes, in which fire, applied immediately to the bottoms of the containing veſſels, is now uſed.

"In dyeing, for inſtance, and in brewing, and in the proceſſes of many other arts and manufactures, the adoption of this method of applying heat would be attended not only with a great ſaving of labour and of fuel, but alſo of a conſiderable ſaving of expence in the purchaſe and repairs of boilers, and of other expenſive machinery: for when ſteam is uſed inſtead of fire for heating their contents, boilers may be made extremely thin and light; and, as they may eaſily be ſupported and ſtrengthened by hoops and braces of iron, and other cheap materials, they will coſt but little, and ſeldom ſtand in need of repairs. To theſe advantages we may add others of ſtill greater importance: boilers intended to be heated in this manner may, without the ſmalleſt difficulty, be placed in any part of a room, at any diſtance from the fire, and in ſituations in which they may be approached freely on every ſide. They may moreover eaſily be ſo ſurrounded with wood, or with other cheap ſubſtances, which form warm covering, as moſt completely to confine the heat within them, and prevent its eſcape. The tubes by which the ſteam is brought from the principal boiler (which tubes may conveniently be ſuſpended juſt below the ceiling of the room) may, in like manner, be covered, ſo as almoſt entirely to prevent all loſs of heat by the ſurfaces of them; and this to whatever diſtances they be made to extend.

"In ſuſpending theſe ſteam-tubes, care muſt, however, be taken to lay them in a ſituation *not perfectly horizontal* under the ceiling, but to incline them at a ſmall angle, making them riſe gradually from their junction with the top of a large vertical ſteam-tube, connecting them with the ſteam-boiler, quite to their furtheſt extremities: for, when theſe tubes are ſo placed, it is evident that all the water formed in them, in conſequence of the condenſation of the ſteam in its paſſage through them, will run backwards, and fall into the boiler, inſtead of accumulating in them, and obſtructing the paſſage of the ſteam, which it would not fail to do were there any conſiderable bends or wavings, upwards and downwards, in theſe tubes; or of running forward, and deſcending with the ſteam into the veſſels containing the liquids to be heated, which would happen if theſe tubes inclined *downwards* inſtead of inclining upwards, as they recede from the boiler.

"In order that clear and diſtinct ideas may be formed of the various parts of this apparatus, even without figures, I ſhall diſtinguiſh each part by a ſpecific name: the veſſel in which water is boiled in order to generate ſteam, and which, in its conſtruction, may be made to reſemble the boiler of a ſteam-engine, I ſhall call the *ſteam-boiler*: the vertical tube, which, riſing up from the top of the boiler, conveys the ſteam into the tubes (nearly horizontal) which are ſuſpended from the ceiling of the room, I ſhall call the *prime conductor*: to the horizontal tubes I ſhall give the name of *horizontal con-*

* Although one ſhould naturally imagine that the notoriety of theſe facts would have been ſufficient to prevent all attempts in our days to claim a right to this invention, yet it is ſaid that a patent for it was taken out only a few years ago.

ductors, or ſimply *conductors of ſteam*: and to the (ſmaller) tubes, which, deſcending perpendicularly from theſe *horizontal conductors*, convey the ſteam to the liquids which are to be heated, I ſhall, excluſively, appropriate the appellation of *ſteam-tubes*.

"The veſſels in which the liquids are put that are to be heated I ſhall call the *containing veſſels*.—Theſe veſſels may be made of any form; and, in many caſes, they may, without any inconvenience, be conſtructed of wood, or of other cheap materials, inſtead of being made of coſtly metals, by which means a very heavy expence may be avoided.

"Each *ſteam tube* muſt deſcend perpendicularly from the *horizontal conductor* with which it is connected to the level of the bottom of the *containing veſſel* to which it belongs; and, moreover, muſt be furniſhed with a good braſs cock, perfectly ſteam-tight; which may be beſt placed at the height of about ſix feet above the level of the floor of the room.

"This *ſteam tube* may either deſcend *within the veſſel* to which it belongs, or *on the outſide of it*, as ſhall be found moſt convenient. If it comes down on the outſide of the veſſel, it muſt enter it at its bottom, by a ſhort horizontal bend; and its junction with the bottom of the veſſel muſt be well ſecured, to prevent leakage. If it comes down into the veſſel, on the inſide of it, it muſt deſcend to the bottom of it, or at leaſt to within a very few inches of the bottom of it; otherwiſe the liquid in the veſſel will not be uniformly and equally heated.

"When the ſteam tube is brought down on the inſide of the containing veſſel, it may either come down perpendicularly, and without touching the ſides of it, or it may come down on one ſide of the veſſel, and in contact with it.

"When ſeveral ſteam tubes, belonging to different containing veſſels, are connected with one and the ſame horizontal ſteam conductor, the upper end of each of theſe tubes, inſtead of being ſimply attached by ſoldering to the under ſide of the conductor, muſt enter at leaſt one inch within the cavity of it; otherwiſe the water reſulting from a condenſation of a part of the ſteam in the conductor, by the cold air which ſurrounds it, inſtead of finding its way back into the ſteam boiler, will deſcend through the ſteam tubes and mix with the liquids in the veſſels below; but when the open ends of theſe tubes project upwards within the ſteam conductor, though it be but to a ſmall height above the level of its under ſide, it is evident that this accident cannot happen.

"It is not neceſſary to obſerve here, that, in order that the ends of the ſteam tubes may project within the *horizontal conductor*, the diameters of the former muſt be conſiderably leſs than the diameter of the latter.

"To prevent the loſs of heat ariſing from the cooling of the different tubes through which the ſteam muſt paſs in coming from the boiler, all thoſe tubes ſhould be well defended from the cold air of the atmoſphere, by means of warm covering; but this may eaſily be done, and at a very trifling expence. The horizontal conductors may be incloſed within ſquare wooden tubes, and ſurrounded on every ſide by charcoal duſt,—fine ſaw-duſt,—or even by wool;—and the ſteam tubes, and prime conductor, may be ſurrounded, firſt by three or four coatings of ſtrong paper, firmly attached to them by paſte or glue, and covered with a coating of varniſh, and then by a covering of thick coarſe cloth. It will likewiſe be adviſable to cover the horizontal conductor with ſeveral coatings of paper; for if the paper be put on to them while it is wet with the paſte or glue, and if care be taken to put it on in long ſlips or bands, wound regularly round the tube in a ſpiral line, from one end of it to the other, this covering will be uſeful, not only by confining more effectually the heat, but alſo by adding very much to the ſtrength of the tube, and rendering it unneceſſary to employ thick and ſtrong ſheets of metal in the conſtruction of it.

"However extraordinary and incredible it may appear, I can aſſert it as a fact, which I have proved by repeated experiments, that if a hollow tube, conſtructed of ſheet copper $\frac{1}{20}$ of an inch in thickneſs, be covered by a coating only twice as thick, or $\frac{1}{10}$ of an inch in thickneſs, formed of layers of ſtrong paper, firmly attached to it by good glue, the ſtrength of the tube will be *more than doubled* by this covering. I found by experiments, the moſt unexceptionable and deciſive—of which I intend at ſome future period to give to the public a full and detailed account,—that the ſtrength of paper is ſuch, when ſeveral ſheets of it are firmly attached together with glue, that a ſolid cylinder of this ſubſtance, the tranſverſe ſection of which ſhould amount to only one ſuperficial inch, would ſuſtain a weight of 30,000 lb. avoirdupois, or above 13 tons, ſuſpended to it, without being pulled aſunder or broken. The ſtrength of hemp is ſtill much greater, when it is pulled equally, in the direction of the length of its fibres. I found, from the reſults of my experiments with this ſubſtance, that a cylinder of the ſize above mentioned, compoſed of the ſtraight fibres of hemp, glued together, would ſuſtain 92,000 lb. without being pulled aſunder.

"A cylinder, of equal dimenſions, compoſed of the ſtrongeſt iron I could ever meet with, would not ſuſtain more than 66,000 lb. weight; and the iron muſt be very good not to be pulled aſunder with a weight equal to 55,000 lb. avoirdupois.

"I ſhall not, in this place, enlarge on the many advantages that may be derived from a knowledge of theſe curious facts. I have mentioned them now in order that they may be known to the public; and that ingenious men, who have leiſure for theſe refearches, may be induced to turn their attention to a ſubject, not only very intereſting, on many accounts, but which promiſes to lead to moſt important improvements in mechanics.

"I cannot return from this digreſſion without juſt mentioning one or two reſults of my experimental inveſtigations relative to the force of coheſion, or ſtrength of bodies, which certainly are well calculated to excite the curioſity of men of ſcience.

"The ſtrength of bodies of different ſizes, *ſimilar in form*, and compoſed of the *ſame ſubſtance*,—or the forces by which they reſiſt being pulled aſunder by weights ſuſpended to them, and acting in the direction of their lengths, *are not in the ſimple ratio of the areas of their tranſverſe ſections*, or of their *fractures*;—but in a higher ratio;—and this ratio is different in different ſubſtances.

"The *form* of a body has a conſiderable influence on its ſtrength, *even when it is pulled in the direction of its length*.

"All bodies, even the moſt brittle, appear to be *torn aſunder*, or their particles ſeparated, or fibres broken, *one after the other;* and hence it is evident, that that *form* muſt be moſt favourable to the ſtrength of any given body, pulled in the direction of its length, which enables the greateſt number of its particles, or longitudinal fibres, to be ſeparated to the greateſt poſſible diſtance—ſhort of that at which the force of coheſion is overcome,—before any of them have been forced beyond that limit.

"It is more than probable that the apparent ſtrength of different ſubſtances depends much more on the number of their particles that come into action before any of them are forced beyond the limits of the attraction of coheſion, than on any ſpecific difference in the intenſity of that force in thoſe ſubſtances.

" But to return to the ſubject more immediately under conſideration.—As it is eſſential that the ſteam employed in heating liquids, in the manner before deſcribed, ſhould enter the containing veſſel at, or very near, its bottom, it is evident that this ſteam muſt be ſufficiently ſtrong, or elaſtic, to overcome, not only the preſſure of the atmoſphere, but alſo the additional preſſure of the ſuperincumbent liquid in the veſſel; the ſteam boiler muſt, therefore, be made ſtrong enough to confine the ſteam, when its elaſticity is ſo much increaſed by means of additional heat, as to enable it to overcome that reſiſtance. This increaſe of the elaſtic force of the ſteam need not, however, in any caſe, exceed a preſſure of five or ſix pounds upon a ſquare inch of the boiler, or *one third part, or one half*, of an atmoſphere.

" It is not neceſſary for me to obſerve here, that in this and alſo in all other caſes, where ſteam is uſed as a vehicle for conveying heat from one place to another, it is indiſpenſably neceſſary to provide *ſafety valves* of two kinds;—the one for letting a part of the ſteam eſcape, when, on the fire being ſuddenly increaſed, the ſteam becomes ſo ſtrong as to expoſe the boiler to the danger of being burſt by it;—the other for admitting air into the boiler, when, in conſequence of the diminution of the heat, the ſteam in the boiler is condenſed, and a vacuum is formed in it; and when, without this valve, there would be danger, either of having the ſides of the boiler cruſhed, and forced inwards by the preſſure of the atmoſphere from without; or of having the liquid in the containing veſſels forced upwards into the horizontal ſteam conductors, and from thence into the ſteam boiler. This laſt-mentioned accident, however, cannot happen, unleſs the cocks in ſome of the ſteam tubes happen to be open. The two valves effectually prevent all accidents.

" The reader will, no doubt, be more diſpoſed to pay attention to what has here been advanced, on this intereſting ſubject, when he is informed that the propoſed ſcheme has already been executed on a very large ſcale, and with complete ſucceſs; and that the above details are little more than exact deſcriptions of what actually exiſts.

" A great mercantile and manufacturing houſe at Leeds, that of Meſſrs. Gott and Company, had the courage, notwithſtanding the mortifying prediction of all their neighbours, and the ridicule with which the ſcheme was attempted to be treated, to erect a *dyeing-houſe*, on a very large ſcale indeed, on the principles here deſcribed and recommended.

" On my viſit to Leeds the laſt ſummer, I waited on Mr. Gott, who was then mayor of the town, and who received me with great politeneſs, and ſhewed me the cloth halls, and other curioſities of the place; but nothing he ſhewed me intereſted me half ſo much as his own truly noble manufactory of ſuperfine woollen cloths. I had ſeen few manufactories ſo extenſive, and none ſo complete in all its parts. It was burnt to the ground the year before I ſaw it, and had juſt been rebuilt on a larger ſcale; and with great improvements in almoſt every one of its details. The reader may eaſily conceive, that I felt no ſmall degree of ſatisfaction on going into the dyeing-houſe, to find it fitted up on principles which I had ſome ſhare in bringing into repute, and which Mr. Gott told me he had adopted in conſequence of the information he had acquired in the peruſal of my *ſeventh* eſſay. He aſſured me that the experiment had anſwered, even far beyond his moſt ſanguine expectations; and, as a ſtrong proof of the utility of the plan, he told me, that his next-door neighbour, who is a dyer by profeſſion, and who, at firſt, was ſtrongly prejudiced againſt theſe innovations, has lately adopted them, and is now convinced that they are real improvements. Mr. Gott aſſured me that he had no doubt but that they would be adopted by every dyer in Great Britain in the courſe of a very few years.

" The dyeing-houſe of Meſſrs. Gott and Company, which is ſituated on the ground-floor of the principal building of the manufactory, is very ſpacious, and contains a great number of coppers of different ſizes; and as theſe veſſels, ſome of which are very large, are diſtributed about promiſcuouſly, and apparently without any order in their arrangement, in two ſpacious rooms,—each copper appearing to be inſulated, and to have no connection whatever with the others,—all of them together form a ſingular appearance. The rooms are paved with flat ſtones, and the brims of all the coppers—great and ſmall—are placed at the ſame height—about three feet above the pavement: ſome of theſe coppers contain upwards of 1800 gallons; and they are all heated by ſteam from one ſteam boiler, which is ſituated in a corner of one of the rooms.

" The horizontal tubes which ſerve to conduct the ſteam from the boilers to the coppers are ſuſpended juſt below the ceiling of the rooms: they are made—ſome of lead—and ſome of caſt-iron; and are from four to five inches in diameter; but when I ſaw them, they were naked, or without any covering to confine the heat. On my obſerving to Mr. Gott that covering for them would be uſeful, he told me that it was intended that they ſhould be covered, and that coverings would be provided for them.

" The vertical *ſteam tubes*, by which the ſteam paſſes down from the horizontal *ſteam conductors* into the coppers, are all conſtructed of lead, and are from $\frac{3}{4}$ of an inch to $2\frac{1}{2}$ inches in diameter; being made larger or ſmaller, according to the ſizes of the coppers to which they belong. Theſe ſteam tubes all paſs down on the *outſides* of their coppers, and enter them horizontally at the level of their bottoms. Each copper is furniſhed with a braſs cock, for letting off its contents; and it is filled with water from a ciſtern at a diſtance, which is brought to it by a leaden pipe. The coppers are all ſurrounded by thin circular brick walls, which ſerve not only to ſupport the coppers, but alſo to confine the heat.

" The rapidity with which theſe coppers may be heated, by means of ſteam, is truly aſtoniſhing. Mr. Gott aſſured me that one of the largeſt of them, containing upwards of 1800 gallons, when filled with cold water from the ciſtern, requires no more than *half an hour* to heat it till it actually boils! —By the greateſt fire that could be made under ſuch a copper, with coals, it would hardly be poſſible to make it boil in leſs than an hour.

" It is eaſy to perceive, that the *ſaving of time* which will reſult from the adoption of this new mode of applying heat will be very great;—and it is likewiſe evident, that it may be increaſed, almoſt without limitation, merely by augmenting the diameter of the ſteam tube: care muſt, however, be taken that the boiler be ſufficiently large to furniſh the quantities of ſteam required.—The *ſaving of fuel* will alſo be very conſiderable: Mr. Gott informed me, that, from the beſt calculation he had been able to make, it would amount to near two-thirds of the quantity formerly expended, when each copper was heated by a ſeparate fire.

" But theſe ſavings are far from being the only advantages that will be derived from the introduction of theſe improvements in the management of heat: there is one, of great importance indeed—not yet mentioned—which alone would be ſufficient to recommend the very general adoption of them. —As the heat communicated by ſteam can never exceed the mean temperature of boiling water by more than a very few degrees, the ſubſtances expoſed to it can never be injured by it. In many arts and manufactures this circumſtance will be

productive of great advantages, but in none will its utility be more apparent than in cookery; and eſpecially in public kitchens,—where great quantities of food are prepared in large boilers; for, when the heat is conveyed in this manner, all the labour now employed in ſtirring about the contents of thoſe boilers, to prevent the victuals from being ſpoiled by the burning to the bottoms of them, will be unneceſſary; and the loſs of heat occaſioned by this ſtirring prevented; and, inſtead of expenſive coppers, or metallic boilers, which are difficult to be kept clean, and often ſtand in need of repairs—common wooden tubs may, with great advantage, be uſed as culinary veſſels; and their contents may be heated by *portable fire-places*, by means of ſteam boilers attached to them.

"As theſe portable fire-places and their ſteam boilers may, without the ſmalleſt inconvenience, be made of ſuch weight, form, and dimenſions, as to be eaſily tranſported from one place to another by two men, and be carried through a doorway of the common width—with this machinery, and the ſteam tubes belonging to it, and a few wooden tubs—a complete public kitchen, for ſupplying the poor and others with ſoups, and alſo with puddings, vegetables, meat, and all other kinds of food prepared by *boiling*, might be eſtabliſhed in half an hour, in any room, in which there is a chimney (by which the ſmoke from the portable fire-place can be carried off); and, when the room ſhould be no longer wanted as a kitchen, it might, in a few minutes, be cleared of all this culinary apparatus, and made ready to be uſed for any other purpoſe.

"This method of conveying heat is peculiarly well adapted for heating baths: it is likewiſe highly probable that it would be found uſeful in the bleaching buſineſs, and in waſhing linen. It would alſo be very uſeful in all caſes where it is required to keep any liquid at about the boiling point for a long time without making it boil; for the quantity of heat admitted may be very nicely regulated by means of the braſs cock belonging to the ſteam tube. Mr. Gott ſhewed me a boiler in which ſhreds of ſkins were digeſting in order to make glue, which was heated in this manner; and in which the heat was ſo regulated, that, although the liquid never actually boiled, it always appeared to be upon the very point of beginning to boil.

"This temperature had been found to be beſt calculated for making good glue. Had any other *lower* temperature been found to anſwer better, it might have been kept up with the ſame eaſe, and with equal preciſion, by regulating properly the quantity of ſteam admitted.

"I need not ſay how much this country is obliged to Mr. Gott, and his worthy colleagues.—To the ſpirited exertions of ſuch men—who abound in no other country—we owe one of the proudeſt diſtinctions of our national character;—that of being *an enlightened and an enterpriſing people*."

For the method of applying heat by ſteam in houſes, &c. ſee the articles HOT-HOUSE and HOT-BED in this SUPPLEMENT.

HEBRON, a town of Paleſtine, ſituated partly on a hill and partly on a plain. The Chriſtians have a church here, which they ſay contains the tombs of Abraham and Sarah, to which the Mahometans, as well as Chriſtians, come in pilgrimage. The valley or plain of Mamre is not far from Hebron; it is fertile, and planted with excellent vineyards. Conſtantine built a church here, the walls of which are yet in exiſtence: eight leagues S.W. Jeruſalem.

HECHINGEN, a town of Germany, in the circle of Swabia, which gives name to a branch of the family of Hohenzoltern, and is the reſidence of the prince; 30 miles S. Stuttgart, and 52 E.S.E. Straſburg.

HEDEMORA, a town of Sweden, in the province of Dalecarlia, and one of the principal towns of the kingdom, ſituated near a lake, well built and commercial. Here is a large manufacture of gunpowder: 53 miles N.W. Upſal. Long. 16. E. Greenwich. Lat. 60. 17. N.

HEDGE *(Encycl.)*. The late Mr. Bakewell was remarkably curious in his fences: he uſed to plant one row at the diſtance of a foot from ſet to ſet; and, after making the ditch, to lay the earth dug out of it, ſo as to form a bank on the ſide oppoſite to the quick. In other parts of England, the bank is made on the ſide of the quick above it. The advantage of Mr. B.'s method is, that the plants grow only in the *ſurface-earth*, not ſecluded from the atmoſphere; whereas, in the common practice, the beſt earth is generally loaded by a thick covering of mud taken from the ditch, and placed obliquely on the bank. There is, however, a conſiderable waſte of land in the former method: for, after the whole was thus formed, he uſually added a double poſt and rail; one on the outſide of ſuch bank, and the other on the outſide of the quick.

Hedges deſigned for ornament in gardens, are ſometimes planted with evergreens, among which the holly is preferable to any other; next in rank is the yew, but the dead colour of its leaves renders ſuch hedges leſs agreeable. The laurel is another plant that may be employed as a fence for gardens; as it is one of the moſt beautiful evergreens; but it ſhoots forth with ſuch luxuriance, that it is very difficult to confine it to any ſhape: its leaves, too, are very large, and, if cut through with the ſheers, preſent a very diſagreeable appearance: hence they ought to be pruned with a knife, and the ſhoots exactly cut down to each leaf.

In the 3d vol. of the *Tranſactions of the Society for the Encouragement of Arts*, &c. Mr. Leatham, of Barton, gives an account of his method of planting quickſet hedges on dry, gravelly, or *thin* ſoils. He conſiders the cauſes which render ſuch hedges very indifferent, to be—1. That they are ſet too low or flat on the ſurface, to allow the roots to ſtrike deeply into the ſoil. 2. That, when planted higher, they are generally too near the ſlope of the bank, and thus cannot receive the benefit of the rain. To remedy theſe inconveniences, two lines are marked out, 12 feet apart; the upper part of the ſoil is taken from three feet within each line, and thrown into the centre of the ſpace, ſo as to form a flat bed, three feet in breadth, in the midſt of which the quicks are planted; the remaining ſpace of 18 inches on each ſide is filled up with the earth, gravel, or ſand taken out of the ditches on both ſides, by which means the bed is extended to five feet, allowing ſix inches for the ſlope of the bank. Quicks, thus planted, will find ſufficient nouriſhment in the ſoil, before the tap-root reaches the barren gravelly bottom; and the earth thus placed, will retain moiſture enough to nouriſh the plants; ſo that they will in a ſhort time form an excellent fence, which, by elevating the bank on each ſide at pleaſure, may be protected at a ſmall expence from the ill effects of ſharp winds, or the air of the ſea. Mr. Leatham obſerves, that the ſpace, on ſuch low-priced ground, is but ſmall; and, as a good thriving fence is obtained, it amply compenſates the expences. A hedge, conſtructed according to the dimenſions above ſtated, coſt him fifteen pence per rod of ſeventy yards in length.

In the 1ſt vol. of the *Letters and Papers of the Bath and Weſt of England Society*, we meet with a communication, in which *elms* are recommended for fences. When elm-timber is felled in the ſpring, the chips made in trimming the trees are to be ſown on a piece of newly-ploughed land, and harrowed in, as is practiſed with corn. Every chip, that has an

eye or bud, will ſpeedily ſhoot like the cuttings of potatoes; and, as ſuch plants have no tap-roots, but ſtrike their fibres horizontally in the richeſt part of the ſoil, they will be more vigorous, and may be more eaſily tranſplanted, than if they had been raiſed from ſeeds, or in any other manner. They poſſeſs this further advantage, that five or ſix ſtems will generally riſe from the ſame chip; and, after being cut down to within three inches of the ground, they will multiply their ſide-ſhoots in proportion, and form a thicker hedge, without running to naked wood, than by any other method hitherto practiſed. Laſtly, if they be kept carefully clipped for the firſt three or four years, they are ſaid to become almoſt impenetrable.

In the ſecond volume of the ſame inſtructive work, we find another communication on the ſubject of hedges; and the great advantages that might be derived from them, by planting cyder-fruit-trees. If a judicious mixture of ſuch trees were ſet in hedges, the profit they afford would amply compenſate the expences incurred, without any loſs of ground. And, as the beſt kinds of this fruit are ſo extremely ſour at the proper ſeaſon of gathering, that even hogs will ſcarcely touch them, depredations are not to be apprehended.

Having already treated on FENCES, we ſhall only add, that thoſe of our readers who wiſh to acquire a more complete information on the ſubject, may with advantage peruſe the firſt and ſecond volumes of Dr. Anderſon's *Eſſays on Agriculture*, in which it is fully diſcuſſed, and the plants beſt calculated for making hedges are judiciouſly pointed out.

HEILIGE-LAND, an iſland of the German Ocean, between the mouths of the Eyder and the Elbe. It belongs to the king of Denmark. Long. 8. 20. E. Lat. 54. 21. N.

HEILIGENBERG, a town of Germany, in the archduchy of Auſtria: 1 mile N. Rotz.

HEILIGENSTADT, a town of Germany, capital of the territory of Etchſet, belonging to the elector of Mentz. It is ſeated at the confluence of the Geiſland and Leina, 30 miles N.W. of Eiſenach. Long. 10. 14. E. Lat. 51. 22. N.

HEILSBRUNN, a town of Franconia, in the principality of Anſpach, with a medical ſpring, 10 miles E.N.E. of Anſpach, and 16. S.W. of Nuremberg.

HEIRSHIP MOVEABLES, in Scots law, the beſt of certain kinds of moveables, which the heir of line is entitled to take, beſides the heritable eſtate.

HELL-GATE, a celebrated ſtrait near the W. end of Long Iſland Sound, eight miles E. of New York. It is remarkable for its whirlpools, which are occaſioned by the narrowneſs and crookedneſs of the paſs, and a bed of rocks extending quite acroſs; but, at proper times of the tide, a ſkilful pilot may conduct a ſhip of any burthen through this ſtrait.

HELMERSHAUSEN, a town of Germany, in the principality of Heſſe-Caſſel, 19 miles W. of Gottingen, and 22 N. of Caſſel. Long. 9. 32. E. Lat. 51. 32. N.

HELMONT, a town of Dutch Brabant, with a ſtrong caſtle, ſeated on the Aa, 17 miles S.E. of Bois-le-Duc. Long. 5. 37. E. Lat. 51. 31. N.

HELZSTADT, a town of Upper Saxony, in the county of Mansfield, 9 miles N. of Eiſleben, and 16. S.E. of Quedlinburg. Long. 12. 14. E. Lat. 51. 47. N.

HEMATH, or HAMATH (anc. geog.), the name of a city (whoſe king was David's friend, 2 Sam. ix.) to the ſouth of Lebanon; from which a territory was called *Nemath*, on the north of Canaan and ſouth of Syria, as appears by the ſpies, Numb. xiii. 1 Kings viii. Ezek. xlvii. Whether one or more cities and diſtricts of this name lay in this tract, neither interpreters nor geographers are agreed. The eaſtern part was called *Hemath-zoba*, 2 Chron. viii. unleſs we ſuppoſe that there was a city in *Zoba* of this name fortified by Solomon. In defining the boundary of Paleſtine, it is often ſaid, *from the entering of Hamath*; as a province to be entered into through a ſtrait or defile. And if there was ſuch, the next queſtion is, from what metropolis it was called *Hemath?* Antioch, capital of Syria, is ſuppoſed to be called *Hemath* or *Amatha* (Jonathan, Targum, &c.); and again *Epiphania*, (Joſephus). Both were to the north of Lebanon; conſequently not the *Hemath* of Scripture, the immediate boundary of Paleſtine to the north, and lying to the ſouth of Lebanon.

HEMMENDORF, a town of Lower Saxony, in the principality of Calenberg, ſituate on the Saale, 12 miles E. of Hamelin.

HENRY IV. emperor of Germany in 1056, ſtyled *the Great*, was memorable for his quarrels with Pope Gregory II. whom at one time he depoſed, for having preſumed to judge his ſovereign; but at another, dreading the effects of the papal anathemas, he had the weakneſs to ſubmit to the moſt humiliating perſonal ſolicitations and penances to obtain abſolution, which impolitic meaſure increaſed the power of the pope, and alienated the affections of his ſubjects: thus circumſtanced, he re-aſſumed the hero, but too late; marched with an army to Rome, expelled Gregory, depoſed him, and ſet up another pope. Gregory died ſoon after: but Urban II. and Paſcal II. ſucceſſively excited his ambitious ſons, Conrad and Henry, to rebel againſt him, and the latter was crowned emperor by the title of Henry V. in 1106; and he had the inhumanity to arreſt his father, and to deprive him, not only of all his dignities, but even of the neceſſaries of life. The unfortunate Henry IV. was reduced to ſuch extremities (after having fought 62 battles in defence of the German empire), that he ſolicited the Biſhop of Spire to grant him an under-chaunter's place in his cathedral, but was refuſed. He died the ſame year, at Liege, aged 55, a martyr to the ignorance and ſuperſtition of the age, and to his own blind confidence in favourites and miſtreſſes.

HENRY IV. king of France (in 1589) and Navarre, juſtly ſtyled *the Great*, was the ſon of Anthony de Bourbon, chief of the branch of Bourbon (ſo called from a fief of that name which fell to them by marriage with the heireſs of the eſtate). His mother was the daughter of Henry de Albert, king of Navarre; a woman of a maſculine genius; intrepid, ſimple, and ruſtic in her manners, but deeply verſed in politics, and a zealous proteſtant. Foreſeeing that her party would want ſuch a protector (for her huſband was a weak indolent prince), ſhe undertook the care of the education of the young hero: his diet was coarſe; his clothes neat, but plain; he always went bare-headed; ſhe ſent him to ſchool with the other children of the ſame age, and accuſtomed him to climb the rocks and neighbouring mountains, according to the cuſtom of the country. He was born in 1553; and in 1569, the 16th year of his age, he was declared the Defender and Chief of the Proteſtants at Rochelle. The peace of St. Germain, concluded in 1570, recalled the lords in the Proteſtant intereſt to court; and in 1572 Henry was married to Margaret de Valois, ſiſter to Charles IX. king of France. It was in the midſt of the rejoicings for theſe nuptials, that the horrid maſſacre of Paris took place. Henry was reduced, by this infernal ſtroke of falſe policy, to the alternative of changing his religion or being put to death: he choſe the former, and was detained priſoner of ſtate three years. In 1587 he made his eſcape; put himſelf at the head of the Huguenot party, expoſing himſelf to all riſks and fatigues of a religious war, and enduring all the hardſhips of the common ſoldier: but he gained a victory this year at Courtras, which eſtabliſhed his reputation in arms, and endeared him to the Proteſtants. On the death of Henry III. religion was urged as a pretext for

one half of the officers of the French army to reject him, and for the leaguers not to acknowledge him. A phantom, the Cardinal de Bourbon, was ſet up againſt him; but his moſt formidable rival was the Duke de Mayenne: however, Henry, with few friends, fewer important places, no money, and a very ſmall army, ſupplied every want by his activity and valour. He gained ſeveral victories over the duke; particularly that of Ivri in 1590, memorable for his heroic admonition to his ſoldiers: "If you love your enſigns, rally by my white plume, you will always find it in the road to honour and glory." Paris held out againſt him, notwithſtanding his ſucceſſes: he took all the ſuburbs in one day; and might have reduced the city by famine, if he had not humanely ſuffered his own army to relieve the beſieged: yet the bigotted friars and prieſts in Paris all turned ſoldiers, except four of the Mendicant order; and made daily military reviews and proceſſions, the ſword in one hand and the crucifix in the other, on which they made the citizens ſwear rather to die with famine than to admit Henry. The ſcarcity of proviſions in Paris at laſt degenerated to an univerſal famine; bread had been ſold, whilſt any remained, for a crown the pound, and at laſt it was made from the bones of the charnel-houſe of St. Innocents: human fleſh became the food of the obſtinate Pariſians, and mothers ate the dead bodies of their children. In fine, the Duke of Mayenne, ſeeing that neither Spain nor the league would ever grant him the crown, determined to aſſiſt in giving it to the lawful heir. He engaged the ſtates to hold a conference with the chiefs of both parties; which ended in Henry's abjuration of the Proteſtant religion at St. Denis, and his conſecration at Chartres in 1593. The following year Paris opened its gates to him; in 1596, the Duke of Mayenne was pardoned; and in 1598, peace was concluded with Spain. Henry now ſhewed himſelf doubly worthy of the throne, by his encouragement of commerce, the fine arts, and manufactures, and by his patronage of men of ingenuity and ſound learning of every country: but though the fermentations of Romiſh bigotry were calmed, the leaven was not deſtroyed; ſcarce a year paſſed without ſome attempt being made on this real father of his people; and at laſt the monſter Ravaillac ſtabbed him to the heart in his coach, in the ſtreets of Paris, on the 14th of May, 1610, in the 57th year of his age, and 22d of his reign.

HENRY, *of Huntingdon*, an Engliſh hiſtorian, of the 12th century, was canon of Lincoln, and afterwards archdeacon of Huntingdon. He wrote, 1. A Hiſtory of England, which ends with the year 1154. 2. A continuation of that of Bede. 3. Chronological tables of the kings of England. 4. A ſmall treatiſe on the contempt of the world. 5. Several books of epigrams and love-verſes. 6. A poem on herbs: all which are written in Latin.—His invocation of Apollo and the goddeſſes of Tempe, in the exordium of his poem on herbs, may not be unacceptable as a ſpecimen of his poetry:

Vatum magne parens, herbarum Phœbe repertor.
Voſque, quibus reſonant Tempe jocoſa Deæ!
Si mihi ſerta prius hedera florente paraſtis,
Ecce meos flores, ſerta parate fero.

HENRY, *of Suſa*, in Latin *de Segusio*, a famous civilian and canoniſt of the 13th century, acquired ſuch reputation by his learning, that he was called *the ſource and ſplendor of the law*. He was archbiſhop of Embrun about the year 1258, and cardinal biſhop of Oſtia in 1262. He wrote *A ſummary of the canon and civil law*; and *A commentary on the book of the decretals*, compoſed by order of Alexander IV.

HENRY (Matthew), an eminent diſſenting miniſter and author, was the ſon of Philip Henry, a nonconformiſt miniſter, and was born in the year 1662. He continued under his father's care till he was 18 years of age; in which time he became well ſkilled in the learned languages, eſpecially in the Hebrew, which his father had rendered familiar to him from his childhood; and from firſt to laſt the ſtudy of the ſcriptures was his moſt delightful employment. He completed his education in an academy kept at Iſlington by Mr. Doolittle, and was afterwards entered in Gray's-Inn for the ſtudy of the law; where he became well acquainted with the civil and municipal law of his own country, and from his application and great abilities it was thought he would have become very eminent in that profeſſion. But at length, reſolving to devote his life to the ſtudy of divinity, in 1686 he retired into the country, and was choſen paſtor of a congregation at Cheſter, where he lived about 25 years, greatly eſteemed and beloved by his people. He had ſeveral calls from London, which he conſtantly declined; but was at laſt prevailed upon to accept an unanimous invitation from a congregation at Hackney. He wrote, 1. Expoſitions of the Bible, in 5 vols. folio. 2. The Life of Mr. Philip Henry. 3. Directions for daily Communion with God. 4. A Method for Prayer. 5. Four Diſcourſes againſt Vice and Immorality. 6. The Communicant's Companion. 7. Family Hymns. 8. A Scriptural Catechiſm; and, 9. A Diſcourſe concerning the Nature of Schiſm. He died of an apoplexy at Nantwich, when upon a journey, in 1714; and was interred at Trinity-church, in Cheſter.

HEPPENHEIM, a town of Germany, in the electorate of Mentz, with a caſtle and an abbey; ſeated between Heidelberg and Darmſtadt, about 14 miles from each. Long. 8. 41. E. Lat. 49. 29. N.

HERAT, a town of Perſia, in the province of Koraſan, 160 miles S. E. of Mechid. Long. 61. 0. E. Lat. 34. 30. N.

HERAULT, one of the 83 departments of France, ſo named from a river which falls into the gulf of Lyons. It includes part of the late province of Languedoc: and the capital of Montpellier.

HERBEMONT, a town of the Auſtrian Netherlands, in the duchy of Luxemburg, with a caſtle ſeated on a mountain, near the river Semoy, three miles from Chiney.

HERBAL (*Encycl.*). Among the different methods adopted by botaniſts, for obtaining a HORTUS SICCUS, the following appear to be the moſt practicable:

1. Lay the plants flat between papers; then place them between two ſmooth plates of iron ſcrewed together at the corners: in this ſtate they are to be committed to a baker's oven for two hours. After being taken out, they muſt be rubbed over with a mixture conſiſting of equal parts of brandy and vinegar, then paſted down on paper with a ſolution of gum-tragacanth in water, after which they are to be laid in a book, where they will adhere, and retain their original freſhneſs.—Although this proceſs was ſuggeſted by Sir R. Southwell, in the 237th Number of the *Philoſophical Tranſactions of the Royal Society*, yet the following method is more ſimple:

2. Flatten the plant, by paſſing a common ſmoothing iron over the papers between which it is placed; and dry it ſlowly in a ſand-heat. For this purpoſe, the cold ſand ought to be ſpread evenly, the ſmoothened plant laid gently on it, and ſand ſifted over ſo as to form a thick bed; the fire is then to be kindled, and the whole proceſs carefully watched, till the plant is gradually and perfectly dried.—Thus, the colour of the tendereſt herb may be preſerved, and the moſt delicate flowers retain all their priſtine beauty.

3. Another, and far more complete method, was ſuggeſted by the ingenious Mr. Whately; and bears a ſlight reſemblance

to that laſt ſpecified. He directs thoſe who intend to follow his plan, previouſly to procure—1. A ſtrong oak-box of the ſame ſize and ſhape as thoſe employed for packing up tin plates: 2. A quantity of fine ſifted ſand, ſufficient to fill the box: 3. A conſiderable number of pieces of pliant paper, from one to four inches ſquare; and, 4. Some ſmall flat leaden weights, and a few ſmall, bound books.

He then directs the ſpecimen of the plant intended for the herbal to be gathered, when dry and in full bloom, with all its parts as perfect as poſſible, and conveyed home in a tin box, well ſecluded from the air. The plant is firſt to be cleared from the ſoil as well as the decayed leaves, and then laid on the inſide of one of the leaves of a ſheet of common cap-paper. The upper leaves and flowers are next to be covered, when expanded, by pieces of the prepared paper, and one or two of the leaden weights placed on them. The remainder of the plant is now to be treated in a ſimilar manner.

The weights ought next to be gently removed, and the other leaf of the ſheet of paper folded over the oppoſite one, ſo as to contain the looſe pieces of paper and plants between them. A book or two is now to be applied to the outſide of the paper, till the intended number of plants is thus prepared; when a box is to be filled with ſand to the depth of an inch, one of the plants put in, and covered with ſand ſufficient to prevent the form of the plant from varying. The other plants may then be placed in ſucceſſion, and likewiſe covered with a layer of ſand, one inch thick between each; after which the whole is to be gently preſſed down in a greater or leſs degree, according to the tenderneſs or firmneſs of the plants.

The box is next to be carefully placed before a fire, one ſide being occaſionally a little raiſed, as may be moſt convenient; the ſides being alternately preſented to the fire, two or three times in the day; or, the whole may be put into an oven gently heated. In the courſe of two or three days, the plants will be perfectly dry, when the ſand ought to be taken out, and put into another box: the plants ſhould likewiſe be removed to a ſheet of writing paper.

This method of preſerving plants, Mr. Whately ſtates to to be preferable to every other, as both the flowers and leaves, if kept looſely within the paper, in a dry room, without being expoſed to the air, will retain their beauty for ſeveral years. It will, however, be neceſſary to inſpect them once in the courſe of a year, for the purpoſe of deſtroying any ſmall inſects, that may accidentally breed among the plants.

HERBORN, a town of Germany, in the circle of the Upper Rhine and territory of Naſſau, with a famous univerſity and woollen manufacture; 8 miles S. W. of Dillenburg. Long. 8. 20. E. Lat. 50. 40. N.

HERETABLE RIGHTS, in Scots law, all rights affecting lands, houſes, &c. or any immoveable ſubject.

HERETAGE, in Scots law, lands, houſes, or any immoveable ſubject, in contradiction to moveables or moveable ſubjects. It alſo ſometimes ſignifies ſuch immoveable property as a perſon ſucceeds to as heir to another, in contradiſtinction to that which he himſelf purchaſes or acquires in any other manner, called *conqueſt*.

HERICOUR, a town of France, in the department of Upper Saone, 11 miles S. E. of Lure, and 23 E. of Veſoul. Long. 6. 28. E. Lat. 47. 34. N.

HERMBACH, a town of Weſtphalia, in the duchy of Juliers, 17 miles S. of Juliers. Long. 6. 20. E. Lat. 50. 42. N.

HERMUS (*Encycl.*). Erroneouſly ſpelt HERMES.

HERNHUT, a famous place in Upper Luſatia, in the territory of the elector of Saxony, between Zittaw and Loebau. Here, in 1722, ſome perſecuted Moravian brethren (deſcendants of the church of the ancient United Brethren, eſtabliſhed in Bohemia and Moravia, as early as the year 1456) ſettled in the fields of the village of Berthelſdorf, belonging to count Zinzendorf, and began to build another village. They were joined by ſome Proteſtants, who had been bred in other ſocieties. They all agreed in adopting the confeſſion of Augſburg, and lived as brethren, without quarrelling about particular ſentiments; and when, after ſome time, the number of thoſe admitted from other Proteſtant churches, became greater than the number of the Moravian brethren, they took the name of Evangelical Brethren, or the Brethren's Unity of the Augſburg Confeſſion. They conſidered Count Zinzendorf as their biſhop and father, and were, for ſome time, called Hernhutters, as this place continued their principal nurſery. There were afterward extended into many different countries; were introduced into America, in 1741, by Count Zinzendorf, and ſettled at Bethlehem in Pennſylvania. Their ſocieties, which are now numerous in that country, afford the moſt pleaſing examples of piety and virtue. See BETHLEHEM, LITIZ, and NAZARETH.

HEROD, falſly ſtyled *the Great*, king and execrable tyrant of Judæa; who, on the ſtrength of a miſinterpreted prophecy, cauſed all the male children of Bethlehem and its neighbourhood to be maſſacred by his ſoldiers at the time of the birth of Chriſt, in the vain hope of deſtroying the Saviour of mankind. He died, eaten with worms, two or three years after the birth of our Saviour, at the age of 71, after a reign of 40 years. He had ordered that all the perſons of quality, whom he kept in priſon, ſhould be maſſacred the moment the breath was out of his body, in order that every conſiderable family in the kingdom might ſhed tears at his death; but that inhuman order was not executed.

HEROLDSBERG, a town of Franconia, in the territory of Nuremberg, 7 miles N.N.E. of Nuremberg.

HERRIEDEN, a town of Franconia, in the biſhopric of Aichſtet, ſituate on the Altmuhl, 5 miles S.W. of Anſpach. Long. 10. 40. E. Lat. 49. 10. N.

HERSTAL, a town of Germany, in the biſhopric of Liege, with an ancient caſtle, ſeated on the Maeſe, 3 miles N. of Liege. Long. 5. 40. E. Lat. 50. 40. N.

HERZEGOVINA, a fortified town of Turkiſh Dalmatia, capital of a duchy of the ſame name, and the reſidence of a Turkiſh governor. It is 80 miles S.S.W. of Belgrade.

HEURNIUS, or VAN HEURN (John), a learned phyſician, was born at Utrecht, in 1543; and ſtudied at Louvain, Paris, Padua, and Pavia. At his return to his native country he became magiſtrate of Amſterdam; after which he was profeſſor of phyſic at Leyden, and rector of the univerſity of that city, where he died in 1601. He wrote, among other works, ſeveral treatiſes on the diſeaſes of different parts of the body, and ſeveral commentaries on the works of Hippocrates. *Otho Heurnius*, his ſon, was alſo profeſſor of phyſic at Leyden, and wrote ſome books.

HEYLESEM, a town of Auſtrian Brabant, 14 miles S.E. of Louvain. Long 5. 7. E. Lat. 50. 45. N.

HEYMERISEN, a town of Germany, in the electorate of Cologne, ſituate on the Erft, 30 miles E. of Aix la Chapelle. Long. 6. 37. E. Lat. 10. 46. N.

HEYTESBURY, a borough in Wilts, that ſends two members to Parliament, but has now no market. It is 20 miles N.W. of Saliſbury, and 93 W. by S. of London. Long. 2. 8. W. Lat. 51. 12. N.

HILLIGENHAVEN, a town of Lower Saxony, in the duchy of Holſtein, ſituate on the Baltic, 37 miles N. of Lubec.

HILLSBOROUGH, a town of N. Carolina, 180 miles W. by N. of Newbern.

HINDIA, a town of the Deccan of Hindooſtan, capital of a diſtrict of the ſame name, in the county of Candeiſh. It is ſituate on the Nerbudda, 90 miles N.N.E. of Burhampour. Long. 77. 10. E. Lat. 22. 35. N.

HINLOPEN, ſee HINDELOPEN.

HINTERGERSDORF, a town of Upper Saxony, in the circle of Erzgeburg, eight miles E. of Freyburg.

HIORRING, a town of Denmark, in N. Jutland, once the ſee of a biſhop, but the biſhopric was removed to Alburg, by Frederic II. It is 27 miles N.N.W. of Alburg. Long. 9. 38. E. Lat. 57. 2. N.

HIRSH-HORN, a town of Germany, in the palatinate of the Rhine, with a caſtle. It is ſeated on the ſide of a hill, on the Neckar, near Eberbach.

HIRSCHOLM, a town of Denmark, in the iſland of Zealand, 12 miles N. of Copenhagen.

HISSAR, a town of Hindooſtan Proper, capital of a diſtrict of the ſame name, in the country of Delhi. It is ſeated near the river Surſoory, 112 miles W.N.W. of Delhi. Long. 75. 40. E. Lat. 29. 5. N.

HOANG-TCHEOU, a city of China of the firſt rank, in the province of Hou quang, on the Yang-tſe: 585 miles S. of Peking. Long. 132. 12. E. Ferro. Lat. 38. 28. N.

HOANG-TCHEOU, a town of the kingdom of Corea, in the province of Hoang-hai: eighty-five miles N.N.W. King-ki-tao. Long. 143. 38. E. Ferro. Lat. 38. 42. N.

HOEING (*Encycl.*). Under HUSBANDRY we have ſpoken fully on the practice of hoeing.

In order further to facilitate this important object, we ſhall preſent to our readers three hand-hoes, much ſuperior to thoſe in common uſe, and which, from their ſimplicity, deſerve to be more generally known. See Plate 33. where fig. 1. is the *Portugueſe hoe*, lately deſcribed and recommended by Lord Somerville.

The handle of this implement is from three feet to three feet four inches in length; and, as it is both light and ſhort, it is peculiarly calculated for ſtrong lands and mountainous ſituations; becauſe the hoe, by its weight and pointed form, cuts deeply into earth, without requiring much exertion.

Fig. 2. Is the *Horſe-ſhoe hoe*, invented by Mr. Mark Ducket, of Eſher, Surrey:

This hoe is furniſhed with a ring or loop, as there repreſented, near the bottom of the handle, for holding a ſtrap, which is faſtened round the waiſt of the perſons at work, as they walk backwards. It is eminently uſeful for cleaning crops of every deſcription, whether *drilled* or *hand-ſet* in rows. Mr. Ducket has judiciouſly availed himſelf of a ſhort handle, and heavy iron-work, the exact reverſe of the common hoe, which requires great exertion to make any impreſſion on the ſoil (excepting on the lighteſt ſands), eſpecially if it has become dry and hard.

It is evident from the engraving, that Mr. Ducket's hoes, by their *convex* form, earth up as well as down; though the ſame implement may alſo be made with *ſtraight* edges; namely, for drilled or dibbled crops at ſix inches interval; for clearing peaſe, beans, &c. at 18 inches diſtance; and for dreſſing crops of any deſcription, at 12 inches interval.—Should theſe hoes, however, from their *ſtraight* edge, be unequal to cope with ſtiff land, Lord Somerville ſuggeſts the expediency of adopting the *conical* edge (or the edge oppoſite to that in the horſe-ſhoe hoe) which will remarkably increaſe their power. Laſtly, his Lordſhip obſerves, that *three* flat hoes at ſix inches; *two* flat ones at twelve inches; and *three* horſe-ſhoe hoes, form the whole number requiſite; and that they all ſcrew into the ſame frame and handle.

HOEI-TCHEOU-FOU, a commercial city of China, in the province of Quangton. Its juriſdiction contains 11 cities of the ſecond and third claſs. Long. 113. 58. E. Lat. 23. 1. N.

HOGARTH (*Encycl.*). A handſome monument to the memory of this exemplary artiſt is to be ſeen in the churchyard at Chiſwick. It conſiſts of a handſome ornamented baſe bearing an urn upon a ſmaller pedeſtal. On the north ſide is the following inſcription:

Farewel, great painter of mankind,
Who reach'd the nobleſt point of art;
Whoſe *pictur'd morals* charm the mind;
And through the eye correct the heart.

If *genius* fire thee, reader, ſtay;
If *nature* touch thee, drop a tear!
If *neither* move thee, turn away;
For HOGARTH's honour'd duſt lies here.

D. GARRICK.

On the eaſt ſide,

Here lieth the body
of WILLIAM HOGARTH, Eſq.
who died Oct. 26, 1764,
aged 67 years.

HOHENZOLLERN, a town of Suabia, capital of a county of the ſame name, with a caſtle. It is ſeated on a mountain, 28 miles S. of Stutgard. Long. 9. 6. E. Lat. 48. 24. N.

HOLBECK, a ſea-port of Denmark, in the iſland of Zealand, with a good harbour, from which great quantities of corn are annually exported. In 1290 this town was deſtroyed by a fleet from Norway. It is 30 miles W. of Copenhagen. Long. 11. 44. E. Lat. 55. 42. N.

HOLSTEBROE, a town of Denmark, in N. Jutland, ſituate on a ſhallow river which runs into the North Sea. Its principal trade is in corn, oxen, and horſes. It is 24 miles W. of Wiburg, and 68 N. of Ripen. Long. 9. 25. E. Lat. 56. 20. N.

HOLTZMUNDEN, a town of Lower Saxony, in the principality of Wolfenbuttle, 28 miles N.W. of Gottingen.

HOLZAPFEL, a town of Weſtphalia, capital of a county of the ſame name, which gives a ſeat in the diets. It is ſituate on the Lahn, at the foot of a mountain, on which is the tower of an ancient caſtle, the original ſeat of the princes of Naſſau, four miles N.E. of Naſſau. Long. 7. 44. E. Lat. 50. 22. N.

HONDTSCHOOTE, a town of France, in the department of the North, ſeven miles S.E. of Dunkirk.

HONEY (*Encycl.*). For a method of extracting ſugar from this ſubſtance, ſee SUGAR, in this SUPPLEMENT.

HORAIDAU, a town of Perſia, in the province of Farſiſtan. 76 miles N.W. of Schiras.

HORSE DEALERS. The following duty impoſed on horſe dealers by ſtat. 24 Geo. III. c. 31. is repealed, and a new duty charged inſtead thereof, viz.

By 36 Geo. III. c. 17. every perſon exerciſing the trade or buſineſs of a horſe dealer, muſt take out a licence from the Stamp Office, for which he ſhall pay annually, if within London, Weſtminſter, the bills of mortality, the pariſh of St. Pancras, or the borough of Southwark, 20l. elſewhere 10l.

The commiſſioners are to grant licences to horſe dealers for not exceeding one year; and every licence ſhall ceaſe on Sept. 29 in the year for which the ſame ſhall be iſſued, and commence from the date; and every licence taken out for any year ſubſequent to the year in which the ſame ſhall be iſſued, ſhall commence from Sept. 29 then next enſuing, and

continue till Sept. 29 following; and a freſh licence is to be taken out ten days at leaſt before the expiration of the year.

One licence is ſufficient for partners, and the licence is confined to the place mentioned therein.

But no licences to be granted to horſe dealers unleſs they declare they ſeek their living by buying and ſelling horſes, and add the name of the place where the ſaid buſineſs is carried on. 29 Geo. III. c. 49.

Horſe dealers, ſo licenſed, ſhall cauſe the words *Licenſed to deal in Horſes*, to be painted or written in large and legible characters, either on a ſign hung out, or on ſome viſible place in the front of their houſe, gateway, or ſtables; and if he ſhall ſell any horſe, without fixing ſuch token, he ſhall forfeit 10l. to be recovered by action, half to the king and half to the informer. 36 Geo. III. c. 17.

Horſe dealers (*not having a licence under the old act of* 24 Geo. III. c. 31.) who ſhall after Jan. 1, 1796, carry on the ſaid buſineſs without having obtained a licence under this act, ſhall be liable to be aſſeſſed to the duties on Riding Horſes, and ſhall deliver liſts thereof as other perſons.

HORSE-HELPER, ALEXIPPOS, or portable SLIDING-LEVER, a curious invention, for which the thanks of the Society for the encouragement of Arts, &c. were voted to Mr. John Snart, optician, of Tooley-ſtreet, London. It is deſigned to be fixed to the under ſide of a cart, for the relief of the horſe when thrown down and entangled in the thills. We earneſtly wiſh, for the ſake of humanity, to alleviate the cruelties to which horſes are ſubjected, and hope the plan here given will at leaſt afford a uſeful hint for further improvements in this line. This machinery will alſo afford ſome advantages in loading carts, where the common length of the cart is too ſhort for the articles intended to be carried.

Views of this invention are given in Plate 34.

Fig. 1. A A A, plan of a common town cart inverted. B B, ſliding bars or levers, *i. e.* the Horſe-helper. C, croſs-bar, or handle of the Horſe-helper. D D, ſpring ſwivels or hooks to receive the ends of the ropes F F. E E, ſtops, to prevent overdrawing the ropes. F F, f f, ropes and hand-rings to project them. G, a prop to prevent hanging the horſe. H H, the bearing plates of the horſe-helper, with pulleys or ſhivers attached thereto. I I, tranſverſe cavities under the axletree to admit the paſſage of B B. K, the extra bar for country carts. L L, the handſpikes for ditto. M M, the axletree or fulcrum. N N, n n, the hind and fore car breadths. O O, the extremities of the ſhafts. P, the back chain. Q, the prop.

Fig. 2. A profile view of the improved cart with the horſe-helper upon a proper angle to clear the packing hooks, &c.

Fig. 3. A ſcale of feet and $\frac{1}{4}$ parts of a foot.

Mr. Snart's account of his invention is the following: "As all librating bodies," ſays he, "act in an exact and direct ratio to their elongations from the fulcra, conſidered in connection with their proportion of weight, and *vice verſâ* (the firſt reſiſtance by the inequality of their matter being excepted), it appears, that as is the ſolidity of the part of the lever reſting on the fulcrum, to the ſolidity of its extremities, ſo is its reſiſtance to be acted upon by a weight which is leſs than its diſproportion; which inequality of power is to the weight added in an inverſe ratio, but directly as the diminution.

"It is evident that the conſtruction of carts at preſent is very unfavourable to the relief of the fallen horſe, who is intentionally placed at the longeſt arm of the lever (for the ſhafts act as a lever by ſuppoſing the axletree to be the quieſcent fulcrum), that he may the better reſiſt the weight of the load, ſhould the equilibrium be by any means deſtroyed; for any given weight upon the hind part of the cart has leſs than half the power of reſiſtance of the horſe; ſo that, if ſuch horſe falls, this advantage is prejudicial to his being raiſed." The inventor, therefore, of the horſe-helper, preſumes that a plan, the object of which is humanity, will ſufficiently apologize for his offering to the public an invention which ſo obviouſly more than counteracts the before-mentioned diſadvantages, as may be ſeen by inſpecting the plan in connection with its ſcale.

"Let A A A (fig. 1.) be a plan of a common town cart inverted, whoſe hind ear-bred, or ear-breadth, N N, projects from its fulcrum, or axletree, M M, 4 feet 7 inches, while the back chain P is 7 feet 6 inches; and the extremes of the ſhafts, O O, which preſs upon the tuggs in the horſe's collar, are 9 feet 6 inches. Now, admitting that the horſe who falls weighs 15 cwt. and that his bearing is 1 cwt. which is 16 cwt. it is very evident that it will require 3316 lb. weight groſs at the ear-breadth N N (which is but 4 feet 7 inches from the fulcrum M M) to counteract ſuch a weight; even admitting that the load had not ſlipped forward at all by the ſudden concuſſion and depreſſion of the fore parts of the cart. The eſtimate, therefore, now will be nearly as follows: 4 feet 7 inches, or 55 inches, to 9 feet 6 inches, or 114 inches, will give for the weight 3316 lb. which is more than that of twenty-two men, at 150 lb. weight each, before a diſabled horſe can be raiſed from the ground: but we know that ſix men cannot bear their weight with advantage on one of our preſent-made carts, without endangering their perſons or clothes, or both; ſo that the horſe is left to ſtruggle with three-fourths of the weight himſelf, and this in a very bad poſture, as he is embarraſſed by the ſhafts, &c. Hence many horſes, if not immediately killed, are at leaſt ruined for ever.

"The advantage of the ſliding-lever is in the proportion of 126 inches, the length of the levers at C, to 114 inches, the length of the ſhaft, viz. O O; and this without the addition of the handſpike L L, which gives a further advantage of one-fourth. Again, if 55 inches, the length of the lever, at N N, require $3316\frac{20}{35}$ lb. weight, what will 126 inches require? Anſwer, $1447\frac{58}{126}$ lb. which is leſs than the weight of ten men, at 150 lb. weight each. This, however, is not half the advantage of the lever, as it affords convenient accommodation for more than twenty men, without hazard to clothes or perſons. And, if we ſuppoſe a ſliding bar at K, one man (if men are ſcarce, as in the country), by applying the two handſpikes L L, may gain power ſufficient to raiſe his horſe himſelf, eſpecially as it fortunately happens that country luggage very frequently conſiſts of ſuch articles as might be removed from the front of the cart, and placed on the bars C and K; ſuch, for inſtance, as ſacks of corn, ſeed, potatoes, bran, flour, peas, beans, &c. &c. which, by being taken from the front, and placed behind, would have more than double the advantage of its real weight; and, in town, where the luggage is different, aſſiſtance is always to be obtained from byſtanders.

"Notwithſtanding the ſtatement of powers for relief which I have here given," ſays Mr. Snart, "it is plain, from daily obſervation, that leſs than half the power here ſtated is only uſed in general, as eight or nine men can often (though with much danger and trouble) raiſe the fallen horſe. Hence, by uſing the ſliding lever three or four men, without danger, delay, or trouble, will be ſufficient. As immediately the horſe falls the driver has only to go behind the cart, lay hold of the hand rings F F, and at one pull the whole apparatus is projected; then lay hold of C, or B B, according as the caſe requires, and the horſe will be inſtantly relieved."

Mr. Snart adds, that this apparatus is quite portable,

coſts but little, and adds not more than $\frac{1}{30}$ to the weight of the cart.

HORSENS, a ſea-port of Denmark, in Jutland, ſeated on the bottom of a bay, which opens into the Categate near the iſland of Hiarnoe, 125 miles W. by N. of Copenhagen. Long. 9. 40. E. Lat. 55. 57. N.

HORSES. The following is the duty impoſed on horſes by 38 Geo. III. c. 41. ſ. 2. There ſhall be paid for all horſes kept for riding, or drawing any carriage chargeable with duty:

	£.	s.	d.
For one ſuch horſe, mare, or gelding, and no more	1	4	0
Two	1	16	0
Three	2	2	0
Four	2	5	0
Five	2	6	0
Six	2	10	0
Seven, and not more than eight	2	11	0
Nine	2	11	6
Ten, and not more than twelve	2	12	0
Thirteen, and not more than ſixteen	2	12	6
Seventeen	2	13	0
Eighteen	2	13	6
Nineteen	2	14	0
Twenty or upwards	2	15	0

And by 41 Geo. III. c. 9. there ſhall be charged, from and after April 5, 1801, upon every perſon keeping one horſe and no more, for which the duty of 1l. 4s. is now chargeable, an additional duty of 10s.

And upon every perſon keeping or uſing two or more horſes, upon which a progreſſive duty is now chargeable, an *additional duty* of 20s. for each horſe.

But the additional duties impoſed by 41 Geo. III. c. 9. are not to extend to horſes uſed ſolely in ſtages or carriages for conveying paſſengers for hire, nor to hackney coaches.

The ſaid rates and duties to be paid by the perſon keeping and uſing the ſaid horſes, mares, or geldings, and to be ſubject to all the exemptions contained in any act in force. 38 Geo. III. c. 41. and 41 Geo. III. c. 9.

The act allows the following exemptions. By 24 Geo. III. c. 31., 29 Geo. III. c. 49., and 36 Geo. III. c. 16., it is provided that nothing therein ſhall charge any horſe belonging to any non-commiſſioned officer, or private ſoldier, of any regiment of cavalry in the King's ſervice; or any regiment of yeomanry cavalry; nor any horſe belonging to, and kept for ſale and not for hire, in the ſtable of a licenſed dealer, nor let to hire for travelling poſt by the mile, or from ſtage to ſtage, or let to hire for a day or leſs period of time, by any poſt-maſter, inn-keeper, or perſon licenſed by the commiſſioners of the ſtamp duties.

Alſo no perſon who ſhall ſerve in any volunteer corps, and ſhall provide a horſe, or who ſhall furniſh a horſe for any perſon ſerving in ſuch corps, ſhall be charged for ſuch horſe, with any of the duties impoſed by 38 Geo. III. c.

Alſo every rector, vicar, or curate, doing duty in his church or chapel, who ſhall not be aſſeſſed to any duties on income, granted by any act relative to the duties on income, and who ſhall not keep more than one horſe for the purpoſe of riding, is exempted from the duty by 41 Geo. III. c. 40.

But not to extend to perſons occaſionally performing the duty of rector, &c. unleſs regular officiating miniſters of the place.

The duties are to be paid by all perſons uſing or hiring horſes or carriages by the year, month, or any other period, *not* the perſon who lets them out; 29 Geo. III. c. 49.

Horſe dealers are to give in a liſt of ſuch as they keep for riding or drawing, and pay the duty; 29 Geo. III. c. 49.

No perſon keeping a horſe, &c. uſed really for huſbandry, or drawing any carriage (except ſuch as was heretofore liable to an exciſe duty), or carrying burthens in the courſe of the trade of the perſon to whom ſuch horſe, &c. ſhall belong, ſhall be chargeable with theſe duties, in caſe ſuch horſe, &c. ſhall not be uſed for any other purpoſe of riding, except when returning from any place to which any load or burthen ſhall by ſuch horſe, &c. have been carried, or going to any place from whence a burthen is to be carried, or being rid to procure medical aſſiſtance, or to or from market, or place of public worſhip, or election of members to ſerve in parliament, or to or from any court of juſtice, or to or from any meeting of commiſſioners of taxes. 26 Geo. III. c. 79.

Perſons excuſed from church and poor, are alſo exempted for one horſe.

Alſo no perſon occupying a farm of leſs than 70l. a-year, and making a livelihood ſolely thereby, ſhall be chargeable with the duty for any horſe occaſionally uſed in riding, if ſuch horſe be *bona fide* kept for the purpoſes of huſbandry. 24 Geo. III. c. 31., 36 Geo. III. c. 16.

Likewiſe no perſon occupying his own eſtate ſolely, or his own eſtate together with a farm, the value of which in the whole ſhall be leſs than an equivalent to a farm of the rent of 70l. a-year (reckoning the value of the eſtate as equivalent to double the like amount of the rent of any rented farm) and making a livelihood ſolely by ſuch eſtate, or by ſuch eſtate and farm jointly, ſhall be chargeable for any horſe occaſionally uſed in riding, if it be *bona fide* kept and uſually employed for the purpoſes of huſbandry. 36 Geo. III. c. 16. ſ. 6.

Alſo ſtage-coach horſes are exempted from the whole of the duties, by 37 Geo. III. c. 134. ſ. 8.

TABLE of the DUTIES on HORSES.

No. of Horſes.	Duties for each. £.	s.	d.	Total Amount. £.	s.	d.
1	1	14	0	1	14	0
2	2	16	0	5	12	0
3	3	2	0	9	6	0
4	3	5	0	13	0	0
5	3	6	0	16	10	0
6	3	10	0	21	0	0
7	3	11	0	24	17	0
8				28	8	0
9	3	11	6	32	3	6
10	3	12	0	36	0	0
11				39	12	0
12				43	4	0
13	3	12	6	47	2	6
14				50	15	0
15				54	7	6
16				58	0	0
17	3	13	0	62	1	0
18	3	13	6	66	3	0
19	3	14	0	70	6	0
20	3	15	0	75	0	0

And ſo on at the rate of 3l. 15s. for every horſe exceeding the number of 20.

By 38 Geo. III. c. 41. ſ. 2. there ſhall be paid the following duties for horſes, mares, and geldings, not charged with any other duty, and alſo on mules.

	£.	s.	d.
For each horſe, mare, gelding, or mule, kept by any perſon, on which is now charged the duty of	0	6	0
By 41 Geo. III. c. 9, an additional duty of	0	4	0

The ſaid rate or duty to be paid by the perſon keeping ſuch horſes, mares, geldings, or mules, and to be ſubject to all

the exemptions contained in any act in force, and not to be charged for any mule which ſhall not have been uſed. 38 Geo. III. c. 41., and 41 Geo. III. c. 9.

The *exemptions* are theſe: This tax does not extend to poſt horſes, nor to any horſe, mare, or gelding, under the height of thirteen hands, of four inches to each hand, nor to any horſe, mare, or gelding, which ſhall not at any time preceding the aſſeſſment have been ridden, or uſed as a draught horſe, or for the purpoſe of carrying any burthen, 36 Geo. III. c. 15.

But the horſes for whom ſuch exemption is claimed muſt be included in the liſt delivered to the aſſeſſors under the title of *Horſes exempted from Duty*, and on demand muſt be produced for examination; and if not produced, or if found not to be exempted, the owner is to be ſurcharged double the duty.—*Ibid.*

Alſo, perſons ſerving in any volunteer corps, or who ſhall furniſh a horſe for ſuch ſervice, ſhall not be chargeable with the duty. 37 Geo. III. c. 106., 38 Geo. III. c. 41.

Likewiſe by 41 Geo. III. c. 9. no perſon occupying a farm, the rack rent of which ſhall be leſs than 20l. a-year, and making a livelihood ſolely thereby, or occupying any other eſtate on any tenure otherwiſe than as tenant at rack rent, or ſuch other eſtate together with a farm at rack rent, the value of which in the whole ſhall be leſs than equivalent to a farm at the rack rent of 20l. a-year, reckoning the value of every eſtate occupied by the owner thereof on any tenure, except at rack rent, as equivalent to double the like amount of any farm at rack rent, and making a livelihood ſolely by ſuch occupation, and keeping not more than two horſes or mules, ſhall be chargeable with any of the duties impoſed either by the former or this act. So as the perſons claiming ſuch exemption return in their liſts the number of horſes kept, and the value of their farms.

HORTSMAR, a town of Weſtphalia, in the biſhopric of Munſter, 15 miles N.W. of Munſter. Long. 7. 2 E. Lat. 52. 9. N.

HOT-BEDS (*Encycl.*). Theſe are of ſuch general uſe in the modern art of gardening, that any method of improving them deſerves the notice of every gardener.

Mr. Richard Weſton, of Leiceſter, has deſcribed a *water-flue* in the thirteenth volume of the Repertory of Arts, &c. p. 238, which is capable of being employed in a double manner; that is, it may convey heat into a hot-bed, either by the ſteam of water, or of dung. In places where hot water cannot ſo conveniently be procured, and where there is plenty of dung, this will be found very uſeful.

Thoſe perſons who already have a water-flue, may alter it for the expence of two or three ſhillings, to anſwer both purpoſes.

The alteration neceſſary conſiſts in changing the pipe of one inch diameter (which is to draw off the water when cold), into a larger one of three inches, and to have the head of a watering-pot of ſix inches diameter made of tin, with a pipe of one foot long to put on it, with holes of a quarter of an inch wide to admit the ſteam, both in the pipe and roſe.

When you chooſe to heat a hot-bed with ſteam, the bed muſt be made in the uſual manner, except that in the front, or at one end, with oblong pipes, the dung ſhould be laid about a yard ſquare, to form a ſtrong body of ſteam, to paſs into the flues, and convey the heat to the earth, and the roots of the plants; but three good corks muſt be firſt put into the two upright ſteam-pipes within the bed *e e*, and the one on the outſide *c*, by which the flue is filled with water to prevent the ſteam from paſſing off through them.

To examine the heat of the bed at any time, draw out the cork, and the heat of the ſteam will inform you of the condition of the bed. If declining too much, the dung muſt be ſtirred up, and freſh added.

If at any time dung cannot be readily procured, it may inſtantly be converted into a water-flue.

On applying to a plumber, who had made ſeveral, it ſeems that inſtead of their being made oval, if two pipes of eleven feet long each (for a nine-feet frame), turned up a foot at one end, to fill them with water, and one or more upright pipes to each in the middle, to convey the ſteam of the hot water into the bed, be laid lengthways in the bed, about three feet aſunder, there will be a ſaving of ſix or ſeven ſhillings on account of leſs ſolder, and trouble in making, and will be found rather more convenient, as appeared from one made which is at work.

The uſe of ſteam from hot water was alſo proved by a gentleman, who obſerved his cucumber-plants declining in vigour, and not having a water-flue, placed four jugs in the bed, and filled them with hot water for three nights, till the freſh lining took effect, which inſtantly recovered his plants, and he afterwards had a flue.

Indeed, the introduction of ſteam from hot water, in increaſing the growth of cucumbers is very ſtrongly proved from the experiments of Mr. Wakefield, publiſhed in the ſame work.

"In a frame conſiſting of three lights," ſays Mr. Weſton, "I would propoſe four, or even ſix ſteam-pipes, and if the top of each be enlarged to four inches in diameter, in the ſhape of the bottom of a trumpet, it will convey more ſteam into the bed. In pl. 33. this is repreſented. *a*, ſhews the pipes to fill them. *b*, ſteam-pipes. *c*, to draw off the water, or put on the roſe when converted into dung ſteam-pipes.

"From the proofs alſo of ſteam being ſo advantageous to cucumbers, I would recommend a pan, made of copper, braſs, or lead (ſix inches wide and three deep, with a pipe, one foot long, to come through the end of the frame, to draw off the water when cold), to be placed at the back of the hot-bed frame, to be filled with hot water at night, and if neceſſary again in the morning.

"If a hole be bored aſlant through the back of the hot-bed-frame, the pan may be filled with hot water, without the glaſs being taken off; and I would rather recommend the flues to be four inches diameter within, than three, becauſe of containing more water or ſteam."

HOT-HOUSE, a building calculated to produce fruit or flowers from plants before the arrival of the natural ſeaſon; or elſe to preſerve alive ſuch as are natives of warmer climates.

The following is the ſpecification of a patent granted to Dr. Anderſon, of Aberdeen, for a method of economiſing fuel in the heating of houſes, and for improving the conſtruction of hot-houſes by a new application of known principles. It is dated Feb. 10, 1801.

" Let the heated ſmoke, as it iſſues from the fire, be conducted into a chamber that will be moſt commodiouſly ſituated beneath the floor of the houſe or apartment intended to be heated; extending the whole of its length and width, if it can conveniently be done, leaving only a vacuity between the inner ſide of the wall of the houſe and the wall of the ſmoke-chamber, all round, of two feet or thereabouts; no preciſe nicety as to its dimenſions being requiſite; the chamber for the ſmoke may be of any form or dimenſions ſo as to ſuit the ſituation, and from two to ſix feet or more in depth, as circumſtances will admit (the deeper always the better); and the roof of it ought to be below the level of the floor of the houſe or apartment intended to be heated, ſo as to leave a vacuity there of one foot, at leaſt, in depth, and if two feet or more, ſo much the better. The roof and ſides of this ſmoke-chamber ſhould be made air-tight, and may be conſtructed of plates of metal, or any other matter that is capable of bearing heat, and of eaſily tranſmitting it, and of being made air-tight. The grate where the fuel is to be conſumed ought to be placed lower than the floor of this chamber, if it can conveniently be done, (but this is not indiſpenſably neceſſary), and the chimney leading from the fire ought to riſe upwards within the ſmoke-chamber till it reach within about one foot of its roof, where it ſhould be diſcontinued and left open, having a ſpark-ſtone or cover laid over it to ſpread the heat. The chimney for carrying the ſmoke from this chamber, and for making the fire burn, ſhould communicate with the chamber near the floor or bottom of that chamber, and in no other place, unleſs occaſionally for particular purpoſes, by an opening formed into it immediately below the roof of the ſmoke-chamber, which is ſhut, in general, by means of a valve that can be opened at pleaſure. This chimney may either riſe directly to the height of the building, without interruption, or it may be made to open into a ſucceſſion of chambers of a ſimilar conſtruction to the ſmoke-chamber juſt deſcribed, as far as reſpects the tranſmiſſion of the ſmoke, though they may be varied in all other reſpects to ſuit the circumſtances of the caſe *ad infinitum*: that is to ſay; theſe chambers may vary in ſize, ſhape, and proportions; in poſition, being either above or below, or upon the ſame level with the original chamber, and ſo on. But although the beſt poſition for the ſmoke-chamber be directly beneath the building to be heated, yet, ſhould obſtructions prevent this, it may be placed without it, or under ſome other building, as near the building that is to be heated as may be.

" Connected with the original ſmoke-chamber, there may be formed another of an auxiliary ſort, which ſhould alſo be air-tight in the roof and ſides. This auxiliary ſmoke-chamber ſhould communicate with the firſt by means of two pipes, that can be cloſed or opened at pleaſure; one placed immediately above the floor, and the other next the roof of the principal ſmoke-chamber; and it ſhould alſo communicate with the open air by another opening or pipe iſſuing from the bottom of that auxiliary chamber. This laſt pipe ought to have a valve to ſtop or open at pleaſure, and ſhould always be cloſed when the fire is burning, and opened whenever it is extinguiſhed, the lower opening into the principal ſmoke-chamber being cloſed at the ſame inſtant that the other is opened; and if there be no auxiliary ſmoke-chamber, an opening of this ſort muſt be made into the principal ſmoke-chamber. Either at the top, or in any other convenient part of the chimney, ſhould be fitted a valve or ſtopper, which admits of being opened, or perfectly cloſed, at pleaſure. When cloſed, it will ſtop circulation, and ſoon extinguiſh the fire. Whenever it is cloſed, the air-hole of the furnace (if the heat be not required for another chamber) ought alſo to be cloſed, and the fire will then be inſtantly extinguiſhed; and the chamber being full of heated ſmoke will gradually tranſmit that heat through its cover and ſides to the air-chamber which furrounds it: the hotteſt part of the air thus heated will riſe to the top. As the heat in the ſmoke-chamber gradually abates, it will, of courſe, contract in bulk; and, by thus forming a kind of vacuum, muſt then draw in a ſupply of air from the auxiliary ſmoke-chamber to ſupply that want. As the higher opening into that chamber alone is now open, it muſt draw in now only the hotteſt part of the air, while the air from without is drawn into the bottom part of the auxiliary chamber; and as it will continue to occupy the loweſt place, no cool air can be drawn in, until the whole of the heated air ſhall be exhauſted.

" The vacuity immediately above and around the principal ſmoke-chamber is intended for an air-chamber: the floor above which, and its ſides all over, muſt be impervious to air or water, and may be formed of flooring tiles or ſtone, or any other material proper for ſuch caſes that can be got cheapeſt at the place. From this air-chamber let a pipe or pipes paſs into the apartment intended to be heated, that can be opened or cloſed at pleaſure, and that can admit at pleaſure alſo of being opened either immediately below the floor, or at any greater depth, ſo as to allow air, more or leſs heated, as ſhall beſt ſuit the purpoſe, to paſs into the apartment intended to be heated. This heated air may (when thus admitted) be either allowed to ſpread in the apartment immediately above the floor, ſo as to heat the whole of the apartment; or it may be conveyed nearly to the roof before it is let looſe, ſo that the upper part of the apartment may be heated to a great degree without affecting the lower part of it, if it ſhould be ſo required.

" Connected with the air-chamber may alſo be an auxiliary air-chamber, capable of retaining the heated air; between which two chambers, there ſhould likewiſe be a communication by means of a pipe; and this auxiliary air-chamber ſhould alſo communicate with the common air by an opening juſt above the floor of it in the loweſt place, and no-where elſe. The pipe that communicates between the air-chamber and its auxiliary, ſhould be ſo made as that the end of it which enters into the principal chamber, ſhould be placed juſt above the floor, and the other end of it ſhould open into the auxiliary chamber high up, very near the upper part of it, and ſhould never be cloſed. In conſequence of this arrangement, when the air in the principal chamber, or heated air, comes to be heated, if the pipe communicating with the apartment above be kept ſhut, then as the air expands in conſequence of the heat acting on it from the ſmoke-chamber below, the coldeſt part of the air in that air-chamber will be forced to paſs into the auxiliary air-chamber, which, in its turn, will force ſome from thence into the open air. In this way, after the cold air is all diſcharged from the principal air-chamber, ſome part of the heated air will be driven into the auxiliary air-chamber, in which, aſſuming the higheſt place, it will there be retained, forcing the colder air below to paſs out into the atmoſphere. The proceſs muſt be continued as long as the air in the internal air-chamber continues to augment in heat, but when a portion of that heated air is let off into the apartment above, or when the fire is ſlackened ſo as to communicate no more heat to it, then in that caſe a ſuction will be made from the inner chamber ſo as to draw in air from the auxiliary air-chamber; but as the pipe opens into

the higher part of the chamber, it will draw back only the hotteſt part of the air in it, and ſo on it will continue to draw back the ſuperfluous air ſo as to derive the whole benefit of it without any waſte whatever. But although this auxiliary air-chamber will be of great utility, it may, nevertheleſs, be diſpenſed with if the owner ſo chooſes: but the opening into the air-chamber below is indiſpenſable.

" If the apartment placed above, and communicating with the principal chamber of heated air, be intended to be employed as a hot-houſe, its walls ought to be made of glaſs all round, if circumſtances will admit of it, on the north as well as towards all other points of the compaſs; thus to obtain not only the benefit of the ſun's heat to the fulleſt extent, but alſo to obtain as much light as poſſible, which is of the utmoſt utility to plants of all kinds, as, without it, they cannot be preſerved in good health. The whole ſhould be made air-tight. The under part of each of the front glaſſes ſhould be ſo formed as to admit of being opened, or to ſhut quite cloſe at pleaſure.

" A row of windows, or air-holes, that admit of being opened at pleaſure, ſhould be placed along the north, or other ſides, towards the top, with this ſingle variation, that they ſhould be made to open alternately from below, riſing upwards, or from above falling downward, but ſo as always to admit of being ſhut ſo cloſe as to be air-tight. Theſe openings are to ſerve the purpoſe of emitting the air at pleaſure, and aſſiſting in ventilating the houſe. The edges of the door ſhould be alſo ſo made as to ſhut quite cloſe.

" For the purpoſe of a *pinery*, or *vinery*, or peach-houſe, and moſt other uſes to which a hot-houſe is uſually applied, the roof of the apartment (in other words the hot-houſe) ſhould be placed in a horizontal poſition, or nearly ſo, ſomething like the ceiling of an ordinary apartment, only that that ceiling ſhould be made of glaſs inſtead of plaſter, and ſhould be fixed to the joiſts above, and made altogether air-tight. The vines or other fruits intended to be forced may be extended cloſe under the glaſs. The bed in the ſtove ſhould be raiſed ſo high as to be as near the roof-glaſſes as the leaves of the plants in it will permit. Pipes of different lengths, which may be opened or ſhut at pleaſure, ought to be paſſed through the upper-part of the hot-houſe for the purpoſe of letting off the heated air to that degree which ſhall be deemed eligible at the time, and ſhould reach to that depth in the houſe that ſhall be thought proper, for the purpoſe of regulating the heat of the ſtove, and keeping up an equality of temperature at all times without any attendance from the gardener. The ſtove being firſt made air-tight everywhere, let a pipe be placed in the floor, communicating directly with the chamber of heated air below; and let the top of that pipe be cloſed by means of a light valve that opens upwards. Let another pipe be placed above, that may communicate with the open air, if judged proper, having a light valve upon its upper end opening upwards alſo. Let an opening be then made into the ſtove near the floor, ſo as to admit a free communication by that means with the open air; lift up then the valve of the bottom pipe, the heated air will riſe upwards through it into the ſtove, gradually filling it; while the cool air that was in the chamber is imperceptibly driven off through the opening below into the atmoſphere.

" When the ſtove has gradually acquired the degree of heat required (ſay ninety degrees of Fahrenheit's thermometer), ſhut the opening below, and all others, quite cloſe. The hot-houſe being now air-tight, it muſt follow, that if more heated air ariſes from below, it will tend to expand the air already in the hot-houſe; in other words, to raiſe the temperature above ninety degrees. But in conſequence of that expanſive effort from within, an effort will be felt to cloſe the lower valve (as is felt in a bellows when the two handles are preſſed together), ſo that no more heated air can find acceſs by that means. The ſame expanſive effort will have a neceſſary tendency to open the upper valve, and thus heated air will be allowed to eſcape until the air in the chamber has come into an equilibrium with that of the atmoſphere; or, in other words, till it be at ninety degrees, at which temperature alone it ever can, as thus regulated, attain that equilibrium.

" If, however, from the coldneſs of the night air, or from any other cauſe, the heat of the ſtove ſhould be diminiſhed, ſo as to fall below ninety degrees, the bulk of the air in it will be at the ſame time contracted, and a kind of vacuum be experienced. In that caſe, in conſequence of the ſuction inwards, the upper valve would be firmly cloſed, ſo that no cold air can be there admitted; and, from the ſame cauſe, the lower valve will be opened ſo as to admit heated air again from below. In this way, as ſoon as the temperature ſhall attain the ninetieth degree, or ſuch other regulated degree of heat as ſhall have been fixed upon, the lower valve would be cloſed, and thus an equal temperature would be kept up within the houſe at all times, whatever variations might take place in the atmoſphere, without the attendance of any perſon whatever. If care be taken to keep up the heat in the air-chamber above ninety, or the regulated degrees, and provided the apartment above it (the ſtove) be perfectly air-tight, the variation of heat that could prove hurtful to the tendereſt plant could never be experienced.

" In the vinery, peach-houſe, and others that require nearly a ſimilar temperature, where the ſun becomes the principal, if not the ſole, ſource of heat, an auxiliary chamber ought alſo to be provided for receiving the heated air when there is an exceſs of it, and reſtoring it back again during the night-time, when the cold or other circumſtances render the contraction within ſenſible. This auxiliary chamber ſhould be conſtructed exactly in the ſame manner with thoſe already deſcribed. In this caſe alſo, as in the former, though the pipe of communication opens alſo into the auxiliary chamber near its roof, it ought to be made to iſſue from the hot-houſe itſelf, either higher or lower at pleaſure, which may be effected by fitting upon its orifice pipes of different lengths. As it may be convenient to rear vines entirely on the outſide of the houſe, proper openings ought to be provided for introducing the vines from without, and for withdrawing them at pleaſure. Theſe openings may be made either immediately under the roof of glaſs, or occaſionally juſt above the floor of the hot-houſe, as ſhall ſuit the inclination of the owner. They ſhould conſiſt of horizontal ſlits of a length and depth ſufficient to admit of the ſhoots being paſſed through them with eaſe, and admit of being cloſed either with a caſe with glaſs in it, or a wooden frame, the openings between the ſhoots being cloſed up with ſoft moſs, cloſe rammed, ſo as to be air-tight, or with a plaſter of grafting loam, or any other ſoft material that is fit to prevent the paſſage of the air without too much cramping the ſhoot.

" Peaches and cherries, which require the influence of the open air in the winter, may be raiſed in large tubs or boxes that admit of being removed; and if the ſtems be trained perpendicularly, nearly as high as the horizontal roof glaſs, and then bended over and trained horizontally, they may be admitted into the houſe, or withdrawn from it through horizontal ſlits, ſimilar to thoſe above deſcribed, which admit of being cloſed in the ſame manner.

" For the purpoſe of forwarding lettuce, or other low-growing plants in winter, or ſtrawberries early in the ſpring, let a ſet of frames be provided, conſiſting of open ſpars ſtrong enough to ſupport the weight that is to be put upon

them; each of theſe frames ſhould be of ſuch dimenſions as to hold three rows of pots of the uſual ſize for that purpoſe, and of a length the whole width of the houſe, wanting two feet or thereabouts A ſet of pans or boxes, made of any light material that can hold water, and having edges turned up one inch, ſhould be provided to be laid on theſe frames, and into theſe pans or boxes the pots ſhould be placed. Theſe frames may be ſuſpended from the ceiling or roof of the chamber by means of cords paſſed over pulleys, ſo as to admit of being raiſed or lowered into a warmer or cooler region of the chamber at pleaſure. The plants may be ſupplied with moiſture by pouring water into the pans without lowering them, and the fruit may be ſeen, without moving them, through the glaſs above.

"Hitherto it has been the practice to have no hot-houſes of more than one ſtage or ſtory in height, but upon the preſent plan, in ſituations where they can be ſecured from effects of wind, nothing is to prevent them from being of two or more ſtages or ſtories; and where this can be ſafely done, it will prove a conſiderable ſaving on account of the roof. In that caſe, all the difference that will occur between the firſt and higher ſtages is, that the floor of theſe laſt, as well as the roof, will be of glaſs. A foot-path of wood or grating for the gardener ſhould be always, in that caſe, formed along the inſide of the north wall, having a ſlight rail on the inſide, of about three feet high, like the rough tree of a ſhip, or otherwiſe, to guard againſt accidents; and a looſe deal ought alſo to be provided to be ſhoved along to the top of the joiſts, when wanted, as a platform for the neceſſary purpoſes. Over the higheſt ſtage or ſtory muſt be thrown a roof, the ſouth ſide of which, and the eaſt and weſt ends, may be made of glaſs, and the north ſide either of glaſs or proper opaque materials. This may be ſo conſtructed as to be employed for the purpoſe of a vinery, and at the ſame time of a reſervoir-chamber for heated air, which may be freed from its ſuperfluous heat, when that becomes too great, by means of a tube from the top, which admits of being opened or cloſed at pleaſure.

"With a view to obviate the bad effects that might occaſionally reſult from too great a degree of heat in the higher regions of the hot-houſe, continued too long through accidental inadvertence in the gardener, the following apparatus may be uſed. Take a bladder, or other flexible bag, that is impervious to air, turn the mouth of it, while it is open, upwards, and heat it then to a conſiderable degree before a fire, or otherwiſe; when it has been made to attain a degree of heat higher than that of the hot-houſe, tie the neck cloſe while it is not yet fully diſtended, though nearly ſo, taking care previouſly to fix a ſtring to the bottom of it, by tying in a part of it, or otherwiſe. Then attach it to ſome fixed object; afterwards bring the houſe to a proper degree of temperature, and while it is in that ſtate faſten the ſtring that proceeds from the bag tight to ſome other object, the conſequence muſt be, that when the heat augments the bag will become more diſtended, and, conſequently, will augment in diameter, and contract in length, ſo as to tighten the cords, and when the heat abates it will become more flaccid, and of courſe ſlacken the cords, ſo that this may be employed as a moving power to open or cloſe a valve as it contracts or dilates; and it will neceſſarily regulate the heat of the houſe by its ſpontaneous movements, without requiring attention from any one.

"For the purpoſe of agitating the air in the houſe at pleaſure, without the neceſſity of introducing air from without, and for many other indiſpenſable purpoſes, the following apparatus has been contrived:—Make a cylindrical box of a conſtruction ſimilar to that of a drum; paſs through it length-wiſe an axle, carrying arms of thin wood, or other light and firm material, to act, when put in motion, as a fan. This axle is to be properly ſupported at each end, and in ſuch manner as to leave an opening at one or both of the ends for the purpoſe of admitting air to the fan. The fan may be moved by means of a ſimple handle, or, if greater velocity is wiſhed, by a large wheel at one end, acting upon a pinion upon the end of the axle, or by a large ſheeve acting upon a ſmall one, connected together by a band, belt, or chain. On one ſide of the cylindrical part of the drum leave an opening for the paſſage of the air when the fan is in motion, to which can be fitted at pleaſure a pipe that admits of movements, and of being occaſionally lengthened or ſhortened: it may be flexible or otherwiſe, as ſhall ſuit the circumſtances of the caſe, terminating in a ſmall nozzle to admit of its being directed to any point where it may be wanted. Let the mouth of another pipe, ſimilar to the above, be ſo formed as to cover the end, opening, or openings of the drum, for the ſupply of air, ſo that all the air that can paſs into the drum muſt firſt paſs through this pipe: by means of this apparatus, the air can be ſucked up by the machine from any part, either within or without the houſe, and ſpouted out into any other part of it, with a greater or leſs degree of violence, as circumſtances ſhall render eligible. The machine itſelf may be driven either by the hand, like a common winnowing machine, or it may be driven by means of a vane, moveable by the wind, placed on ſome convenient part of the building: or by water, or ſteam, or horſes, or any other moving power, which circumſtances may render eligible. Or this kind of ventilator may be produced by means of a bellows, having pipes of the ſort above deſcribed, adapted to the nozzle and the under valve of the bellows.

"With a view further to economize fuel when that becomes neceſſary for the production of heat, care ſhould be taken to have the whole of the ſmoke that ariſes from the burning fuel conſumed, To effect this, let a fire-place be conſtructed in the following manner:—Let this fire-place have two grates, ſo connected as to admit of communicating alternately with each other: each grate ſhould have two air-holes opening into the cavity below the grate, being cloſe every-where elſe: one of theſe air-holes ſhould communicate with the atmoſphere directly in front of the grate, and the other with a paſſage below, that goes directly from the one grate to the other. Theſe two air-holes ſhould admit of being opened or cloſed at pleaſure, but ſo as they can never be both open at the ſame time unto the ſame grate; this may be conveniently effected by a ſhifting door, or valve, which, when it cloſes the one hole, muſt neceſſarily open the other. For the ſake of diſtinctneſs, let one of theſe grates be called No. 1, and the other No. 2. When the fire is to be lighted, let the air-hole in front of the grate No. 1 be opened, and the other air-hole to that grate will of courſe be cloſed. The coals in No. 1 being then kindled, the ſmoke, as it iſſues from the fire, ſhould be conducted at firſt right upwards for a ſmall diſtance, and it ſhould then bend in the ſame plane with the wall, ſo as to aſſume a horizontal poſition, and in a direction pointing towards the other grate No. 2. It ſhould then bend downward, ſtill in the ſame plane, and proceed in that direction until it comes into the paſſage that leads from the one grate to the other beneath the level of the grates reſpectively. As the opening from this paſſage into the grate No. 1 is at this time cloſed, the air-hole in front being open, the ſmoke muſt paſs on towards the other grate, No. 2, whoſe air-hole in front being now cloſed, it can receive no air to keep alive the burning fuel but that which comes through that paſſage;

and as this air conveys along with it the whole of the ſmoke that came from the burning fuel in the grate No. 1, that ſmoke, in paſſing through the fire No. 2, will be inflamed and entirely conſumed, thus tending greatly to augment the heat. It being always underſtood that the fuel in the grate No. 2, is at this time in the ſtate of charred coal, having been kindled previouſly to that in No. 1. After paſſing through the grate No. 2, the heated air riſes at firſt through the chimney of No. 2, in a perpendicular direction, to the ſame height as that of No. 1. It then bends in a horizontal direction towards No. 1, in the ſame plane with the wall; from thence it bends backwards in a horizontal direction for a ſmall ſpace, and may be then carried off through a chimney in any other direction that convenience can ſuggeſt. But when the fuel, that had been put upon the grate No. 1, ſhall be ſo far conſumed as to emit little ſmoke, let the front air-hole of No. 2 be opened, and freſh fuel be put upon it, the other air-hole of that grate being neceſſarily cloſed when the front air-hole is opened. The ſmoke ariſing from thence, will now paſs upwards as before, but, inſtead of going back into the chimney as before, a moveable door or valve there being ſhifted, that opening is then cloſed, and another opening made into the ſame chimney to receive the vapour ariſing from the fire No. 1. The ſmoke will then be obliged to paſs downwards, and ſhould be conducted in the ſame manner as that before deſcribed of No. 1, into the paſſage that communicates between the two grates, and thus be forced to go under the grate No. 1 (the air-hole leading from that paſſage to No. 1, having been previouſly opened by ſhutting the air-hole in front), where it muſt paſs through the fire and be inflamed, from whence it riſes up, and paſſes off through the chimney, as that from No. 2 did before

"Obſerve that at the place where the ſmoke enters from above into the paſſage that leads between the two grates, there is a moveable valve, which is opened at the ſame time that the ſaid air-hole into the chimney on that ſide is ſhut; the ſaid valve, when it opens, thus cloſing the ſimilar opening belonging to the other grate. Thus may the two fires have freſh fuel put upon them alternately, and be interchangeably ſhifted as often as can be wanted ſo as always to conſume the whole of the ſmoke. The form and ſituation of theſe chimneys, grates, and valves, may be varied at pleaſure, preſerving the principle of cauſing the unconſumed ſmoke to paſs through the fire that has ceaſed to ſmoke.

"For the purpoſe of obtaining *ſteam* when wanted, let the upper part of the chimney above deſcribed, where it runs in a horizontal poſition between the two grates, be made of ſuch a width as ſhall be deemed convenient, and that upper ſurface ſhould conſiſt of the flat bottom of a pan; or a flat pan may be placed above any kind of grate. Let a chamber be made above that, whoſe tops and ſides are formed by a veſſel containing water flat above, but projecting downward all round to the depth of ſeveral feet, ſo that water ſhall ſurround the chamber on all ſides, except at the bottom part, which is the pan. The edges of the water-chamber ſhould go an inch or two lower than the pan, being wider than it; and an opening ſhould be left below the edges of the water chamber. Within this chamber, and immediately over the pan, let there be placed another veſſel containing water. The pan is to be uſed for boiling and evaporating water. It is to be ſupplied with water from this inner veſſel, in proportion as it is evaporated by means of a ball cock or float, and that veſſel, in its turn, is to be in like manner ſupplied with water, as it is drawn off from the outer veſſel that ſurrounds the chamber; ſo that it will be always heated before it reaches the evaporating pan. The ſteam that is firſt raiſed, will fill the chamber above deſcribed, where it will accumulate until that chamber be wholly filled, ſo as to make its eſcape below the bottom of the ſides, from whence it may be conveyed, by a proper conduit, into a houſe, when it is there wanted. A pipe ſhould alſo be taken through one of the ſides, cloſe below the upper part of what may be called the ceiling of the water-chamber, that admits of being opened at pleaſure, by means of which the whole of the ſteam can be let off when it ſhall be judged proper. But as it may often happen that ſteam will be wanted only in moderate quantities, and at particular times, ſo as to render it unneceſſary to continue the evaporation of water during the whole time that the fire burns; in that caſe, the following apparatus may be reſorted to. By means of a bellows formed for that purpoſe, or a forcing pump, throw in a ſmall ſhower of water from time to time, into the dry bottom of the pan, properly guarded by tiles laid above the bottom, ſo as to cover it when fully heated, which will be inſtantly converted into ſteam: and, after a ſhort interval, another and another, until as much ſteam ſhall be generated as ſhall be wanted at that time, when the evaporation may be diſcontinued.

"For the purpoſe of obtaining a moderate degree of heat occaſionally, without being under the neceſſity of lighting a fire in the houſe, the following apparatus may be adopted.—Make a hollow cylinder of metal, or other matter that is capable of retaining ſmoke and tranſmitting heat, open at bottom, but cloſe at top. This cylinder ought to be of conſiderable proportional depth, and of a ſize proportioned to the uſe intended by it. The ſides of this cylinder may do for ſome purpoſes if only ſingle; but, in general, it ought to be double, leaving an opening between the two cylinders all round of about an inch or more in the clear. Theſe two cylinders ſhould be joined cloſe together at the bottom, and the outer cylinder ſhould riſe ſomewhat higher than the part that cloſes the inner cylinder above; round the top of the outer cylinder ſhould be formed a horizontal rim, of ſuch a breadth as to admit of being depreſſed into a circular groove all around it, for the purpoſe of receiving a perpendicular rim running round the lower part of the cover, like that of the lid of a tea-pot. The cover itſelf may be made of ſuch ſhape and dimenſions as ſhall beſt ſuit the purpoſes intended at the time. Let the cylinder thus prepared, be heated to the degree wanted, by an Argand's lamp placed within it, which, inſtead of a glaſs tube to receive the flame, has one made of metal fitted to it, which is of ſuch a length as to reach from the lower edges of the cylinder till within half an inch of the top of the inner cylinder; or it may be heated by ſuſpending it over a good fire, upon a crow or otherwiſe, until it be ſufficiently warmed, when it may be carried into the place where it is wanted, and there ſuffered to ſtand till it communicates heat to the ſurrounding bodies. If water be put into the upper cavity above the top of the inner cylinder, the cover being at the ſame time taken off, ſteam in ſmall quantities may be raiſed in the houſe where a greater degree of heat is wanted; and, for long continuance, this apparatus may be made of very large dimenſions, and of any form that may beſt ſuit, and fixed in its place. The ſides may be made of bricks, or other ſolid ſubſtances, and a culinary fire adopted inſtead of the lamp, ſo that its power may be thus augmented to ſuch a degree as to anſwer many important purpoſes."

HOUAT, an iſland of France, between that of Belleiſle and the Continent. It is 10 miles in circumference.

HOUDAIN, a town of France, in the department of the Straits of Calais, ſix miles S. of Bethune. Long. 2. 34. E. Lat. 50. 39 N.

HOUDAN, a town of France, in the department of Eure

and Loire. It has a manufacture of woollen ſtockings, and is ſeated on the Vegre, 32 miles S.W. of Paris. Long. 1. 41 E. Lat. 48. 47. N.

HOULSTON (Thomas), an eminent phyſician and active philanthropiſt, was born at Liverpool, on the 26th of November, 1746. After a good claſſical education, being deſigned for the medical profeſſion, he made himſelf acquainted with pharmacy, and ſpent a conſiderable time in medical attendances in London, where his extraordinary diligence and eager deſire of information attracted the notice and partiality of Dr. George Fordyce, to whom he afterwards dedicated his Inaugural Theſis. To demonſtrate the ſufficiency of his acquirements, even before the uſual courſe of ſtudy in that *then* moſt celebrated Univerſity, he took the degree of Doctor of Phyſic, at Leyden, where his abilities obtained him diſtinguiſhed marks of approbation from the profeſſors Albinus and Gaubius, &c. As he was yet only of the age of twenty-one, and his natural thirſt after knowledge was by no means ſatisfied, he travelled through the Continent for further improvement, and viſited moſt of the foreign univerſities. This tour, in which he was much diſtinguiſhed and employed by Engliſh travellers of rank, occupied him upwards of ſeven years, his ſtay being conſiderably prolonged in thoſe parts of the Continent where the ſalutary practice of inoculating for the ſmall-pox had either not been introduced, or had declined under the prejudices of the people. In this purſuit he laboured with a degree of zeal and perſevcrance that obtained him great celebrity; and at Vienna, where he continued about two years, he moſt effectually eſtabliſhed the practice, and was honoured by the late Emperor Joſeph II. with a long converſation on that ſubject. But—"envy will merit, like its ſhade, purſue"—ſuch diſtinguiſhed patronage could not but ſubject the doctor to oppoſition even where before he had experienced ſupport. The celebrated Van Swieten, ſacrificing candour and the good of his fellow creatures to the artful inſinuations of Brambillo, an Italian ſurgeon employed by the court, became the diſcourager of inoculation; and the latter, who neceſſarily took a part in the inoculation of the then King of Poland's nephew and niece, exulted in (if he did not infamouſly promote) the unfortunate event of the loſs of an eye to the princeſs. This, though a mere conſequence of ſcrofulous inflammation, and much more likely to have happened under the natural ſmall-pox, checked the progreſs of inoculation among the higher ranks, and had, no doubt, a correſponding effect on the ſtronger prejudices of the multitude. This obſtacle, however, produced only temporary effects; and Dr. Houlſton had the ſatisfaction of witneſſing the preſervation of thouſands by inoculation, before he returned to his native country, which he did in 1771 or 2, preferring his native place, where he might enjoy the ſociety of his family for the reſt of his life, to the more ſplendid proſpects of medical practice in the metropolis.

In this more limited ſcene, where there exiſted fewer incitements to profeſſional exertion, he nevertheleſs enjoyed an abundant ſhare of celebrity; but here the predominant feature of the doctor's character, which was philanthrophy, rather ſuperſeded the uſual anxiety for medical pre-eminence. This propenſity alſo acquired ſtrength with the decline of his health, a fixed diſreliſh of life and its purſuits, and a growing confidence in the promiſes of Chriſtianity, of which he was a firm believer. At this period, the ſhades which mark the human character, it is ſaid, were not unobſerved by the moſt partial of his friends; yet his errors were of that venial ſort which unfortunately diſguſt without injuring mankind. His continual charities to the poor muſt protect his memory from the inſinuations of thoſe who accuſe him of an undignified partiality to the means of affording them; and the ſum of his good deeds muſt be balanced againſt thoſe failings, which too uniformly deteriorate the character of man.

He wrote, 1. Diſſertatio inauguralis de Inflammatione. 2. A Method of treating the Small-pox (a tranſlation). 3. An Eſſay on Poiſons, in which the means of counteracting thoſe of the mineral claſs was firſt ſuggeſted; (ſee POISONS, *Supp.*) 4. A paper on the preſervation of thoſe who are in danger from having drank largely of ſpirituous liquors. Several other of his productions, particularly thoſe calculated to extend the means of recovering drowned perſons, are to be found in fugitive publications.

Doctor Houlſton died in 1787, after labouring a long time under the effects of an incurable fiſtula. He was, from the firſt of his ſettling there, phyſician to the hoſpital at Liverpool; a member of ſome of the learned ſocieties; and, what is not generally known, he was the great grandſon, by the mother's ſide, of Preſident Bradſhaw.

HOUSE OF CORRECTION, a place where crimes are puniſhed by confinement, diſcipline, and extraordinary labour; (ſee BRIDEWELL). The mode of remedying the defects and abuſes exiſting in theſe eſtabliſhments, will appear from the following account of the jail and houſe of correction at Dorcheſter, by William Morton Pitt, eſq. M. P.

The building of the new jail, at Dorcheſter, and the reform in the management of the old one, began in 1790. The old houſe of correction at Sherborne was ſold in 1794, and its priſoners were transferred to one of the wings of the new priſon, which was then appointed the houſe of correction for the county. From that period, both eſtabliſhments have been under the direction of the ſame keeper, and under the inſpection of the ſame magiſtrates; and have had but one chaplain, ſurgeon, &c. The preſent priſon, built on a plan approved by Mr. Howard, coſt £. 16,179. 10*s*. 6*d*. and was firſt occupied in December, 1793. It contains eighty-eight ſleeping cells, beſides thoſe for the condemned, the reception cells, and working cells, which are all *ſingle*—the infirmaries, two large dormitories for male debtors, in addition to the cells in the debtors' wing, and two for female debtors and female fines, and alſo dark *ſingle* cells for the refractory. Each dormitory contains four beds, but is capable of containing more in caſe of neceſſity.

In 1791, manufactures were introduced, for the employment of all ſuch priſoners as either were compelled by law, or could be induced by encouragement, to work. Convicts, and all perſons ſentenced to impriſonment and hard labour (to whom the law has not already allotted any certain portion of their earnings), are allowed one-ſixth part thereof, beſides broth in addition to their bread; and, if they earn to the amount of five ſhillings per week, they are alſo allowed meat*.

* In many of our houſes of correction, the priſoners, even to this day, are fed chiefly, and *without diſtinction*, on bread and water; a diet that has been found to have a tendency to dropſical complaints; and that has as little good effect on the health of the culprit, as the indiſcriminate ſyſtem of treatment, devoid of inducement or encouragement, can produce on his morality and induſtry. The perſons confined might be very comfortably fed, at the ſame expence as they now are on bread and water; eſpecially if a difference was made in the diet of the induſtrious and well behaved, and of the idle and vicious, as has been done with great effect at Dorcheſter. That, and the ſecuring to them a fixed and liberal intereſt in their labour, to be paid them on their diſcharge, would produce an immediate change in our priſons and houſes of correction; and make them really the in-

Debtors, and perſons committed for trial, not being compellable to work, enjoy the whole of their earnings, if they purchaſe their own raw materials and ſell the produce on their own account; but, if they are ſupplied with the materials, and the county has the riſk of the ſale of the goods, they have then only the half of ſuch earnings.

In all caſes, except where debtors and others voluntarily working, provide themſelves with materials, the jailer is allowed one-ſixth of the earnings, as a gratuity for his extra trouble, and as an incitement to further exertions; and the remainder (after deducting the jailer's and priſoners' ſhares) is placed to the credit of the county. The full amount, however, of the ſhares of the earnings, except thoſe of debtors, are not paid to the priſoners until their diſcharge, but are carried to their reſpective accounts; and two-pence per week only is allowed them for the purpoſe of procuring for themſelves any little indulgences, conſiſtent with the police of the priſon; even the ſums placed to their accounts being liable, in the whole or in part, to forfeiture, in caſe of miſbehaviour. There are inſtances of men who have received eight or ten pounds, or more, on quitting the priſon; and the money has for the moſt part been laid out by them in clothes, tools, furniture, a ſtock of bacon, or other proviſions, &c. for their future comfort and advantage *.

The produce of the work, the expence of maintenance, &c. are ſtated in the table, No. I. In No. II. is added an account of the manner in which the donations left the priſon, and other charitable contributions, have been applied, in liberating and aſſiſting debtors, in aid and relief to other priſoners diſcharged at the aſſizes or ſeſſions, and in rewards to perſons who have heretofore been in confinement, and who have obtained certificates, properly authenticated, of their induſtry, honeſty, and good behaviour, in the ſervices in which they have been ſince they have left the jail.

TABLE. No. I.

Number of priſoners, account of earnings and ſalaries.

	1791.	1792.	1793.	1794.	1795.	1796.
Average number of priſoners in the ſeveral years	40	47	50	50	51	49
General amount of earnings in the ſeveral years	£. s. d. †51 6 11	£. s. d. 275 6 0	£. s. d. 287 2 0	£. s. d. 366 11 5	£. s. d. 382 5 11	£. s. d. 462 12 0
Annual average of each priſoner's individual earnings	1 7	5 17 0	5 14 10	7 6 7	7 9 11	9 8 8
General amount of priſoner's *ſhares* of earnings	8 15 6	75 5 1	60 16 11	64 0 5	72 3 5	99 4 3
Annual average of each priſoner's individual *ſhare* of earnings	0 4 10	1 12 0	1 4 4	1 5 7	1 8 3	2 0 5
Amount of ſalaries, a permanent expence attached to the eſtabliſhment	270 0 0	270 0 0	270 0 0	293 10 0	298 0 0	298 0 0

ſtruments of correcting, inſtead of their being as at preſent the means of increaſing, habits of vice, deſpondency, and idleneſs. The wild beaſt may be ſtarved into ſubmiſſion, or compelled to ſubjection; but beings endowed with reaſon, and deſtined by their Creator for ſocial intercourſe, are not to be reformed *merely* by ſolitary confinement, by depreſſion of condition, or privation of food: there muſt be added—encouragement to thoſe who do well—diſtinction between them and the ill-behaved; the objects of labour muſt be made eaſily attainable, and its conſequences and advantages deſirable.

* It were much to be wiſhed that the example of the reform of Dorcheſter jail and houſe of correction were followed in every priſon and houſe of correction in the kingdom. The reader will perceive that it has been produced, by ſecuring to the priſoner, not only a preference in diet and accommodation, but a *certain* and *liberal ſhare* of the earnings of his induſtry, and by huſbanding that produce for him againſt the time of his quitting the houſe; ſo that he may go out, not only with habits of application and with character, but with the means of ſubſiſtence, and of carrying his induſtry to the moſt advantageous market. To expect, from the general maſs of mankind, *a willing continuance in labour from day to day*, without the ſpur of intereſt, without an object of expectation, and without the engagement of the inclination by a ſhare, at leaſt, of the profits, —or to hope for ſucceſs in the attempts daily made, in our houſes of correction, to *compel* priſoners to work, not as the means of increaſed comfort and advantage to them, but as a *puniſhment* of their offences, is abſurd and ridiculous.—Compare the difference between that which perſons may be *induced*, and what they may be *compelled* to do.—In the ſpinning-ſchool at Epping, a little child, of 9 years old, will, with cheerfulneſs and pleaſure, and without abridging its hours of play and recreation, earn four pence a-day; and will dine plentifully and comfortably, for a penny; while a ſtout active man, in the prime of life, in one of our houſes of correction, with an allowance of *nine pence* a-day for his food, is (in a ſtate of mortification and ſuffering) earning *one penny a day* in picking oakum.

† N. B. The working ſyſtem did not commence till late in the year 1791.

TABLE. No. II.

Application of donations and charitable contributions.

	1792.			1793.			1794.			1795.			1796.

Paid rewards to perſons who had been diſcharged, and afterwards obtained certificates of good behaviour - -	0	0	0	0	0	0	4	4	0	4	4	0	5	5	0

In this inſtitution, the object has been to combine the two principles of induſtry * and reflection, and, by the judicious application of ſolitude in a greater or leſſer degree as the ſpecific caſes may require, to reform the offenders, ſo as to reſtore them to ſociety in an improved ſtate, and encourage them to perſevere in a courſe of induſtry and virtue.—The attempt has in a great meaſure ſucceeded.

In the laſt ſix years there have been but as many inſtances of offenders having been a ſecond time committed to priſon; viz. one for felony, two for petty larceny, one for an aſſault, one for leaving his family chargeable, and one for returning unlawfully to her pariſh after an order of removal. Of thoſe who have been diſcharged, twenty-ſeven have entered into the ſea ſervice, nine into the land ſervice; and thirty-five are known to be, at this time, maintaining themſelves and their families by honeſt induſtry. This would probably be found to have been the caſe with many more, who are ſtrangers to the county, if information were obtained of their preſent reſidence and ſituations in life.

HOUSE OF INDUSTRY, a houſe of reception for paupers, who either from advanced age, or the want of talents, health, ſtrength, or even of inclination, are unable to procure a livelihood by their exertions elſewhere. The following extract from an account of an incorporated houſe of induſtry, for two united hundreds, in the county of Norfolk, by Edward Parry, eſq. appears in the Reports of the Society for bettering the Condition of the Poor.

"The houſe of induſtry, for the hundreds of Mitford and Launditch, in the county of Norfolk, was eſtabliſhed and incorporated by act of parliament in the year 1775. Theſe hundreds contain 32 pariſhes; two of them large market-towns, but without manufactories. This houſe of induſtry certainly has the merit of being managed with great attention to the health, comfort, and (in ſome degree) to the morals of the poor. I ſpeak of it (ſays Mr. Parry) from experience, having been an active director of it for 13 years, during my reſidence in the county of Norfolk. The following is the plan on which it is conducted.—There is a large building which contains on an average about 500 perſons of all ages; and there is an hoſpital, about a quarter of a mile from the houſe,

* Upon examining the general produce of labour, in a workhouſe or houſe of correction, it ſhould ſeem that there is ſomething in the name, the air, the ſituation, or in the *ſyſtem* of them, that palſies the power of human induſtry, and reduces the energy of a ſtrong vigorous man to a level with that of an helpleſs child. Mr. Bernard, however, ſtates an exception, equally honourable to the individual, to the magiſtrates, and to Mr. Ayres, the governor of the Middleſex houſe of correction, in Cold-Bath Fields.—In February, 1797, a perſon was committed to that houſe for a twelvemonth, on account of his concern in a fraudulent tranſaction, which he had been drawn into by a combination of artful Jews; and, in the progreſs of which, he had been ſtripped of nearly all his own property. He was a ſmith, and a very excellent workman. With permiſſion of the magiſtrates, Mr. Ayres, the governor, fitted him up a forge, and employed him to repair the locks of the houſe, which are 800 in number, and were got into bad condition. The locks are, of neceſſity, large, and of an expenſive conſtruction. In the courſe of eleven months, ending on the 8th of February, 1798, he cleaned and put in order all the locks in the priſon, ſo completely, that they are now better than when they were firſt put on. During thoſe eleven months, he has, by his own wiſh, extended his working hours beyond thoſe of the other priſoners. He had ſometimes the aſſiſtance of a perſon to blow his bellows; but he has compenſated for this by doing a good deal of other work in the houſe, beſides repairing locks. The whole, therefore, of that work may be fairly placed to his own account. Eſtimating what he has done, at a lower rate than the county ſmith has ever charged to the houſe, his eleven months' work amounts to the ſum of 169l. 12s. On the time of his confinement being expired, the magiſtrates ordered him a donation of 30l. out of the produce of his work. He then ſaid, that he had received ſuch ill treatment in the world, and had experienced ſuch kindneſs and real friendſhip in that place, from the governor of the houſe, that, if he could maintain his wife and two children decently by his labour, he would paſs the remainder of his days there. An apartment has, in conſequence, been fitted up for him and his wife; his two children being placed in a charity-ſchool: he is appointed the county ſmith, and ſhe the inſpectreſs of the female priſoners, with a ſalary perfectly ſatisfactory to them both.——I am favoured with this account by the Rev. Dr. Glaſſe.

in which the ſick are kept ſeparate, according to their different diſorders. They have a governor and matron, to which appointments, by preference, a man and wife are elected; and they have apartments in the houſe, where they muſt conſtantly reſide. The former has £.60. a-year, the latter £.25; and they have coals, candles, and waſhing. There is a chaplain, who is generally a neighbouring clergyman, and has a ſalary of 30l. a-year; his duty is to read prayers once every day, and preach on Sundays. There is alſo a ſurgeon, who has 60l. a-year; he is a reſident of one of the neighbouring market-towns; but muſt attend every day, and has an apothecary's ſhop in the houſe, the medicines being found by the corporation.

"There are alſo four ſurgeons for the out diſtricts of the hundreds; who for attendance and medicines are allowed 45l. a-year each, and attend all caſualties, and report the ſtate and condition of the patient and his family to the next committee. The director's clerk, who is always an attorney, has 50l. a-year; he attends all committees and meetings. There muſt, by the act of parliament, be 36 directors, and 24 guardians. Every perſon, having a freehold eſtate of 300l. a-year, and being reſident in the diſtrict, is compelled to be a director, and to act as ſuch; and, in caſe there are not enough of that deſcription, the deficiency to be made good out of reſident freeholders of 150l. a-year (in which all rectors of livings of that value are included), until the whole number of directors is completed.

"The guardians are choſen by ballot, annually, out of the farmers who rent 100l a-year and upwards, or perſons having eſtates of that value. There is an annual meeting, and three quarterly meetings, of the directors and guardians, at one of the inns at the town of Dereham. At the annual meeting, which muſt be in the month of June, the directors and guardians are formed into twelve committees by ballot; three directors and two guardians being to attend, every month, at the houſe of induſtry, on each Tueſday, from ten o'clock in the forenoon, till three, four, and ſometimes five o'clock in the afternoon; for the purpoſe of viſiting, and inſpecting the ſtate of the houſe and the governor's accounts; of receiving reports from the overſeers of the pariſhes, ſigned by the ſurgeons of the diſtrict, as to the ſtate and condition of the ſick poor in the ſeveral pariſhes—and of granting them temporary relief—and alſo of directing that employment may be found for ſuch as apply for it.

"There is a farm of about 150 acres of land, belonging to the houſe, and kept in hand and managed by the governor; this provides a dairy, and occaſionally fats a few oxen and ſheep: there is likewiſe a garden of ſix or ſeven acres; which is cultivated by the old men of the houſe, and produces an abundant ſupply of vegetables. The governor purchaſes the wheat, at market, from harveſt till March or April, for the whole year: it is ground into meal by a mill belonging to the houſe; and is made into bread, unſifted even from the bran, a kind of bread commonly eaten in all farmers', and moſt gentlemen's houſes, in Norfolk.

"All the meat is purchaſed in the animal, and killed in the houſe. There are ſeveral manufactories eſtabliſhed in the houſe; and all articles of their wearing apparel are made by the poor themſelves; the whole eſtabliſhment being managed with economy, but with ſufficient plenty.

"From this account it may be ſuppoſed that the poor of thoſe hundreds are upon the whole well taken care of, and made comfortable in their old age; at the period when their labour is over.

"And it is certainly true that thoſe in the houſe are, generally ſpeaking, well lodged, fed, and clothed: but, when it is conſidered that theſe five hundred people are, or are preſumed to be, merely paupers, it will appear that there muſt remain a large claſs of induſtrious poor, who only want aſſiſtance occaſionally, being generally employed. As to thoſe with large families, the mode is to relieve them, by taking ſome of their children into the houſe: but I have known many parents, who, rather than conſent to this, have half ſtarved themſelves and their children; and ſometimes carried it ſo far, that, by reducing themſelves too low, they have been at length obliged to leave their cottage, and to be carried altogether to the houſe of induſtry; the man's ſpirit broken, and he himſelf (if he has ſtamina left to recover) becoming a burthen all his life; as he ſeldom returns out of the houſe, capable of the ſame induſtry and exertion that he poſſeſſed before he went in.

"It is further to be obſerved, that as the farmers pay a certain and limited rate to the corporation, which cannot be raiſed, they care very little about the poor; and they frequently ſend whole families into the houſe, who might with a little aſſiſtance ſupport themſelves out of it. Beſides this, the ſeparating of their children from them, deſtroys all natural affection, and often occaſions a wiſh that it would pleaſe God to take the child, inſtead of their being compelled to ſend it into the houſe of induſtry.

"Of the 500 perſons in the houſe, about half are children under 14 years of age. At that age, the children are ballotted on the farmers or tradeſmen (keeping ſervants) * for one year; who are compelled by the act of parliament to take them, or pay 10l.; but at the end of that year it happens that many return to the houſe of induſtry, unable to get another place; being found too delicate to perform that ſervice, which the farmer gets from thoſe whom he hires out of cottages; and in conſequence, many of them become fixed to the houſe for life.

"The other half conſiſts of profligate men, who, through idleneſs and debauchery, have reduced their families to depend on the eſtabliſhment for their ſupport;—diſſolute wenches, who come to lie-in of baſtard children, or to be cured of bad diſeaſes;—and (with theſe) the honeſt induſtrious poor, who, after many years of hard labour or long ſervice, can no longer provide for themſelves; and are then of neceſſity driven from their peaceful cottages to a ſociety, which muſt diſguſt and diſtreſs them the remainder of a life, the preceding part of which has been uſefully employed in the ſervice of the community

"The above are part of the many objections to inſtitutions

* The benefit of pariſhes placing out young perſons in ſervice, though only for a year, is, that it ſoon makes them fit for ſervice in other pariſhes, and relieves their own pariſh from any further burthen. The *compulſory* binding of poor children under the ſtatute law, till the age of twenty-one, is liable to this objection; that the maſter is not likely to uſe his apprentice ſo well, or the apprentice to ſerve his maſter ſo diligently, as if the contract was of ſhorter duration, and by mutual conſent. Mr. Adam Smith is of opinion, that even in trades, or what he terms *ſkilled labour*, long apprenticeſhips are unneceſſary and prejudicial to induſtry; and he gives powerful reaſons for his opinion (vol. i. p. 184—192): but whatever may be the caſe as to trades, ſurely to bind a young lad, from fourteen years of age to twenty-one, to huſbandry, or ſervice, merely becauſe he is out of work at the time, is a harſh and violent meaſure, and muſt have a tendency to check induſtry and exertion. In the houſe of induſtry, which is the ſubject of Mr. Parry's paper, children cannot be bound to huſbandry for a longer term than three years.

of this ſort: and I confeſs that, after having attentively conſidered the ſubject ſome years, I think if workhouſes of any kind ſhall be deemed uſeful (which I do not hold to be the caſe, except perhaps in cities and large towns), the beſt plan is to unite three or four, or at moſt ſix pariſhes; which ſhall have a ſmall new-built houſe, planned on purpoſe, merely as an aſylum for the aged and infirm; to be ſuperintended by the gentlemen and farmers who reſide in the pariſhes; and to be ſubject to the inſpection and control of the magiſtrates acting for the diviſion in which they are ſituated. That all the poor capable of work, though requiring occaſional relief, either on account of bodily infirmity, or of large families, ſhould receive it at their own houſes; and in general in clothes, or other neceſſaries in preference to money. It is well known that the preſent wages do not enable a labourer to ſupport ſeveral ſmall children during the period that they are incapable of labour. I therefore think he ſhould be allowed one ſhilling per week with every child above three, who ſhall be under the age of twelve years; and that when theſe children are to enter upon a ſervice, they ſhould always be clothed by the pariſh. This latter article is almoſt univerſally followed at the houſe of induſtry, which I have before mentioned. It was adopted, about eight years ago, on my recommendation: at firſt it met with many opponents; but is, I believe, now conſidered by all the directors and guardians as a very great ſtimulus to the parents to get them ſervices, and thereby to preclude them from afterwards being any burthen to the pariſh.

"In general, workhouſes are very improperly ſo called; being moſtly filled with aged and infirm poor, who are conſidered as paſt work; or with idle profligate wretches, whom the overſeers ſuffer to live in filth and inactivity, rather than complain to a magiſtrate to have them compelled to labour, or than to offer them any employment, whereby a part of their maintenance might be obtained. This ſtate of the workhouſe being known throughout the pariſh, the honeſt and induſtrious labourer, who has brought up a large family with credit, and who from misfortune is poor, and from age paſt his labour, will rather ſubmit to be half ſtarved, than take up his abode amidſt ſuch wretchedneſs and profligacy; although he knows the overſeer will give him no relief out of the houſe. This, I am ſorry to ſay, I have found to be the caſe; and in one inſtance, upon hearing ſuch a declaration from a poor man, a gentleman, who acted in the ſame diviſion as myſelf, went with me unexpectedly to viſit a pariſh workhouſe; where we found men, women, and children, of different families, crowded together, nineteen perſons in two rooms of twelve feet ſquare, and little more than ſix feet high.

"Children ſhould on no account be put into workhouſes *, if they have parents or relations who will take care of them; although it be requiſite to give ſome allowance, and even to the full of what they would coſt in the workhouſe. Experience proves that children brought up in cottages, half naked, and indifferently fed, make hardier and better labourers, than thoſe in pariſh workhouſes. This I have ſeen demonſtrated in houſes of induſtry, where though the children are taken early from their parents, well clothed and well fed during their continuance in the houſe, and though they generally look healthy, yet they become ſo delicate, as to be unfit for huſbandry labour, in a farmer's ſervice; and are frequently a heavy expence to their employer, from diſorders they contract, when taken from warm work-rooms, and expoſed to field employments in winter.

"It is however to be obſerved, that one general ſyſtem cannot be adopted in all caſes; and that, in large manufacturing towns, houſes of induſtry, well managed, may ſtill be deſirable; becauſe the children, being brought up to ſedentary employments, will be thereby accuſtomed to the habits of life which they will in all probability be induced to follow.

"One great advantage Norfolk has long derived from the cuſtom of putting out all work by the piece, thraſhing by the quarter, &c. (and which is making its way to other counties), is, that the father takes his ſons to the field as ſoon as they can handle a hook, or raiſe a mattock; and they ſoon earn their living, beſides being at an early age inured to induſtry and weather.

"I think every thing ſhould be done to give the labouring man an idea, that he has *an intereſt in the proſperity of the pariſh he lives in;* and that his children will be taken care of, if death, or misfortune, prevent his ability to do it. The two great points are, firſt, to provide employment for all the poor, while able to work: ſecondly, to encourage, by every unexceptionable mode, friendly ſocieties, or purſe clubs; that, when their labour is over, they may look forward to a comfortable ſupport, without the dreary proſpect through life, of a workhouſe, to end their days neglected by their relations, perhaps at a diſtance from them; and where every morſel of victuals is often grudged them by an abuſive overſeer, or by a man who has farmed them at ſo much per head."

Houſes of induſtry are too frequently undeſerving of the name, from a want of ſuperintendency; and hence they have acquired the quaint names of *poor*-houſe, or *work*-houſe, denoting rather what is expected than what is performed. It may be ſeen, however, under the article DUBLIN *(Supp.)*, that theſe inſtitutions are capable of conſiderable amelioration; and this will be ſtill more evident on peruſing the following extract from a further account of the improvements in the houſe of induſtry in Dublin, by the Right Hon. Thomas Pelham.

The acting governors of the houſe of induſtry in Dublin, have made a ſecond report of their proceedings, by which it appears that (notwithſtanding the confuſion which muſt neceſſarily have attended the rebellion in Ireland, during great part of the ſummer) the zeal, the activity, and the diligence of the governors of this inſtitution have not abated; but that improvements, which they had commenced and ſuggeſted in the preceding year, have been confirmed and realized in the laſt. They have ſtated to the parliament of Ireland, the means by which they have encouraged the induſtry, and increaſed the comfort, of thoſe who have been conſigned to their care.

They have augmented the former allowance of 2d. in the ſhilling earned by the poor in the houſe, to 8d.; and the payment of this quota is in a coin, current only in the houſe; which has effectually prevented the purchaſe of ſpirituous

* The defect of ſeveral workhouſes is, that many perſons are kept there, who could do better for themſelves, and with leſs expence to the pariſh, out of it. In one, that I have attended to, I found, on viſiting it, 53 perſons: of theſe, 13 were above the age of 50; 3 helpleſs men and women under that age; and 11 children, too young to be placed out in the world: 15 of the remaining 26 were placed out by me in ſervice, or otherwiſe, in the courſe of a month; and the other 11 were only kept till places could be found for them.—In this inſtance it is to be obſerved that 26 of theſe 53 perſons would have been better out of the workhouſe; but the houſe *had been farmed;* and on that account it had not been the man's intereſt to put them out, as that would have occaſioned ſome immediate expence; and it might probably have been the cauſe of his allowance from the pariſh being reduced at the end of the year, or of his loſing his contract by the competition of a lower offer.

liquors, and is laid out in extra provifions and clothes, at a fhop eſtabliſhed within the houſe, upon the plan of the village ſhops recommended in a former report of this ſociety. The adult poor have no clothing, but ſuch as they procure by their *induſtry:* and they are better clad than formerly.—A work-ſhop with twelve ſtocking frames has been erected, in which a number of females have been employed; and it is well obſerved by the governors, "that the employing females in this manufacture, and in others of a like kind, where an expert hand is more requiſite than maſculine ſtrength, ſhould be encouraged."

The children of both ſexes are apprenticed for ſeven years, to thoſe who ſuperintend their inſtruction, with a reſervation to the Board, of the power of aſſigning over their indentures at the end of the two firſt years, to ſuch manufacturers as ſhall propoſe to take them for the remaining five. The perſons who inſtruct the children, have at preſent a fixed ſalary. It is intended to give them one-third of the earnings; to lay out one-third in clothing the children, and the remainder to be expended in premiums.—The hoſpital is open to all the poor of Dublin; and it appears, that, in the year 1798, out of 1,659 patients admitted, 1,443 were reſtored to health, and to their families; and that of 66 lunatics, 47 have been cured. —The walls of the ſick wards are waſhed every month with lime, and it is purpoſed to have a detached houſe excluſively for fevers.

"With a view to better the condition of the poor of Dublin in general, and to prevent the funds of the houſe of induſtry from being incumbered by unneceſſary claims, the board of governors determined to open a public kitchen, or ſoup ſhop, detached from the houſe of induſtry." Their addreſſes to the public, and their proceedings reſpecting their public kitchen, are worthy of applauſe and imitation. The ſucceſs is proved by the numbers that have been benefited by it: 6,431 perſons were ſupplied with food from this kitchen*, between the 4th day of February, the day of opening, and the 28th of February, the date of their report.

It is to be obſerved, that this inſtitution differs very materially from any poor-houſe, or other inſtitution, in Great Britain, both in its object, its government, and its reſources. In Ireland there are no poor laws, or local taxes, for the ſupport of the poor. This inſtitution was intended for the purpoſe of providing employment, and for the maintenance of the poor of Dublin, and for the puniſhment of the vagrants and beggars who infeſted the ſtreets of that city. The government was veſted by act of parliament in a certain number of public officers; the mayor and aldermen of Dublin, and many other individuals; ſome of whom were named in the act, and others elected: and conſiderable grants have been annually made by parliament for its ſupport. The inſtitution certainly did not at firſt anſwer the expectation of the public, but fell into diſcredit.

The ſtatement of theſe circumſtances will render the report of the acting governors more intelligible, and, by explaining their ſituation, enhance the merit of their exertions.

HOUSE OF RECOVERY, an inſtitution of a very recent deſcription, but of infinite conſequence to the preſervation of the poor, as will appear from the following account of the Houſe of Recovery, eſtabliſhed by the Board of Health a Mancheſter, by Thomas Bernard, Eſq.

In May, 1796, an houſe for *the prevention of infectious fevers*, was opened upon private ſubſcription, at Mancheſter, by the Board of Health there; and placed under the inſpection of a medical committee, conſiſting of the medical gentlemen of the Infirmary. The following REGULATIONS were adopted reſpecting it:

1ſt. That the phyſicians of the Infirmary ſhall be authorized to give one or two ſhillings from the funds of this inſtitution (by a ticket to the ſecretary of the Board of Health) to the perſon who ſhall furniſh the earlieſt information of the appearance of fever in any poor family, within the limits of their reſpective diſtricts.

2d. That as ſoon as the ſecretary has received this ticket, he ſhall apply, or take care that application be made, to ſome truſtee of the Board of Health, living within the diſtrict, and who is a ſubſcriber to the infirmary, for an immediate recommendation of the ſick perſon as a home patient.

3d. That ſuch patients as the phyſicians ſhall deem peculiar objects of recommendation, either on account of their extreme poverty, or of the cloſe and crowded ſtate of their habitations, ſhall be conveyed in a ſedan chair (provided with a moveable waſhing lining, and kept for the ſole purpoſe, and diſtinguiſhed by proper marks) to the Houſe of Recovery.

4th. That the phyſicians ſhall be requeſted to form the neceſſary regulations for the domeſtic government of the families of the home patients, afflicted with fever.

5th. That a reward to the amount of ſhall be given to the heads of the family, after the ceſſation of the fever, on condition that they have faithfully obſerved the rules preſcribed for cleanlineſs, ventilation, and the prevention of infection, amongſt their neighbours. This reward ſhall be doubled in caſes of extraordinary danger, and when the attentions have been adequate and ſucceſsful.

6th. That, after the viſitation of fever has ceaſed in any poor dwelling-houſe, the ſum of or a ſufficient ſum, ſhall be allowed (to be expended under the direction of an inſpector) for white-waſhing and cleanſing the premiſes, and for the purchaſe of new bed-clothes, or apparel, in lieu of ſuch as it may be deemed neceſſary to deſtroy, to obviate the continuance or propagation of fever.

7th. That an inſpector ſhall be appointed in each diſtrict of the Infirmary, to aid the execution, and to enforce the obſervance of the foregoing regulations. And that the gentlemen of the Stranger's Friend Society ſhall be requeſted to undertake this office.

The following are the *Internal Regulations* for the Houſe of Recovery:

1ſt. Every patient, on admiſſion, ſhall change his infectious for clean linen; the face and hands are to be waſhed clean with lukewarm water, and the lower extremities fomented.

2d. The clothes brought into the houſe by patients, ſhall be properly purified and aired.

3d. All linen and bed-clothes, immediately on being removed from the bodies of the patients, ſhall be immerſed in cold water before they are carried down ſtairs.

---

* A public kitchen had been previouſly tried with ſucceſs at Cork; (ſee CORK, *Supp.*). The diſtribution made at Dublin, amounted to 12 ounces of bread and a quart of ſoup; which was given *gratis* to any poor perſon who applied, and who was not in receipt of relief from the Houſe of Induſtry. Inconveniences, however, had attended the mere donation; and in truth, that which is indiſcriminately given is never duly valued. It was thought better that the ſoup and bread ſhould be ſold at a reduced price; ſo that the poor might receive it by tickets given them by their more opulent neighbours, and that the working mechanic might be ſupplied at a very moderate rate; that of two pence for half a pound of bread and a quart of ſoup. This has been accordingly done.

4th. All diſcharges from the patients ſhall be removed from the wards without delay.

5th. The floors of the wards ſhall be carefully waſhed twice a-week, and near the beds every day.

6th. Quick-lime ſhall be ſlaked in large open veſſels, in every ward, and renewed whenever it ceaſes to bubble on the affuſion of water. The walls and roofs ſhall be frequently waſhed with this mixture.

7th. No relation or acquaintance ſhall be permitted to viſit the wards, without particular orders from one of the phyſicians.

8th. No ſtrangers ſhall be admitted into the wards; and the nurſes ſhall be ſtrictly enjoined not to receive unneceſſary viſits.

9th. No linen or clothes ſhall be removed from the Houſe of Recovery, till they have been waſhed, aired, and freed from infection.

10th. No convaleſcents ſhall be diſcharged from the houſe, without a conſultation of the phyſicians.

11th. The nurſes and ſervants of the houſe ſhall have no direct communication with the Infirmary; but ſhall receive the medicines in the room already appropriated to meſſengers from the home patients.

12th. The committee of the Stranger's Friend Society ſhall be requeſted to undertake the office of inſpecting the Houſe of Recovery.

13th. A weekly report of the patients, admitted and diſcharged, ſhall be publiſhed in the Mancheſter newſpapers.

14th. When a patient dies in the wards, the body ſhall be removed as ſoon as poſſible, into a room appropriated to that uſe; it ſhall then be wrapped in a pitched cloth; and the friends ſhall be deſired to proceed to the interment as early as is conſiſtent with propriety.

15th. All proviſions and attendance, for the patients in this Houſe of Recovery, ſhall be provided from the funds of this inſtitution, without any communication with the Infirmary.

The circumſtances of the firſt patients, removed to the Houſe of Recovery, all tended to prove the truth of the poſition, that the moſt contagious and deſtructive fevers, by which manufacturing and other crowded towns have been afflicted, had procceded from *individual infection;* and that if, upon the appearance of the fever, the poor patient had been removed to a clean well ventilated room, and diſmiſſed after recovery with clothes properly purified, much diſeaſe and miſery would have been prevented, and many lives ſaved.

As the ſtatement of the circumſtances of the firſt patients that were admitted into the Houſe of Recovery, may tend to ſhew the ſufferings of the poor, where no houſe of recovery is prepared for them, we here ſtate them from the phyſician's reports inſerted in the Minutes of the Board of Health.

"Mary Parkinſon, aged 20, the ſecond daughter of Ann Parkinſon, lodging with her mother and ſiſter, at James Ruſhton's (who rents a garret, No. 50, Great Turner-ſtreet), was ſeized on the 17th inſtant with a ſpotted fever, and viſited in a day or two after, as a home patient of the Infirmary.

"She was found almoſt deſtitute of covering, lying upon a collection of rags ſpread upon the floor of a cloſe, dirty, and noiſome garret. In this wretched ſubſtitute for a bed, the mother and another grown-up daughter (juſt recovering of fever) likewiſe ſlept. In an oppoſite corner of the room, James Ruſhton, his wife, and three children, ſlept upon a bed, ſimilar to that above deſcribed. Under ſuch circumſtances, I was fully convinced, that it would be impracticable to prevent the fever from ſpreading, unleſs the infected perſon could be removed. But, as the Houſe of Recovery was not then opened, the removal of the patient could not be effected. In a day or two, as I expected, the daughter of James Ruſhton ſickened, and became dangerouſly ill of the fever. As the wife (who was far advanced in her pregnancy), and the reſt of the inhabitants of the room, might be ſuppoſed to be in hourly danger of infection; I propoſed, therefore (the Houſe of Recovery being now ready), as the moſt likely method of ſaving the lives of the two women ſo dangerouſly affected, and of preventing the reſt from receiving the infection, that the ſick perſons ſhould be inſtantly removed into the Houſe of Recovery. With every expreſſion of joy and gratitude, the parents of both the patients accepted the offer, and they were accordingly removed without ſuffering any injury, or apparent inconvenience, by the removal.

"Mary Weſt, the wife of a ſoldier belonging to the Manks Fencibles, was infected with fever from attending her huſband, who had recovered, and was ordered to join the regiment.—She had been driven out of doors upon the ſymptoms of fever appearing, and was refuſed admittance wherever ſhe applied. In conſequence of expoſure to cold, and diſtreſs of mind, her complaint rapidly increaſed, and ſhe got a recommendation as in-patient to the Infirmary. But the rules of this charity forbad her admittance. She was, therefore, received into the Houſe of Recovery, as an object peculiarly claimed by the nature of the inſtitution.

"Jeremiah Bowcock was removed, on the firſt appearance of fever, from a family living at No. 74, Newton-lane; and, beſides himſelf, conſiſting of ſeven men, four women, and three children. On the ſame floor with, and adjoining to the chamber (at No. 78, Newton-ſtreet) in which he and three others ſlept, a man, his wife, and three children, conſtantly reſide. The ground floor is occupied by two men, one woman, and three children; and the cellars are let for work-rooms. The diſeaſe was introduced into his houſe by Bowcock's brother, who had been turned into the ſtreets, when labouring under *typhus*, by the perſons with whom he lodged.—Immediately after the removal of this patient, the room in which he had been confined was duly waſhed and ventilated; and means were taken to dis-infect the clothes and bedding, by a free expoſure of them in the open air.

"Margaret Billington, wife of a private in the York Fencibles, was removed on the 10th day of her diſeaſe, from a ſmall room, at No. 8, Pump-ſtreet, which has been for ſome time the nightly abode of four grown perſons, and three children. On her removal, the bedding was expoſed to the air, in an open ſpace, for ſeveral hours; the floor of the apartment was ſcoured; the walls were white-waſhed; fumigations with nitrous gas were employed, according to the practice of his majeſty's naval hoſpitals; and a reward was promiſed to the heads of the family, provided their endeavours to extinguiſh contagion were attended with ſucceſs.

"John Owen, Robert Williams, and William Williams, from a houſe in Salford, where ſix perſons lay ill of a fever at the ſame time, in two very ſmall rooms. One patient only remains in that houſe, who is now recovering.

"William Lomax, a child from a houſe in Longworth-ſtreet, where a family of five perſons had only one bed-room for their accommodation. The eldeſt daughter was firſt taken ill; after ſhe recovered, the father, mother, and this boy, were all ſeized with the fever together. The father died. The mother miſcarried, from grief and fatigue, the day after his death. A younger daughter has ſince been taken ill, and will be admitted as ſoon as poſſible.

"Samuel Gould, from a large family with whom he lodged. His fever is of a very dangerous nature, and it is hoped that, by his removal, the infection of the whole family will be prevented."

The beneficial effects of the Houſe of Recovery, even after a year and a half, are almoſt beyond belief. The facts are, how-

ever, eſtabliſhed by authentic documents.—The number of fever patients (as entered in the phyſician's book at the Infirmary) in Portland-ſtreet, Silver-ſtreet, and the other ſtreets in that pile of buildings, in the neighbourhood of the Houſe of Recovery, for the two preceding years and eight months, were 1,256, ſomething more than the average of 400 a-year: —thoſe in the ſame diſtrict from July, 1796 (a period commencing two months after the eſtabliſhment of the Houſe of Recovery), to July, 1797 (being twelve months), were only twenty-ſix;—of theſe, there were, in July, 1796, only five ſuch patients; in Auguſt, but one; in September, 1796, none; and in the four laſt months, from March to July, 1797, only one fever patient.

In the report of the weekly board of the Infirmary at Mancheſter, notice is taken of the extraordinary effects of the Houſe of Recovery, in diminiſhing the proportion of the fever patients in the Infirmary. It appears from the phyſician's books of the Infirmary, that in January, 1796 (before the eſtabliſhment of the Houſe of Recovery), the whole number of the home patients at the Mancheſter Infirmary was 296, of which 226 were caſes of fever: and that in January, 1797, the number of their home patients was 161; and, of theſe, only 57 were caſes of fever.

From the opening of the Houſe of Recovery, on the 19th of May, 1796, to the 2d of November, 1797, 542 fever patients have been admitted. Of theſe, 465 have been cured and ſent home; 48 (and theſe were ſome very bad caſes) have died; and 29 were, on the 2d inſtant, remaining in the houſe. The account, therefore, up to the 2d inſtant, ſtands thus:

Cured and diſcharged - -	465
Dead - - - - -	48
Remaining in the houſe - -	29
Total admitted -	542

But the proportional number of cures in the laſt half-year (a benefit that will probably increaſe) is greater than that of the preceding period; becauſe the poor are now induced to apply in the earlier ſtages of the fever, when medicine can be applied with more effect. The account from the 8th of May, 1797, to the 2d inſtant, being near ſix months, is as follows:

Cured and diſcharged - -	141
Dead - - - - -	8
Remain in the houſe - -	29
Total -	178

Many of the opponents of the Houſe of Recovery in Mancheſter * are become its active friends; and that, which was at firſt an act of philanthropy in a few individuals, is now ſupported by the good wiſhes and contribution of the greater part of the reſpectable inhabitants at Mancheſter. Other conſequences have attended the extraordinary ſucceſs of this inſtitution:—viz. firſt, that the Board of Health does *now* receive fever patients into the houſe from places beyond the diſtricts for which it was firſt eſtabliſhed; by which means the environs of the town will be cleared of the epidemic fever: ſecondly, that the Infirmary alſo receives a variety of patients, which they were obliged to refuſe, when the Infirmary and town were oppreſſed by the enormous crowd of fever patients, whoſe claims ſeemed to ſuperſede thoſe of perſons not afflicted with contagious diſeaſes: and thirdly, that in the year 1796, there was a decreaſe of near 400 in the bills of mortality at Mancheſter.

It may be obſerved, in concluſion, that a Board of Health and a Houſe of Recovery, upon the plan of that at Mancheſter, would be uſeful in all towns; but particularly where the poor, employed in manufactures, are incapable of receiving proper medical relief, in their own confined habitations; and where they are peculiarly liable to communicate contagion, not only to their own family, and to thoſe who dwell under the ſame roof, but to the neighbourhood. A Board of Health, to prevent the ſpreading of contagious diſeaſes among the poor, is peculiarly applicable to a populous town: but it is not excluſively ſo. It would be very uſeful in country villages and country neighbourhoods, to aſſiſt and ſtimulate the overſeers in that part of their duty which relates to the health of the poor, and to prevent the progreſs of infectious diſorders. It is peculiarly in the prevention of diſeaſe and contagion, that the benefit returns with increaſe upon the benefactor, and that the merciful receive mercy.

A ſubſequent report from the Society for bettering the Condition of the Poor, acquaints us, that in Auguſt, 1798, there were 19 patients in the houſe. Their apartments appeared to be as airy, as clean, and as comfortable as could be wiſhed. The upper floors are laid together, ſo as to form four large wards; and each of the front rooms below will contain two beds, ſo as to accommodate in the whole 28 patients conveniently. The rooms on the ground floor are appropriated to the convaleſcents; and to the uſe of the ſervants, who conſiſt of a head nurſe and three other nurſes; occaſional aſſiſtance being hired, when neceſſary. The wards are furniſhed with iron bedſteads, without curtains, and with ticks filled with ſtraw, which is changed at proper periods. The mode of removing the ſick into the houſe is in a ſedan-chair, kept in an out-building for that purpoſe.

When patients are admitted into the houſe, a flannel dreſs is provided for them, and their own clothes are carried into the yard, to be waſhed, ſcoured, and ventilated. During their convaleſcence they wear the dreſs of the houſe; which conſiſts of a jacket and trowſers for the men, and of a wrapping gown and petticoat for the women. Part of a vacant piece of ground, adjoining to the houſes, is incloſed with a wall for the purpoſe of waſhing and airing the clothes of the patients. At the time of diſcharging them their own clothes are returned to them perfectly clean, and they rejoin their families, and reſume their occupations, without the hazard of communicating infection to others.

To ſo great a degree have contagious fevers been reduced †, ſince the eſtabliſhment of the Houſe of Recovery, that the limits

---

* Similar eſtabliſhments have been ſucceſsfully made in London, Cheſter, Stockport, Liverpool, and ſome other places in England, and at Waterford, in Ireland. For a detail of the principles and rules to be adopted in country towns, to check the progreſs of diſeaſe and infection, the reader is referred to a very excellent pamphlet by the Rev. Sir William Clerke, bart. rector of Bury in Lancaſhire, publiſhed by Johnſon, St. Paul's Church-yard; and alſo to a tract on the ſame ſubject by the late Dr. Murray, who has recently fallen a ſacrifice to his zeal and activity, in promoting the views of the Society for bettering the Condition of the Poor, in this reſpect.

† In the former report it was ſtated the extraordinary diminution that had taken place in the bills of mortality at Mancheſter, ſince the opening of the Houſe of Recovery. An additional proof, of a ſingular nature, appears in the laſt year's accounts of the overſeers of the poor; in which the charge for deceaſed paupers' coffins is 100l. 16s. It uſed to be *half as much again*.

of the houſe are now extended to the whole of Mancheſter and its extenſive ſuburbs, and to every part of the vicinage, for two miles round, from whence a fever patient can be ſafely removed. The number of home patients of the infirmary at Mancheſter has alſo, in conſequence, been gradually diminiſhed. There were admitted on the phyſicians' books during the year, ending 1ſt June, 1796 - - 2880
Ditto in the year ending June, 1797, being the firſt year of the houſe of recovery being opened - 1759
Ditto in the year ending June, 1798, - - 1564

During the ſpring and ſummer of the preceding year, contagious fevers of an alarming nature had appeared in different parts of the town and neighbourhood. By removing, however, the patient into the Houſe of Recovery, the extenſion of the fever was in every inſtance prevented. The account of the houſe for one year, ending the 31ſt of May, 1798, at which time 710 patients had been admitted, is as follows:

Cured and diſcharged - - -	300
Dead - - - - -	16
Remained then in the houſe - - -	23
	339

Account for another Year, to 31ſt May, 1799.

Cured and diſcharged - - -	364
Dead - - - - -	24
Remained in the houſe, 31ſt May, 1799 -	11

To a poor creature who has been languiſhing in a cold, damp cellar, or in a garret expoſed to the injuries of the weather, amidſt the neglect and confuſion of a wretched family, —to ſuch a patient a clean bed, a quiet ward, an attentive nurſe, and the frequent viſits of the phyſician, are of moſt potent efficacy. To theſe cauſes it muſt be imputed that, upon a return of the epidemic fever of 1797, of 149 dangerous caſes received from the beginning of May to the beginning of October, only four patients died.

Of the benefits of the Houſe of Recovery, it is one of no ſmall conſequence, that the owners of cotton mills are now induced to pay a more ſcrupulous attention to the health of their work-people; and that their buildings are, in general, kept cleaner and better ventilated. A ſalutary impreſſion has alſo been made on the minds of the poor, reſpecting the utility of cleanlineſs in their houſes. The idea of fever comprehends, among them, that of ruin to their circumſtances, and deſertion by their neighbours. It may therefore be expected, that they will catch at every means within their reach to avoid ſo dreadful an evil: and when they find that a public charity extends its care to them ſo far, as to whitewaſh their houſes, when the phyſicians report it to be neceſſary, they muſt feel the propriety of attending more to this object.

HOYER, a town of Denmark, in the duchy of Sleſwick, celebrated for its oyſter-fiſhery, four miles W. of Tonderen.

HUBERTSBERG, a town of Upper Saxony, with a magnificent hunting-ſeat, built by Auguſtus III. then electoral prince. A peace was concluded here between the kings of Pruſſia and Poland and the empreſs queen. It is 22 miles E. of Leipſic.

HUDDERSFIELD, a town in the W. riding of Yorkſhire, with a market on Tueſday. It is ſituate near the Calder, amid barren moors, and is the mart for narrow cloths, called plains. It is 42 miles S.W. of York, and 189 N.N.W. of London. Long. 1. 40. W. Lat. 53. 40. N.

HUDICKSWALL, a ſea-port of Sweden, in the province of Helſingland, with a good harbour. The inhabitants carry on an advantageous trade in the timber, flax, linen, butter, fiſh, &c. It is 130 miles N. of Upſal. Long. 18. 36. E. Lat. 61. 48. N.

HUDSON, a city of the United States, in New York, ſeated on eminence, on the E. ſide of Hudſon's River, 30 miles S. of Albany, and 130 N. of New York. Long. 75. 20. W. Lat. 42. 23. N.

HUESSEN, a town of Dutch Guelderland, ſeated on the Rhine, three miles S. of Arnheim.

HUETINBERG, a town of Germany, in Carinthia, eight miles S.W. of Reichenfels.

HUETTA, a town of Spain, in New Caſtile, 67 miles E. of Madrid. Long. 1. 55. W. Lat. 40. 22. N.

HUFFINGEN, a town of Suabia, in the principality of Furſtenburg, four miles N.N.W. of Furſtenburg.

HULHEN, a town of Auſtrian Brabant, nine miles S.E. of Bruſſels. Long. 4. 37. E. Lat. 51. 44. N.

HUNDSFELD, a town of Sileſia, ſeated on the Wide, eight miles N E. of Breſlaw. Long. 17. 18. E. Lat. 51. 9. N.

HUNDSRUCH, a diſtrict of Germany, in the circle of Upper Rhine, ſituate between the Rhine, the Moſelle, and the Nahe; belonging partly to the elector of Treves, the elector palatine, and the prince of Heſſe.

HUNGEN, a town of Germany, in the circle of Upper Rhine, and county of Solms Braunfels, 14 miles S.E. of Wetzlar.

HUNMANBY, a town in the E. riding of Yorkſhire, with a market on Tueſday, 34 miles N.E. of York, and 209 N. of London. Long. 0. 12. W. Lat. 54. 12. N.

HUNTER (John), a celebrated phyſiologiſt, was the youngeſt child of John Hunter, of Kilbride, in the county of Lanark. He was born on the 14th of July, 1728, at Long Caldewood, a ſmall eſtate belonging to the family. His father dying when he was about ten years of age, though he attended the grammar-ſchool he made no progreſs in learning; and may be ſaid to have been almoſt totally illiterate when, in September 1748, he arrived in London. His brother, Dr. William Hunter, was then celebrated as a teacher of anatomy, and John had expreſſed a deſire to aſſiſt him in his reſearches. Accordingly, he had here every opportunity of improvement, as all the diſſections at this time carried on in London were confined to that ſchool.

In the ſummer 1749, Mr. Cheſelden, at the requeſt of Dr. Hunter, permitted him to attend at Chelſea Hoſpital; and he there learned the firſt rudiments of ſurgery. The following winter he was ſo far advanced in the knowledge of human anatomy, as to inſtruct the pupils in diſſection, to whom Dr. Hunter had very little time to pay attention. This office, therefore, fell almoſt entirely upon him, and was his conſtant employment during the winter ſeaſon. In the ſummer months of 1750, Mr. Hunter attended the hoſpital at Chelſea; in 1751, he became a pupil at St. Bartholomew's, and in the winter was preſent at operations occaſionally, whenever any thing extraordinary occurred. The following ſummer he went to Scotland; and in 1753 entered, it is difficult to conceive for what reaſon, as a gentleman commoner at St. Mary-hall, Oxford. In 1754 he became a ſurgeon's pupil at St. George's Hoſpital, where he continued during the ſummer months; and in 1756 was appointed houſe-ſurgeon. In the winter 1755, Dr. Hunter admitted him to a partnerſhip in his lectures, and a certain portion of the courſe was allotted to him; beſides which, he gave lectures when the doctor was called away to attend his patients.

Anatomy and phyſiology ſeem to have been purſuits for which Mr. Hunter's mind was peculiarly fitted, and he applied to them with an ardour and perſeverance of which there is hardly any example. His labours were ſo uſeful to his brother's collection, and ſo gratifying to his diſpoſition, that although in many other reſpects they did not agree, this ſimple tie kept them together for many years.

Mr. Hunter employed himſelf for ten years on human anatomy, during which period he made ſome addition to that knowledge. He traced the ramifications of the olfactory nerves upon the membranes of the noſe, and diſcovered the courſe of ſome of the branches of the fifth pair of nerves. In the gravid uterus, he traced the arteries of the uterus to their termination in the placenta. He was alſo the firſt who diſcovered the exiſtence of the lymphatic veſſels in birds.

Many parts of the human body being ſo complex, that their ſtructure could not be underſtood, nor their uſes aſcertained, Mr. Hunter was led to examine ſimilar parts in other animals, in which the ſtructure was more ſimple, and more within the reach of inveſtigation; this carried him into a wide field, and laid the foundation of his great collection in comparative anatomy. This active enquirer began with the more common animals, and preſerved ſuch parts as appeared by their analogy, or in ſome other way, to elucidate the human economy.

In 1760 his health was ſo much impaired by exceſſive attention to theſe purſuits, that he was adviſed to go abroad, having complaints in his breaſt, which threatened a conſumption. Mr. Adair, inſpector-general of hoſpitals, appointed him ſurgeon on the ſtaff; and in the following ſpring he went with the army to Belleiſle, leaving Mr. Hewſon to aſſiſt his brother during his abſence.

Mr. Hunter ſerved, while the war continued, as ſenior ſurgeon on the ſtaff, both in Belleiſle and Portugal, till the year 1763; and in that period acquired his knowledge of gun-ſhot wounds. On his return to England he ſettled in London; where, not finding the emoluments from his half-pay and private practice ſufficient to ſupport him, he taught practical anatomy and operative ſurgery for ſeveral winters. He returned alſo, with unabated ardour, to comparative anatomy; and as his experiments could not be carried on in a large town, he purchaſed for that purpoſe, above two miles from London, a piece of ground near Brompton, at a place called Earl's Court, on which he built a houſe. In the courſe of his enquiries, this excellent anatomiſt aſcertained the changes which animal and vegetable ſubſtances undergo in the ſtomach when acted on by the gaſtric juice; he diſcovered, by means of feeding young animals with madder (which tinges growing bones red), the mode in which a bone retains its ſhape during its growth; and explained the proceſs of exfoliation, by which a dead piece of bone is ſeparated from the living.

On the 5th of February, 1767, he was choſen a fellow of the Royal Society. His deſire for improvement in thoſe branches of knowledge which might aſſiſt in his reſearches, led him at this time to propoſe to Dr. George Fordyce, and Mr. Cumming, an eminent mechanic, that they ſhould adjourn from the meetings of the Royal Society to ſome coffee-houſe, and diſcuſs ſuch ſubjects as were connected with ſcience. This plan was no ſooner eſtabliſhed, than they found their numbers increaſed; they were joined by Sir Joſeph Banks, Dr. Solander, Dr. Maſkelyne, Sir George Shuckburgh, Sir Harry Englefield, Sir Charles Blagden, Dr. Noothe, Mr. Ramſden, Mr. Watt of Birmingham, and many others. At theſe meetings diſcoveries and improvements in different branches of philoſophy were the objects of their conſideration; and the works of the members were read over and criticiſed before they were given to the public. It was in this year that, by an exertion in dancing, after the muſcles of the leg were fatigued, he broke his tendo Achillis. This accident, and the confinement in conſequence of it, led him to pay attention to the ſubject of broken tendons, and to make a ſeries of experiments to aſcertain the mode of their union.

In the year 1768, Mr. Hunter became a member of the corporation of ſurgeons; and in the year following, through his brother's intereſt, he was elected one of the ſurgeons of St. George's Hoſpital. In May 1771, his Treatiſe on the Natural Hiſtory of the Teeth was publiſhed; and in July he married Miſs Home, a daughter of the ſurgeon to Burgoyne's regiment of light horſe. After his marriage, his private practice and profeſſional character advanced rapidly, and though his family began to increaſe, he ſtill devoted much of his time to the forming of his collection, which, as it daily became larger, was alſo attended with greater expence. The whole ſuit of the beſt rooms in his houſe were occupied by his preparations; and he dedicated his mornings, from ſunriſe to eight o'clock (the hour for breakfaſt), entirely to his purſuits. To theſe he added ſuch parts of the day as were not engaged in attending his patients.

The knowledge he derived from his favourite ſtudies, he conſtantly applied to the improvement of the art of ſurgery, and omitted no opportunity of examining morbid bodies; from which he made a collection of facts which are invaluable, as they tend to explain the real cauſes of ſymptoms, which during life could not be exactly aſcertained, the judgment of the practitioner being too frequently miſled by theoretical opinions, and deluſive ſenſations of the patients.

In the practice of ſurgery, where caſes occurred in which the operations proved inadequate to their intention, he always inveſtigated, with uncommon care, the cauſes of that want of ſucceſs; and in this way detected many fallacies, as well as made ſome important diſcoveries, in the healing art. He detected the cauſe of failure, common to all the operations in uſe for the radical cure of the hydrocele, and was enabled to propoſe a mode of operating, in which that event can with certainty be avoided. He aſcertained, by experiments and obſervations, that expoſure to atmoſpherical air ſimply, can neither produce nor increaſe inflammation. He diſcovered in the blood ſo many phenomena connected with life, and not to be referred to any other cauſe, that he conſidered it as alive in its fluid ſtate. He improved the operation for the fiſtula lachrymalis, by removing a circular portion of the os unguis inſtead of breaking it down with the point of a trochar. He alſo diſcovered that the gaſtric juice had a power, when the ſtomach was dead, of diſſolving it; and gave to the Royal Society a paper on this ſubject, which is publiſhed in the Philoſophical Tranſactions.

In the winter 1773, he formed a plan of giving a courſe of lectures on the theory and principles of ſurgery, with a view of laying before the public his own opinions upon that ſubject. For two winters he read his lectures *gratis* to the pupils of St. George's Hoſpital; and in 1775, gave a courſe for money upon the ſame terms as the other teachers in the different branches of medicine and ſurgery. But giving lectures was always particularly unpleaſant to him; ſo that the deſire of ſubmitting his opinions to the world, and learning their general eſtimation, were ſcarcely ſufficient to overcome his natural diſlike to ſpeaking in public. He never gave the firſt lecture of his courſe without taking 30 drops of laudanum to take off the effects of his uneaſineſs.

Comparative anatomy may be conſidered as the purſuit in which Mr. Hunter was conſtantly employed. No opportunity eſcaped him, as is evident from the various accounts of the peculiar ſtructure of different animals publiſhed in the Philoſophical Tranſactions.

In January 1776, Mr. Hunter was appointed ſurgeon-extraordinary to his Majeſty; and in the ſpring he gave to the Royal Society a paper on the beſt mode of recovering drowned perſons.

In the autumn he was taken extremely ill, and the nature

of his complaints made his friends as well as himſelf, conſider his life to be in danger. When he reflected upon his own ſituation, that all his fortune had been expended in his purſuits, and that his family had no proviſion but what ſhould ariſe from the ſale of his collection, he became very ſolicitous to give it its full value, by leaving it in a ſtate of arrangement. This he accompliſhed with the aſſiſtance of Mr. Bell, an ingenious draughtſman who reſided in his houſe, and his brother-in-law, Mr. Home.

In 1781 he was elected a fellow of the Royal Society of Sciences and Belles Lettres at Gottenburg. And in 1782 he gave the Royal Society a paper on the Organ of Hearing in Fiſh. Beſides the papers which he preſented to that learned body, he read ſix Croonian lectures upon the ſubject of Muſcular Action, for the years 1776, 1778, 1779, 1780, 1781, and 1782. In theſe lectures he collected all his obſervations upon muſcles, reſpecting their powers and effects, and the ſtimuli by which they are affected; and to theſe he added Comparative Obſervations upon the moving Powers of Plants. Theſe lectures were not publiſhed in the Philoſophical Tranſactions, for they were withdrawn as ſoon as read, not being conſidered by the author as complete diſſertations, but rather as materials for ſome future publication.

In 1783 he was choſen into the Royal Society of Medicine and the Royal Academy of Surgery in Paris; and the ſame year the leaſe of the houſe which he occupied in Jermyn-ſtreet having expired, he purchaſed the leaſe of a large houſe on the eaſt-ſide of Leiceſter-ſquare, and the whole lot of ground adjoining to Caſtle-ſtreet, on which there was another houſe. In the middle ſpace between the two houſes, he erected, at the expence of 3000l. a building for his collection; though, unfortunately for his family, the leaſe did not extend beyond 24 years.

In the building formed for the collection there was a room fifty-two feet long, by twenty-eight feet wide, lighted from the top, and having a gallery all round, for containing his preparations. Under this were two apartments; one for his lectures, and the other, with no particular deſtination at firſt, but afterwards made uſe of for weekly meetings of medical friends during the winter. To this building the houſe in Caſtle-ſtreet was entirely ſubſervient; and the rooms in it were uſed for the different branches of human and comparative anatomy.

About this period Mr. Hunter may be conſidered as at the height of his chirurgical career; his mind and body were both in their full vigour. His hands were capable of performing whatever was ſuggeſted by his mind; and his judgment was matured by former experience. Inſtances of his extraordinary ſkill are numerous and well known.

Among other important diſcoveries, was a new mode of performing the operation for the popliteal aneuriſm, by taking up the femoral artery on the anterior part of the thigh, without doing any thing to the tumor in the ham. The ſafety and efficacy of this mode have been confirmed by many ſubſequent trials; and it muſt be allowed to ſtand very high among the modern improvements in ſurgery.

If we conſider Mr. Hunter at this period of his life, it will afford us a ſtrong picture of the turn of his mind, of his deſire to acquire knowledge, and his unremitting aſſiduity in proſecuting whatever was the object of his attention.

He was engaged in a very extenſive private practice; he was ſurgeon to St. George's Hoſpital; he was giving a very long courſe of lectures in the winter; he was carrying on his enquiries in comparative anatomy; had a ſchool of practical human anatomy in his houſe; and was always employed in ſome experiments reſpecting the animal economy.

He was always ſolicitous for ſome improvement in medical education; and, with the aſſiſtance of Dr. Fordyce, inſtituted a medical ſociety, which he allowed to meet in his lecture-rooms, and of which he was choſen one of the patrons. This ſociety, called the *Lyceum Medicum Londinenſe*, under his auſpices and thoſe of Dr. Fordyce, has acquired conſiderable reputation, both from the numbers and merits of its members.

In the year 1786, in conſequence of the death of Mr. Middleton, Mr. Hunter was appointed deputy ſurgeon-general to the army. He now publiſhed his work upon the Venereal Diſeaſe; and his Obſervations on certain parts of the Animal Economy.

In the year 1787, his collection, which had been the great object of his life, both as a purſuit and an amuſement, was brought into a ſtate of arrangement; and he had then the ſatisfaction of ſhewing to the public a ſeries of anatomical facts formed into a ſyſtem, by which the economy of animal life was illuſtrated.

Upon the death of Mr. Adair, which happened in the year 1792, Mr. Hunter was appointed inſpector-general of hoſpitals, and ſurgeon-general to the army. He was alſo elected a member of the Royal College of Surgeons in Ireland. In the year 1791, he was ſo much engaged in the duties of his office, as ſurgeon-general to the army, and his private practice, that he had little time to beſtow upon ſcientific objects; but his leiſure time, ſmall as it was, he wholly devoted to them, as his various publications, at that period, evince.

Earl's Court to Mr. Hunter was a retirement from the fatigues of his profeſſion; but in no reſpect a retreat from his labours; there, on the contrary, they were carried on with leſs interruption, and with an unwearied perſeverance. From the year 1772, till his death, he made it his cuſtom to ſleep there during the autumn months, coming to town only during the hours of buſineſs in the forenoon, and returning to dinner.

It was there he carried on his experiments on digeſtion, on exfoliation, on the tranſplanting of teeth into the combs of cocks, and all his other inveſtigations on the animal economy, as well in health as in diſeaſe. The common bee was not alone the ſubject of his obſervation, but the waſp, hornet, and the leſs known kinds of bees, were alſo objects of his attention. It was there he made the ſeries of preparations of the external and internal changes of the ſilk-worm; alſo a ſeries of the incubation of the egg, with a very valuable ſet of drawings of the whole ſeries. The growth of vegetables was alſo a favourite ſubject of enquiry, and one on which he was always engaged in making experiments.

The collection of comparative anatomy which Mr. Hunter has left, and which may be conſidered as the great object of his life, muſt be allowed to be a proof of talents, aſſiduity, and labour, which cannot be contemplated without ſurpriſe and admiration. It remains an unequivocal teſt of his perſeverance and abilities, and an honour to the country in whoſe ſchools he was educated, and by the patronage of which he was enabled on ſo extenſive a ſcale to carry on his purſuits. In this collection (now poſſeſſed by the Royal College of Surgeons in London) we find an attempt to expoſe to view the gradations of Nature, from the moſt ſimple ſtate in which life is found to exiſt, up to the moſt perfect and moſt complex of the animal creation—man himſelf.

By the powers of his art, this collector has been enabled ſo to expoſe, and preſerve in ſpirits, or in a dried ſtate, the different parts of animal bodies intended for ſimilar uſes, that the various links of the chain of perfection are readily followed and may be clearly underſtood.

This collection of anatomical facts is arranged according to

the ſubjects they are intended to illuſtrate, which are placed in the following order: *Firſt*, Parts conſtructed for motion. *Secondly*, Parts eſſential to animals reſpecting their own internal economy. *Thirdly*, Parts ſuperadded for purpoſes connected with external objects. *Fourthly*, Parts for the propagation of the ſpecies and maintenance or ſupport of the young.

Mr. Hunter was a very healthy man for the firſt forty years of his life; and, if we except an inflammation of his lungs in the year 1759, occaſioned moſt probably by his attention to anatomical purſuits, he had no complaint of any conſequence during that period. In the ſpring of 1769, in his forty-firſt year, he had a regular fit of the gout, which returned the three following ſprings, but not the fourth; and in the ſpring of 1773, having met with ſomething which very forcibly affected his mind, he was attacked at ten o'clock in the forenoon with a pain in the ſtomach, attended with all the ſymptoms of *angina pectoris*. In the life of him prefixed to his *Treatiſe on the Blood, Inflammation, and Gun-Shot Wounds*, the reader will find one of the moſt complete hiſtories of that diſeaſe upon record. Suffice it, in this place, to ſay, that for twenty years he was ſubject to frequent and ſevere attacks of it, which however did not, till a ſhort time before his death, either impair his judgment or render him incapable of performing operations in ſurgery. "In autumn 1790 (ſays Mr. Home), and in the ſpring and autumn 1791, he had more ſevere attacks than during the other periods of the year, but of not more than a few hours' duration: in the beginning of October 1792, one, at which I was preſent, was ſo violent that I thought he would have died. On October the 16th, 1793, when in his uſual ſtate of health, he went to St. George's Hoſpital, and meeting with ſome things which irritated his mind, and not being perfectly maſter of the circumſtances, he withheld his ſentiments; in which ſtate of reſtraint he went into the next room, and turning round to Dr. Robertſon, one of the phyſicians of the hoſpital, he gave a deep groan and dropt down dead; being then in his ſixty-fifth year, the ſame age at which his brother, Dr. Hunter, had died."

It is a curious circumſtance, that the firſt attack of theſe complaints was produced by an affection of the mind, and every future return of any conſequence aroſe from the ſame cauſe; and although bodily exerciſe, or diſtention of the ſtomach, brought on ſlighter affections, it ſtill required the mind to be affected to render them ſevere; and as his mind was irritated by trifles, theſe produced the moſt violent effects on the diſeaſe. His coachman being beyond his time, or a ſervant not attending to his directions, brought on the ſpaſms, while a real misfortune produced no effect.

Mr. Hunter was of a ſhort ſtature, uncommonly ſtrong and active, very compactly made, and capable of great bodily exertion. His countenance was animated, open, and in the latter part of his life deeply impreſſed with thoughtfulneſs. When his print was ſhewn to Lavater, he ſaid, "That man thinks for himſelf." In his youth he was cheerful in his diſpoſition, and entered into youthful follies like others of the ſame age; but wine never agreed with his ſtomach; ſo that after ſome time he left it off altogether, and for the laſt twenty years drank nothing but water.

His temper was very warm and impatient, readily provoked, and, when irritated, not eaſily ſoothed. His diſpoſition was candid, and free from reſerve, even to a fault. He hated deceit; and as he was above every kind of artifice, he deteſted it in others, and too openly avowed his ſentiments. His mind was uncommonly active; it was naturally formed for inveſtigation, and that turn diſplayed itſelf on the moſt trivial occaſions, and always with mathematical exactneſs. What is curious, it fatigued him to be long in a mixed company which did not admit of connected converſation; more particularly during the laſt ten years of his life.

He required leſs relaxation than moſt other men; ſeldom ſleeping more than four hours in the night, but almoſt always nearly an hour after dinner; this, probably, aroſe from the natural turn of his mind being ſo much adapted to his own occupations, that they were in reality his amuſement, and therefore did not fatigue.

Though he ſpoke too freely, and often harſhly, of other practitioners; in private practice he was liberal, ſcrupulouſly honeſt in ſaying what was really his opinion of the caſe, and ready upon all occaſions to acknowledge his ignorance, whenever any thing preſented itſelf which he could not comprehend.

HUS, or Hussu, a town of Turkey in Europe, in Moldavia, the ſee of a Greek biſhop. Here Peter the Great made peace with the Turks. It is ſituate on the Pruth, 70 miles S.W. of Bender. Long. 28. 34. E. Lat. 46. 35. N.

HUSBANDRY (*Encycl.*). An improvement in the culture of turnips, by the uſe of the drill lately invented by Mr. Jackſon, is ſpoken of under the article Turnip in this Supplement.

HUSSINGABAD, a town of Hindooſtan, in the province of Malwa, but on the S ſide of the Nerbudda, and the frontiers of Nagpour, the eaſtern diviſion of the Mahratta empire. It is 140 miles N.W. of Nagpour. Long. 77. 54. E. Lat. 22. 42. N.

HUTTANY, a town of the Deccan of Hindooſtan, in the country of Viſiapour, 30 miles S.S.W. of Viſiapour. Long. 75. 6. E. Lat. 17. 5. N.

HUTTWIEL, a town of Swiſſerland, in the canton of Bern, 16 miles N.E. of Bern, and 22. N.W. of Lucern.

HYDRABAD, the capital of Golconda, in the Deccan of Hindooſtan, ſeated on a river that falls into the Kiſtna, 352 miles N. by E. of Madras. Long. 78. 51. E. Lat. 17. 12. N.

Hydrabad, a fort of Hindooſtan Proper, in the province of Sindy, and the reſidence of a Mahometan prince, who is tributary to the king of Candahar. It is ſituate on the Indus, not far above the head of the Delta, and in the neighbourhood of Nuſſerpour. Long. 69. 30. E. Lat. 25. 29. N.

HYDROPHANÆ, in natural hiſtory: a genus of ſemipellucid gems, compoſed of cryſtal and earth; the latter ingredient being in large proportion, and mixed imperfectly, as in the chalcedony; and giving a general cloudineſs or miſtineſs to the ſtone; but of ſuch an imperfect and irregular admixture, as not to be capable of a poliſh like the chalcedony; and appearing of a duſky and foul ſurface till thrown into water, in which they become lucid and in ſome degree tranſparent, either in part or totally; alſo changing their colour, which returns to them on their being taken out of the water. To this genus belongs the oculus beli of authors, or whitiſh grey hydrophanes variegated with yellow, and with a black central nucleus; and the oculus mundi, or lapis mutabilis, which is likewiſe a whitiſh grey kind without veins.

HYKES, a ſpecies of blankets, commonly uſed by the inhabitants of Barbary. They conſiſt of a light woollen cloth, woven by women, who conduct every thread with their fingers, and without the aid of a ſhuttle. This manufacture appears to be a coarſe kind of ſhawl, and is the more remarkable, as each of ſuch hykes is from five to ſix yards in length, and breadth: it forms the whole apparel of the wretched natives, and ſerves them as a covering for their beds during the night.

I. J.

JAFFIERABAD, a town of the Deccan of Hindooſtan, in the country of Berar, 40 miles N.N.E. of Aurungabad, and 60. S. of Burhampour. Long. 76. 25. E. Lat. 20. 22. N.

JAGRSBURG, a town of Germany, in the principality of Heſſe Darmſtadt, 13 miles S.S.W. of Darmſtadt.

JALALABAD, a town of Hindooſtan Proper, in the country of Cabul, ſituate on the Kameh, 60 miles E.S.E. of Cabul.

JALLINDAR, a town of Hindooſtan Proper, capital of a diſtrict of the ſame name, in the country of Lahore. It is 30 miles E. of Lahore. Long. 74. 10. E. Lat. 30. 50. N.

JALONITZA, a town of Turkey in Europe, in Walachia, on a river of the ſame name, 95 miles S.W. of Iſmail.

JALOUR, a town of Hindooſtan Proper, in the county of Agimere, 65 miles W.N.W. of Cheitore. Long. 73. 40. E. Lat. 25. 15. N.

JAMES'S POWDER (*Encycl.*). To the receipts already given for making this valuable preparation, we have to add that of Mr. Chenevix, for preparing it by precipitation, by which it may be had at a cheaper rate. In his paper read at the Royal Society, this ingenious chemiſt gives the following account of his diſcovery:

"After the obſervations and experiments made by Dr. Pearſon, to inveſtigate the nature of Dr. James's Powder, and preſented by him to this Society, very little remained to be effected or deſired, towards a further knowledge of the ſubject. But thoſe very experiments ſerved to ſuggeſt, that the mode of preparation was far from being the beſt that the preſent improved ſtate of chemical knowledge might afford; and that, in all probability, a leſs defective compoſition might reſult from a proceſs more conformable to ſome improvements, which of late have been advantageouſly applied to pharmaceutic chemiſtry.

"It may be laid down as a general principle, that, in delicate experiments, whether analytical or ſynthetical, fire (that potent and once believed to be univerſal agent) is too precarious in its means, and too uncertain in its application, to be employed with full and conſtant ſucceſs. And, if it is ſtill recurred to, the advantage of promptneſs, and a remnant of ancient cuſtom, are the principal reaſons. But, where other methods can be deviſed to effect the ſame combinations (and the humid way offers many), every perſon converſant in chemical knowledge will allow the benefit of adopting them. The recent improvement in the mode of preparing calomel, is a ſtriking example of ſuch ſalutary corrections being ſucceſsfully introduced.

"A few obſervations upon the formula according to which Dr. James's Powder, or the *Pulvis Antimonialis*, is prepared, and upon ſome properties of antimony, will place this aſſertion in a more prominent point of view.

"In order to prepare this powder, we are told to take equal weights of bone or hartſhorn ſhavings and crude antimony, and calcine them together, at a high temperature: in other words, to take phoſphate of lime, which already contains a great exceſs of lime, and add to it an oxide of antimony. In this proceſs, it has been ſuppoſed, that the phoſphoric acid of the bone or hartſhorn will ſaturate, not only the lime with which it was originally combined, but, in addition to it, a new portion of metallic oxide, and a new portion of lime. For, what little ſulphuric acid might, during the proceſs, have been formed by the combuſtion of the ſulphur of the crude antimony, is diſſipated, at a much lower temperature than that to which the powder is expoſed.

"Every oxide of antimony with which we are acquainted, is volatile at a high degree of heat; it would therefore be hazardous to aſſert, that it is poſſible to preſerve always the ſame proportion of antimony, whatever care may be employed in directing the operation; and a diſſimilarity in the chemical reſult muſt neceſſarily be attended with uncertainty in the medical application.

"To this property may be added another, no leſs conducive to error. That portion of oxide of antimony which is not volatilized, becomes, in a great meaſure, inſoluble in all the acids. What the effect of the gaſtric juice may be, upon a ſubſtance which reſiſts the action even of nitro-muriatic acid, it is not my purpoſe to determine. It is ſufficient for me to ſay, that, as the quantity of inſoluble matter, in a given quantity of Dr. James's Powder, prepared at different times, may vary, the effect of any doſe alſo may differ, according to the proportions of ſoluble and inſoluble matter.

"I look upon it as a fortunate circumſtance, that thoſe experiments and obſervations which I mentioned in the beginning of this paper, exiſted as a ſtandard to which I might refer my own attempts, and by which I might eſtimate their validity. Dr. Pearſon has proved (as by my own experiments I have found), that in Dr. James's Powder about 28 per cent. reſiſted the action of every acid. In examining ſome of the *Pulvis Antimonialis* of the London Pharmacopœia, I found the average quantity of inſoluble matter to be about 44 per cent. This proportion, however, was liable to conſiderable variation *.

"The powder here treated of is denominated, by Dr. Pearſon, a triple ſalt, or real ternary combination of a double baſis (lime and antimony), with phoſphoric acid. What I have mentioned, with regard to the quantity of acid contained in bone or hartſhorn, as being too ſmall to ſaturate a new portion of theſe baſes, may throw ſome doubts upon the poſſibility of any ſuch combination in the preſent caſe. But I have made ſome more direct experiments, which tend to prove, that no ſuch combination does exiſt.

"I took ſome white oxide of antimony (formerly called Algaroth Powder), precipitated by water from muriate of antimony, and heated it for a long time with phoſphoric acid.

"* I find, from the information of ſeveral medical gentlemen, that the *Pulvis Antimonialis* is generally conſidered as ſtronger than Dr. James's Powder. This ſeems rather extraordinary, when we conſider that the quantity of inſoluble matter is greater in the former than in the latter; and would almoſt lead us to ſuſpect it to be the active part of the medicine."

I decanted the liquor, and washed the powder that remained. No antimony could be found in the liquor; nor could any traces of phosphoric acid be detected in the residuary oxide of antimony. I then took a solution of muriate of antimony, and divided it into two equal parts: into one, I poured distilled water; and, into the other, a solution of phosphate of soda. In each liquor, a copious precipitate was formed; which precipitates, after being well washed, were dried. The weight of both was the same; whereas it is evident that, had any phosphoric acid been combined with the oxide, there would have been an augmentation of weight in that which was precipitated by the solution of phosphate of soda. This precipitate likewise, upon examination, gave no traces of phosphoric acid. From these experiments it appears, that there exists no combination, which can be denominated a phosphate of antimony.

"To attempt an explanation of the real nature of the powder here spoken of, I had recourse to some experiments of Mons. Berthollet. By detonating sulphuret of antimony and nitrate of potash in a crucible, he obtained a mass, which he reduced to powder, and washed The liquor gave, upon evaporation, a crystalized salt, which M Berthollet terms an *antimoniate of potash*. I never could succeed in any attempt to form a similar combination between the above white oxide of antimony and potash, owing, I believe, to the small quantity of oxygen contained therein, compared with that which is combined with the oxide obtained by detonation. I cannot therefore say, that the powder in question is, in any degree, what M. Berthollet would call an *antimoniate of lime*.

"But be the state, whether of mixture or of combination, what it may, my purpose is to endeavour to produce a substance, which, from its more certain mode of preparation, may be more equal and constant in its effects.

"Dissolve, together or separately, in the least possible portion of muriatic acid, equal parts of the fore-mentioned white oxide of antimony and of phosphate of lime *. Pour this solution gradually into distilled water, previously alkalizated by a sufficient quantity of ammonia. A white and abundant precipitate will take place, which, well washed and dried, is the substitute I propose for Dr. James's Powder.

"The theory of this precipitation is so clear and simple, that it does not require any comment. It may be useful, however, to those who wish to make this preparation, to remark, that it is absolutely necessary that the solution of phosphate of lime and of oxide of antimony, in muriatic acid, should, after being well mixed, be poured *into the alkaline liquor*, in order to obtain a precipitate homogeneous throughout the operation. For, should the alkaline liquor be poured *into the acid solution*, the water of the former would act upon the entire mass of oxide of antimony, while the alkali would precipitate the phosphate of lime only as it saturated the acid which held that salt in solution: thus, the precipitate would contain more antimony in the beginning; and, towards the end, the phosphate of lime would be predominant. For the same reason too, a pure alkali is preferable to its carbonate; for the carbonic acid disengaged, would retain in solution a portion of phosphate of lime.

"Whether this composition be a chemical combination or a mixture, I will not take upon me to determine; but, for the reasons above mentioned, in speaking of Dr. James's Powder, I believe it to be merely a very intimate mixture. At all events, it must be more homogeneous than any that can be prepared in the dry way. It is entirely soluble in every acid that can dissolve either phosphate of lime or oxide of antimony separately; and to have it constantly and uniformly the same, no further address is in preparing it is required, than to avoid the errors I have mentioned.

"As, after some medical trials of the powder, it was suggested to me, that it might be more advantageous to render it somewhat stronger, I prepared another portion, by taking two parts of oxide of antimony and but one of phosphate of lime, and precipitating as above described. The medicinal power was then considerably increased.

"Dr. James's Powder is a medicine which has been so long in use, and is so deservedly ranked among the most valuable we possess, that every attempt to render the process for preparing it more simple and more certain, must be allowed to be of some importance. But, whatever reason there was to think, by arguing upon its chemical properties, that I had really succeeded in improving its medicinal virtues, it still remained to be proved, by actual experiment, that the hoped-for success was not merely conjectural. To ascertain this, I gave some of my powder to Dr. Crichton, Dr. Babington, and Mr. Abernethy; gentlemen whose extensive practice and acknowledged skill sufficiently enabled them to judge of its medical properties. They all concur in opinion, that, in its general effects, it agrees with Dr. James's Powder and the *Pulvis Antimonialis;* but, that it is more mild, and consequently may be given in larger quantities, seldom producing nausea or vomiting, in doses of less than eight or ten grains."

JAMSIO, a town of Sweden, in the province of Blekingen, 32 miles W. of Carlscrona.

JANVILLE, a town of France, in the department of Eure and Loire, 20 miles S.E. of Chartres. Long. 1. 47. E. Lat. 48. 12. N.

JAO-TCHEOU-FOU, a city of China, in the province of Kiang-si, seated on the river Po, which, at a small distance, enters the lake Po-yang. It commands seven cities of the third class.

JAPARA, a sea-port on the N. coast of the island of Java, with a good harbour. It was the capital of a considerable kingdom, till the Dutch made themselves masters of it; and now they have a colony here, and a considerable trade. It is 253 miles E. by S. of Batavia. Long. 110. 45. E. Lat. 6. 20. S.

JARISBERG, a town of Norway, capital of a district abounding in mines, in the diocese of Aggerhuys, five miles N. of Tonsburg. Long. 10. 19. E. Lat. 58. 55. N.

JAULNAIS, a town of France, in the department of Vienne, six miles N. of Poitiers. Long. 0. 23. E. Lat. 46. 41. N.

---

* In order to procure the phosphate of lime, I dissolved in muriatic acid a quantity of calcined bone, and precipitated by ammonia in its state of greatest causticity. By this means, the excess of muriatic acid, which held in solution the phosphate of lime, is saturated, and the phosphate is precipitated; but no muriate of lime is decomposed, if the ammonia is quite free from carbonic acid. This is the most direct method of obtaining phosphate of lime pure. This salt is not decomposed, as some have asserted, by muriatic acid, but merely dissolved by it. I have been induced to state fully these particulars, because, from the beneficial effects of this salt in the treatment of rachitis, as proposed by M. Bonhomme (*Annales de Chimie*, vol. xviii. p. 113), it may become of general use. The oxide of antimony I obtained by precipitating, by water, the common butter of antimony of the shops.

ICE-BOAT. See *Ice*-BOAT, *Supp.*

ICHTERHAUSEN, a town of Upper Saxony, in the principality of Gotha, 12 miles E.S.E. of Gotha. Long. 11. 1. E. Lat. 51. 48. N.

ICKWORTH, a town in Suffolk, with a market on Friday. Here are the ruins of an ancient priory, and ſeveral Roman coins have been dug up. It is 23 miles N.W. of Ipſwich, and 74. N.N.E. of London. Long. 1. 0. E. Lat. 52. 22. N.

IDA, MOUNT. See CANDIA.

IDA, a mountain of Turkey in Aſia, in Natolia Proper, famous, in ancient fable, for the judgment of Paris, and for being the reſort of the gods during the Trojan war.

IDANHA-LA-NUEVA, a town of Portugal, in the province of Beira, 3 miles S. W. of Old Idanha. Long. 6. 16. W. Lat. 39. 37. N.

IDANHA-LA-VELLA, a town of Portugal, in the province of Beira. The French took it by aſſault in 1704. It is ſeated on the river Ponſul, 25 miles N.E. of Caſtel Branco, and 20 N.W. of Alcantara. Long. 6. 14. W. Lat. 39. 39. N.

IDRIA, a town of Italy, in Friuli, and in the county of Goritz, with a caſtle. It belongs to the houſe of Auſtria, and there are rich quickſilver mines in the town itſelf. It is 17 miles N.E. of Goritz, and 25 N. of Trieſt. Long. 13. 52. E. Lat. 46. 20. N.

IDSTEIN, a town of Germany, in Wetearvia, which is the reſidence of a branch of the houſe of Naſſau, to whom it belongs. It is 12 miles N.E. of Mentz. Long. 8. 23. E. Lat. 50. 2. N.

JEAN, ST. a town of France, in the department of Moſelle and late province of Lorrain. It is ſeated on the river Sare, 12 miles W. of Deux-Ponts, and 8 N.W. of Sarguemine. Long. 7. 12. E. Lat. 49. 16. N.

JEAN-D'ANGELY, a town of France, in the department of Lower Charente and late province of Saintonge, with a late fine Benedictine abbey. It was taken from the Huguenots, in 1621, by Lewis XIII. who demoliſhed the fortifications. It is famous for its brandy, and is ſeated on the river Boutonne, on which are two powder-mills; 15 miles N E. of Saintes, and 32 S.E. of Rochelle. Long. 0. 20. W. Lat. 45. 59. N.

JEAN-DE-LONE, ST. a town of France, in the department of Côte d'Or, and late province of Burgundy, ſeated on the river Saone, 15 miles S.E. of Dijon, and 155 S.E. of Paris. Long. 5. 19. E. Lat. 47. 8. N.

JEAN-DE-LUZ, ST. a town of France, in the department of the Lower Pyrenées, and late province of Baſques, the laſt next Spain, with a harbour. This little town owes its opulence to the cod and whale fiſhery. It is ſeated on a ſmall river, near the ſea, 10 miles N.E. of Fontarabia, 12 miles S.W. of Bayonne, and 315 S. by W. of Paris. Long. 1. 40. E. Lat. 43. 23. N.

JEAN-DE-MAURIENNE, a town of Savoy, capital of the county of Maurienne, in a valley of the ſame name, with a biſhop's ſee. It is ſeated on the river Arc, 15 miles S. by W. of Montier, and 25 N.E. of Grenoble. Long. 6. 20. E. Lat. 45. 17. N.

JEAN-PIED-DE-PORT, ST. a conſiderable town of France, in the department of the Lower Pyrenées, and late province of Lower Navarre. It is ſeated on the river Nive, and defended by a good citadel, upon an eminence, at the entrance of thoſe paſſages, or defiles, in the Pyrenées, which, in this country, are called *Ports*. It is 20 miles S.E. of Bayonne, and 30 N.E. of Pampeluna. Long. 1. 33. E. Lat. 43. 12. N.

JED, a river of Roxburghſhire, in Scotland, which joins the Teviot, a little below Jedburgh, at a place where the Marquis of Lothian has an elegant ſeat, called Mount Teviot; and near this, on the W. ſide of the river, are the beautiful ruins of an abbey, founded by King David; a part of which ancient pile ſtill ſerves for a pariſh church. On the banks of this river, are alſo ſeveral large caverns, which were the ſtrong-holds, or hiding places, of ancient border warriors.

JEGUN, a town of France, in the department of Gers, eight miles N.N.W. of Auch, and 13 S. of Condom. Long. 0. 21. E. Lat. 43. 45. N.

JENA, a ſtrong town of Upper Saxony, in Thuringia, with a univerſity. It is ſeated on the Sala, 10 miles S.E. of Weimar, and 25 S.E. of Erfurt. Long. 12. 4. E. Lat. 51. 2. N.

JENITZ, a town of Upper Saxony, in the principality of Anhalt Deſſau, ſituate on the Muldau, two miles N.E. of Deſſau.

JENITZA, a town of Turkey in Europe, in Macedonia, ſituate on a lake which communicates with the gulf of Salonichi, by a canal 12 miles long. It is 24 miles W.N.W. of Salonichi.

JENO, a town of Upper Hungary, 20 miles S. of Great Waradin, and 48 N.E. of Segedin. Long. 21. 5. E. Lat. 46. 40. N.

JEREMIE, a town, juriſdiction, and cape, on the ſouthern peninſula of the iſland of St. Domingo. The town is ſituate on an eminence, in a fertile ſoil, particularly excellent for the culture of coffee, five miles W. of St. Domingo. Long. 70. 14. W. Lat. 18. 18. N.

JERICHO, an ancient and famous town of Paleſtine, built by the Jebuſites. It is now called Herubi by the Arabs, and contains only a few wretched huts, where ſome beggarly Arabs reſide. It is five miles W. of the river Jordan, and 20 E. by N. of Jeruſalem. Long. 35. 50. E. Lat. 31. 58. N.

JERICHO, a town of Lower Saxony, which gives name to a circle or diviſion of the duchy of Magdeburg. It is ſituate on the Elbe, 32 miles N.N.E. of Magdeburg.

JERMAH, a town of the kingdom of Fezzan. It is diſtinguiſhed by the numerous herds of ſheep and goats, that are ſeen around it; by the various and abundant produce of the adjacent fields; and by the numerous and majeſtic ruins, that exhibit to the inhabitants of its clay-built cottages, inſcriptions of which they know not the meaning, and veſtiges of greatneſs to which they are perfectly indifferent. Jermah is 60 miles S.E. of Mourzook. Long. 17. 17. E. Lat. 27. 5. N.

JLAK, or JALAK, a town of Nubia, on the Nile, ſuppoſed by ſome to be the ancient Meroe. Long. 34. 30. E. Lat. 18. 48. N.

ILLE, a town of France, in the department of the Eaſtern Pyrenées, 10 miles S.E. of Perpignan. Long. 3. 5. E. Lat. 42. 35. N.

ILLER, a river of Germany, which riſes in Tirol, runs N. through Suabia, paſſing by Kempten, Memmingen, and Kirchberg, and falls into the Danube, at Ulm.

ILLESCAS, a town of Spain, in New Caſtile, 15 miles S.S.W. of Madrid, and 15 N.N.E. of Toledo.

ILLOCK, a ſtrong town of Sclavonia, ſeated on the Danube, 15 miles from Peterwaradin, and 55 N.W. of Belgrade. Long. 20. 6. E. Lat. 45. 36. N.

ILM, or STADT-ILM, a town of Upper Saxony, in the county of Schwartzburg-Rudolſtadt, 14 miles S. of Erfurt.

ILMEN, a lake of Ruſſia, in the government of Novogorod, about forty-eight miles long, and twelve to eighteen wide; Novogorod is ſituated near it. Long. 34. 0. E. Lat. 58. 0. N.

ILMINSTER, a town in Somerſetſhire, with a market on Saturday; ſeated in a dirty bottom, among hills, 26 miles S.W. of Wells, and 137 W. by S. of London. Long. 2 54. W. Lat. 50. 55. N.

ILSLEY, or EAST ILSLEY, a town of England, in the county of Berks, with a weekly market on Wedneſday: 14 miles N.W. of Reading, and 53 W. of London. Long 1. 12. W. Lat. 51. 32. N.

ILST, or YLST, a town in the ſtate of Frieſland, defended by a ditch filled with the waters of the river Weymer: 12 miles N.E. Staveren, and five S.E. Bolſwaert.

ILSTROP, a town of Sweden, in the province of Weſt Gothland: 27 miles S.S.E. of Gotheborg. Long. 11. 51. E. Lat. 57. 23. N.

ILTEN, a town of Germany, in the circle of Lower Saxony, and principality of Lunenburg: ſixteen miles S.S.W. of Zell.

ILTZHOFEN, a town of Germany, in the circle of Swabia, in the territory of Halle: eight miles N.E. of Halle.

IMBRO, an iſland in the Grecian Archipelago, mountainous and woody, with plenty of game: it is about 20 miles in circumference, and contains five villages, two of which are defended by caſtles. Long. 25. 44. E. Ferro. Lat. 40. 10. N.

IMENSTADT, a town of Suabia, 20 miles E. of Lindau. Long. 10. 20. E. Lat. 47. 35. N.

IMMENHAUSEN, a town of Germany, in the principality of Heſſe Caſſel, eight miles N.N.W. of Caſſel, and 16 N.E. of Naumburg.

IMMENSTADT, a town of Suabia, in the county of Konigſegg, ſituate on a ſmall river, which ſoon after falls into the Iller, 12 miles S. of Kempten, and 14 S.E. of Iſny.

INDAPOUR, a ſea-port on the S.W. coaſt of the iſland of Sumatra. Long. 100. 50. E. Lat. 1. 30. S.

INDEN HOTUN, a town of Chineſe Tartary, the capital of the Mantcheou Tartars, where they began to eſtabliſh their empire over China. It is 420 miles E.N.E. of Pekin. Long. 124. 36. E. Lat. 41. 46. N.

INDIGO (*Encycl.*). The following is an extract of a Memoir on the Cultivation of the Indigo-plant, and the preparation of Indigo, read by Citizen Brulley, at a public meeting of the Lyceum of Arts, in Paris.

"Indigo," ſays he, "is known to be a precipitated fecula, dried and reduced into a ſolid maſs, light, brittle, and of a very deep azure colour. This ſubſtance is of great utility in the arts. A great conſumption is made of it in dyeing, painting, bleaching, and other proceſſes of different manufactures.

"The vegetable which produces this colouring fecula is termed the indigo-plant, *indigo-fera*. It is of the genus of the polypetal plants, of the family of the leguminous, and has much reſemblance with the *Galegas*.

"There are twenty-ſeven ſpecies of indigo-plants. To enumerate their differences and deſcribe their botanical characters would be ſuperfluous. It will be ſufficient to direct our attention to the moſt intereſting ſpecies, namely, that which yields the beſt indigo. It is termed *indigo-franc*, *indigo-fero anil*. It is indigenous in America; and is cultivated with ſucceſs in the Southern parts of this country, and in the Antilles. In theſe iſlands is found a variety of the beſt ſpecies of indigo, which grows to twice the height of the indigo-franc. It is termed the wild indigo-plant or maron.

"It is to be remarked, that in the French colonies in the Antilles, where fine indigo is prepared, the ſeed of the indigo-franc is purpoſely mixed with that of the indigo-maron, in order to obtain a more conſiderable and better product. The purpoſes for which this mixture is made, as well as all the operations belonging to the cultivation of the indigo-plant, are related in a detailed memoir that has been laid before the Lyceum of Arts. For the preſent we ſhall confine ourſelves to giving an account of an eſſential improvement in the preparation of indigo.

"It will undoubtedly be heard with aſtoniſhment, that though indigo has been manufactured during the ſpace of nearly a century, its preparation ſtill conſiſts in ſuch imperfect approximations, that, even with the beſt manufacturer, generally ten, fifteen, and even to the number of twenty-five tubs fail, out of a hundred which he undertakes. Sometimes even, either owing to want of experience or the contrarieties of temperature, a much larger number of tubs fail, and ruin the proprietor, who reckons upon large profits: hence in part ariſes the high price of indigo.

"But ſhould the proprietor of indigo-plants be ſecured, by means of a certain proceſs, againſt the danger of loſing the fruits of his expence and labour, he would then be able to ſell his indigo at a cheaper rate. This would be a great advantage to the arts and manufactures, and conſequently to the commerce of France.

"This great advantage France will at ſome future period be able to enjoy, and ſhe will owe it to the labours and intelligence of one of the colonial proprietors of St. Domingo, who is at preſent in France, and one of the free aſſociates of the Lyceum of Arts, I mean Citizen Nazon. Judicious obſervations and a long courſe of experience have convinced him that it is poſſible to enſure the ſucceſs of all the tubs of indigo.

"In order to obtain this colouring ſubſtance, the indigo-plant is cut when it has arrived at its maturity. The whole is put to macerate in a baſin of brick-work, which is termed the tub (*cuve*). Its dimenſions are generally twelve feet.

"To bring the maceration to its ultimate point, requires from fifteen to thirty and even thirty-ſix hours, more or leſs, according to the temperature of the atmoſphere at the time when the operation is performed; it is alſo neceſſary to take into conſideration the quality of the indigo-plant, the nature of the ſoil that has produced it, and that of the water in which it is immerſed.

"The firſt indication from which it is judged that the maceration begins to approach its ultimate point, is the ſinking of the ſcum, which elevates itſelf in the ſpace of about half a foot, which has been left empty in the tub, including the plants. When this ſcum has become a kind of cruſt of a copper-blue colour, the moment is concluded to be near at hand, at which the plants will be ſufficiently macerated. However this indication is inſufficient and often even fallacious. There is another upon which greater reliance is placed: it conſiſts in drawing off a ſmall quantity of the water by means of a cock placed at the lower part of the tub. It is received into a ſilver cup, and it is obſerved whether the fecula tends to precipitate itſelf to the bottom of the cup: when this is the caſe, it is concluded that the plants have attained that degree of maceration which is requiſite for obtaining the indigo from them.

"Such was the proceſs moſt generally practiſed; but it too often gave riſe to error. To avoid this we have a ſure means, which conſiſts in accurately obſerving the water contained in the cup: five or ſix minutes after it has been poured into it, it forms round the ſides of the cup a ring or edge of fecula, which at firſt is of a green colour and afterwards becomes blue. As long as the maceration has not yet been carried to the proper pitch, this ring detaches itſelf with difficulty from the ſides of the cup. But at laſt it is ſeen to precipitate and concentrate itſelf at the bottom of the veſſel, always towards the centre, under the water, which has become limpid, though with a yelloviſh tinge.

" When theſe appearances are obſerved, they infallibly indicate the ſucceſs of this firſt operation. The water is then drawn off into a ſecond baſin or tub, placed beneath the firſt. This ſecond tub is termed *batterie*, as its uſe is for beating the water ſtill charged with the fecula. In order that it may ſeparate quickly, it is agitated. This operation is performed either by the labour of the hands, or by means of a mill. It is of eſſential conſequence not to agitate it for too great a length of time: exceſſive agitation mixes anew the fecula with the water, from which it does not ſeparate any more, and the tub fails. Inſtead of indigo, we obtain nothing but muddy water.

" This latter inconvenience may eaſily be obviated by a little attention. When we have diſcovered that the fecula is ſufficiently united, we draw off the water from the *batterie* into a third and ſmaller baſin, which is termed the *diablotin*. We then find the bottom of the *batterie* covered with a very liquid blue paſte; this is received into bags of coarſe linen cloth, of the form of inverted cones, which ſuffer the watery part to run off. Theſe bags are afterwards emptied of their contents upon tables in the drying rooms, where this blue paſte is kneaded, and after it has acquired a denſer conſiſtence, it is ſpread out and cut into ſmall ſquares, in order that it may dry the ſooner. The manufacture of the indigo is now completed, and it is ſoon after ſufficiently dry to be introduced into commerce.

" I omit the details contained in a longer memoir, of which I confine myſelf to giving an extract. What was of importance to be made known, is that there exiſts a certain proceſs, by following which one may be ſecure againſt failure in the manufacture of indigo.

" Experience has ſhewn that this proceſs has never failed of complete ſucceſs; of this, more than 1500 tubs of indigo manufactured in different parts of St. Domingo, have furniſhed the proofs."

INDUSTRY. The following extract from an account of a SOCIETY, *for the promotion of induſtry*, in the county of Eſſex, by John Conyers, eſq. appears in the Reports of the Society for bettering the Condition of the Poor, &c.

In November, 1794, a meeting was held at Epping in Eſſex, to take into conſideration a propoſal for the promotion of induſtry in that neighbourhood*. An aſſociation was formed of fourteen pariſhes, the parochial ſubſcription being agreed to be one per cent on their rates, and that of individuals not more than five ſhillings each. This, with a few benefactions, produced in 1795, the ſum of 154l. which was purpoſed to be ſet apart as a fund† for giving annual preſents of clothing to thoſe children who ſhould produce the beſt ſpecimens of induſtry; and ſums of money, not exceeding 10l. each, for any ſuch young perſon on their going to apprenticeſhip, or ſervice, or being married, according to the number of annual prizes ſuch young perſons ſhould have obtained; and alſo rewards in money to poor perſons who had brought up four or more children to the age of fourteen years without pariſh relief, and to overſeers who ſhould diſtinguiſh themſelves in the execution of their office, and in the employment of the poor. The ſociety at the ſame time took meaſures for having work-rooms and teachers provided in the different pariſhes, and ſpinning wheels and a ſupply of work for the poor at their own houſes; and alſo for enſuring to them that they ſhould be paid by their pariſhes the *full price*‡ of their work; which, though making a difference of only three pence or four pence in the pound, and being a very trifling expence to the pariſh, was, nevertheleſs, to the individual who received it, a very powerful reward and encouragement.

---

* The plan alluded to " was founded on one of the wiſeſt and moſt humane laws, which this country has to boaſt of; and which was paſſed in the forty-third year of Queen Elizabeth's reign, for the maintenance and employment of the poor. The object of this act was, not merely to relieve the *indigent*, but to prevent *indigence* itſelf. It was calculated not only to guard againſt poverty and diſtreſs, but againſt vice and immorality alſo. It regarded the mental, as well as the corporeal welfare of thoſe whom it profeſſed to protect. He could not avoid obſerving the ſuperiority of the act juſt mentioned, over ſome of the acts which have been ſince paſſed for the regulation of the poor; acts which permitted pariſhes *to farm their poor to governors of workhouſes* (whoſe *intereſt* it was to make as great a profit of them as poſſible), and to *affix badges* to the clothes of beggars. Theſe regulations had indeed made it painful to indigent perſons of any ſenſibility to apply for relief, which the infirmities and calamities, incident to human nature, rendered neceſſary for them; but neither of theſe meaſures had reduced, or was likely to reduce, the number of the poor, or to correct the profligacy of their manners."

† The reader is referred for further particulars, to a printed account of the inſtitution, publiſhed for the benefit of the Society, and ſold by Cadell and Davies in the Strand.

‡ The poor, who might otherwiſe be inclined to ſpin yarn, labour under great diſcouragement, ariſing from the manner in which they are paid for their work when finiſhed. The ſhop-keeper of whom they get their yarn, profeſſes to pay them at the rate of a penny per hank; but, when the work is returned to him, he deducts three pence or four pence (or in caſes when the trade has been ſlack, five pence) from every pound of wool ſpun. This is conſidered as the woolſtapler's profit. Thus an indifferent ſpinner, who makes but twelve or perhaps ten hanks of a pound of yarn, gets but eight pence or ſix pence for her work. But this is not the only diſcouragement. The ſhop-keeper makes a favour of ſupplying her with yarn, and will not ſupply her with any, unleſs ſhe will conſent, not only to take out in ſhop goods the amount of what ſhe earns by ſpinning, but will engage to purchaſe of *him alone* ſuch neceſſaries for her family as his ſhop will furniſh. By theſe means ſhe is precluded from laying out her money at any other ſhop, where ſhe thinks ſhe could get articles of a better quality, or at a cheaper rate; and is obliged to ſubmit to any impoſition, which a griping ſhop-keeper may lay upon her.—The committee of induſtry in Eſſex, conſidering their fund as inſufficient for the purpoſe of relieving the poor from this oppreſſion, by paying them the full price of their work, has recommended the plan to pariſhes. In that of Chipping Ongar, by the attention of the Rev. Mr. Herringham and ſome of the principal inhabitants of the pariſh, this plan has been carried into execution, and has produced a very good effect. The pariſh procures a ſtock of wool from a worſted maker: this is depoſited at the workhouſe; and the poor, upon application to the perſon who has the management of this buſineſs, obtain from him a ticket; which being taken to the miſtreſs of the workhouſe, ſhe delivers the wool, and files the ticket. The work, when finiſhed, is carried to the perſon who gave the ticket, and he immediately makes a payment in money, deducting (for the preſent) four pence for every pound of work. This is done merely to prevent careleſsneſs in ſpinning, or frauds in reeling; and the groats ſo deducted are withheld, till the whole ſtock of wool is returned to the manufacturer, where every ſpinner's

At a meeting of the ſociety on the 31ſt of December, 1795, there were 52 children candidates for prizes, as ſpinners and knitters; and 21 parents, who had brought up four or more children in lawful wedlock without pariſh relief. The parents received donations, not exceeding two guineas each, varied according to the number of their children, and other circumſtances: and 31 of the children received preſents in clothing, not exceeding twenty ſhillings each, according to their different merits. They alſo received, with the premiums, certificates of good behaviour, which they conſider as marks of diſtinction, and of which they will feel the benefit through life.—In the enſuing year, an equal number of parents received donations, on account of the families they had brought up; and clothing, to the amount of 36l. 15s. was given to 37 children, who had then produced the ſpecimens of induſtry, in ſpinning, knitting, and plain needle-work.—In the preſent year (Jan. 1798), donations of clothing have been made to 61 induſtrious children to the amount of 51l. 13s.; and to parents, the ſum of 23l. 12s. 6d. on account of the families which they have brought up.

This eſtabliſhment, formed on the ſame plan as that of the Rev. Mr. Bowyer in Lincolnſhire, and rendered ſucceſsful by the great attention given to it by the truſtees of the different diſtricts, requires very little comment. It is obvious that its operation, by the moſt pleaſing and acceptable means, thoſe of *encouragement* and *attention*, muſt be to increaſe the induſtry and good habits of the poor in the neighbourhood, and greatly to improve the riſing generation. The donations may appear ſmall to thoſe who have not ſufficiently attended to the circumſtances of the labouring poor, to learn that the very trifling rewards, given with *kindneſs*, in a *diſintereſted* and *honourable* way, and unincumbered with any *humiliating condition*, will do wonders in exciting the induſtry and economy of the cottager; and in attaching him, by every tie of gratitude and affection, to thoſe who feel ſufficiently the obligation of *their own duty*, to become the friends and benefactors of the poor.—We cannot omit taking this opportunity to obſerve, that every meaſure of this kind ſhould be ſo framed and conducted, that the motives may not merely eſcape the *guilt* of *being intereſted*, but be exempt from the *diſcredit* of *being ſuſpected*.

In April, 1796, a meeting of the inhabitants of Lewiſham was called, for the purpoſe of ſetting up a ſchool of induſtry, for the children of that pariſh. The ſubſcribers came to a reſolution to prepare accommodations for the reception of 60 children, and the houſe was opened on the 30th of May, 1796.

The children are admitted on the recommendation of ſubſcribers, and by order of the committee. In ſummer the ſchool is open from ſix o'clock in the morning to ſix at night, and in winter during the hours of daylight; but the children have uſually finiſhed their taſk by two o'clock; they then go away, unleſs, which is the caſe with ſome of them, they *prefer* to work additional hours *on their own account*. They receive two meals a-day, a breakfaſt and a dinner; one hour being allowed at dinner, and half an hour at breakfaſt. They are employed in ſpinning, winding, and knitting; and one boy in weaving. The preſent weaver is an active boy, not ten years of age: his predeceſſor had been employed but a very little time, before he had an offer of a permanent engagement at a cotton mill. In rotation they all receive leſſons in reading. The children's weekly maintenance is eſtimated at 1s. 6d. per head; and where they earn more in any week (as ſome do 6d. a-week, and ſome 1s.) they are paid, and carry home the overplus. One little boy (who came from the work-houſe with but a bad character, but who now poſſeſſes a very good one) earns not leſs than an extra ſhilling a-week; he has during the laſt month, put into the maſter's hands, in truſt for him, the ſum of 5s. In the caſe of the pariſh children, who are entirely maintained at the pariſh expence, there is, as yet, no certain allowance; but they are rewarded according to their induſtry and good behaviour. It is however in contemplation to make them a certain allowance; probably a ſixth of their weekly earnings.

Spinning wheels are lent, and materials are furniſhed at home, for any of the adult inhabitants of the pariſh, who wiſh employment; and they are paid for their work upon delivery. A ſuit of clothes, made of the cloth and camblet of their own manufacture, is yearly given to each of the children, who attend the ſchool, as a reward for their good behaviour, and to enable them to appear decently and regularly at church on Sundays.

In the infancy of a manufacture, there is neceſſarily a loſs from the waſte of raw materials. In the preſent inſtance it muſt be admitted, that very little profit accrued from the labour of the children, during the firſt ſix months: but for the next half-year, the profit was gradually increaſing; and it advanced ſo much, that at the end of the year, on the 30th of May, 1797, the net profit of the manufactory had amounted to 55l.—That profit may be fairly ſtated at 100l. a-year in future. The ſchool of induſtry now ſupplies the pariſh work-houſe with moſt of their articles of clothing: beſides which, a ſtock of knitted ſtockings, and of camblets and worſted, is kept in the warehouſe, to be ſold by wholeſale and retail. The demand for them has been gradually increaſing; and the inhabitants have found their advantage in the purchaſe of them.

The weekly expence of the family, upon an average, is 3d. a-head per day; including the * 20 pariſh children, and the maſter and miſtreſs and their two children, who have their three meals a-day, and lodge in the houſe. For each of the pariſh children the eſtabliſhment is allowed the ſum of 3s. a-week; which is near 50l. a-year leſs than the expence of merely feeding them in the work-houſe, during the preceding year.

The following is a pretty correct eſtimate of the expences and receipts of the eſtabliſhment.

---

work is ticketed with her name.—Upon receiving the approbation of the manufacturer as to the work, the ſpinners are paid their groats; and far from complaining of their being withheld in the firſt inſtance, they expreſs a ſatisfaction at having "a lump of money" as they call it, to lay out in clothing. The account is kept as follows:

Names.	Work iſſued.	When iſſued.	When returned.	No. of hanks.	Money paid.	Groats due.
M. Weſtwood.	3 lb.	Mar. 15, 1798.	Mar. 19.	30	2s. 0d.	3
Ann Smith.	4 lb.	Mar. 16, 1798.	Mar. 21.	48	2s. 8d.	4

* This number occaſionally varies; there have been 23 in the ſchool at a time: but the number will probably be much leſs.

PAYMENTS.	£.	s.
Maintenance of the family, clothing, &c. -	250	0
Wages of maſter and miſtreſs; 10s. per week. *He is extremely well acquainted with every proceſs in the woollen manufacture* - -	26	0
School miſtreſs; who teaches the children to read	3	0
Rent of the houſe, and the wooden building behind. *It was a blackſmith's ſhop, but is now the ſchool and work-room* - - -	13	10
Inſurance - - -	1	0
Mr. Hall, the manager, who does not live in the houſe, but attends occaſionally. *He purchaſes the proviſions and materials for the work, and provides a ſale for the articles of manufacture* -	30	0
Incidents, gratuity to the ſecretary, &c. -	26	10
	350	0

RECEIPTS.		
Pariſh rents appropriated to the inſtitution -	60	0
Allowance for 20 pariſh children, at 3s. a-week each	156	0
Profits of manufactory per annum; ſuppoſed	100	0
	316	0
Deficiency in the infancy of the eſtabliſhment, to be made good by ſubſcription - -	34	0
	£. 350	0

There are 48 perſons, including the maſter and miſtreſs and their two children, who breakfaſt and dine regularly in the houſe. The table of diet, and quantities allowed for them, which are quite as much as they wiſh, are as follows:

Monday. Breakfaſt. Rice milk; made of 4 lb. of rice, 1 lb. of flour, 1 lb. of ſugar, and 4 quarts of milk.
——— Dinner. 20lb. of beef, and a peck of potatoes, with 17 lb. of bread.
Tueſday. Breakfaſt. Broth and 13 lb. of bread.
——— Dinner. Boiled rice; conſiſting of 15 lb. of rice, 1½ lb. of ſugar, and 3 quarts of milk.
Wedneſday. Same as Monday.
Thurſday. Same as Tueſday.
Friday. Breakfaſt. Gruel, made of 2 quarts of oatmeal, with the allowance of 1 lb. of butter, 11 lb. of bread, and ¼ lb. of ſalt.
——— Dinner. Beef-ſtew; conſiſting of 22 lb. of ſhins of beef, and a peck of potatoes, with 17 lb. of bread.
Saturday. Same as Tueſday and Thurſday.

The workhouſe children and the maſter's family (in all 24) have, for their Sunday breakfaſt, gruel, made of one quart of oatmeal, with the allowance of half a pound of butter 8 lb. 10 oz. of bread, and 4 oz. of ſalt; for dinner, 12 lb. of beef, half a peck of potatoes, 5 lb. 5 oz. of bread, 8 oz. of ſalt, and 3 quarts of beer; for ſupper on Sunday, 6 lb. 8 oz. of bread, ½ lb. of cheeſe, and 2 quarts of beer, and the ſame ſupper on the other days of the week, with a little additional allowance of bread, of which they ſeem to require more on week-days than on Sunday. The price of the beef is 3s. a ſtone, or 4½d. per pound; of the 2 ſhins of beef (weight per average, including bone, 22 lb.) 2s. 6d.; of potatoes 20d. a buſhel; of their bread, which is good ſeconds, 7½d. the quartern loaf, or rather more than 1½d. a pound.

By the preceding bill of fare it will appear, that the cheap article of rice now forms a very conſiderable proportion of the children's diet. The uſe of it has been gradually increaſed, partly in conſequence of their having acquired a greater fondneſs for it than for other food, and partly from the obſervation of its nutritive and wholeſome qualities. Its average increaſe, on boiling in mere water, has been found to be fourfold: with the addition of milk, it is much more.—The good health which the children have uniformly enjoyed has been remarkable: ſeveral of them who were weak and ſickly at their admiſſion, have ſince become healthy and vigorous; to which their new habits of cleanlineſs and regularity, and the exerciſe of ſpinning by hand-wheels in an airy apartment, as well as their diet, which is nutritious and plentiful, may probably have conduced. The improvement in their morals and behaviour has been equally ſatisfactory to the wiſhes of the promoters of the inſtitution. It is found that, in proportion as the children become ſkilful and uſeful, their parents and friends, learning their value, become deſirous of withdrawing them, becauſe they can employ them to more advantage. This has already been the caſe of many, and generally has happened in the courſe of ſix months after they have been received into the ſchool; as the habits of order and induſtry, which the children acquire there, render them ſo deſirable as apprentices, that, though there has been a difficulty heretofore in finding ſituations in private families for any pariſh children, becauſe *they came out of a workhouſe*, yet they are now ſought for, and the pariſh is relieved from the expence of their maintenance at a much earlier age, than if they had been kept in the workhouſe.

One other very great advantage reſulting from this eſtabliſhment, and from its neceſſary connection with the poor of the pariſh, is, that the gentlemen who have intereſted themſelves in its ſucceſs, have thereby been induced to take a very active part in the management of the poor; and one of them, Robert Saunders, eſq. is now ſerving the office of overſeer for his ſecond year. It will be obvious that a greater benefit to the poor, and a conſiderable ſaving to the pariſh, muſt be the conſequences of ſuch an inſtitution. The poor are more happy, and better taken care of, than they were before; and the ſaving, from the new ſyſtem, will hardly be leſs than 500l. a-year.

By the preceding account it will appear, how much may, at a very ſmall expence, be effected by a judicious and ſpirited adoption of one of the meaſures directed by the ſtatute 43d Elizabeth. It is needleſs to obſerve upon the effects which this eſtabliſhment has neceſſarily produced on the morals, the cleanlineſs, and the health of the children; who, being now habituated to induſtry, inſtructed in reading, and accuſtomed to a regular attendance on divine ſervice, are bred up in the knowledge and practice of obedience and reverence to their Creator, and of that utility, which he has enjoined as a duty to their fellow-creatures.

Beſides the advantage of ſeparating the pariſh children from the contagion of thoſe diſſolute and profligate characters, which are to be found in all workhouſes, the maintaining of them at a leſs expence, and the educating of them in the habits of induſtry and virtue (circumſtances which apply to the pariſh children removed from the workhouſe to the ſchool of induſtry), it ſhould be obſerved, that a very great relief is alſo given to the other poor of the pariſh, by eaſing the parents of the burthen of maintaining ſo many of their children, and by giving the mothers profitable employment at home; a relief that, by improving the circumſtances of the cottager, has a juſt and honourable tendency to reduce the poor's-rates.—Eſtabliſhments, like that at Lewiſham, have alſo the merit of correcting the little pilfering habits of the infant poor, the ſource of ſo many vices and crimes in ſociety; and of preſerving them from idleneſs and bad example, and training them in virtuous and induſtrious habits, ſo as to make them bleſſings to their parents, and uſeful and valuable members of ſociety."

For the benefit of the adult poor, a ſociety was inſtituted at Wendover, by the Rev. Joſeph Smith, who, in the ac-

count of the ſteps taken to eſtabliſh it, ſays, "I confined my endeavours at the commencement, to inducing, in all my poorer neighbours, a habit of ſaving ſome part of their earnings, during that period of the year when they could beſt ſpare it, againſt a time when they would moſt want it. To the poor, therefore, both male and female, and of all ages, I propoſed that part of the plan only; as the means of laying up, from the exceſs of the moſt productive part of the year, that which might procure them comfort and relief at the ſeaſon the leaſt productive, and the moſt expenſive; and, in order to make it generally known, I employed the ſchoolboys at the writing ſchool in the pariſh, to copy out *propoſals, for a weekly contribution of money during the ſummer months*, to be repaid them with a conſiderable increaſe, the addition of one-third at leaſt, at the end of the year. Certain gentlemen were named to "receive at their houſes *weekly ſums*, of *2d. 3d. 6d.* or more, and depoſit the ſame in a box provided for that purpoſe, and keep an exact account of the ſame in a book. It is propoſed that Sunday morning be the time of making the payments; becauſe, among the other duties of that day, the labourer can then beſt ſpare time to look forward for the future comfort of his family; and becauſe they who have attended their duty at church, after having paid in their weekly ſix-pence to accumulate for their families, will feel the leſs inclination to ſpend another ſix-pence idly at the ale-houſe. At Chriſtmas the diſtribution will be made; that is to ſay, for every three ſhillings paid in, not leſs than four ſhillings ſhall be returned; and ſo in proportion. Further attention and conſideration will be paid to thoſe who have made their payments regularly, and who have been regular in their duties at church. Any perſon may receive back his or her own money at any time before Chriſtmas; but without any addition thereto. It is not intended that this act of prudence in the poor ſhould preclude them from pariſh relief, in caſe of ſickneſs, or in caſe of want of work, during ſevere weather; but it is meant to enable them to purchaſe a warm garment, half a load of wood, or any other domeſtic comfort they may want at the moſt inclement ſeaſon. The donations and friendly communications of any of the pariſhioners to this undertaking, are thankfully received."

Copies of this paper were placed on the church doors, and diſtributed in the pariſh. The boys alſo, who had received a trifling gratuity for making the copies, contributed very much to make the terms known to their parents and connections. "We gave notice of receiving contributions," ſays Mr. Smith, "on the firſt Sunday in May.—The labourers have embraced the offer held out to them, in a manner extremely gratifying; the ſociety already conſiſting of near *ſixty* ſubſcribing labourers, who bring their ſubſcriptions very regularly after morning ſervice; none leſs than ſix pence, very many of them a ſhilling.

The above may be deſerving of attention in thoſe country pariſhes, which, like Wendover, are not capable of receiving the entire benefit of the plan adopted in the biſhopric of Durham. It is certainly of great importance, to induce habits of frugality and foreſight, among the poor. Theſe good qualities are rarely unaccompanied by the other virtues; and when they are wanting, there can be little hope of ſtrict moral or religious character among men, who are to ſubſiſt on the produce of their daily labour.

There is a peculiar advantage in the Wendover ſociety, that neither time, nor money, is expended in ale-houſe meetings. There are no incidental charges to exhauſt the common purſe. There is a ſure and certain benefit to the members; and there exiſts no expence to diminiſh the amount of it. Friendly ſocieties, though very deſerving of encouragement, are not always equal and certain in their effects. *If not conducted properly, they may degenerate into drunken meetings; they may be diſgraced by fraud, be directed by a party, and become the inſtruments of ſedition.* From theſe inconveniences the ſociety at Wendover is exempt. Their one entertainment will be only an annual addition given to their family dinner at home, on Chriſtmas-day.

A great advantage of this and of ſome other ſimilar eſtabliſhments (beſides that important one of uniting perſons together for a common and uſeful purpoſe) is, that they contribute to make the rich and the poor more known to, and more connected with, each other; and to give thoſe who are deſirous of making a proper uſe of their property, an opportunity of appreciating correctly the character and ſituation of moſt of the cottagers in their neighbourhood.

The eſtabliſhment of this ſociety will, it is to be hoped, prove of much greater advantage to the members, than the mere amount of the addition to their own ſavings; and will be the cauſe of their beginning the new year not only *happily*, but *wiſely*. We underſtand they derive permanent good effects already from their frugality and prudence; Mr. Smith having eſtabliſhed the ſociety on a more durable footing, and with additional improvement and benefit to the members.

INFECTION (*Encycl.*). Under the article CONTAGION, we have ſpoken fully on this ſubject; and have under FEVER in this SUPPLEMENT, inſerted ſome uſeful cautions for the ſecurity of thoſe who are neceſſarily expoſed to danger from this cauſe. The following paper on the means of purifying infectious air, &c. is extracted from a work of Citizen Guyton de Morveau, by Citizen Deyeux, and publiſhed in the Annales de Chimie.

"Amongſt the important diſcoveries, which we owe to chemiſtry (ſays the latter writer), thoſe chiefly deſerve our attention, which, at the ſame time that they preſent us with facts valuable in a ſcientific point of view, afford alſo reſults from which great advantages may accrue to ſociety in general. It is then, chiefly, that the utility of chemiſtry ceaſes to be a problem, and that we are compelled to acknowledge the juſt title, which this ſcience has to be ranked amongſt thoſe, the ſtudy of which ought moſt aſſiduouſly to be cultivated.

"The work, of which I am about to give an extract, we owe to a diſtinguiſhed man of learning, a profound chemiſt, who, having meditated for a long time upon various important phenomena, that had preſented themſelves to him under a multitude of circumſtances, conceived that he might make uſe of the knowledge which he had acquired, in order to combat one of thoſe ſcourges which deſolate the human race, and againſt which all the art of medicine has hitherto proved inſufficient.

"Having once conceived this idea, he had a difficult taſk to accompliſh. Citizen Guyton, however, has ſurmounted all the obſtacles that ſtood in his way, and, by his courage, his patience, and perſeverance, has obtained ſuch ſatisfactory reſults, that he thought he ought no longer to withhold from the public the fruits of his labours.

"His work is divided into ſix parts. In the firſt, the author gives an hiſtorical ſketch of the experiments which he made in the year 1773, with the muriatic acid employed in fumigations.

"Already, at this period, he ſays, attempts had been made to diſinfect the air tainted by putrid miaſmata; but, as all the ſubſtances that had been employed for this purpoſe had not produced the effects that were expected from them, I imagined, after long reflection upon the ſubject, that I ought to turn my attention to the muriatic acid; as the great expanſibility of its vapours led me to ſuſpect, that they might be proper for ſeizing upon the ammoniac, which I then ſuppoſed to accompany all the odorous putrid miaſmata, and for

compelling it to quit them, and leave them to ſubſide by their own gravity.

" It was neceſſary to aſcertain the powers of the remedy, which theory ſeemed to point out, by the teſt of experiment: Citizen Guyton, therefore, availed himſelf of a circumſtance, which he thought it the more neceſſary for him to make uſe of, as it afforded him an opportunity of making an experiment upon a large ſcale, and ſuch as he ſtood in need of, in order to obtain reſults concerning the nature of which no doubt could remain.

" In the courſe of the winter of 1773, the burying-vaults of the principal church at Dijon being found to be entirely full, it was ordered that they ſhould be cleared. Some precautions that had been taken, with a view to prevent the exhalation of the putrid vapours, which, it was preſumed, muſt ariſe during this operation, having proved unſucceſsful, the infection ſoon became ſo inſupportable, that it was neceſſary to abandon the church. In the mean time, the putrid effluvia diffuſed themſelves among the neighbouring houſes, and then gave riſe to a contagious fever.

" It was then that it was thought proper to conſult Citizen Guyton, who, after having informed himſelf of all the precautions that had been uſed, propoſed fumigations with muriatic acid.

" His advice was adopted; and the effects were ſo ſpeedy and decided, that, four days after, the church was re-opened, and all the eccleſiaſtical offices were re-eſtabliſhed in it, without danger, and even without apprehenſion.

" Similar fumigations were afterwards practiſed in the dungeons of the priſons of Dijon, in which a contagious fever had produced ſuch terrible effects, that the greater part of the priſoners periſhed.

" Though the infection was of the moſt virulent nature, it was at laſt ſo completely deſtroyed, that a ſtudent of ſurgery requeſted leave to ſleep in one of the dungeons that had been diſinfected.

" Succeſs ſo decided, naturally produced a great deal of confidence in the remedy. We find, therefore, that when the *Conſeil de Sante* & Vicq d'Azyr were conſulted upon the means of ſtopping the progreſs of a contagion that had appeared in the military hoſpitals, and in the ſtables where a great number of cattle were kept, they did not heſitate to preſcribe fumigations with muriatic acid, as the moſt certain remedy to which they could have recourſe.

" A circumſtance, which certainly ought to excite ſurpriſe, is, that the perſons, to whom the care of executing theſe fumigations was intruſted, neglected to give ſufficient publicity to reſults ſo ſatisfactory as thoſe which it is known they obtained.

" This neglect, as Citizen Guyton very juſtly remarks, is the more unpardonable, as it has tended to retard the adoption of a proceſs, which, in many caſes, would have proved invaluable, as, by means of it, many thouſands of perſons might have eſcaped the effects of contagions, to which they have fallen ſacrifices, on account of the inſufficiency of the means that were employed againſt them.

" The muriatic is not, it appears, the only acid which has been conſidered capable of depriving the air of its contagious quality. This we find from the account which the author gives, in the ſecond part of his treatiſe, of experiments made in foreign countries with fumigations of different mineral acids.

" One of the oldeſt works relative to this ſubject, which fell into the hands of Citizen Guyton, is entitled *Rapport des Experiences faits en Angleterre, par Ordre de l'Admirauté, à bord du Vaiſſeau d'Hôpital, l'Union.*

" The Lords of the Admiralty having requeſted Dr. Smith to direct means for putting a ſtop to the contagion that had appeared on board the Union, he adviſed Mr. Menzies, ſurgeon to the navy, to try fumigations with nitric acid. Theſe fumigations were made with great care, and were attended with ſuch ſucceſs, that, from the day on which they were begun to be employed, the mortality ceaſed, and the greater part of the accidents occaſioned by the contagion diſappeared.

" Some time after, the ſame means were employed for deſtroying the contagion on board of the Ratveſan, and the Revel frigate, in which a malignant fever had alſo broke out.

" The ſucceſs which Mr. Menzies obtained in theſe three inſtances left no doubt in his mind of the utility of the proceſs which he had employed, and of the neceſſity of having recourſe to it, whenever it ſhould be neceſſary to purify the air of putrid miaſmata.

" The ſame opinion was alſo adopted by Dr. Smith; for he concludes the report, in which the above-mentioned facts are related, with ſaying, That the experiments of Mr. Menzies, clearly eſtabliſh two facts; in the firſt place, that the nitric acid has the power of deſtroying contagion; ſecondly, that it may be employed without producing troubleſome effects upon the perſons who reſpire it. He conſiders this diſcovery as being applicable to every kind of contagion, and even to that of the plague. Conſidered in this laſt point of view, he thinks it ought to intereſt every nation, &c.

" Thus the beneficial effects of the nitric acid, ſeem to be as decidedly eſtabliſhed as thoſe of the muriatic; however, as Mr. Menzies very properly obſerves, the uſe of the nitric acid is only exempt from inconvenience, as long as we are able to reduce it into vapour, without its being converted into nitrous acid; for, otherwiſe, it would occaſion accidents, which it would be difficult to remedy.

" Mr. Cruikſhanks appears alſo to have employed acid fumigations; however, it is evident that he has given the preference to the oxygenated muriatic acid gas.

" The proceſs which he employs for obtaining it is very ſimple: it conſiſts in mixing accurately two parts of common ſalt, and one part of the black oxyd of manganeſe. After having diluted this mixture with a ſmall quantity of water, concentrated ſulphuric acid is gradually added to it. Immediately a large extrication of vapours takes place, which unite with the putrid effluvia in ſuch a manner, that the air, in the place where the experiment is made, is ſoon found to be purified.

" In Spain, the fumigations with ſimple muriatic acid, reduced to the ſtate of vapour, are generally adopted; and they are there conſidered to be ſo little capable of producing accidents, that they are performed even in chambers actually inhabited.

" Finally, it appears, that ſimilar fumigations have frequently been practiſed in France, and that whenever they have been properly conducted, they have been attended with ſucceſs.

" In the third part of his treatiſe, the author makes ſome reflections on the effects of acid fumigations, and examines the different opinions that have been advanced, in order to explain their mode of operation.

" The principal problem to be reſolved in ſeeking the means of purifying a maſs of infected air, was to find out agents that poſſeſſed the power of deſtroying the contagious miaſmata, and particularly the putrid ſmell that always indicates their preſence. It has been ſhewn, in the two firſt parts of this work, that ſome of the mineral acids had produced this two-fold effect; but it was uſeful to enquire, whether theſe acids acted in the ſame manner, and whether the reſults

which they preſented were equally ſatisfactory. It was neceſſary alſo to aſcertain, whether their operation ought to be attributed to oxygen; whether ammoniac formed an eſſential part of the putrid effluvia; whether they were always accompanied with carbonic acid gas; and, finally, whether the vegetable acids might not be employed with advantage.

" The ſolution of all theſe queſtions could not fail to throw a great deal of light upon the cauſes and immediate effects of contagion; the author, therefore, thought it an object that particularly demanded his attention. For this purpoſe, he inſtituted a courſe of experiments, both with a view to inveſtigate the nature of the putrid miaſmata, and to aſcertain the mode of operation of the agents with which they are brought into contact.

" The infected air upon which he performed his experiments, was obtained from ſlices of raw beef, which he had expreſsly placed in a ſituation to putrify. This air, which poſſeſſed all the properties that were required, had ſcarcely been mixed with lime-water, when it immediately appeared that this was decompoſed. The ſame circumſtance took place with the ſolutions of the nitrates of ſilver and mercury; but, notwithſtanding this decompoſition, the fetid ſmell continued to be perceived as before.

" Slips of paper, ſtained with fernambourg, the petals of mallows, curcuma, and a ſolution of copper, were ſuſpended in veſſels filled with the putrid air. After having remained there for the ſpace of twenty-four hours, the colours appeared ſomewhat fainter, but they had undergone no change that indicated the preſence of ammoniac.

" Several metallic oxyds, ſuch as that of zinc, the black oxyd of manganeſe, the brown oxyd of lead, &c. having been left for ſeveral days in contact with the ſame putrid gas, exhibited no change of colour, and had produced no diſengagement of ammoniac.

" From the reſults of theſe, and ſeveral other ſimilar experiments, the author draws the following inferences: 1. That air impregnated with putrid effluvia contains more carbonic acid than the ordinary air of the atmoſphere. 2. That the effects of putrid air are entirely independent of the preſence of carbonic acid; ſince, after the ſeparation of this acid, the air ſtill retains its putrid ſmell. 3. That putrid air does not contain ammoniac in a free ſtate, as it does not change the colours of ſtained paper that is placed in it.

" Theſe points being aſcertained, Citizen Guyton ſubjected a certain quantity of putrid air to the teſt of the eudiometer; not ſo much with a view to determine its degree of ſalubrity, as to aſcertain in what proportion oxygen gas was contained in it.

" The reſult of this ſecond ſet of experiments ſoon proved, that the putrid air contained very nearly as much oxygen gas as the ordinary air of the atmoſphere; and that, conſequently, the deleterious effects of the putrid air ought not to be attributed to the deficiency of oxygen gas.

" The nature of the effluvia that rendered the air fetid, ſtill remained to be inveſtigated. In order to obtain a perfect knowledge of their nature, one muſt have been able to analyſe theſe effluvia; but, unfortunately, the chemical means were found inadequate to the purpoſe.

" All that could be preſumed was, that theſe putrid effluvia, being compound ſubſtances, muſt, like all other compound bodies, be ſuſceptible of decompoſition, whenever we preſent to them agents poſſeſſing greater affinity with one or more of their elements than theſe elements have with each other.

" Here alſo experiments were neceſſary, in order to aſcertain in how far this idea might be founded. We ſhall ſoon ſee how uſeful the reſults of thoſe which Citizen Guyton has inſtituted for this purpoſe have been to him, and what advantages he has derived from them, in order to fix once for all the opinions that ought to be adopted, with reſpect to the choice of the means to be employed for diſinfecting air vitiated by putrid miaſmata.

" Convinced that the atmoſpherical air ought to be conſidered as ſerving merely as a vehicle to the putrid effluvia, the author brought fetid air into contact with various odorous vapours, ſuch as are extricated during the combuſtion of benzoin, aromatic plants, &c. He afterwards ſtrongly agitated another quantity of theſe putrid effluvia with the ſolutions of myrrh, benzoin, and balſam of Peru in alcohol. The reſult of all theſe trials was not ſatisfactory, for the putrid ſmell ſtill continued to be perceptible.

" The ſame happened alſo with the pyro-lignous acid. Neither was the reſult more favourable, when he tried the detonation of gunpowder, at ſeveral times, in large veſſels filled with putrid air; he only remarked, in this caſe, that a diſplacement of the maſs of infected air was produced, but its qualities were not corrected.

" The reſult was not the ſame with the *acetic* acid; its action was ſpeedy; for the putrid ſmell very ſoon ceaſed to be perceptible. He alſo tried the *ſulphuric* and ſulphureous acid. The firſt produced no change; the ſecond was obſerved to have diminiſhed the ſmell, but not to have removed it entirely.

" Beſides the experiments which I have quoted, the author has attempted a great many more, which I ſhall paſs over, as they proved altogether abortive; but there are ſome upon which I ſhall dwell, on account of their importance; I mean thoſe that were made with the nitric, the ſimple muriatic, and the oxygenated muriatic acids.

" The greateſt difficulty which Citizen Guyton had at firſt to ſurmount in this new kind of experiments, was to obtain the vapours of nitric acid free from nitrous gas; however, having at length, after a number of trials, obtained them ſuch as he wanted, he immediately brought them into contact with the infected air. Upon afterwards examining this air, it did not appear to retain the ſmalleſt trace of a fetid odour.

" In order to eſtabliſh the inference by a compariſon of the reſults in circumſtances perfectly ſimilar, he afterwards ſubjected the muriatic acid to preciſely the ſame experiments. In this caſe alſo the fetid ſmell was completely deſtroyed.

" Finally, the oxygenated muriatic acid acted in ſo decided a manner upon the putrid air, that from the moment when it was mixed with it, the putrid ſmell ceaſed to be perceptible.

" When we reflect upon the experiments that have been recorded, it is eaſy to ſee, that, if their reſults have not all been equally ſatisfactory, they may at leaſt ſerve to point out the agents in which we may place ſome confidence, and enable us to chooſe thoſe whoſe power of deſtroying putridity appears the moſt decided.

" The only means of determining our choice of ſuch agents would, undoubtedly, be to compare the effects produced by the different agents that were employed in the above-mentioned experiments.

" Thoſe produced by the uſe of perfumes, vinegar, the detonation of gunpowder, the pyro-lignous acid, the ſulphurous and ſulphuric acids, &c. were, as has been ſeen, either none at all, or tardy, or of little efficacy. The acetic and nitric acids have appeared to act in a very decided manner; but the difficulty of obtaining them in that ſtate, in which it is

neceſſary they ſhould be, in order to produce ſuch favourable effects, is a conſiderable objection againſt their uſe.

" The ſame is not the caſe with the ſimple muriatic acid; the facility with which it is reduced into vapour, the great expanſibility of this gas, and above all, the promptitude of its operation upon the putrid miaſmata, ſhew of how great importance it is not to neglect its uſe.

" However, adds the author, I have the ſatisfaction of announcing, that this is not yet the moſt powerful means with which the progreſs of chemiſtry has furniſhed us for reſiſting contagion. The oxygenated muriatic acid is, beyond all contradiction, the moſt certain ſpecific, and the moſt ready preſervative which we can employ againſt it.

" It ſeems that, after having entered into the diſcuſſion of all the ſubjects in queſtion, Citizen Guyton might have preſented the public with the general concluſion of his treatiſe: however, he thought it ſtill incumbent upon him to examine the influence which oxygen might exert of itſelf in the proceſs of diſinfection, and to enquire whether all kinds of contagious miaſmata were equally ſubject to the operation of the ſame agents.

" Since chemiſtry has made us acquainted with the particular nature and properties of oxygen, it was ſoon found that it poſſeſſes a great diſpoſition to combine with various ſubſtances, and particularly animal matter. The conſtant obſervations that have been made upon this ſubject have led to the ſuppoſition, that oxygen might be employed as a medicine.

" In fact, it is certain that medicines act only by inducing changes in the body, that tend to attenuate the morbid matter, and re-eſtabliſh the order and regularity of the animal functions; it muſt alſo be allowed, that oxygen, as it poſſeſſes ſuch properties, muſt be a real medicinal ſubſtance, and that, in order that it may act with efficacy, it is only neceſſary to employ it in a ſtate of appropriation that may enſure its ſucceſs.

" This fact is at preſent ſo well demonſtrated, that ſeveral phyſicians of the higheſt reputation are inclined to admit of only two ſpecies of medicines, namely, the *ſuperoxygenating* and the *diſoxygenating*; the action of which they explain by ſaying, that they *burn* or *unburn* (*brûlent* ou *debrûlent*) the bodies with which they are brought into contact; meaning, that they furniſh them with the oxygen which they want, or deprive them of that which they poſſeſs in too large a proportion.

" The expreſſion of *burning*, employed in order to account for the manner in which medicines operate, as forced as it may appear, will be acknowledged to be ſtrictly juſt, when we conſider that, beſides the combuſtions that take place with rapidity and an extrication of heat, there are alſo others which go on ſlowly, but the effects of which are perfectly ſimilar to thoſe of the former.

" Both in the one and the other, it is always the oxygen which tends to combine itſelf, and which, according to its greater or leſs degree of affinity with the body with which it unites, entirely changes the form of this body, its weight, its taſte, and its colour, and at laſt imparts to it properties which it did not poſſeſs before.

" According to this explanation, it is eaſy to ſee that the alterations which animal ſubſtances inceſſantly undergo are, in fact, the effects of combuſtions, ſlow indeed, but which may, in ſome degree, be accelerated by preſenting theſe ſame ſubſtances with a large quantity of oxygen at once, or placing them in contact with bodies, which, containing a large quantity of this principle, may eaſily yield to them a portion of it.

" It was a ſimilar theory, which led, almoſt naturally, to the medicinal uſe of oxygenated ſats, nitric acid, oxygenated muriatic acid, the ſuper-oxygenated muriate of pot-aſh, and various other oxygenated ſubſtances, the ſure effects of which afford the means of combating a variety of maladies, to the progreſs of which medicine had before no remedy to oppoſe, or could only cure with a great deal of difficulty.

" Since, therefore, it is impoſſible to deny the power which oxygen inceſſantly exerciſes upon animal ſubſtances, it muſt alſo be admitted, that the putrid effluvia that exhale from theſe ſame ſubſtances muſt alſo be ſubject to the action of this agent, and that, by combining with it, they muſt neceſſarily acquire new properties.

" In order to explain more at large his ideas with reſpect to this ſubject, the author has thought proper to treat of the oxygenating ſubſtances, and particularly the oxygenated muriatic acid, conſidered only as preſervatives againſt contagion.

" It is a fact univerſally admitted, that among perſons the moſt expoſed to the influence of contagious maladies, there are ſome upon whom they produce no bad effects. Great pains have been taken, and always in vain, to explain the cauſe of ſo ſingular a circumſtance. But, ſays Citizen Guyton, what need is there to have recourſe to abſtract theories, or even to enquire at all into the cauſes of a change of properties that does not exiſt, when the reſiſtance, which ſome perſons ſhew towards the morbific matter, may be explained in a ſimple and purely chemical manner, from its analogy with one of thoſe general phænomena which are daily exemplified before our eyes in an infinite variety of operations?

" Let us take an example, he adds. We know with what facility the ſulphuric acid attacks aluminous earth. This earth, however, is ſuſceptible of a ſtate of aggregation, in which it reſiſts all combination, without there being the ſmalleſt ground to ſuſpect that it has undergone any alteration in its nature. Might it not alſo be the ſame with the human body? and might we not aſſert that a certain ſtate of health is connected with a ſtate of aggregation, that reſiſts that combination of the contagious miaſmata with the body, which would take place if the force of aggregation were different?

" Moreover, this explanation ſeems to accord with facts, which various obſervations that are conſtantly made have enabled us to collect. It is known that the beſt means of guarding one's ſelf againſt the impreſſion of contagious miaſmata, when we cannot remove ourſelves out of the infectious atmoſphere, is to ſupport, and even augment, the vital powers: now, as the oxygenating ſubſtances poſſeſs this property in the higheſt degree, it is evident what great advantage may reſult from their uſe, and how much thoſe eſpecially deſerve the preference, which, like the oxygenated muriatic acid, may eaſily be reduced into the ſtate of gas.

" Carried thus, by reſpiration, into the naſal and pulmonary cavities, diſſeminated in the ambient atmoſphere, or introduced, by reſpiration, into the ſtomach, acting finally upon the whole ſurface of the body, they operate as a ſtimulant, which augments the activity of the organs, excites their ſenſibility, and ſoon puts a ſtop to the effects of the miaſmata, which, in general, act only by debilitating.

" Under this point of view, Citizen Guyton has conſidered the mode of operation of the oxygenating ſubſtances. This efficacy appeared to him to be ſo well demonſtrated by theory and experience, that he preſumes that thoſe who reflect upon the ſubject will no longer fear the appearance of contagion, as they will be ſure of having the means of guarding themſelves againſt it.

" One grand queſtion, however, ſtill remained to be decided. It was neceſſary to aſcertain, whether the anti-con-

tagious agents that were propoſed as capable of producing ſuch ſalutary effects, were applicable to all the different kinds of contagion.

" The author admits, without heſitation, that it would be contradictory to all evidence to ſuppoſe that all the maladies which a ſick perſon can communicate to a healthy one, have the ſame matter for their cauſe.

" However, admitting the diſtinction that has been juſtly eſtabliſhed between the maladies that proceed from certain effluvia ſuſpended in the atmoſphere, and thoſe which are only contracted from the immediate contact of a matter ſometimes alſo inviſible, but more fixed; it muſt alſo be allowed, upon the authority of unequivocal obſervations, that the firſt are thoſe which prevail the moſt frequently, againſt which it is the moſt difficult to guard one's ſelf, and againſt which, conſequently, the neceſſity of preſervatives and anti-contagious remedies is the moſt urgent. To this claſs belong the fevers of hoſpitals, jails, and ſhips, and that which occurs in the vicinity of marſhes; in a word, all thoſe malignant fevers which owe their origin to putrid exhalations.

" As to the maladies of the ſecond claſs, that can only be contracted by immediate contact; it is alſo admitted that they originate from the preſence of ſome virus, which aſſuredly is not a ſimple ſubſtance, but rather a compound body, which muſt be ſubject to the condition which obtains in all its products, namely, that of undergoing combuſtion, whenever it is brought into contact with oxygen. Hence it appears, that we have already reaſon to preſume that the virus of diſeaſes muſt experience great changes from the action of the oxygenating ſubſtances, and that conſequently their properties muſt neceſſarily be altered.

" To ſubſtantiate this concluſion, the author adduces the following facts. The variolous virus is certainly one of thoſe, the ſpecific contagion of which is the moſt diſtinctly characteriſed; however, it is certain, according to the experiments of Mr. Cruikſhank, that a portion of this virus, mixed with oxygenated muriatic acid, produced no effect, when it was attempted to inoculate with it; whilſt another portion, with which none of the acid had been mixed, communicated the variolous contagion.

" It is alſo known, from practical obſervations, that the ſyphilitic virus is deſtroyed by oxygenated mercurial remedies, and that it produces no infection; whilſt the matter taken from the ſame ulcer, without ſuch admixture, produces a chancre, and other venereal ſymptoms.

" The hydrophobia, which has hitherto been conſidered as incurable when the malady makes a rapid progreſs, may, however, be attacked with ſucceſs, by touching the wound that has been made by the rabid animal, with powerful oxygenating ſubſtances, before the local nervous irritation has produced the rabific fever.

" Finally, the pſoric virus may alſo be deſtroyed by the oxygenating remedies; the effects of which, in theſe caſes, are ſo well known, as to have no manner of doubt reſpecting the ſubject.

" It cannot indeed be denied, that it has not been demonſtrated with the ſame degree of evidence, that the oxygenating remedies are capable of acting with equal efficacy upon the virus of the plague, as experiments have not yet been made upon this ſubject; but, if it be permitted us to draw concluſions from mere probabilities, we may aſſert, that this virus, being undoubtedly a compound ſubſtance, muſt undergo, by the action of oxygen, a combuſtion which, whilſt it changes its nature, muſt alſo change its deleterious properties.

" From what has preceded it will be ſeen, that the author has done all in his power to make known thoſe means of diſinfection which appeared to him capable of producing ſuch important effects; but, in order to enable his readers to judge for themſelves of the utility of thoſe proceſſes, which, before thoſe which he has pointed out, were in ſome degree of reputation, he has compared them together, and aſſigned to each that rank in the ſcale of utility to which it is entitled.

" From this compariſon, which is compriſed in the third part of the work, it appears:

1. " That cold water, lime, reſinous ſubſtances, the kindling of fires, the burning of ſimple and aromatic vinegar by throwing it upon red-hot coals, the detonation of gunpowder, &c. ought not to be conſidered as real preſervatives and anti-contagious remedies, as they do not poſſeſs the power of decompoſing the putrid miaſmata.

2. " That ordinary vinegar poſſeſſes, indeed, the power of decompoſing the miaſmata; but that this power does not exert itſelf in a perceptible manner, unleſs the infected ſubſtances are immerſed in this acid, or are capable of being waſhed with large quantities of it.

3. " That radical vinegar, or acetic acid, produces effects ſufficiently rapid; but that the difficulty of obtaining it in large quantities, at a moderate expence, will frequently be an objection againſt its uſe.

4. " That the ſulphuric acid, on account of its great fixity, is not capable of contributing to the diſinfection of the air.

5. " That the nitric acid is very capable of deſtroying the putrid miaſmata, but that the uſe of this remedy is ſtill attended with ſome inconvenience, owing to the impracticability of entirely depriving it of nitrous gas, the action of which is always prejudicial to the health of thoſe who reſpire it.

6. " That the muriatic acid, on account of the prodigious expanſibility of its vapours, which enables them to reach every part of the ſubſtance upon which we wiſh to operate, affords us very great advantages.

7. " Finally, that the oxygenated muriatic acid juſtly deſerves the preference over all the other remedies, not only on account of the promptitude and facility with which it is everywhere diffuſed, but alſo becauſe its action is always certain, and it immediately deſtroys all the putrid miaſmata, that are either floating in the atmoſphere, or fixed upon bodies.

" I think I have ſaid ſufficient to enable the reader to form an idea of the work which Citizen Guyton has preſented to the public. I ſhall only add, that it would be difficult to treat a ſubject, like that which forms the argument of this work, in a more methodical, perſpicuous, and, above all, in a more intereſting manner.

" All the facts which the author has adduced, are ſubſtantiated by vouchers that cannot leave the ſmalleſt doubt of their authenticity; all the experiments which he has recorded have been performed with care and accuracy; and the inferences which he has drawn from their reſults are juſt, and little ſubject to objection; finally, it appears to me, from all theſe reaſons, that the work of Citizen Guyton ought to be gratefully welcomed by all thoſe who, alarmed at the ravages unfortunately too frequently produced by contagious diſeaſes, have ardently wiſhed that means might be diſcovered for putting an end to the devaſtations occaſioned by theſe ſcourges of the human race.

" What is ſtill to be wiſhed is, that the work of Citizen Guyton may obtain all that publicity which it merits; and that particularly phyſicians, and in general all whoſe profeſſional duty it is to watch over the health of their fellow-citizens, may receive ſuch a conviction of the efficacy of the means here propoſed, as no longer to heſitate in recommending them to be put in practice. The ſucceſs with which

they would be attended would ſoon afford ſufficient motives of encouragement; and, convinced then of the utility of Citizen Guyton's method, they would unite with all the friends to humanity in paying him that tribute of gratitude which his labours have deſerved."

INGELMUNSTER, or ENGELMUNSTER, a village of Flanders, where is a caſtle, which was often made a garriſon in the religious wars of the ſixteenth century. It is ſituate near the river Mandel, five miles N. of Courtray.

INGLING, a town of France, in the department of Moſelle, ſix miles E. of Thionville. Long. 6. 22. E. Lat. 46. 22. N.

INGRANDE, a town of France, in the department of Mayne and Loire, ſituate on the Loire, 15 miles W.S.W. of Angers. Long. 0. 25. W. Lat. 47. 23. N.

INK *(Encycl.)*. M. Ribaucourt, in the "*Annales de Chimie*," directs eight ounces of Aleppo galls, and four ounces of logwood, to be boiled in twelve pounds of water, till the quantity is reduced to one half; when the liquor ſhould be ſtrained through a linen or hair ſieve into a proper veſſel. Four ounces of ſulphate of iron (green vitriol), three ounces of gum-arabic, one ounce of ſulphate of copper (blue vitriol), and a ſimilar quantity of ſugar-candy, are now to be added: the liquid ſhould be frequently ſhaken, to facilitate the ſolution of the ſalts. As ſoon as theſe ingredients are perfectly diſſolved, the compoſition is ſuffered to ſubſide for twenty-four hours; when the ink may be decanted from the groſs ſediment, and preſerved for uſe in glaſs or ſtone bottles, well ſtopped.

This ink exhibits a purpliſh-black colour in the bottles; but the writing performed with it, is ſaid to be of a beautiful black caſt, which it retains, unaltered, for a conſiderable length of time. Each quart of the preparation contains:

	oz.	*drs.*	*grs.*
Of Galls	2	5	20
Green vitriol	1	2	40
Logwood	1	2	40
Gum	1	0	0
Blue vitriol	0	2	40
Sugar-candy	0	2	40

M. Ribaucourt is of opinion, that ink thus prepared, may be preſerved ſeveral years in a ſtate of perfection, without depoſiting either galls or iron.

INOCULATION (*Encycl.*). See COW-POX, *Supp.*

INNICHEN, a town of Germany, in the Tyrol, ſituate on the Drave, 29 miles E. of Brixen. Long. 12. 17. E. Lat. 46. 48. N.

INSECTS (*Encycl.*). Dr. Darwin is of opinion, that the moſt ingenious, as well as the moſt effectual, method of preventing the depredations of inſects, conſiſts in artificially propagating the larvæ of the aphidivorous fly, of which we have given a repreſentation in pl. 33, and which has been obſerved by naturaliſts to depoſit its eggs where the aphis abounds.

As ſoon as the larvæ are produced, they devour the aphides around them, ſeizing the latter in their mouth, as delineated in the plate, and extracting their juices. We have not been able to aſcertain their exact duration in a caterpillar ſtate, but believe that in about a fortnight they contract, and attach themſelves to ſome ſolid matter, by means of a little gluten which is diſcharged from their mouth; and are thus converted into *chryſales* or *nymphæ*, as above repreſented. In this ſtate, the inſect continues 10 or 11 days, when it burſts its cell, and emerges a perfect fly, of which likewiſe a delineation is given at *a*.

If theſe inſects could be collected, carefully preſerved during the winter ſeaſon, and properly diſpoſed on nectarine and peach-trees, early in the ſpring, Dr. Darwin thinks it is probable that the depredations of the blite might be counteracted, "by the natural means of devouring one inſect by another; as the ſerpent of Moſes devoured thoſe of the magicians."

A kind of bellows has been invented by Mr. Green, of her majeſty's flower-garden, Kew, for the purpoſe of deſtroying the red ſpider, and other noxious inſects in hot-houſes and pineries, with the fumes of burning tobacco. The ſame noxious vermin may likewiſe be exterminated by burning (when the hot-houſe is ſhut) matches moiſtened with a ſpiritnous tincture of aſa-fœtida, and rolled in a powder conſiſting of equal parts of ſulphur and Scotch ſnuff. It will alſo be of ſervice to waſh the frames of hot-houſes, &c. with four ounces of ſublimate, diſſolved in two gallons of water; but this operation ſhould be performed with the utmoſt caution, on account of the corroſive properties of the mercury.

In the *Annales de Chimie*, M. Tatin gives an account of a compound which he has ſucceſsfully uſed for exterminating inſects. He directs $1\frac{3}{4}$ of a lb. of the beſt black ſoap, a ſimilar quantity of flowers of ſulphur, 2 lbs. of any kind of muſhrooms, and 15 gallons of rain or river water, to be employed. The fluid is to be divided into two equal parts, one of which is put into a barrel, together with the ſoap and muſhrooms, after the latter have been ſomewhat bruiſed. The other half is to be boiled in a kettle with the ſulphur incloſed in a bag, and fixed to the bottom of the veſſel, by means of a ſtone or other weight.

Theſe ingredients are to be boiled 20 minutes, during which the ſulphur ſhould be well agitated with a ſtick, that the water may be the better impregnated. When the liquid is taken from the fire, it is to be poured into the barrel, and ſtirred daily, till the mixture become in a high degree fetid: for, the older and ſtronger the compoſition is, the more ſpeedy and powerful will be its effects. The liquor is to be ſprinkled on the plants infeſted with inſects; great numbers of which it deſtroys on the firſt application: it will, however, be neceſſary to repeat the aſperſion, in order to exterminate ants, or other vermin that breed beneath the ſoil; and, for this purpoſe, from two to eight pints are required, according to the depth and extent of their neſts.

Although inſects are very injurious to vegetation, yet Dr. Darwin is of opinion that they may be rendered extenſively uſeful as a *manure*. Hence, in the ſummer months, he recommends heaps of dung to be ſupplied with water, for promoting the propagation and nouriſhment of myriads of vermin; which, when ſuffered to decay on the ſoil, would greatly contribute to its fertility.

In a recent publication, entitled, "*Illuſtratio Iconographica Inſectorum*," &c. Mr. Fabricius has deſcribed ſeveral new inſects, which he ſaw in the different collections at Paris. His deſcriptions, however, being not always ſufficient for determining the ſpecies he had in view, the great difficulties hence ariſing can only be removed by good figures of the originals, ſigned by his hand; by which means theſe objects will, as it were, be multiplied and perpetuated, and which, if once deſtroyed, may perhaps not be found again. It is therefore incumbent upon us to do proper juſtice to the zeal and merit of Cit. Coquebert, author of the work we are here announcing, which conſiſts in repreſenting by figures, coloured after his own drawings, the inſects obſerved in the Paris cabinets, and deſcribed by Mr. Fabricius; in adding the deſcription and ſynonimous terms of that naturaliſt; and in publiſhing other new ſpecies, or thoſe that are leſs known. The celebrated artiſts, Cit. Maleuvre for engraving, and Didot the elder for the typographical part, have aſſiſted in this intereſting work, and ſeconded the pencil of a man, who knows how neceſſary it is to obſerve and ſtudy nature, before he at-

tempts to copy her. The 10 firſt plates contain about 120 figures, a great number of which preſent the inſects in detail. He begins with thoſe that are particularly ſubject to be deſtroyed, belonging at the ſame time to leſs numerous claſſes than others, viz. the *Symitotes, Peezotes,* and *Ryngotes* of Fabricius. North America, Cayenne, the Barbary ſtates, and the ſouth of France, are the principal countries from which the ſpecies he has figured are brought. The new genera of Delphax, Oryſſus, and Pſocus, are there figured, with an accurate repreſentation of their organs of manducation, in which he has been much aſſiſted by Cit. Latraille, to whom the plate is entirely owing of the little known genus Pſocus, which on account of their minuteneſs and fugacity, had hitherto eſcaped the obſervation of naturaliſts. Some anatomical obſervations, new ſynonimous terms, and other remarks, give an additional value to this work; and we are convinced that it will meet with the moſt favourable reception by every naturaliſt and amateur.

INSTERBURG, a town of Pruſſian Lithuania, containing about 3000 inhabitants. Corn and beer are the principal articles of trade. It is 44 miles E. of Konigſburg. Long. 21. 40. E. Lat. 54. 40. N.

INSTITUTE, the French name for a national *ſchool* or *academy* in Paris, having, if we may credit its own reports, and thoſe of its founders, high claims to ſuperiority and diſtinction. When royalty was aboliſhed in France, it would have been inconſiſtent to continue the titles *Royal* Academy of Sciences, *Royal* Academy of Inſcriptions, &c.; but inſtead of merely aboliſhing the word *royal*, and ſubſtituting *national* in its ſtead, it was thought a prudent meaſure to aboliſh the ſeven academies themſelves, or rather to melt them all down into one great academy; to which was given the appellation of the *National Inſtitute*. This academy, founded on a decree of the new conſtitution, was opened on the 7th of December, 1795, when Benezech, the then miniſter for the home department, attended, and the following decree of foundation was read:

"The Academy of Arts and Sciences belongs to the whole republic, and Paris is its place of reſidence. Its employment is to aim at bringing all arts and ſciences to the utmoſt perfection of which they are capable. It is to notice every new attempt, and all new diſcoveries, and to keep up a correſpondence with all foreign literary ſocieties. And by the particular orders of the Executive Directory, its firſt ſtudies are to be directed to thoſe ſubjects which more immediately tend to the reputation and advantage of the French republic."

The academy, which is not yet completely formed, is to conſiſt of 288 members, half of whom are to reſide in Paris, the other half in the departments; and to them is to be added a certain number of foreigners, as honorary members, confined at preſent to twenty-four.

The academy is divided into three claſſes, each claſs into ſections, each ſection to contain twelve members; viz. *1ſt claſs.* Mathematics and natural philoſophy. This claſs is divided into ten ſections. 1. Mathematics. 2. Mechanical arts. 3. Aſtronomy. 4. Experimental philoſophy. 5. Chemiſtry. 6. Natural hiſtory. 7. Botany. 8. Anatomy and animal hiſtory. 9. Medicine and ſurgery. 10. Animal economy, and the veterinary ſcience. *2d claſs.* Morality and politics. This claſs conſiſts of ſix ſections. 1. Analyſis of ſenſations and ideas. 2. Morals. 3. Legiſlature. 4. Political economy. 5. Hiſtory. 6. Geography. *3d claſs.* Literature and the fine arts. This claſs conſiſts of eight ſections. 1. Univerſal grammar. 2. Ancient languages. 3. Poetry. 4. Antiquities. 5. Painting. 6. Sculpture. 7. Architecture. 8. Muſic.

For each claſs a particular room in the Louvre is appropriated. No one can be a member of two claſſes at the ſame time, but a member of one claſs may be preſent at the meetings of any other. Each claſs is to give to the public, yearly, an account of its tranſactions.

Four times a-year there are public meetings. On theſe occaſions, the three claſſes meet together. At the end of each year, they give a circumſtantial account to the legiſlative body of the progreſs made in that year in the arts and ſciences. The prizes given yearly by each claſs are publicly notified at certain times. The ſums requiſite for the ſupport of the inſtitution are decreed yearly by the legiſlative body, upon a requiſition made by the government.

The firſt forty-eight members were choſen by the Executive Directory, to whom the choice of the remaining members was confined. To the members, reſident in Paris, is reſerved the choice both of the department and foreign members. On a vacancy in any claſs, three candidates are named by the claſs for the choice of the body at large.

Each claſs is to have, at its place of meeting, a collection of the products, both of nature and art, and a library, according to its particular wants. The regulations of the inſtitution, with reſpect to the times of meeting, and its employments, are to be drawn up by the body at large, and laid before the legiſlative aſſembly. The hall in which the body at large holds its meeting, forms part of the weſt wing of the Old Louvre, at preſent called the Muſeum. It formerly went by the appellation of the Hall of Antiques (*Salle des Antiques*); and as long as the kings of France inhabited this part of the palace, was occupied by their guards, from which circumſtance it obtained the name of the Hall *des Cent Suiſſes*. It was likewiſe appropriated to banquets and entertainments, given by the court on gala days; and it was to this place that Henry IV. was conveyed, on his aſſaſſination by Ravaillac. It was built at the ſame time with the reſt of this part of the Louvre, about the year 1528, after the deſigns of Pierre Leſcot, abbot of Clagny. It is 144 feet in length, and 40 in breadth, and holds from 1000 to 1200 perſons. In order to adapt it to its new deſtination, the floor has been ſunk, which gives a greater air of lightneſs to the roof. In the centre ſtands a double table, in the form of a horſe-ſhoe, ſupported by ſphinxes, at which the members of the Inſtitute take their ſeats. This table is ſurrounded by two tiers of benches, which are raiſed for the accommodation of ſpectators, who have likewiſe ſeats provided for them in the vaſt embraſures of the windows, and at each extremity of the hall.

Whether ſcience will be eſſentially advanced by this innovation, time muſt determine; but candour compels us to acknowledge, that thus far the proceedings of the National Inſtitute have been abundantly intereſting.

INSTRUCTION, National, a novel eſtabliſhment of the French republicans, propoſed with a view of making the riſing generation in France *all* that its founders *can wiſh*, in politics, in morals, and with regard to religion; and thus give permanency to the new order of things. When Chriſtianity was aboliſhed in France, it was impoſſible to continue the univerſities and other ſeminaries which were founded by Chriſtians, and obliged by their conſtitution to teach, whether pure or not, the doctrines of Chriſtianity. They were accordingly all ſwept away, and a new ſyſtem of education planned, which was to be carried on in what they call

The Primary Schools.
The Central Schools.
The School of Health.
The School of Oriental Languages.
The Polytechnic School.
The National Inſtitute.
The Jury of Public Inſtruction.
The Commiſſion of Public Inſtruction.
The Legiſlative Committee of Inſtruction. And various

other national eſtabliſhments for the improvement of particular ſciences.

The firſt degree of public inſtruction is to be met with in the *Ecoles Primarées*, eſtabliſhed by a decree of the convention of the ſecond *Pluvioſe*, in the ſecond year of the republic. Every diſtrict is furniſhed with one of theſe ſchools; the profeſſors or maſters in which are paid from the national treaſury; and to which every head of a family, without exception, is compelled by law to ſend its children for inſtruction. The ſubjects taught in theſe primary or elementary ſchools are divided into nine claſſes:

1ſt, Inſtructions connected with the phyſical and moral ſituation of children, prior to their entering into theſe ſchools. *2d*, Similar inſtructions as a guide to teachers in the national ſchools. *3d*, The arts of reading and writing. *4th*, The elements of French grammar. *5th*, Elements of arithmetic and geometry, with the theory of the new menſuration. *6th*, The elements of geography. *7th*, Explanations of the principal phenomena and productions of nature. *8th*, Elements of agriculture. *9th*, Elements of republican morals.

Next to the primary ſchools in rank and conſequence are the *Ecoles Centrales*, which were eſtabliſhed by a decree of the Convention of the ſeventh *Ventoſe* in the third year. They are ſituated in the capital of every department, bearing the proportion of one central ſchool to 300,000 inhabitants. In theſe ſchools the republican youths are taught the ſciences, and their application in real life. In each of them are profeſſors for the following branches: 1. For mathematics. 2. Experimental philoſophy and chemiſtry. 3. Natural hiſtory. 4. Agriculture and commerce. 5. Logic and metaphyſics. 6. Political economy and legiſlation. 7. The philoſophical hiſtory of nations. 8. The art of healing. 9. Arts and manufactures. 10. Univerſal grammar. 11. The belles lettres. 12. The ancient languages. 13. The modern languages. 14. The fine arts.

Each central ſchool is furniſhed with an extenſive public library—a botanic garden—a cabinet of natural hiſtory—an apparatus for experimental philoſophy—and a collection of machines and models connected with the arts and manufactures.

The profeſſors of each ſchool hold, every month, a public ſitting, in which conferences are held relative to ſubjects connected with the improvement of letters, the ſciences, and the arts, which are the moſt beneficial to ſociety.

The object in the eſtabliſhment of the primary and central ſchools was, the general inſtruction of all claſſes of the citizens; and it being incompatible with the perfect completion of that important purpoſe, to expect from them the propagation of particular branches of ſcience, it became neceſſary to eſtabliſh other literary and ſcientific academies. Accordingly, the French government have founded,

1ſt, Schools of health (*les ecoles de ſante*), in Paris, Straſburgh, and Montpellier, where medicine and ſurgery are ſtudied; which ſchools are affirmed, by thoſe who find nothing wrong in France, to be the moſt perfect of their kind, as well as new and unparalleled models for ſuch inſtitutions.

2d, Two ſchools for *Oriental languages*, in the national library, and in the college of France.

3d, The *Polytechnic* ſchool in Paris, or central ſchool for the direction of public works. This eſtabliſhment is very generally admired, and conſidered as a model for imitation. It contains more than 400 young perſons, previouſly educated in the mathematics, and the majority of them intended for engineers in various lines; and they labour under the immediate direction of their tutors nine hours every day. It occupies the principal part of the *Palais de Bourbon* in Paris, and is furniſhed with a large collection of inſtruments and models. The journal of the Polytechnic ſchool, which is publiſhed by the bookſellers Regent and Bertrand at Paris, is a perfectly original work, and admirably calculated to convey uſeful information.

Of the National Inſtitute a ſufficient account has been given in the preceding article. We proceed therefore to the jury of public inſtruction (*Le Jury Central d'Inſtruction*), of which the principal buſineſs is to ſuperintend the primary and central ſchools. It appoints the profeſſors in the ſchools, and examines into their conduct. Like the legiſlative body, it is renewed by at hird every half-year. When they have choſen a profeſſor for a central ſchool, they ſubmit their choice to the department; and, in caſe of diſapprobation, they make another appointment. To this jury of public inſtruction the profeſſors in the central ſchools are amenable for all miſconduct connected with their offices; it may expel them, but all its deciſions muſt be ſubmitted for confirmation to the tribunal of the department.

There is alſo eſtabliſhed at Paris a ſupreme council, called *The Commiſſion of Public Inſtruction*, to which is entruſted the whole executive department. The preſervation of the national monuments, of public libraries, muſeums, cabinets, and valuable collections; the ſuperintendance of all the ſchools and the modes of inſtruction; all new inventions and ſcientific diſcoveries; the regulation of weights and meaſures, national ſtatiſtics, and political economy; are all placed under the authority of this ſupreme commiſſion. For the commodious and regular execution of ſo many complicated branches of buſineſs, there is a large office, called *Le Secretariat*, which is divided into three departments. 1. For the regulation of the different kinds of inſtruction; of the modes of education in the ſchools; and for the choice of elementary books. 2. For weights and meaſures; inventions and diſcoveries; libraries and bibliography; muſeums, works of art, and literary rewards and encouragements. 3. For theatres, national feaſts, republican inſtitutions, and the erection of monuments.

As all public eſtabliſhments require the ſuperintendance and occaſional correction of the legiſlature, in addition to that of their own immediate executive authority, it has been deemed neceſſary to appoint a permanent committee of inſtruction in the legiſlative body, to provide ſuch ſums as may be neceſſary for the preſervation and improvement of this ſyſtem of inſtruction. This legiſlative committee are inveſted with due authority for theſe purpoſes. Their objects are preciſely the ſame as thoſe of the commiſſion of public inſtruction above deſcribed, only with this difference, that the latter ſuperintends the execution of exiſting laws, whilſt the former receives and improves them, or propoſes new ones. This committee is divided into three departments, as is the commiſſion, with exactly the ſame arrangement of their reſpective labours. The committee being charged with the enaction of all new laws, its members, with a view to obtain accurately all the requiſite information relative to the numerous branches of the arts, have procured from the legiſlative body the appointment of a *commiſſion temporaire des arts* to be annexed to them, and to meet in the ſame houſe with them; which temporary commiſſion is divided into ſixteen claſſes: viz. 1. For Zoology; 2. Botany; 3. Mineralogy; 4. Phyſics; 5. Chemiſtry, 6. Anatomy; 7. Machinery; 8. Geography; 9. Artillery and Fortification; 10. Medals and antiquities; 11. Bibliography; 12. Painting; 13. Architecture; 14. Sculpture; 15. Bridges and cauſeways; and, 16. Muſical Inſtruments.

The improvements of the national literary and ſcientific eſtabliſhments are numerous and important.

1ſt, By a decree of the convention of the 11th *Prairial*, in

the ſecond year, it was enacted, that means ſhould be adopted by which every poſſible advantage might be derived from the botanic gardens of the republic, in Turkey and other foreign countries. This politic decree clearly tended to render France, in the language of the reporter, *L'abregé de tous les climats, et l'entrepot de l'Europe*—"The epitome of every climate, and the magazine of Europe." Thoſe plants which thrive between the tropics may be cultivated in the ſouth of France; and thoſe which are the produce of northern climates, may be cultivated in the northern departments; by which means, France will be in poſſeſſion of all foreign plants and drugs, without the exportation of ſpecie.

2*d*, The National Bibliography was decreed in the ſitting of 22d *Germinal*, in the ſecond year. It conſiſts of a complete catalogue of books of all deſcriptions, the property of the nation; it was then aſcertained, that the republic poſſeſſed more than ten millions of books. The titles of them were to be adjuſted by actual compariſons; the manuſcripts to be regiſtered ſeparately; anonymous productions were to be arranged according to their ſubjects; and thoſe of known authors in the alphabetical order of the names. The ſeveral editions to be claſſed according to their dates: and what may be deemed more important, this French National Bibliography will contain a dictionary of anonymous books, as well as thoſe publiſhed under fictitious names, a deſideratum in the republic of letters.

3*d*, The annihilation of all *patois*, or dialects, decreed in the 16th *Prairial*, in the ſecond year. Notwithſtanding the univerſality of the French language, and that it was excluſively ſpoken in the majority of the inland departments, yet there exiſted thirty various dialects in France. It is more aſtoniſhing that Rozier had remarked, that between one neighbouring village and another, there was ſo conſiderable a difference in the dialect, that the inhabitants could not underſtand each other; and the vineſtock had thirty different names. The naturaliſt, Villars, has ſtated, that in the nomenclature of vegetables, in the departments, he had only met with an hundred which had a common appellation.

4*th*, The eſtabliſhment of the *Conſervatoire des Arts et Métiers*, was decreed in the ſitting of the 8th of *Vendemiaire*, in the third year. This conſiſts of a ſpacious hall, in the form of an amphitheatre, and contains the inſtruments and the models of machinery connected with the arts, and a deſcription of their uſes, with every book relating to them. Annexed to this eſtabliſhment are three expoſitors and a draughtſman, who explain to the ſtudents the uſe of each inſtrument, and who regiſter every new diſcovery, which is preſented to the *Bureau de Conſultation*, to the Lyceum of Arts, the *ci-devant* Academy of Sciences, or to the Board of Commerce.

5*th*, The eſtabliſhment of the Board of Longitude was decreed in the ſitting of the 7th of *Meſſidor*, third year. It was certainly a diſgrace under the monarchy, that an aſtronomical and nautical eſtabliſhment, which had already proved ſo beneficial to Great Britain, ſhould not have been adopted in France. In conſequence of this decree, the French board is now as complete as the Engliſh. It conſiſts of ten members, and has under its juriſdiction the national obſervatory at Paris, and all the aſtronomical inſtruments belonging to the republic. It correſponds with foreign aſtronomers, delivers public lectures on aſtronomy and navigation; and its proceedings are annually recited in a public ſitting.

6*th*, The general ſchool of the Oriental languages was eſtabliſhed by a decree of the 10th of *Germinal*, in the fourth year. This ſchool adjoins to the national library, and all the books and manuſcripts relative to Oriental literature are depoſited in it.

7*th*, The National Muſeum of Antiquities was decreed in the ſitting of 20th of *Prairial*, fourth year. A ſchool of this deſcription was ſucceſsfully eſtabliſhed at Vienna, by Eckel; at Gottingen, by Heyne; at Leipſick, by Erneſt; and even at Straſburgh, by the celebrated Obelin: Paris was, however, without one. This national archeology, or ſcience of antiquity, is divided into nine different claſſes: inſcriptions, characters, ſtatues, *bas-reliefs*, ſculptures, paintings, moſaics, medals, civil, religious, and military inſtruments. This extenſive eſtabliſhment is under the direction of two principal profeſſors; *le Conſervateur Profeſſeur*, and *le Conſervateur Bibliothecaire*. The province of the former is to deliver public lectures on the ſeveral branches of antiquities, to teach the theory of medals and engravings, the hiſtory of the arts among the ancients, &c. The duties of the latter are merely of a bibliographical nature.

8*th*, The new modelling of the Grand National Library, was decreed in the ſitting of the 25th *Vendemiaire*, in the fourth year. By virtue of this decree, the place of librarian in chief was ſuppreſſed, and the whole eſtabliſhment placed under a *conſervatoire* of eight members; of whom two were appointed for the ſuperintendance of printed books; two for manuſcripts; two for antiquities; and two for engravings. From theſe a temporary director is annually choſen, who ſuperintends the whole, acts occaſionally as preſident of this aſſembly, and maintains a regular correſpondence with the conſtituted authorities relative to the concerns of the library.

9*th*, The augmentation of the Muſeum of Natural Hiſtory, formerly called *Le Jardin Royal des Plantes*. This eſtabliſhment was decreed the 15th *Brumaire*, third year, upon a report of Thibadeau, in the name of the committee of Public Inſtruction. Beſides the addition of large rooms, and various other buildings, there are new collections of natural curioſities and productions; and the library is much increaſed. It is open to the public three times a-week. At ſtated periods all the naturaliſts in Paris deliver courſes of lectures in the various branches of natural hiſtory. The muſeum is ſaid to have received greater improvements from this augmentation than from all the labours of Buffon, or from its foundation, ſince the time of Tournefort.

10*th*, The *Ecole des Mines*, was eſtabliſhed in the *Hotel des Monnaies*, and has for its direction the naturaliſt Le Sage. This inſtitution is unrivalled in Europe; and the collection of mineralogical curioſities ſurpaſſes whatever can be conceived.

11*th*, The Society of Natural Hiſtory in Paris, deſervedly claſſes among thoſe which have rendered the greateſt ſervices to the cauſe of ſcience ſince the revolution. A lecture of public inſtruction is held every ten days, which is generally given by one of the members, and which is open to all the lovers of natural hiſtory. Premiums are propoſed for diſſertations; one of which, by the late C. Herman, jun. (whoſe early deceaſe was a great loſs to the republic of letters), on the *apterous* claſs of inſects, may be ſaid to conſtitute an epocha in the annals of natural hiſtory. The ſociety has publiſhed a volume of memoirs, in folio, entitled, "*Tranſactions of the Society of Natural Hiſtory.*" It has likewiſe erected a ſtatue to the great Linnæus, in the national garden of plants; and, at the period when every public inſtruction was ſuſpended, gave lectures on the different branches of ſcience belonging to its department. Several intelligent and ſkilful navigators, among others thoſe ſent in ſearch of the unfortunate La Pérouſe, as well as thoſe which accompanied Buonaparte on his expedition to Egypt, were members of this ſociety.

This account of the preſent ſtate of public inſtruction, the ſciences, the arts, and the progreſs of national literature, in

France, has been taken from a miſcellany, the principal writers of which call it a *ſublime* ſyſtem; and ſeem to conſider the increaſe of the national library, the improvement of the botanic gardens, and the diſcoveries that have been made by the different ſchools or inſtitutes, as furniſhing a demonſtration that the republican government is more favourable to the advancement of ſcience, than the monarchical, whether abſolute or limited. But it ſhould not be forgotten, that this ſyſtem is yet in its infancy; and that in proſecuting new ſchemes, all men, and more eſpecially Frenchmen, are actuated by an enthuſiaſm which gradually cools as their purſuits become familiar. We therefore rather wiſh than expect that the progreſs of ſcience in that country will be more rapid than it was under the monarchy.

That ſomething may be learned from this ſyſtem to improve the modes of education in other countries it would be illiberal and uncandid to doubt; but its almoſt total neglect of what is moſt valuable in education, *the culture of the heart*, and, above all, the ſilence obſerved with regard to RELIGION, which is the only BASIS of *private happineſs* and *public welfare*, are defects too glaring to paſs unobſerved by the moſt inconſiderate reader.

INSTITUTION, ROYAL, a new eſtabliſhment in London, ſet on foot for the diſtinct purpoſe of applying ſcience to the common purpoſes of life.

In January, 1799, a committee was appointed by the Society for bettering the Condition of the Poor, &c. to confer with Count Rumford on the formation of an inſtitution; which, beſides having a general view to the benefit of arts and manufactures, and to the advancement of taſte and ſcience, in this country, ſhould ſpecifically direct itſelf to the improvement of the *means of induſtry and of domeſtic comfort among the poor*. Though the ſociety has had reaſon to flatter itſelf that conſiderable benefit had been diffuſed among the general maſs of the people by its labours, yet difficulties have impeded the progreſs of any conſiderable melioration in the *diet* and *domeſtic habits* of the poor; and there appeared very little proſpect of thoſe difficulties being removed, until *a centre of action* could be fixed, to which perſons might apply for examples,—for models,—and for engravings, accompanied by printed inſtructions; without being any longer compelled implicitly to rely on the talents, the docility, and the conſcientious moderation, of the different tradeſmen, who might be employed to make and ſell them.

It appeared very evident that an eſtabliſhment of this nature, if on a ſcale calculated to be extenſively uſeful, muſt embrace too great a variety of objects, and be far too intereſting and too important, to be annexed to the ſociety for the poor, or to any other exiſting ſociety. The committee therefore was of opinion that, after they obtained from Count Rumford the original ſketch or outline of the plan, and had engaged him to take an active and leading part in the conduct and execution of it (their own members giving their individual ſupport to the meaſure), nothing further remained to be done on the part of the ſociety.

The models and inventions, in which the poor are moſt immediately concerned, will be thoſe which may promote economy in food and fuel, and tend to correct and purify the air in cottages, and alſo in workhouſes, hoſpitals, manufactories, and in all public buildings; and which may furniſh means and inſtruments of induſtry, on a cheap and ſimple conſtruction; ſo as to afford the cottager and his family thriving and healthful occupation at home during bad weather, or at times when proper employment is not to be obtained abroad. The ſupply of ſuch means and inſtruments of induſtry has been long, and anxiouſly, deſired by the friends of the poor. Many heavy and ſolitary hours might then be occupied with pleaſing employment; and the cottager would thereby be enabled to educate his children in thoſe *regular and even habits of induſtry and attention*, which, when ſecurely and permanently acquired, will afford them ſupport and ſatisfaction through life.

The diſſemination of theſe improvements and inventions is extremely wanted by the poor. Nothing can be more comfortleſs than their preſent ſyſtem of diet in many parts of England: nothing more waſteful than their application of fuel for warming and tempering the air in their cottages; that being an article, the too general want of which is the ſource of thoſe petty pilfering habits among the poor, which often lead to atrocious crimes. The aſſiſting and encouraging the domeſtic economy and management of the cottager, and the promotion of his comfort ſo as to give him more benefit and enjoyment from the means of life which his ſituation in ſociety affords him, and the improvement of the general ſyſtem of thoſe public buildings with which the poor are concerned, will be among the moſt uſeful and important objects of the models to be exhibited at the inſtitution. Theſe will conſiſt of improved fire-places and kitchens, and of flues and *louvres* for ſupplying rooms either with tepid or freſh air; ſo as to produce a conſiderable ſaving in the quantity of food and fuel conſumed, either in cottages, or in public eſtabliſhments; and materially to increaſe the health and well-being of thoſe of our fellow-ſubjects, whoſe employment or ſituation obliges or induces them to continue the greater part of their time in cloſe and crowded rooms.

But we ſhall better ſucceed in conveying an adequate idea of the plan of this admirable undertaking, by the following extracts from the *Proſpectus*, and from a ſubſequent *Report* of its progreſs, publiſhed by order of the managers, dated May 25, 1801. The former of theſe will ſhew its beginning, the latter its progreſs, and the eagerneſs of the public to embrace a propoſal ſo manifeſtly calculated for the benefit and the proſperity of the country at large.

"The pre-eminence of any people in civilization ought ever to be eſtimated by the ſtate of induſtry and mechanical improvement among them. This is proved by an immediate reference to the experience of all ages and countries, where ſucceſsful exertions having given courage to the ſpirit of invention, the ſciences have flouriſhed; and, according to the increaſe of the moral and phyſical powers of man, improvements have been made, which, in an earlier ſtate of ſociety, would have been deemed altogether viſionary. Printing, navigation, and the uſeful and extended powers of the ſteam-engine—inventions, the practical excellence of which we all know and acknowledge, and the future effects of which can ſcarcely yet be conjectured—offer irreſiſtible proofs of this; and it is to remove thoſe cauſes which yet impede the progreſs towards perfection of thoſe and other arts material to the accommodation of man, that the Royal Inſtitution is ſet on foot.

"The ſlowneſs with which improvements of every kind are adopted, eſpecially ſuch as are calculated to be of general utility, is very remarkable. Beſides the prejudices of individuals, and the power of habit, which attaches them to what has the ſanction of univerſal practice, the ſupporters of this undertaking have to contend with many other circumſtances equally unfavourable to the introduction of improvements. Some perſons overlook them through mere indolence; ſome are diſguſted with the very propoſal of any thing new, and are aſhamed and mortified that they ſhould be deemed ignorant of what they long had ſuppoſed themſelves perfect maſters; ſome, who even ſubmit to be inſtructed, work too awkwardly with tools to which they have been unaccuſtomed, not to tire of their buſineſs, their teacher, and his doctrines,

before they arrive at the object of their purſuit. But another cauſe, which occaſions little attention to be paid to thoſe who propoſe improvements, is a ſuſpicion of intereſted motives, which, indeed, is often but too well founded. Thus the moſt meritorious exertions to promote the public proſperity are either received with indifference, or viewed with ſuſpicion: and many, even of thoſe who are convinced of the excellence of what is propoſed, are deterred by motives of jealouſy, or envy, from promoting its ſucceſs.

"Theſe are the chief cauſes which prevent the reception of valuable inventions already known, and of ſuch as the ingenious might otherwiſe bring forward to public notice. But another ſerious obſtacle ariſes from that ſub-diviſion of labour which naturally takes place where active induſtry and the ſecurity of property are eſtabliſhed; and from which it happens, that almoſt every man becomes confined to ſome appropriate occupation, ſeldom knowing, or caring, what may be the proceſſes to which the material of his trade may be ſubjected, before or after his art has been exerciſed on it; and ſtill leſs aware of what is done in other trades or manufactures. The attention of theſe individuals is wholly engaged in the acquiſition of wealth; and hence it is, and from a natural fear of pecuniary riſk, that the generality of manufacturers poſſeſs neither the knowledge, the inclination, nor the ſpirit, to make improvements.

"Among the various claſſes of civil ſociety, one which performs a great and very eſſential part of the general work is the claſs of philoſophers, who have devoted themſelves to the labour of obſerving, comparing, and inventing, and who engage in the developement of truth by thoſe remote analogies which eſcape the vulgar mind. But though invention and diſcovery are peculiarly their province, it may juſtly be doubted whether their moral and intellectual habits are calculated to produce uſeful practicable improvements. This kind of knowledge, indeed, no leſs than the ſtimulus of intereſt, and the capital of the manufacturer, are with them altogether wanting; while the latter, on his part, ſtands no leſs in need of the general information and accurate reaſoning of the man of ſcience. The great object, therefore, is to benefit the community by bringing to a ſalutary point of union the talents and means of both theſe deſcriptions of men.

"Three direct methods ſuggeſt themſelves for the removal, or diminution, of the difficulties ſtated above: 1ſt, To give premiums to inventors, which is already done by the ſociety for the encouragement of arts, &c. 2dly, To grant temporary monopolies, which is done by the grant of patents. 3dly, To diffuſe the knowledge, and facilitate the introduction of uſeful mechanical inventions and improvements, which is propoſed to be done by the Royal Inſtitution.

"In the houſe [purchaſed in 1799, in Albemarle-ſtreet, London, by the managers] it is intended to exhibit to the public the completeſt working models, or conſtructions of the full ſize, of all ſuch new and valuable inventions as are capable of being applied to the common purpoſes of life. By this arrangement, thoſe who adopt them may readily determine, if any failure happen in their experiments, whether the miſtakes of workmen, the management of ſervants, or the principle of the invention, have been the cauſe. Such a repoſitory muſt alſo be of infinite uſe to artificers in furniſhing models, and muſt enable every enquirer to obtain a thorough acquaintance with the nature and principles of what he wiſhes to imitate. Whatever is viſible and tangible addreſſes itſelf more forcibly to the underſtanding than can be conveyed by any graphic or written deſcription: it is not, however, intended to neglect the aid of the latter; and, accordingly, detailed accounts or deſcriptions, accompanied with ſuitable drawings, will alſo be exhibited by way of illuſtration.

"Arrangements will alſo be made, and correſpondences eſtabliſhed, for obtaining a knowledge of new inventions, both at home and abroad. Viſitations of manufactories, and examinations of various proceſſes in the arts, are likewiſe intended; and to the growing maſs of inſtruction, which may ariſe from theſe ſources, the managers will add a library of all the beſt publications on the ſubjects for which this inſtitution is eſtabliſhed.

"For teaching *the application of ſcience to the uſeful purpoſes of life*, a temporary lecture-room is fitted up for philoſophical lectures and experiments; a complete laboratory and philoſophical apparatus, with the neceſſary inſtruments, will be provided; and men of the firſt eminence in ſcience engaged to officiate in this eſſential department. The machines and models will afford a perpetual ſource of inſtruction; and the lectures will be particularly uſeful to elucidate and apply thoſe general principles which are only in part diſcernible in particular ſtructures. The firſt principles of mechanics will be exhibited and explained in the ſimple engines, called the mechanical powers; and, as connected with theſe, the practical operations of various arts will be regarded, and the mutual connection between the theory of mechanics, and the experimental knowledge of the materials. Under general mechanics will be ſhewn the advantages we derive from thoſe happy expedients by which the labour of man is abridged in huſbandry, and the various operations of art.

"Chemiſtry, with the aid of a laboratory and complete apparatus for the ſeveral proceſſes, will be taught in the ſame ſimple and perſpicuous manner; and this elementary knowledge, ſo indiſpenſable to the intelligent manufacturer, will be connected with the great operations of the arts and of trade.

"From the vaſt field of individual operations or ſeparate manufactories, the enquirer will be led to other works of more general conſideration, which include not only the objects of mechanics and chemiſtry ſtrictly taken, but likewiſe thoſe of commercial operation and political economy. Under this claſs of objects will be found the ſtructure of roads and forms of vehicles; the eſtabliſhment of canals; the improvement of rivers, harbours, and coaſts; the art of war, and various objects connected with it. In the courſe of theſe enquiries, the exhibition of working models will particularly diſplay the powers of hydraulic machines, and that ſtriking uſeful apparatus the ſteam-engine.

"But, above all, we ſhall find our contemplations urged to *the phenomena of light and heat*, thoſe great powers which give life and energy to the univerſe! powers which, by the wonderful proceſs of *combuſtion*, are placed under our command indeed, but of the advantages of which we do not half avail ourſelves."

Having thus given, as much at large as our limits will allow, an account of the *riſe* of this truly grand public undertaking, we ſhall here add a few particulars from the laſt report, with a view of ſhewing its *preſent ſtate*.

"The Inſtitution," ſays the report, "is now placed on a moſt reſpectable foundation; and although none of the details of this great and extenſive eſtabliſhment are quite completed, yet enough has already been done to ſhew that it muſt ſoon become extremely intereſting, and very uſeful; and that it will long remain,—an ornament to the metropolis,—and a proud monument of the energy—wealth—and liberality—of the private individuals of the Britiſh nation.

"In the infancy of the eſtabliſhment, before the Inſtitution had acquired a viſible form, and adequate ſupport, it was natural to expect that ſome doubts would be entertained, even by the moſt ſanguine, of the poſſibility of completing ſo great a public undertaking, by the mere voluntary exer-

tions of individuals; but all grounds for such doubts are now happily removed. The permanent existence of the Institution,—and even as a *body politic* and *corporate*,—has been secured by the authority of a *Royal Charter*; and the establishment has been taken under the immediate patronage of *his Majesty*.

"The lists of the proprietors and subscribers to the institution contain the names of many of the most illustrious characters in this country; and the money subscribed to carry the proposed plans into execution amounts already to a sum almost incredibly great—to 23,200l.; and this, exclusive of 7000l. generously offered by a small number of the proprietors (but which will not be wanted), for enabling the managers to defray the expences of erecting the new buildings.

"Upon settling the accounts, and calling in, and paying off, all debts outstanding against the Institution, up to the first day of the present month, it was found, that a sum amounting to above 10,800l. then remained at the disposal of the managers; which sum will, no doubt, be quite sufficient, not only to defray all the expences of finishing and furnishing the buildings of the Institution, in all their numerous and extensive details, but also for fitting up all the workshops; and providing them with tools, and a stock of materials for work.

"The house and premises, which have been purchased for the Institution, are extensive; the ground covered by the principal edifice having originally been allotted for building four houses for private families; and no situation could have been found, in this metropolis, more convenient, or better adapted to all the purposes of this public establishment.

"Professors and lecturers in natural philosophy, chemistry, and mechanics, have been engaged; and lectures are now given, daily, in two spacious lecture rooms; the one capable of containing 300, the other 900, persons.

"A spacious and most complete chemical laboratory has been built, and is now furnishing with all the implements and apparatus necessary for carrying on, upon a large scale, all the various processes of practical chemistry; and chemical analysis; and for making new and interesting experiments. A director of the laboratory has been appointed, and also a chemical operator; and the managers are now in treaty with a very ingenious German chemist, whom they hope to engage, as an assistant in the laboratory, and who will devote his whole time to the business of it.

"The workshops of the Institution, where models, &c. of new and useful inventions will be constructed, and sold at reasonable prices to such proprietors and subscribers as may apply for them, are quite finished; and are now furnishing with the most complete sets of tools that can be procured.

"A master of the workshops has been engaged, who is himself a working mathematical instrument maker and model maker; and will have the care of all the philosophical apparatus belonging to the Institution, and keep it constantly in repair and ready for use. He will reside in the house,—and superintend and direct all the workmen who are employed in the workshops:—he will likewise superintend and instruct all such ingenious and well-behaved young men as may, at the recommendation of proprietors, be admitted into the workshops of the Institution, to receive instruction, and to complete their education in any one or more of the mechanic arts.

"The following workmen are already engaged for the workshops of the Institution, viz. A mathematical instrument maker,—A model maker.—A cabinet maker.—A carpenter.—A worker in brass and copper.—A tin-plate worker; and an iron-plate worker. To these will soon be added bricklayers and stone-masons; who will be instructed, and enabled to instruct others, in setting new-invented fire-grates, roasters, ovens, boilers, &c.

"A complete kitchen, for a small family,—with a small roaster, on the most simple construction—a cottage fire-place grate—and a small boiler with steamers,—has been put up in the housekeeper's room; and may be examined by all those who frequent the house of the Institution.

"The principal kitchen will contain roasters, ovens, boilers, steamers, &c. on the newest and most approved construction; and, in order that the proper method of managing them may be seen, they will be kept in daily use, and persons will attend to shew them.

"In order that the proprietors and subscribers may be enabled to judge, from actual experiment, of the merit of any new method of cooking, or of any new dish that may be proposed, a *dining-room* has been built, and will soon be ready for use, at the house of the Institution, in which the managers will, occasionally, order *experimental dinners*, to which the proprietors and subscribers will be invited, in as far as the accommodations will admit; the expence of such dinners to be defrayed by those who partake of them."

To render the house of the Institution more pleasant, an additional room has been set apart for their private and exclusive use:—This has been called the *conversation room;* and to render it still more useful and agreeable, it will be furnished with a collection of good maps; and, as soon as some necessary previous arrangements (which are now actually making) shall be finished, those who frequent this room will be furnished, at the most reasonable prices, from the housekeeper's room below, with soups of various kinds—tea, coffee, chocolate, and other refreshments. Besides these, other accommodations for the proprietors and subscribers are provided, as the opportunity of writing letters; and a general and twopenny post for their conveyance.

"A complete Printing Office, with a press, types, and every other instrument and implement necessary in printing, has been established at the house of the Institution; and a Printer is engaged, and has for some time past been constantly employed in printing for the Institution. It is expected that the printing of the journals of the Institution, which in a few months will begin to appear at regular intervals, probably once a-week, will give full employment to this press: for as these journals will contain not only an account of all that is doing at the Royal Institution, and in the country at large, to introduce new and useful inventions and improvements, but will also contain selections from all the newest foreign scientific journals, and other scientific publications, which will all be regularly taken in at the Royal Institution, there is no doubt but that the Journals of the Royal Institution of Great Britain will become one of the most interesting and most useful periodical works that has ever appeared in any country; and, consequently, that they will be much sought after, and much read.

"The reports of the various committees, for specific scientific investigations (which will soon be appointed by the managers), will, no doubt, furnish much interesting matter for the Journals of the Institution."

All the principal scientific periodical publications, foreign and domestic, the transactions of learned societies, &c. are regularly taken in, and laid on the table in the reading-room the moment they arrive.—All the daily English newspapers are taken in, in like manner, and perused, in a separate apartment, by the subscribers.

In a second reading-room, which is spacious and airy, are elegant book-cases, and library tables; and, as it is furnished

with double windows, and thin white window blinds, it is uncommonly quiet and pleaſant as a reading-room, though it is ſituated on the ground floor, and near the ſtreet. The carriages which paſs are ſcarcely heard through the double windows; and as the blinds prevent its being overlooked from without, it has an air of ſtillneſs and retirement which is very ſtriking, and very pleaſant to thoſe who frequent it.

Many valuable books have been preſented to the library of the Inſtitution, and it was not till all the book-caſes in the room were filled by theſe generous contributions, that new book-caſes were provided. All books proper to appear in a public library, thoſe only excepted which are profeſſedly on political queſtions, are received by the managers, and their thanks are returned for them.

As the Royal Inſtitution was ſpecially deſigned for promoting *mechanical* improvement, and exciting and encouraging *practical* ingenuity and *uſeful induſtry*, the inveſtigation of all ſubjects lying within the provinces of either of the *three learned profeſſions* are juſtly avoided; conſequently, all diſcuſſion relative to *religion*, *law*, and *medicine*, is declined.

One of the moſt intereſting details of the Inſtitution ſtill remains to be mentioned:—It is the *repoſitory*. The meaſures neceſſary for forming it have not been neglected, but; from its nature, it cannot be finiſhed, nor indeed can it be begun, till the eſtabliſhment is quite complete in all its other eſſential parts. Models of mechanical inventions and contrivances, in order to their being really uſeful, muſt be ſo made as to ſerve for imitation, conſequently they muſt be conſtructed with the greateſt care; and they cannot be made in the Royal Inſtitution till thoſe ſhops are fitted up, and furniſhed with the beſt tools, and the beſt workmen. Theſe workſhops will ſoon be completed, and properly manned; in the mean time, a ſpacious and elegant room, 44 feet long, and 32 feet wide, with the ceiling ſupported by two rows of columns, has been built for the repoſitory, and in leſs than one month will be perfectly finiſhed, and ready for the reception of the machines and inſtruments which it may be judged proper to exhibit to public inſpection.

As ſoon as ſome addition to the buildings ſhall be completed, it is intended to accommodate a certain number of young men, of different mechanical profeſſions, who, at the recommendation of proprietors, will be taken into the houſe to be inſtructed. Theſe will be boarded and lodged in the houſe, and be employed in the workſhops;—and for their improvement in drawing—practical geometry—and mathematics,—an evening ſchool, under the direction of the clerk of the works, will be eſtabliſhed in the houſe.

"As moſt of the young men who will be admitted into this ſeminary will probably come from diſtant parts of the country, and will return home, after a reſidence of three or four months at the Inſtitution, carrying with them a perfect knowledge of ſuch new and uſeful inventions, applicable to the common purpoſes of life, as may be deſerving of being generally known and adopted, it is eaſy to foreſee that this arrangement will be of great and extenſive public utility. It is, perhaps, that part of the eſtabliſhment preciſely which will be the moſt intereſting, and which will contribute the moſt powerfully to the attainment of the principal object of the Inſtitution; "*The diffuſing the knowledge, and facilitating "the general introduction of uſeful mechanical inventions and "improvements.*"

The funds of the Inſtitution ariſe, 1ſt, from 60 guineas paid by each *hereditary ſubſcriber*, who is named a *proprietor*; 2d, from 15 guineas paid by each life-ſubſcriber; 3d, from three guineas paid by each annual ſubſcriber; 4th, from particular donations and legacies.

A proprietor has an hereditary *transferable ſhare* in the houſe and all the property belonging to it, has a vote in the election of managers and viſitors, and two transferable tickets of admiſſion to the eſtabliſhment and lectures. A life-ſubſcriber has a ticket of admiſſion for life, not transferable. An annual ſubſcriber is entitled to a ſimilar ticket during the continuance of his ſubſcription. The three claſſes are alike open to ladies and gentlemen, and every claſs of ſubſcribers has the privilege in common of having copies of models or drawings made (at their own expence) from thoſe belonging to the Inſtitution.

The *lectures* are, 1ſt, a courſe of *experimental* philoſophy, comprehending the principles of aſtronomy, electricity, magnetiſm, mechanics, hydroſtatics, pneumatics, and optics. In this courſe all abſtract and mathematical reaſoning are avoided, and the whole calculated at once to inſtruct and amuſe. 2d, A courſe of *chemiſtry*, in which the principles of the ſcience and the modern diſcoveries are illuſtrated by experiments, and its application to the arts and manufactures, &c. ſhewn. 3d, An evening courſe, calculated for perſons mechanically and ſcientifically engaged, in which the foregoing ſubjects are minutely and *technically* treated.

"The number of the proprietors of the Inſtitution (1802) amounts to 325;—the life-ſubſcribers to 268;—and the annual ſubſcribers to 527;—making in the whole 1120 perſons, who have already come forward in ſupport of this great public undertaking.—This number is undoubtedly very great, but the liſts of the members of the Royal Inſtitution will appear doubly reſpectable when the many diſtinguiſhed names which dignify them are taken into conſideration. But if ſo many perſons of great abilities,—high rank,—and moſt reſpectable character,—could be found to come forward and ſupport an undertaking, not only unfiniſhed, but new in its kind, and of the ſucceſs of which doubts might well be entertained, we may ſafely look forward with confidence to a period, not far diſtant, when the Royal Inſtitution of Great Britain, completed in all its details, and in full activity, will become ſo intereſting, that every perſon of liberality and diſcernment, who takes pleaſure in contemplating the progreſs of human improvement, will be deſirous of belonging to it, and willing to aſſiſt in promoting its permanent proſperity."

INTERLACHEN, a town of Switzerland, capital of a bailiwic of the ſame name, in the canton of Bern. It is ſeated between the lakes of Brientz and Thun, 28 miles S.S.W. of Lucern, and 32 S.E. of Bern.

INTERFERING, in farriery, a local diſeaſe incident to horſes. It ariſes from various cauſes; and though this malady is ſometimes conſtitutional in the animal, yet it is more frequently occaſioned by an improper method of ſhoeing; in conſequence of which the horſe moves his hind feet ſo cloſely together, that hard ſcabs are gradually formed by their continual friction, and the diſorder at length is attended with halting or lameneſs.

According to Profeſſor Bradley, *interfering* may be cured by a compound made of three parts of freſh ſheeps' dung, and one part of rye or wheaten flour, well dried.—Theſe ingredients ſhould be formed into a cake, then baked in an oven, and applied warm to the part affected, which will thus ſpeedily heal; or, it may be anointed with a mixture of turpentine, and verdigreaſe finely pulverized, by the uſe of which the ſcabs in general ſhortly diſappear.

INVERESK, a village in Edinburghſhire, ſituate on the E. ſide of the mouth of the Eſk, on the Frith of Forth. In 1783, the ſubterraneous remains of a Roman hot bath were diſcovered here.

INVERBURY, a borough in Aberdeenſhire, ſituate on the fertile banks of the Don, juſt above its confluence with the river called Urie Water. It is 15 miles N.W. of Aberdeen.

JOACHIMSTHAL, a town of Bohemia, celebrated for its ſilver mines, which are the beſt in the kingdom. It is 52 miles S.S.E. of Dreſden.

JOCKGRIM, a town of France, in the department of Lower Rhine, ſituated on an eminence, near the Rhine, nine miles S.E. of Landau. Long. 8. 16. E. Lat. 49. 13. N.

JOHANNESBURG, a town of Eaſtern Pruſſia, with a citadel, ſeated on the river Pych, near the lake Spirding, 95 miles S.E. of Koningſberg. Long. 22. 39. E. Lat. 53. 16. N.

JOHN, St. one of the Philippine iſlands, E. of Mindanao. Long. 126. 32. E. Lat. 9. 30. N.

John, St. a river of New Brunſwick, which, running from N. to S. enters the bay of Fundy, at the city of St. John's.

John, St. a city of New Brunſwick, ſituate at the mouth of the river St. John, in the bay of Fundy. Long. 65. 15. W. Lat. 45. 12. N.

John, St. a town on the E. ſide of the iſland of Newfoundland. It has a good harbour, entirely landlocked, and defended by ſeveral forts, in one of which the governor of the iſland reſides. Long. 52. 21. W. Lat. 47. 32. N.

John, St. the capital of Antigua. It is one of the moſt regular towns in the Weſt Indies, and has the moſt commodious harbour in the Leeward Iſlands. Long. 62. 4. W. Lat. 17. 4. N.

JOHNQUERA, a town of Spain, in Catalonia, ſeated at the foot of the Pyrenées, 20 miles S. of Perpignan.

JOHORE, Jor, or Ihor, a town of the kingdom of Malacca. It was deſtroyed by the Portugueſe in 1603, but has been rebuilt, and is in the poſſeſſion of the Dutch. Long. 93. 55. E. Lat. 1. 15. N.

JONESBOROUGH, a town of Tennaſſe, capital of the diſtrict of Waſhington, ſeated near the foot of the Iron mountains, 80 miles E. by N. of Knoxville. Long. 82. 46. W. Lat. 36. 8. N.

JONKIOPING, a town of Sweden, capital of the province of Smoland, and ſeat of the parliament, or ſuperior court of juſtice for Gothland. The houſes are chiefly of wood, covered with turf or moſs; no thatching being uſed, as both too dear and too dangerous in caſe of fire. In order to keep out the rain, large layers of birch bark are ſpread over the timber-work of the roof, under the covering of turf or moſs. Theſe turf roofs make a ſingular appearance, many of them producing herbage, which is occaſionally cut for the uſe of the cattle; and a few are ornamented with flowers. The town is ſeated on the S. end of the lake Wetter, with a ſtrong citadel, 50 miles N.W. of Calmar. Long. 14. 46. E. Lat. 57. 12. N.

JORDAN, a river of Paleſtine, which riſes in Mount Libanus, and runs from N. to S. forming two lakes, the one formerly called the Sea of Galilee, or the lake of Tiberias, and the other, the Dead Sea.

JOSEPH (II.) Emperor of Germany. The genius of this emperor was active and prompt, but vehement and impetuous, and embracing too many objects at the ſame time. He was ſuperficial in all his acquirements, and though anxious to learn every thing, he maſtered nothing. He poſſeſſed magnanimity, and, in deſpite of detraction, his heart was open to the impreſſions of ſenſibility; and if he often refuſed to aſſiſt the ſuffering individual, it was becauſe he wiſhed to reſerve the means of exerciſing his beneficence in favour of the unfortunate in general. Never was he really inexorable but towards thoſe who tranſgreſſed the laws, and even then the public good was the motive of his ſeverity; his actions were rather the reſult of principle than inclination. He has been reproached with aggravating puniſhments, and modifying deciſions to the caprice of his own arbitrary will. Without meaning to juſtify him in this particular, we may allege the uprightneſs of his intentions, which deſigned to intimidate by example, and to prevent lenient or corrupt judges from ſecuring the guilty from puniſhment; and, above all, his profound ignorance in points of juriſprudence, which continually led him to miſtake the bounds of his own power. To the ſame cauſe we muſt attribute his enterprifes againſt the property and the privileges of the citizens; of which there cannot be a ſtronger proof than the ſurpriſe he teſtified on many occaſions, when the clamours of the public, and the oppoſition he met with, convinced him of the diſcontent of his ſubjects.

Few princes have been inflamed by a ſtronger paſſion for the good of their people, and none have been occupied with more activity and zeal about the means which he eſteemed proper to promote it. This purſuit was ſo predominant, that it abſorbed all others; and he was ſo devoted to the weighty cares of government, that every inſtant of his life he was the monarch, and had ſcarcely time to know that he was a man; thence it was, that he had none of the weakneſſes which ſo often diſhonour princes, and oppreſs their ſubjects. He was a prey to no ruinous whim, to no miſtreſſes who exhauſt the ſtate, and conſign its employments to unworthy hands. Simple in his manners, and inimical to luxury of any kind, he erected no palaces whoſe foundation reſted upon the ſhattered fabric of the poor man's cottage. How then, it may be aſked, did it happen, that though poſſeſſed of theſe rare virtues and qualities, his reign ſhould be marked with a ſeries of calamities? The fact, it will be ſaid, is not aſtoniſhing when we recollect that he was generally ſuperficial, was curſory in all his obſervations, drew falſe conſequences from every thing he ſaw, and built upon them a plan of reformation which was as defective as the principles upon which it was founded. This is, indeed, the opinion of many of his judges, but cannot be adopted by ſuch as will take the trouble of diſcriminating between what he did, and what he wiſhed to do. It is true that the education of the emperor left his natural genius deſtitute of cultivation, and that wandering at hazard, and deſtitute of principles to guide it, he muſt have been often deceived; but theſe defects, it muſt be acknowledged, were, to a certain point, corrected by nature, in beſtowing on him an accuracy of judgment, and a facility of conception: he readily diſcovered the abuſes which were conſecrated by the preſcription of cuſtom; he knew the abilities and the neceſſities of the ſtate, and the means to be employed to raiſe it to the degree of proſperity and power of which it was capable. If he failed in his endeavours, we ſhould be wrong to conclude that his views were ill directed, or that his theory was incorrect; but a variety of prejudices, fatal to his happineſs and to our own, led him aſtray in the execution. The moſt exceſſive partiality cannot refuſe to his deſigns the tribute of admiration which they juſtly merit.—They were ſuch as required a man of ſuperior powers to form, and to dare to accompliſh them. They were intended to unite in the ſame political form of government the various provinces of the monarchy; to incorporate, into one people, twenty nations, differing in their laws, cuſtoms, and languages; to purify their morality and religion, by determining invariably the principles on which both were to be practiſed and preached; to increaſe uſeful knowledge, by multiplying and improving the public ſchools; to encourage commerce, by exciting and protecting the national induſtry; to enſure the progreſs of agriculture, by ameliorating the lot of the huſbandman; to unite to the ſtate, by means of toleration, citizens who had been alienated from it by their religious opinions; in a word, to make of the monarchy one conſiſtent whole, the parts of

which being well connected, ſhould render it powerful and happy at home, reſpected and formidable abroad.

Such was his deſign, which certainly was in itſelf at once great and judicious. The obſtacles which might offer themſelves in the execution were not of a nature to reſiſt the effort of a dextrous hand to prevent, or at leaſt to remove them: and it is not to be doubted that an abſolute prince, who had united to the power of rendering himſelf formidable, the talent of making himſelf beloved; who had aſſociated to his enterpriſes men whoſe capacity and probity might have fixed the public eſteem; would have ſucceeded in ſurmounting them, with the aid of time and the wiſdom of his meaſures. Unfortunately no monarch was ever leſs capable of employing thoſe means. Vehement by conſtitution, he was ſtill more ſo by his mode of reaſoning; perſuaded that if he did not precipitate the reforms which he projected, he would not have time to complete them, the moſt violent meaſures were ever thoſe which he preferred. In vain was it repreſented to him, that this was the moſt improper method to produce the effect which he promiſed himſelf; his ſelf-confidence confirmed him in his obſtinacy, and made him deſpiſe theſe prudent counſels. To this fault was joined his extreme miſtruſt, which induced him to diſcover in thoſe whoſe rank attached them to his perſon, or whoſe office deſtined them to ſhare with him the charge of the government, ſo many ſecret enemies of the good cauſe which he eſpouſed; who were ſeeking their own fortunes, and diſpoſed to ſacrifice the intereſts of the public to their private emolument. This ſuppoſition, as falſe in its principle as dangerous in its conſequences, alienated the affections of his ſubjects, and raiſed a barrier between the prince and thoſe whoſe abilities might have corrected his own ideas. We cannot then wonder at the invincible perſeverance with which he purſued any ruinous or chimerical project, notwithſtanding it might be oppoſed by the united voice of the whole kingdom. Convinced that the more he ſought to promote the general good, the more obſtacles private intereſt would raiſe againſt him; he almoſt always judged of the excellence of his deſigns, by the degree of reſiſtance which he experienced to their execution. Another conſequence of this principle was, that not being able to confide, without danger, to any one the care of fulfilling his wiſhes, he was forced to undertake it himſelf; and by being at once the proprietor and the agent, he muſt do every thing in order to its being well done. From this complicated deluſion it followed, that he deprived himſelf of the means of concluding any thing; and that, by continually deſtroying what he began, he could never raiſe the fabric which was to ſupply the place of that he had overthrown. His mind, oppreſſed by the weight and multiplicity of buſineſs, was loſt in the labyrinth he had created; and forgetting to-day the decrees which had been yeſterday publiſhed, he was perpetually contradicting himſelf. The number of oppoſite edicts of his reign prove the fact, and added contempt and ridicule to the diſcontent which his adminiſtration inſpired, in deſpite of the beſt intentions. In the deſign of correcting abuſes, he ſucceſſively directed his endeavours againſt all the orders of his ſubjects: beginning with the clergy, whom he rendered contemptible without amending, he paſſed to the commercial claſs, whom he cruſhed under the weight of prohibitory laws; and from them to the nobility, whom he completely ruined, under pretence of relieving the huſbandman, who found no redreſs, from his changing, miſplacing, and perverting every thing. He affected to deſpiſe what he called prejudice, and violated without ſcruple the moſt ſacred contracts which ſubſiſted between prince and people. So many violent acts, whoſe motive may render them excuſable in the eyes of God, but not in thoſe of men, and eſpecially of thoſe who were the victims of them, drew upon him ſo general a hatred, that it would be difficult to aſcertain the extremities which might have followed, if that power who watches over the preſervation of the monarchy, had not terminated its evils, by removing its author. The emperor died, but his expiring regrets could not reconcile him to a people oppreſſed by vexations of every kind, by a ruinous war, and by the loſs of the fineſt province of the monarchy. May this inſtructive example of Joſeph II. bring conviction to the minds of princes, of the difficulty of governing with propriety, though with the advantage of the moſt brilliant qualities of the heart and underſtanding; of the eſſential neceſſity of repreſſing their pride, and gaining the affections of their ſubjects; and if there ſhould ariſe any of his ſucceſſors who might be tempted to tread in his ſteps, let him recal to mind *his* wretched fate, and, by avoiding raſh innovations, permit the ſtate to experience that repoſe which is ſo neceſſary to its well-being.

JOSSELIN, a town of France, in the department of Morbihan, 25 miles N.E. of Vannes. Long. 2. 23. W. Lat. 48. 0. N.

JOUARE, a town of France, in the department of Seine and Marne, with a late magnificent Benedictine abbey, 10 miles S.E. of Meux, and 35 E. of Paris.

JOYEUSE, a town of France, in the department of Ardeche, ſeated on the Baune, 27 miles S.W. of Privas.

IPHOFEN, a town of Germany, in the biſhopric of Wurtzburg, 15 miles E.S.E. of Wurtzburg.

IPS, a town of Germany, in the archduchy of Auſtria, ſituate near the confluence of the Ips and Danube, 48 miles W. of Vienna. Long. 15. 11. E. Lat. 48. 13. N.

IPSALA, a town of Turkey in Europe, with a Greek archbiſhop's ſee. Near it are mines of alum. It is ſeated on the Lariſſa, 20 miles S.W. of Trajonopoli, and 118 W. of Conſtantinople. Long. 26. 10. E. Lat. 40. 57. N.

IPSERA, a ſmall iſland in the Archipelago, in the form of a heart, 15 miles N.W. of the iſland of Scio. To the W. is another ſmall iſland, called Anti-Ipſera.

IPSHEIM, a town of Germany, in the principality of Culmbach, 17 miles N.N.W. of Anſpach.

IRAC-ARABIA, or BABYLONIAN-IRAC (the ancient Chaldea), a province of Turkey in Aſia; bounded on the W. by the deſert of Arabia, on the N. by Curdiſtan and Diarbeck, on the E. by Irac-Agemi and Kuſiſtan, and on the S. by the gulph of Perſia. It is watered by the Euphrates and Tigris; and is almoſt all under the dominion of the Turks. Bagdad is the capital.

IRAC-AGEMI, or PERSIAN-IRAC, a province of Perſia; bounded on the Weſt by Irac-Arabia and Kuſiſtan, on the North by Aderbeitzan and Ghilan, on the Eaſt by Couheſtan, and on the South by Farſiſtan. Iſpahan is the capital.

IREBY, a town in Cumberland, with a market on Thurſday. Many Roman antiquities have been dug up here. It is ſeated in a valley, at the ſource of the river Ellan, 10 miles N.E. of Cockermouth, and 299 N.N.W. of London. Long. 3. 18. W. Lat. 54. 50. N.

IREKEN, JERKIN, or YARKAN, a rich and populous town of Tartary, the capital of Bocharia, with a caſtle. It is the ſtaple town of all the trade carried on between India and the North part of Aſia. The Kalmucks are maſters of it; and never diſturb any one on account of their religion. It is eight miles N. of Caſhgur. Long. 73. 25. E. Lat. 41. 40. N.

IRJAH, a town of Hindooſtan Proper, in the country of Cabul, 46 miles S.E. of Cabul. Long. 69. 8. E. Lat. 33. 50. N.

IRKUTZK, the largeſt and leaſt populous government of

Ruſſia, compriſing all the E. part of Siberia, from the Northern Ocean to the frontiers of Chineſe Tartary, and from the boundaries of the government of Tobolſk to the Eaſtern Ocean. This large territory was gradually conquered and appropriated by the Ruſſians in their deſultory excurſions from Tobolſk. It is divided into the four provinces of Irkutzk, Nertſhiuſk, Yakutſk, and Okatſk.

Irkutsk, a town of Ruſſia, capital of a government of the ſame name, and the ſee of a Greek biſhop. It is ſituate on the lake Baikal, and is a place of conſiderable commerce, the caravans which trade to China paſſing through it. Long. 104. 58. E. Lat. 52. 4. N.

IRON-ACTON, a village in Glouceſterſhire, at the conflux of the Staure and Laden, which form the river Frome, three miles from Briſtol. Much iron has formerly been dug up, and many iron works and great heaps of cinders are to be ſeen here.

IRRIGATION (*Encycl.*). The principal object in irrigating the ſoil, is a proper ſupply of water; and, if that fluid abound with mud, the land will be more permanently improved, than by conducting a clear ſpring over its ſurface: hence it is certain, that if the liquor collected in farm-yards, the waſhings of different ſinks, ditches, and the drains of the contiguous fields, could be conveyed into the common ſtream, the water would acquire a more fertilizing property.

But, in order to manage this important branch of rural economy with ſucceſs, it will be requiſite previouſly to aſcertain, whether the ſtream will admit of a temporary weir or dam being conſtructed acroſs it; whether the water can be raiſed to ſuch a height as to overflow a particular ſpot, without injuring the contiguous land; and whether it can be drawn off with the ſame facility as it is conducted on the ſoil. If theſe objects can be attained, the proceſs of irrigation may be undertaken in the following manner:

When the deſcent cannot be determined with tolerable preciſion by the eye, an accurate level of the ground muſt be taken, and the moſt elevated part compared with the height of the ſtream to be employed. The inſtrument uſed for this purpoſe, is called a *water-level;* and, as the common machines are but imperfectly adapted to the purpoſe, we have given in Pl. 33, the repreſentation of a ſimple implement for taking levels, contrived by Dr. James Anderſon; as it has been recommended to the notice of the public, by the Board of Agriculture.

It conſiſts of two legs of common deal, A and B, about twelve feet in length, which are joined together at the top, and connected below by a croſs bar, as delineated in the plate. From the angle at the top, a plummet, C, is ſuſpended by a ſmall cord; which, when a mark is made in the middle of the connecting bar, and the two legs are perfectly ſtraight, will ſtrike ſuch mark, ſo that the level may be eaſily aſcertained.

In the practical uſe of this inſtrument, Dr. Anderſon directs a wooden pin, on which one of the legs of the frame may reſt, to be driven into the ground at the level of the water, where the irrigation is intended to commence. The other leg is then to be brought round, till it touch the ground, on a level with the top of ſuch pin, when another is to be driven in. After the level has in this manner been perfectly adjuſted, the laſt-mentioned pin is to be employed as a reſt for one foot, and the other turned about, till the level is found in the ſame manner. Thus, the preciſe direction which the ſtream ſhould take will at once be diſcovered, without any trouble, or incurring any additional expence by digging through heights or filling up cavities.

The level being taken as directed, a wide ditch is to be cut as near to the dam as poſſible, that the water may be conveyed to the higheſt part of the meadow; the ſides and banks of the ditch being uniformly kept at an equal height, and elevated about three inches above the ſurface. Where the meadow is extenſive, and the ſoil uneven, it will be neceſſary to have three works or dams in different directions, each of which ſhould be five feet in width, if the meadow contain fifteen acres; and the higheſt part be the moſt diſtant from the ſtream. A ditch, ten feet wide, and three in depth, will, in general, be fully adequate to overflow ten acres of land; and if there be three works or dams in a meadow, and *flood-hatches*, or flood-gates, be placed at the mouth of each, when the water is not ſufficient to irrigate the whole ſoil at once, it may be performed at three different periods; by taking out one of the hatches or gates for the ſpace of ten days, at the expiration of which it is to be let down, and the other two taken up alternately for a ſimilar period: thus each diviſion will receive a proper ſhare of water in its turn, and derive from it equal benefit.

Where the fall of the meadow renders it practicable, the bottom of the firſt work ſhould be made as deep as the bed of the river; becauſe the water, in proportion to its depth, will carry a larger or ſmaller quantity of mud with it, and conſequently fertilize the ſoil in a more or leſs effectual manner. Small ditches, or troughs, ought likewiſe to be cut from the works at right angles, about 12 yards apart from each other; and their breadth ſhould be adequate to the diſtance to which the water is to be conveyed: thus a trough two feet in width, and one foot deep, will irrigate a ſurface twelve yards wide, and forty feet in length.

It will, however, be requiſite to provide the ditches with occaſional flood-gates or ſluices, eſpecially when the water is rapid, in order to keep it ſufficiently high to flow through the perforations in the gates, or over the ſides. Between every ſecond trough, a drain is to be cut at equal diſtances in a parallel direction, and of a proper depth for receiving all the water which overflows the adjacent lands, and conducting it to the principal drain with ſuch rapidity, as to keep the whole ſtream in conſtant motion. For, if it be ſuffered to ſtagnate, it will be productive of the worſt conſequences; as the turf would become rotten, the ſoil be ſoaked without being ameliorated, and the land produce only coarſe graſs, ruſhes, or other aquatic weeds.

Where the meadows are cold, flat, and ſwampy, the width of the bed, that is, of the intermediate ſpace between the trough and drain, ought never to exceed ſix yards. In ſuch caſes, the land cannot be too much interſected, eſpecially when there is an abundant ſupply of water. The fall of the bed in every meadow ought to be in the proportion of one inch to each foot; for a rapid current always contributes to produce fine and ſweet herbage; but the water ought never to flow more than two inches, nor leſs than one inch deep, except during the ſummer months.

Such is the method of irrigation practiſed in Glouceſterſhire, and likewiſe, with very few variations, in the counties of Wilts, Dorſet, Cambridge, Hants, &c. Its advantages, indeed, are ſo important that, we truſt, no rational agriculturiſt will heſitate to adopt the practice of floating land, throughout Britain, in every ſituation where a command of water can be obtained.—Common meadows are not only enriched, but thoſe of a ſwampy nature are conſolidated by means of the mud conveyed on them. They are alſo protected from the effects of froſt by the flowing water, or by the ice when it is frozen; hence the roots of graſs remain unaffected by the cold, and excellent crops are thus produced ſo early, as to be of intimate ſervice for ſpring food, before the natural graſs appears.

By irrigation, good paſturage may be procured in the be-

ginning of March; and, if the ſeaſon be mild, much earlier. This crop is particularly excellent for feeding ſuch cattle as have been *hardly* wintered, and ſo great are the benefits attending the flooding of lands, that the farmers of Glouceſterſhire are enabled to commence the making of cheeſe, at leaſt *one month* earlier than thoſe who do not poſſeſs the ſame opportunity. The utility of watering land is ſtill further evinced by this circumſtance, that from the great forwardneſs of graſs, the feeding between the months of March and May, is worth one guinea per acre; in June one acre will yield two tons of hay; and the *after-graſs* may always be eſtimated at twenty ſhillings, whether the ſummer be wet or dry.—The expence of irrigation is computed at from 3l. to 6l. per acre.

Land may be floated at any period of the year. In the months of December and January, the chief care conſiſts in keeping the ſoil ſheltered by the water from the ſeverity of froſty nights. It will, however, be neceſſary to expoſe the ſurface to the air every ten days, or fortnight, during the winter, by laying it as dry as poſſible for a few days; and to diſcontinue the flooding, whenever the land is covered with a ſheet of ice.

In February, greater attention is required; for, if the water be ſuffered to flow over the meadow for ſeveral days in ſucceſſion, a white ſcum will be generated, which is very pernicious to the graſs; and, if the water be drawn off, and the land expoſed to a ſevere froſty night, without being previouſly dried for a whole day, the greater part of the tender plants will be totally deſtroyed.

In the beginning of March, the graſs on well-flooded meadows will, in general, be ſo forward as to furniſh abundant paſturage; when the water ſhould be drained for the ſpace of a week, that the ſoil may become firm, before heavy cattle be allowed to graze on ſuch land: theſe, however, if the ſeaſon be cold, ought to be ſupplied with a little hay every night, during the firſt week.

In the month of April, the graſs may be eaten down cloſely; but no cattle ſhould be turned in later; as otherwiſe the crop of hay will be much impaired, the graſs become ſoft or woolly, and conſequently its value be conſiderably diminiſhed.

In the beginning of May, the water is again thrown over the ſoil for a few days, in order to moiſten it; but the practice ought on no account to be continued during the ſummer; for it has an unfavourable effect on the *after-math*; and produces in ſheep fed on it, the diſorder called the *rot*.

Many other advantages ariſe from irrigation, which have been ſtated in our original article; and thoſe readers who are deſirous to acquire further information relative to this intereſting branch of rural economy, may alſo conſult Mr. G. Boſwell's *Treatiſe on Watering Meadows*, &c. in which the neceſſary implements, and terms employed in irrigation, are explained and illuſtrated with engravings; as likewiſe Mr. Wright's *Art of Floating Land*, &c. where the ſubject is perſpicuouſly treated, and objections are ably anſwered.

IRRITABILITY (*Encycl.*). We have already ſtated this term to denote that eſſential property of animals, in conſequence of which their fibres, on being touched, contract or become ſhort, in a greater or leſs degree.

Chemiſts have lately endeavoured to ſhew, that not only animal, but *vegetable irritability* originates from the *oxygen* which is inhaled by the lungs, or reſpired by the leaves, or abſorbed by the roots. And as reſpiration is every minute requiſite to the ſupport of animal life, Dr. Darwin conjectures that ſomething immediately neceſſary to their exiſtence, is acquired by the lungs of animals from the atmoſphere, rather than from the food they digeſt; and that this nameleſs ſomething, perhaps oxygen, is mixed with the blood, and again ſeparated from it by the ſpinal marrow, after having undergone certain changes in the courſe of its circulation, or ſecretion. In a ſimilar manner, he conſiders it as probable that the ſpirit of vegetation may be derived from that ſource, namely, the uncombined oxygen of the air, which is reſpired by the upper ſurfaces of the leaves, and not from that which is abſorbed by roots, in a more combined ſtate: further, that this oxygen is again ſeparated from the juices by the *ſenſorium*, or brain, of each individual bud, after having undergone ſome change in its paſſage through the ſecretory veſſels.

A long-continued, unuſual, or unnatural ſtimulation of vegetable fibres, by an increaſe of heat, exhauſts the ſpirit of vegetation: hence a ſlighter degree of cold, will deſtroy ſuch fibres; becauſe, after having been excited for a conſiderable time by a more powerful ſtimulus, they will ceaſe to act on the application of one that is weaker, ſo that in conſequence of hot days, tender plants are more liable to periſh from the coldneſs of the night. For this reaſon, gardeners in the more northern climates, ſhelter both the flowers of apricots and the tender vegetables, during the ſpring-froſts, from the meridian ſun, as well as from the deſtructive cold of the night, which is generally the moſt intenſe about one hour before ſun-riſe.

In the hot days of the month of June, 1798, Dr. Darwin twice obſerved ſeveral rows of garden-beans to become quite ſickly; and ſome of them even died, in conſequence of being irrigated for one or two hours with water from an adjoining canal. This circumſtance he attributes to the ſudden application of cold, after the plants had been greatly enfeebled, and deprived of their irritability by the exceſſive heat of the ſeaſon, rather than to the too copious watering of the dry ſoil. Some vegetables, however, ſuch as ſtrawberries, onions, &c. which were equally exhauſted, are leſs liable to be thus injured, and even receive benefit from occaſional irrigation in dry and ſultry weather.

On the contrary, the ſpirit of vegetation acquires additional vigour, if plants have been expoſed for a conſiderable time to a leſs than uſual degree of heat; but, if they be ſuddenly removed from a cold to a warm place, they will experience a ſimilar fate with thoſe hapleſs perſons, to whoſe frozen limbs ſudden heat was imprudently applied: thus, too great increaſe of action occaſions inflammation, which is generally ſucceeded by mortification and death. This fact has been aſcertained and confirmed by the experiments of M. Van Uſlar, who kept two ſpecies of the ſpurge, or wartwort, namely, the *Euphorbia Peplus*, and *Eſula*, L. ſecluded from the light and heat, with a view to render them more irritable: on expoſing theſe plants afterwards to a meridian ſun, they became gangrenous, and in a ſhort time decayed.

The increaſed, or diminiſhed, degree of irritability in plants, is by Dr. Darwin attributed to their previous habits, with reſpect to the ſtimulus of greater or leſs heat. Thus, the periods at which vegetables thrive in the ſpring, appear to be greatly influenced by their acquired habits, as well as by their preſent ſenſibility to heat: hence potatoes will germinate in a much cooler temperature during the ſpring than in autumn; hence alſo, the vernal months are the moſt favourable to the proceſs of making good malt; becauſe the barley will then ſprout with a leſs degree of heat than at any other ſeaſon.

The irritability of plants has been diſcovered to be greater in the morning than at noon, and leſs in the evening than at mid-day; though it is conſiderably augmented during cool and rainy weather. In a ſimilar manner, the limbs of animals acquire a greater ſenſibility of heat, after having been expoſed to the cold; thus, the hands, after immerſing

them for a ſhort time in ſnow, glow with warmth on entering the houſe;—and the late celebrated Spallanzani obſerved ſeveral animals and inſects, that conceal themſelves under ground in a torpid ſtate during the winter, and enjoy the genial warmth of the ſpring, again to diſappear at a ſeaſon when the heat of the atmoſphere was much higher than on their firſt emerging from their ſubterraneous abode.

From theſe conſiderations, Dr. Darwin infers, that ſuch plants as are ſheltered in a warm room, during the winter, ought to be occaſionally expoſed to a cooler atmoſphere, in order to increaſe their irritability; otherwiſe their growth in the ſucceeding ſpring will be much retarded. For the ſame reaſon, the continual viciſſitudes of the air and weather are eſſentially neceſſary to mankind; as the frequent changes of heat and cold have an obvious tendency to preſerve or reſtore their irritability, and conſequently the activity of the ſyſtem. Hence not only the health and energy of men are more conſpicuous in our variable climate, but their longevity is comparatively greater than on thoſe tropical continents, which experience both a more conſiderable degree of heat, and a more ſteady atmoſphere.

ISERLOHN, or LOHN, a town of Weſtphalia, with conſiderable manufactures in iron and tin, and of ribbands, velvets, ſilks, and ſtuffs. It is 32 miles N.E. of Cologn. Long. 7. 19. E. Lat. 51. 2. N.

ISMANING, a town of Bavaria, which gives name to a county, now united by purchaſe to the biſhoprie of Freiſingen. It is ſituate on the Iſer, eight miles N.N.E. of Munich, and 9 S.S.W. of Freiſingen.

ISMID, or Is-NIKMID, a town of Turkey in Aſia, ſuppoſed to have been the ancient Nicomedia, the capital of Bithynia. It is ſituate on a gulf or bay of the ſea of Marmora, 45 miles E.S.E. of Conſtantinople. Long. 29. 47. E. Lat. 40. 37. N.

ISMID, a town of Turkey in Aſia, in Caramania, 24 miles E.S.E. of Cogni.

ISPERLICK, a town of Turkey, in Europe, in Servia, 24 miles N.N.E. of Niſſa. Long. 22. 40. E. Lat. 43. 32. N.

ISSELBURG, a town of Weſtphalia, in the duchy of Cleves, 14 miles E.N.E. of Cleves.

ISSELSTEIN, a town of the United Provinces in Utrecht, capital of a ſmall territory, which formerly belonged to William III. king of England. It is ſituate on the Iſſel, 5 miles S. of Utrecht, and 21 S. of Amſterdam.

ISSIGEAC, a town of France, in the department of Puy de Dome, ſituate on the Couze, near the Allier, 15 miles S.S.W. of Clermont.

IS-SUR-TILLE, a town of France, in the department of Cote d'Or. In its vicinity are quarries of a white ſtone, which is not affected by the froſt. It is ſeated on the Ignon, near the Tille, 12 miles N. of Dijon.

ITCHEN, or ALRE, a river in Hants, which riſes near Alreſford, in the centre of the county, and watering Winchester, enters the bay of Southampton, at the town of that name.

JUAN DE FUCA, STRAITS OF, a large bay or gulf of the N. Pacific Ocean, on the W. coaſt of N. America. The entrance is in Long. 124. 55. W. Lat. 48. 25. N.

IVANITZ, a town of Croatia, on the river Lonia, 42 miles N.E. of Carlſtadt. Long. 16. 14. E. Lat. 46. 5. N.

JUBO, a kingdom of Africa, on the coaſt of Ajan, with a capital of the ſame name, ſubject to the Portugueſe. Long. 43. 20. E. Lat. 0. 50. N.

IVINGHO, a town in Buckinghamſhire, with a market on Friday, 6 miles S.W. of Dunſtable, and 32 N.W. of London. Long. 0. 35. W. Lat. 51. 54. N.

JULFAR, a town of Arabia, in the province of Oman, ſituate on a bay of the Perſian Gulf, 100 miles N.W. of Oman. Long. 56. 14. E. Lat. 25. 55. N.

JUMELLA, a town of Spain, in the province of Murcia, 22 miles S.W. of Murcia.

JUNAGUR, a town of Hindooſtan Proper, in the country of Guzerat, 170 miles S.W. of Amedabad. Long. 69. 58. E. Lat. 21. 45. N.

JUNGNAU, a town of Suabia, capital of a lordſhip of the ſame name, belonging to the princes of Furſtenberg. It is 40 miles S. of Stutgard. Long. 9. 12. E. Lat. 46. 40. N.

JUNKSEILAN, a fertile iſland in the India Ocean, near the S.W. coaſt of Siam, 63 miles long, and from 10 to 20 broad. The principal town, of the ſame name, is ſituate on the N. part of the iſland, and has a harbour capable of receiving veſſels of a moderate ſize. Long. 98. 30. E. Lat. 8. 40. N.

JUSSEY, a town of France, in the department of Upper Saone, ſituate on the Amance, 15 miles N.W. of Veſoul, and 22 E. of Langres. Long. 5. 48. E. Lat. 47. 49. N.

JUSTINGEN, a town of Suabia, the capital of a lordſhip purchaſed in 1751, by the Duke of Wirtemberg. It gives a ſeat and voice in the diets of the empire. It is 32 miles S.E. of Stutgard.

JUTERBOCK, a town of Upper Saxony, ſituate on the Angerbach, 18 miles N.E. of Wittemberg, and 24 S. of Potſdam. Long. 12. 52. E. Lat. 52. 1. N.

K.

KAFFUNGEN, a town and monaſtery of Germany, in Heſſe, near Caſſel. Long. 9. 30. E. Lat. 51. 15. N.

KAIRVAN, a city of Tunis, capital of a government of the ſame name. It is the ſecond city in the kingdom for trade and population; is celebrated for the moſt magnificent moſque in Barbary; and is 20 miles W. of Sufa. Long 10. 25. E. Lat. 35. 40. N.

KAISARICH, or KAISARIJAH, a town of Turkey in Aſia, in Caramania, the capital of a ſangiacat. It was the ancient Cæſarea of Cappadocia. It is ſituate at the foot of a mountain always covered with ſnow; and is five miles in circumference, ſurrounded with walls, and defended by a caſtle. It is populous, and divided into 180 quarters, in each of which there is a moſque or chapel. The principal trade is in Morocco leather. It is 150 miles NE. of Cogni, and 250 E.S.E. of Conſtantinople.

KALAAR, a town of Perſia, in Chilan, with a conſiderable manufacture of ſilk. Long. 58. 45. E. Lat. 36. 23. N.

KALIMBURG, a town of Denmark, in the iſle of Zealand, the capital of a conſiderable bailiwic. Long. 11. 11. E. Lat. 55. 47. N.

KALIR, a town of Suabia, in the duchy of Wirtemberg, with a caſtle. Long. 9. 45. E. Lat. 48. 38. N.

KALKAS, a tribe of the Mogul Tartars, in Chineſe Tartary. They inhabit the country N. of the Mogul Tartars, properly ſo called, which ſtretches as far as the kingdom of the Eleuthes; and is near 300 leagues in extent from E. to W. They live in tents, on the banks of their numerous rivers. They adore a lama of the ſecond order, who is held in ſuch veneration, that bonzes from China, Hindooſtan, Pegu, &c. come to pay their devotions at his reſidence in Iben Pira.

KALMUNZ, a town of Bavaria, in the principality of Neuberg, ſituate at the confluence of the Vilz and Nab, 12 miles N.N.W. of Ratiſbon.

KALTENBRUNN, a town of Weſtphalia, in the principality of Sulzbach, 12 miles N.E. of Sulzbach.

KAMNITZ, a town of Bohemia, in the circle of Leitmeritz, with a manufacture of ſtockings, which forms its principal trade. It is 21 miles N.N.E. of Leitmeritz, and 30 S.E. of Dreſden.

KANDEGHERE, a town of the peninſula of Hindooſtan, in the Carnatic. In 1599 it was the capital of a kingdom, called Narſinga, the reſidence of a Hindoo king, whoſe dominions extended over Tanjore and Madura; and in 1640, a deſcendant of that prince, who reigned here, permitted the Engliſh to form a ſettlement at Madras. It is 70 miles N.W. of Madras. Long. 79. 24. E. Lat. 13. 46. N.

KANG-HY, Emperor of China, and of both the Tartaries. He was ſon of Chun-Tchi, founder of the preſent reigning dynaſty, called Tai Tſing. He aſcended the throne in the year of our Lord 1662, and reigned ſixty-one years. His will, which is tranſlated and enriched with notes by Joſeph de Grammont, miſſionary at Pekin, preſents many curious facts and obſervations relative to the hiſtory, religion, laws, and manners of China. It runs in theſe words:

"From the foundation of the empire to the preſent time, every ſovereign has paid religious reſpect to Heaven, and imitated the examples of his anceſtors.

"According to this law, which is the baſis of every good government, the principal duty of an emperor is to maintain order, peace, and plenty in his dominions; to watch, without intermiſſion, for the purpoſe of averting from his ſubjects every thing which can tend to diſturb their tranquillity and eaſe; to treat foreigners with kindneſs; to maintain a reciprocal commerce with other nations; and to enjoy with them the riches contained within the four ſeas*. Happy the prince whoſe conduct is regulated by this ſacred duty.

"For me, I have attained the ninetieth year of my age, and the ſixty-firſt of my reign; I do not attribute my long life and reign to my feeble virtue, I owe this double bleſſing ſolely to the protection of Heaven and Earth †, to the benignity of that Spirit who governs all generations ‡, and to the ſingular merits of my anceſtors §.

---

* As this ſmall tract contains many things not well known to the majority of readers, it has been thought proper to elucidate it with notes. Chineſe geographers repreſent the earth ſquare, and ſurrounded on every ſide with water. The ſquare continent is the empire of China only, which they call the middle kingdom *Tchou Kao*, becauſe they ſuppoſe the other kingdoms to be nothing more than ſmall iſlands diſperſed among the four ſeas, which anſwer to the four ſides of their land. They are now a little more enlightened on this ſubject, but their maps are unaltered.

† According to the Chineſe, the heavens and earth joined together, *Tien-ty*, deſignate the Ruler of the univerſe.

‡ The Chineſe ſuperſtition places genii and ſpirits every-where; fire, thunder, mountains, rivers, roads, houſes, all places, and almoſt all beings, have their tutelary ſpirits; the ſpirit here alluded to is that of the earth.

§ The Chineſe of diſtinguiſhed birth, or dignity, are of opinion, that the *Chang-ty*, or ſupreme Lord of heaven, confides to their anceſtors the care of their whole family. Following this vain and preſumptuous idea, when a Chineſe is deſirous of obtaining ſome ſignal bleſſing, he addreſſes his prayer to one of his anceſtors; and the greater the merits of the anceſtor, the more his deſcendant thinks himſelf ſecure of proſperity.

"I have perused, with attention, the history of the monarchy, from the reign of its founder, Hoang-ty *, to this time; four thousand three hundred and fifty-one years are elapsed. Of the three hundred and one emperors who have filled the throne, during these forty-three centuries, not one has had so long a reign as myself: I did not expect so long a career; when I attained my twentieth year, I did not expect to live till thirty, but never dared to flatter myself that I should reach forty. How distinguished, then, how favoured am I by Heaven, in being permitted to live to the age of ninety!

"We read in the *Chu King* †, that long life, riches, and strength of body, joined with peace of mind, love of virtue, and an easy death in an extreme old age, are the principal sources of human happiness. From this it may be inferred, that very few men are perfectly happy, for the last source of happiness is rarely conjoined with all the preceding ‡. I know not, nor can I foresee, when the end of my days will arrive; but, at my present advanced age, I consider myself as having attained the summit of happiness. Lord of a mighty empire, I possess all that is environed by the four seas encircling China; at the head of a family, my sons and grandsons, who amount to fifty in number, give me assurance of long and brilliant posterity: moreover, wars and commotions have utterly ceased throughout my states; from one end of my empire to the other, my subjects, submissive and faithful, enjoy the most profound peace.

"When I reflect on the events of my reign, I see no probability that my tranquillity should be interrupted; and if this day were appointed to be my last, I think my mind would maintain the most perfect composure. Every one knows the cabals, the factions, and intrigues, and the system of plunder which preyed on the state when Heaven chose me as governor. I do not presume to arrogate to myself the merit of those singular events which have so happily changed the face of affairs, and which fixed me on a tottering throne; but it affords me the purest consolation to see order, peace, plenty, and subordination now generally prevalent throughout the whole of my extensive empire.

"This glorious revolution, I own cost me immense labour and pains; imitating the emperors of the three first dynasties §, I keep a vigilant eye on all quarters of the empire. The parties and revolts which arose on all sides, at every moment rent my heart, engaged all my attention, kept me in perpetual uneasiness, and permitted me to take no repose night or day. What oppositions have I not submitted to! What griefs have I not concealed, and what obstacles have I not surmounted!

"When I reflect on the embarrassments and corporeal labours I have endured, I cease to wonder that the emperors of preceding dynasties did not reign longer. No, it was not intemperance and voluptuousness, as some inconsiderate historians, whose pleasure consists in censuring even the most irreproachable sovereigns, have pretended; it is not, I say, intemperance and voluptuousness which have abridged their days; but the immense weight of public affairs, the uninterrupted series of cares and solitudes, the short periods of their domination must be imputed: they have sunk under the weight of empire, like *Tchu-ke Leang* ||, who terminated his career of glory exhausted with fatigues and labours. Oh, how few ministers of state endeavour to imitate this great man!

"A minister who assumes the management of affairs, can renounce it when he will; the engagement by which he is attached to his prince, only retains him while his zeal for the service continues; as soon as he is disgusted he dismisses himself from his employ, retires from court, and returns to his family; where, liberated from all cares and inquietudes,

---

* It is certain that Tou-hy and Chin-noug are looked upon by the Chinese as the first emperors who governed China, but they do not know the era and duration of their reign. Hoang-ty afterwards restored the peace of the empire, established ministers, and regulated the form of government. It is not surprising that he should be considered the founder of the empire.

† The *Chu King* is one of the six sacred books of the Chinese; it includes the foundation of their ancient history, the principles of government of their first emperors, and their precepts of morality.

‡ To the sources of happiness here enumerated, the *Chu King* opposes six sources of misery: 1st, a short and vicious life; 2d, poverty; 3d, disease; 4th, grief; 5th, weakness; 6th, cruelty. The gospel alone shews the real sources of happiness and misery; the most sublime systems of pagan philosophy contain only feeble conjectures on this important subject.

§ The three first dynasties, or families, who governed the empire were distinguished by the appellatives of Hia, Chang, and Tcheou.

The first, Hia, founded by Yu the Great, began 2200 years before the christian era, and in the space of 441 years, produced seventeen emperors.

The second, Chang, acknowledges Tching-tang for its founder; it began 1765 years before the christian era, and produced twenty-eight emperors, who reigned 644 years.

The third, Tcheou, founded by Vu Vang 1121 years before Christ, reigned 875 years, and gave birth to thirty-five emperors. The reader is not to imagine that all these princes were models worthy to be followed: several in each dynasty were known only by their debauchery, cruelty, injustice, and impiety. The most celebrated in history are Ty-Kié, of the first, and Chen Sin, of the second dynasty, who deserve to be considered as the Neros of China: but Yu the Great, Chao Kang, Tchu, of the first; Ven-Vang, Tching-Tang, Tai-Kia, Vai-Jiu, &c. of the second; and Vu-Vang, Thing-Thang, &c. of the third dynasties, were emperors so distinguished for their wisdom, equity, moderation, love of their people, and zeal for the public good, that all wise emperors make a merit and glory of imitating their actions and virtues.

|| Tchu-Ke Leang rendered himself famous under the two last emperors of the dynasty of Han, about the year of Christ 220. His inviolable fidelity to his sovereigns, his constant application to business, his superior talents for government, raised him to the first dignities of the empire; but that which principally distinguished him in those times of trouble and disorder was his great bravery and ability in the conducting of armies. The greatest generals were afraid even of his shadow. He died in arms in the cause of his sovereign. The fall of the dynasty of Han speedily followed the death of this great man, who was its only support.

he finds consolation in the embraces of his offspring, and after spending an easy, mild, and agreeable life, he sinks quietly into the grave.

" How different the lot of an emperor! When once he has assumed the helm of affairs, whatever difficulties may attend the conduct of them, he is forbid to delegate his trust into other hands; the rest of his life is then only a web of troubles, uneasiness, and labour.

" Those who read the histories of Chun and Yu, will see with admiration that those two emperors * never for an instant abandoned the reins of empire, that they themselves entered into all the affairs of all their subjects, for them alone they lived and both died exhausted with labour and fatigue, and far distant from their court and their families; the one at Tchan-ow, the other at Hoei-Ki-Kien. Let any one consult the Y-King, that sacred book, where good and evil, virtue and vice, are exhibited without disguise, and painted in appropriate colours; he will find no trait of reproach on the imperial character. In fact, to be without a place of rest, to exert, and even exhaust his strength, is the lot of an emperor. But among all those who have governed the empire prudently, I dare pronounce that no one will be found whose reign has been so replete with troubles as my own

" Neither jealousy, love of glory, nor ambition, placed my family on the throne of China. In consequence of the misunderstanding which prevailed between the Ming † family and mine, my father justly declared war against him; and the troubles ‡ which then desolated China, rendered it an easy conquest. My father was even advised by his ministers and generals not to let pass so favourable an opportunity of making himself feared and respected by his neighbours: but, considering it contrary to the decrees of Heaven to dispossess a family who had been legally in possession of the throne for near 300 years, he resisted every solicitation, and could never resolve to adopt so violent a measure. Meanwhile the troubles of the empire daily increased. The Y-Tching was master of Pekin; the emperor Tsong-Tching hung himself through despair. All the empire in alarm and consternation then turned their eyes towards my father, and implored his aid against the tyranny of the usurper. Touched with the woes of the nation

---

* Yao-Chun and Yu have always been considered by the Chinese as the most perfect models for sovereigns; fathers of their people, their only aim was to render them happy and virtuous. Their reign may, with reason, be regarded as the reign of clemency, justice, prudence, and all the social virtues. The emperor Chun ascended the throne 2277 years before the christian era. After a reign of fifty years, he died at Ishan-ou, in the province of Kuang si, aged 110 years.

Before he attained the throne and acquired the love and esteem of his people by those virtues which make great kings, the emperor Yu had already entitled himself to their eternal gratitude by the important services he had rendered the state. The renewal and amelioration of agriculture, the liberty and facility of trade in all the provinces, but especially the draining of the waters with which all the low lands of the empire were overflowed, a work worthy of ancient Rome, were the immortal fruits of the indefatigable application and superior genius of this great prince. He began his reign in the year 2217 before Christ, and, after ten years, terminated his illustrious career at Hoei-Ki-Kien, a city of the third order, dependent on Chus-hiu-tu, in the province of Tche Kiang.

† The dynasty of Ming was that immediately preceding the reigning family, called Tai-Tsing. It was founded by Ming tait-son, in the year of Christ 1384. It produced sixteen emperors in the space of 276 years. The misunderstanding between the two families originated solely in the haughtiness and contempt manifested by the last emperors of the Ming family, or rather by their eunuchs and mandarins, towards the Tartar princes. These misunderstandings occasioned frequent wars.

‡ China was then in a most critical situation. The Se-Schum, the Hu-Kuang, the Kiang-Si, the Ho-Nan, the Chen-Si, all these fine provinces were a prey to different parties of rebels, every chief of whom pretended to the empire; violence, murder, and plunder, were generally prevalent. Of all the chiefs of parties, Li-Tse-Tsching was the most powerful and most to be dreaded: while the others by fire and sword destroyed cities and countries, and sought only to enrich themselves by the spoils of the great and of the poor, he, less ferocious and more cunning, still retained some vestiges of humanity; and if he despoiled individuals in high stations, he employed the booty in relieving the miseries of the people. By this artful conduct, he increased his party to such a degree, that his troops were equal to those of the emperor, not only in courage and discipline, but in numbers. Seeing himself at the head of such a fine army, after making himself master of the Ho-Nan and the Chen-Si, he did not hesitate to assume the title of emperor, and advance towards the capital. He knew that place, defended by a garrison of 60,000 men, to be impregnable; but informed of the misunderstanding which prevailed between the eunuchs and the military officers, and of the disposition of a great party which had been formed in his favour by means of his emissaries, he was secure that the gates would be opened to him. In fact, in three days after his arrival, he entered the city at the head of 300,000 men. The emperor Tsong Tching, who had bestowed all his confidence on the eunuchs, was entirely ignorant of all that was passing without. He thought his enemies were still at a great distance, when two eunuchs came to him from Li-Tse Tching, announcing his arrival, and demanding the crown. By this distressing proposition, Tsong-Tching perceived he was betrayed. He wished to leave his palace without delay, accompanied by his guards, but no one had the courage to follow him. The unhappy prince, thus deserted, and feeling that he was now without resource, put his family affairs in the best order he could, and yielding implicitly to the dictates of his despair, retired into his garden, where he hung himself on the branch of a tree by his girdle. A few hours afterwards the rebel entered the palace, and caused himself to be again proclaimed emperor.

While this revolution took place in the capital, prince V-Geer was commanding the Chinese troops in the Leao-Tong. Hardly had he learned the state of things, when, resolved to avenge his sovereign, he immediately made peace with the Tartars, and called in their aid to expel the rebel, and give peace to the empire. Li-Tse-Tching could not long hold out against the valour of the Chinese and Tartar troops united. After a few battles, in which he constantly had the disadvantage, he at length took to flight, and retired to the Chen-Si, with the wrecks of his army, where, after a time, he fell in a battle with the prince V-San-Quei.

which were already at their greateſt height, my father yielded to the wiſhes of the people. He entered China, exterminated the rebel and all his party, and by the acclamations of the grandees and people was ſaluted and acknowledged emperor.

" His firſt care was to diſplay his eſteem for the emperor Tſong-Tching, by decreeing that all due funeral obſequies ſhould be performed, according to the cuſtoms of the empire.

" If we aſcend further, to the preceding dynaſties, we ſhall perceive that Han-Kao-Tſou *, founder of the dynaſty of Han, was only a ſimple commiſſary of a diſtrict: that Ming-Tai-Tſu, founder of the dynaſty of Ming, once ſerved as footman in a monaſtery of bonzes †: that towards the end of the dynaſty of Yuen ‡, general Tching-Yen-Leang, at the head of a conſiderable army, obtained the imperial dignity, which was ſoon ſnatched from him by the founder of the Ming family.

" My race is deſcended from the kings of Eaſtern Tartary; they took poſſeſſion of the empire by virtue of a particular diſpenſation of Heaven, and the conſent of the nation.

" In times of diſorder and anarchy, when every department of a ſtate is in confuſion, he who by his prudence, his authority, or his ſuperior talents, ſucceeds in reſtoring order and peace, always becomes maſter, and legitimate poſſeſſor of the ſupreme authority: this fact is proved by hiſtory. No man by his own ſingle exertions can raiſe himſelf to ſovereignty, for ſceptres and crowns are given by Heaven. He on whom the choice falls has nothing to fear from man; if Heaven deſtines him to a long and peaceful reign, the united efforts of all mankind cannot impede or abridge its courſe.

" From my earlieſt youth I have ſtudied the writings of the ancients and moderns; and I am not unacquainted with their uſeful, curious, and inſtructive ſentiments on every ſubject. In the vigour of my days, I could bend a bow of one hundred and fifty pounds weight, and ſhoot an arrow of thirteen handfuls long §. The leading of armies and conduct of battles and ſieges are arts in which I am perfectly verſed.

" Yet, although I am a great man of war, bred in the tumult and din of arms, no man can reproach me with having at any time violated the laws of juſtice and humanity. I never in my life put an individual to death unjuſtly: if I ordered the deſtruction of the three kings ||. and the extermination of the family of Mo-pe ¶, theſe ſacrifices were required for the intereſt and welfare of the ſtate.

" As to the imperial treaſure, I have always conſidered it as the blood and ſweat of the people; and accordingly I have never uſed it but for the ſupport of my armies in the time of war, and the ſubſiſtence of the poor in times of dearth: I never made a ſuperfluous or uſeleſs expenditure of it.

" Let any one enter the different palaces ** in which I reſide during my progreſſes, he will find nothing rich or curious in the furniture or the ornaments. Ten or twenty thouſand taels a year ſuffice for the expenditure incident to each palace. The repairs of the dykes coſt the nation annually upwards of three millions of taels; thus for the maintenance of all my palaces, not a hundredth part of the money is expended which it coſts to repair the dykes.

" Have I not reaſon, then, to feel perfectly at eaſe reſpecting the judgment of poſterity?

" Formerly, Leang-Vu-Ty by his valour obtained the diadem. At the age of fourſcore he was dethroned by his vaſſal Heu-King, who cauſed him to be ſhut up between

---

* Han-Kao-Tſou, before he attained the empire, was known by the name of Lien Pang. At firſt, he was a mere adventurer, who, from being a ſimple commiſſary of a diſtrict, put himſelf at the head of a troop of abandoned characters. His natural and perſuaſive eloquence, his moderation, his courage, and ſkill, by degrees formed for him a conſiderable faction, by which he was enabled to declare war againſt his ſovereign, and to deprive him of the empire. He aſcended the throne 205 years before the chriſtian era. The hiſtory of China ſpeaks in high terms of praiſe of his reign, which laſted twelve years. The dynaſty of Han, founded by him, produced, in 426 years, twenty-five emperors.

† Ming-Tai-Tſu, before he was emperor, was known by the name of Tchu, afterwards Hung-Vu: while he was yet a ſervant in a monaſtery of bonzes, he enrolled himſelf in a numerous troop of outlaws, and ſoon became their chief. By his valour and intrepidity, he ſucceeded in wreſting the crown from the Mongol race, and in expelling them from the empire.

‡ The dynaſty of Yuen, or of Eaſtern Tartars, known by the name of Mongols, was founded by Chit-Su, in the year after Chriſt 1280. In the ſpace of 89 years it gave nine emperors. In the reign of the laſt, named Chun-Sy, a prince entirely taken up with trifles and frivolities, among the rebels who contended for the empire, Tching-Yeu-Leang was the moſt powerful. He had already cauſed himſelf to be proclaimed emperor, but ſoon afterwards loſt his crown and his life in a ſea-fight with Tchu, or Ming-Tai-Tſu.

§ By a handful muſt be underſtood the breadth of four fingers. Thus, an arrow of thirteen handfuls long, is equal to thirteen times the breadth of four fingers. The Tartars, who are all extremely expert at archery, aſſert that to ſhoot an arrow of that length from a bow of 150 pounds weight, requires an extraordinary degree of force.

|| Theſe three kings were the kings of Yun-Nan, Kung-Tong, and Fou-Kien. The paſt conduct of theſe three monarchs, their power, both in itſelf and in relation to that of Canton, its good underſtanding and trade with the Dutch, gave umbrage to the Manchou Tartars, then recently eſtabliſhed in China.

¶ The text is ſuppoſed to refer to ſome Weſt Tartar families.

** The emperors never leave the capital, unleſs it be to go to Cheu-Si-Chantong, Kiang-Nau, Leaotong, or Ge-Ho (a palace of pleaſure, ſeven days' journey from Pekin). On all the roads leading to theſe different places there are imperial palaces, called King-Kung, at the diſtance of about five or ſix leagues from each other. Theſe King-Kung are in number about 80 or 90. It is very remarkable, that they are all built in places ſo remote from habitation, that the emperor and his family can alone find accommodation; his ſuite, amounting often to 50,000 men, are obliged to lodge under tents.

four walls and ſtarved to death *. The emperor Soui-Ven-Ty† alſo got poſſeſſion of the crown without reſiſtance, owing to a ſingular trait of feebleneſs in Tchong-Tching-Kung; yet he did not perceive that his ſon Yang-Ty would wreſt from him his throne and life.

"Theſe two emperors ſhould, by timely precautions, have guarded againſt the ambition and the wickedneſs of theſe miſcreants. An attentive obſerver ſpeedily diſcerns plots, however ſtudiouſly concealed.

"As for me, I know my ſubjects, and that they are all well affected towards me. Among the princes, the grandees, the miniſters, and mandarins; among the ſoldiers and the lower order of people; even among the Mongol princes, there is not an individual who does not wiſh me well, and ſincerely pray for a prolongation of my life and reign.

"Old as I am, and approaching the utmoſt limit of life, I feel, nevertheleſs, that my mind and my heart are perfectly at reſt; I even experience a delicious pleaſure when I reflect that the ſons and grandſons of the princes Y-Tſing-Vang and Jao-Yu-Vang, my uncles, are ſtill in full life and health.

"Oh, all you who compoſe my family, do not grieve at my return ‡! So you live long in happineſs and unanimity, I am content, and die with pleaſure.

"Yong-Tſing-Vang §, my fourth ſon, reſembles me in many reſpects. He has all the talents requiſite for government: I command him, after my death, to take poſſeſſion of the empire; let a mourning of ſeven-and-twenty days, according to the preſcribed forms be obſerved ‖; and let my will be publiſhed at court and in the provinces."
